

## Week Beginning 12 June 2017

### MANAGEMENT NOTES:

- Heavy rainfall and lower than expected night time temperatures have caused grass growth to fall back sharply this week both on the GrassCheck plots and farms however growth is expected to remain around the seasonal average.
- Although ME contents have stabilised after heading, the lower dry matter contents may still hinder grass dry matter intakes. On wetter farms, this has coincided with more difficult grazing conditions and delayed fertiliser application.
- Using multiple gateways and tracks will help ensure continued access to grass, with better grazing conditions expected early into next week. Consider pre-mowing to keep on top of sward quality.
