

Influenza Weekly Surveillance Bulletin

Northern Ireland, Week 6 (5th February – 11th February 2018)

Summary

In week 6, the surveillance data continues to indicate moderate seasonal flu activity. GP consultation rates slightly increased, while there was a decrease in OOH consultations in week 6 (week commencing 5th February 2018). Total detections of influenza virus fell in week 6.

Northern Ireland Primary Care Consultation Rates

- GP consultation rates for combined flu and flu-like illness (flu/FLI) slightly increased from 29.0 per 100,000 population in week 5, 2018 to 30.6 per 100,000 population in week 6. Rates remain above the Moving Epidemic Method (MEM) threshold for moderate level flu activity¹.
- OOH GP consultation rates for flu/FLI decreased from 17.0 per 100,000 population in week 5, 2018 to 12.6 per 100,000 population in week 6.

Microbiological Surveillance (Flu and RSV)

- The proportion of all positive influenza specimens fell slightly from 37% in week 5, 2018 to 34% in week 6.
- RSV remained the same in week 6 at 2%.

Secondary Care (Hospital both non-ICU and ICU)

- The number of detections of influenza from hospital wards reported to PHA decreased from a total of 184 detections in week 5, 2018 to 129 in week 6.
- There were five cases reported in ICU with laboratory confirmed influenza in week 6 giving a total of 80 cases this season to date.
- Three deaths were reported in week 6 among ICU patients. The total deaths in ICU with confirmed influenza to date is 15.

Influenza Outbreaks across Northern Ireland

- There was no influenza outbreaks reported to the PHA in week 6. Therefore, the total confirmed Influenza outbreaks to date remains at 33.

Mortality

- The proportion of deaths related to respiratory keywords (bronchiolitis, bronchitis, influenza and pneumonia) decreased from 40% in week 5, 2018 to 36% in week 6.

¹ The baseline MEM threshold for Northern Ireland is 22.58 per 100,000 population this year (2017/18). Low activity is 22.6 to <26.6, moderate activity 26.6 to <85.1, high activity 85.1 to <142.4 and very high activity is >142.4.

Introduction

Influenza is an acute viral infection of the respiratory tract (nose, mouth, throat, bronchial tubes and lungs). There are three types of flu virus: A, B and C, with A and B responsible for most clinical illness. Influenza activity in Northern Ireland is monitored throughout the year to inform public health action and to prevent spread of the infection. The influenza season typically runs from week 40 to week 20. Week 40 for the 2017/18 season commenced on 2nd October 2017.

Surveillance systems used to monitor influenza activity include:

- Northern Ireland GP surveillance representing 98% of Northern Ireland population;
- Sentinel flu-swabber GP practices representing 11.2% of the NI population, contributing to the measurement of circulating influenza in the community
- GP Out-of-Hours surveillance system representing the entire population;
- Virological reports from the Regional Virus Laboratory (RVL);
- Individual virology reports from local laboratories (as outlined);
- Influenza outbreak report notification to PHA Duty Room;
- Critical Care Network for Northern Ireland reports on patients in ICU/HDU with confirmed influenza;
- Mortality data from Northern Ireland Statistics and Research Agency (NISRA);
- Excess mortality estimations are calculated using the EuroMOMO (Mortality Monitoring in Europe) model based on raw death data supplied by NISRA

NB: Please note the change in the collection of Flu/FLI consultation data in 2017-18. Data will now be collected from 325 GP practices, representing 98% of the Northern Ireland (NI) population. This represents a change from previous seasons when data was collected from 37 sentinel GP practices (representing 11.7% of the NI population).

As a result, Flu/FLI consultation rates and the MEM threshold in 2017-18 will be generally lower than in previous years. Please take this into account when interpreting the figures in this season's bulletin.

Northern Ireland GP Consultation Data

Figure 1. Northern Ireland GP consultation rates for flu/FLI 2015/16 - 2017/18

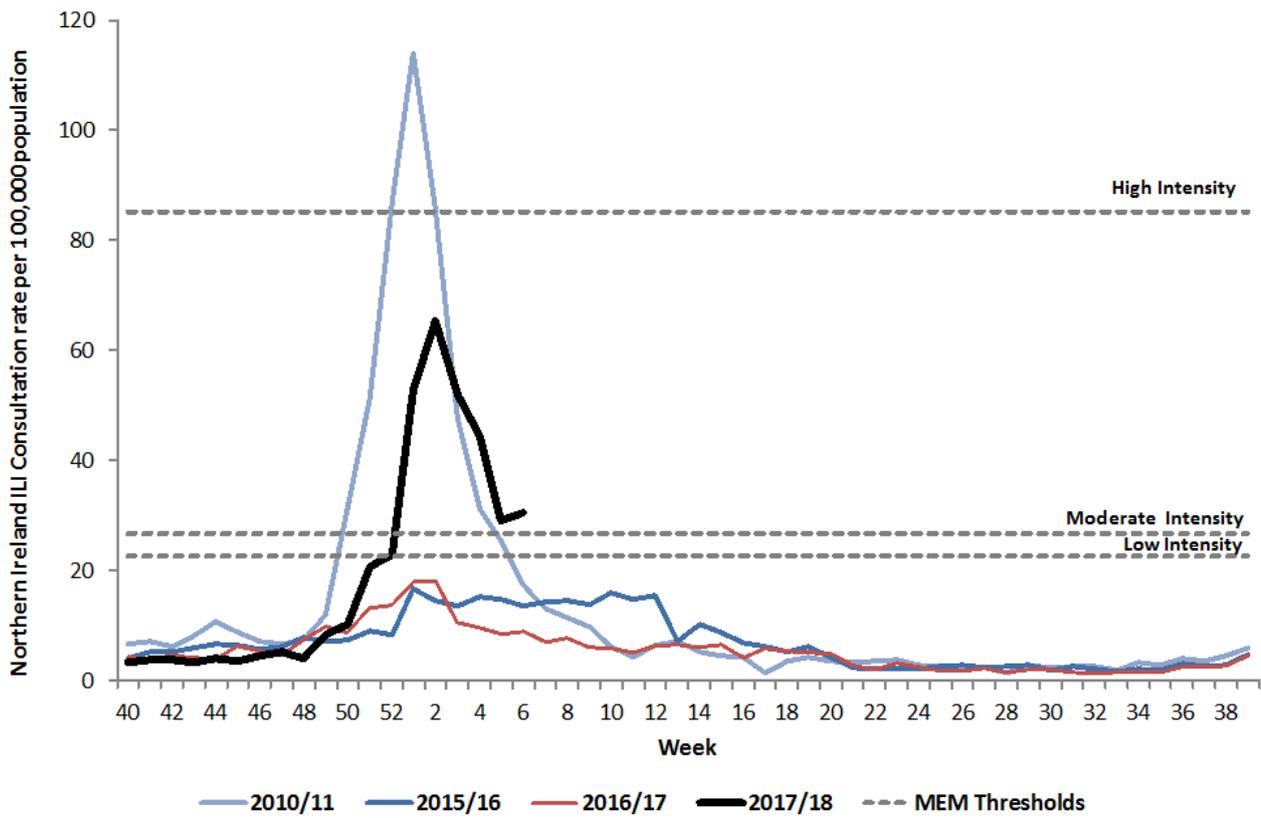

Figure 2. Northern Ireland GP consultation rates for flu/FLI and number of influenza positive detections 2012/13 – 2017/18

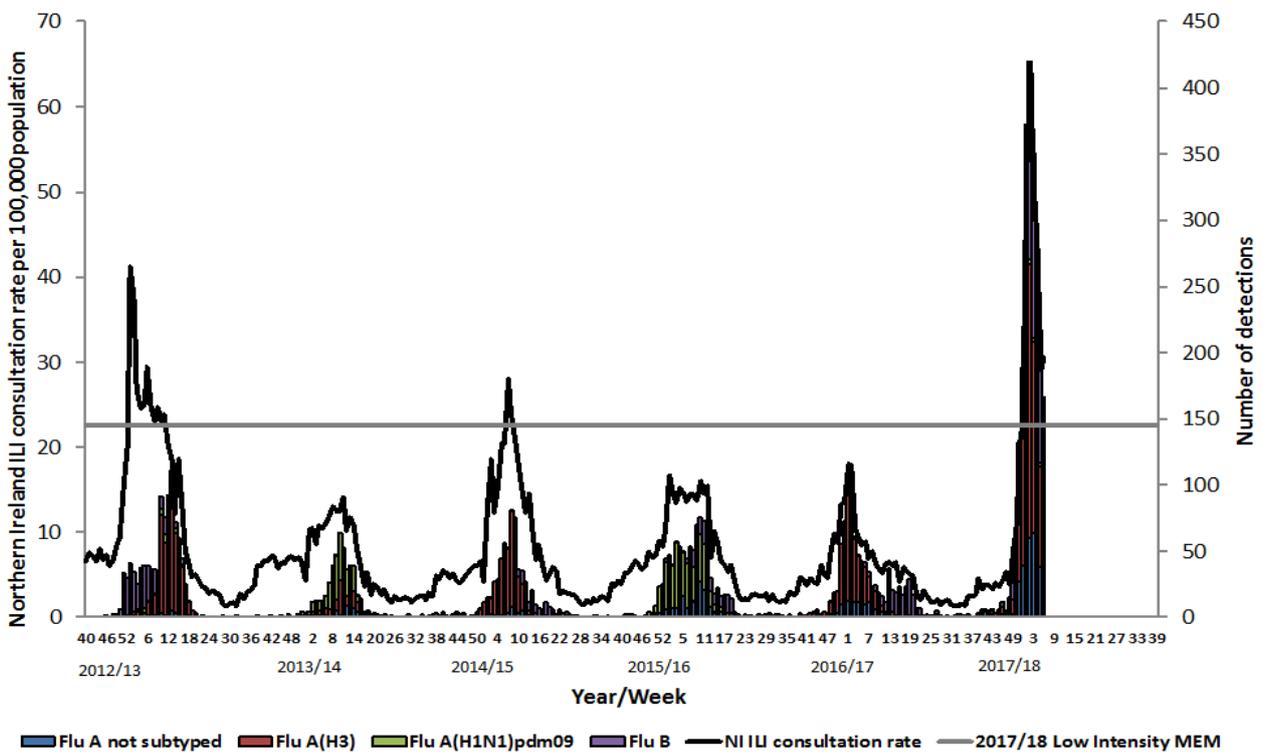

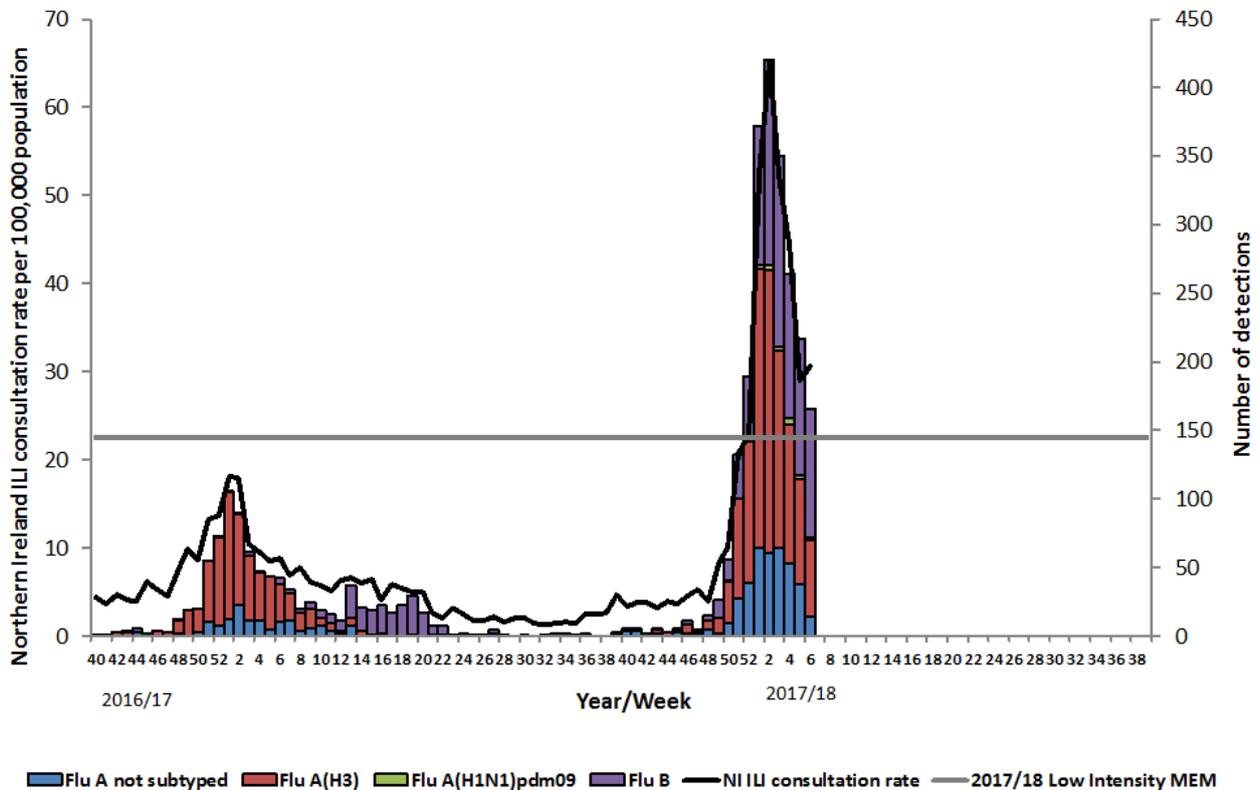

Figure 3. Northern Ireland GP consultation rates for flu/FLI and number of virology 'flu' detections from week 40, 2016

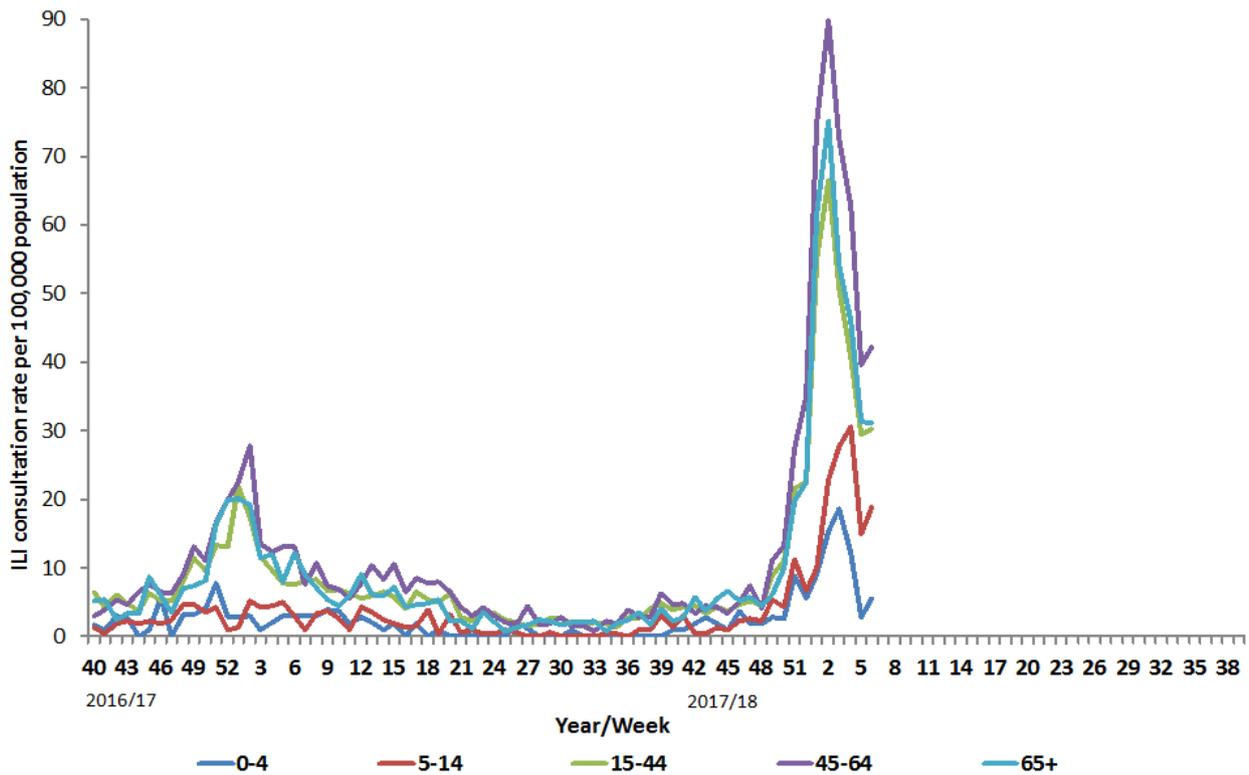

Comment

NI GP consultation rates increased slightly from 29.0 per 100,000 population in week 5, 2018 to 30.6 per 100,000 population in week 6, and activity remains at moderate intensity (between 26.6 to <85.1 per 100,000 population). The NI GP consultation rate in week 6 remains higher than rates for similar periods in the last number of years (Figure 1).

The number of positive influenza laboratory detections decreased from 217 in week 5, 2018 to 166 in week 6. At this point in the season there have been a total of 1031 detections of influenza A(H3), 806 of influenza B, 393 of influenza A (typing awaited), and 22 detections of influenza A(H1N1) 2009 (Figures 1, 2 and 3).

Further information about laboratory detections of influenza is detailed on page 8.

Figure 4. Northern Ireland GP age-specific consultation rates for flu/FLI from week 40, 2016

Comment

NI GP age-specific consultation rates have slightly increased in almost all age-groups in week 6, 2018, though remained unchanged for those aged 65+ years (31.4 per 100,000 in week 5 and 31.2 per 100,000 in week 6). Consultation rates remained highest in those aged 45-64 years at 42.2 per 100,000 population and lowest in those aged 0-4 years at 5.6 per 100,000 population. Consultation rates in those aged 5-14 years is 18.8 per 100,000 and 30.3 per 100,000 population in those aged 15-44 years (Figure 4).

Out-of-Hours (OOH) Centres Call Data

Figure 5. OOH call rate for flu/FLI, 2015/16 – 2017/18

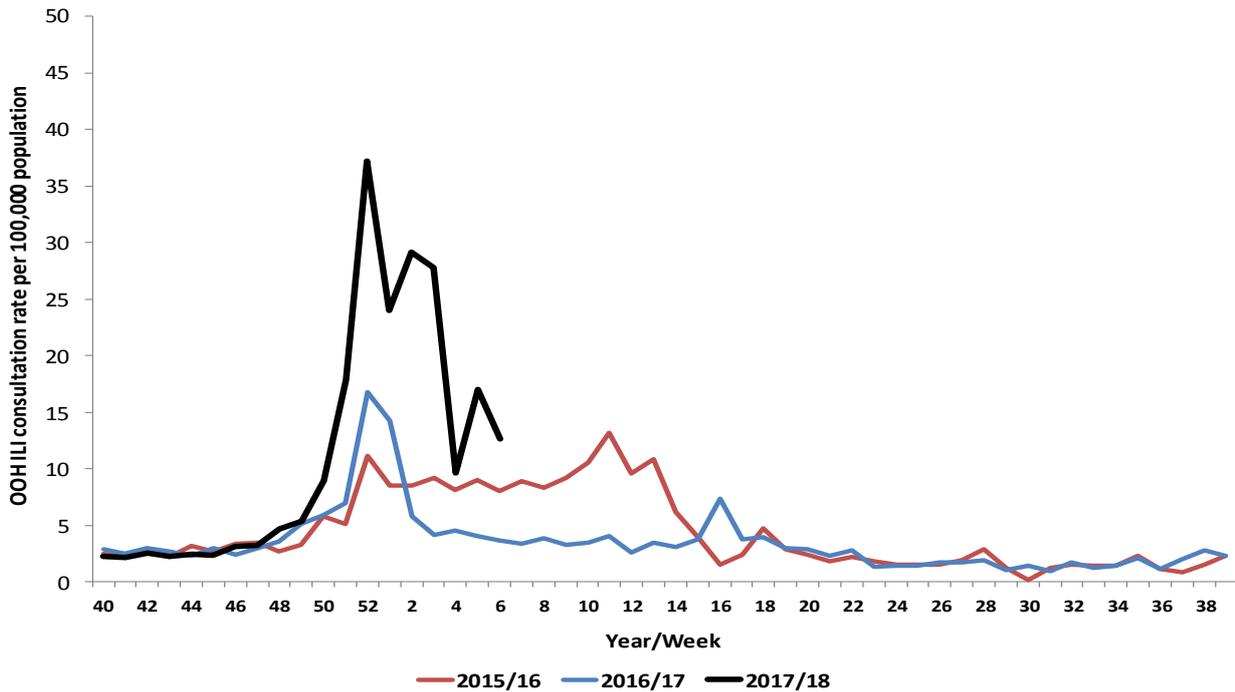

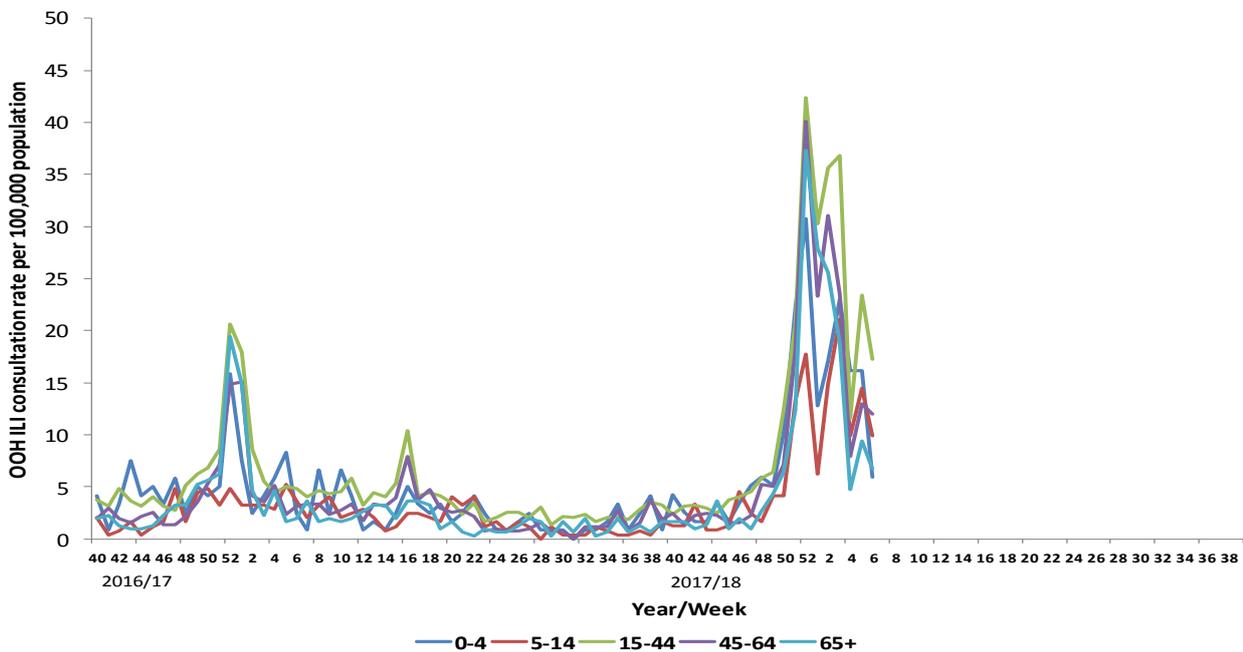

Figure 6. OOH call rates of flu/FLI by age-group from week 40, 2016

Comment

OOH GP consultation rates decreased in week 6, 2018 from 17.0 per 100,000 in week 5 to 12.6 per 100,000 population. Rates remain higher than those in the same period in 2016/17 (3.7 per 100,000 population) (Figure 5).

The proportion of calls related to flu in OOH centres decreased from 2.9% in week 5, 2018 to 2.1% in week 6.

OOH flu/FLI rates decreased among all age groups in week 6, 2018. The highest age-specific OOH flu/FLI rate in week 6 was in those aged 15-44 years at 17.3 per 100,000 population. The lowest rate in week 6 was in those aged 0-4 years at 6.0 per 100,000 population (Figure 6).

Virology Data

Table 1. Virus activity in Northern Ireland by source, Week 6, 2017/18

Source	Specimens Tested	Flu AH3	Flu A(H1N1) 2009	A (untyped)	Flu B	RSV	Total influenza Positive	% Influenza Positive
Sentinel	23	1	0	1	9	0	11	48%

All ages	93	6	14	100	213	10	938	16	379	706	2039	552

Note

All virology data are provisional. The virology figures for previous weeks included in this or future bulletins are updated with data from laboratory returns received after the production of the last bulletin. The current bulletin reflects the most up-to-date information available. Sentinel and non-sentinel samples are tested for influenza and for RSV. Cumulative reports of influenza A (untyped) may vary from week to week as these may be subsequently typed in later reports.

Figure 7. Number of samples tested for influenza and proportion positive, 2016/17 and 2017/18, all sources

Comment

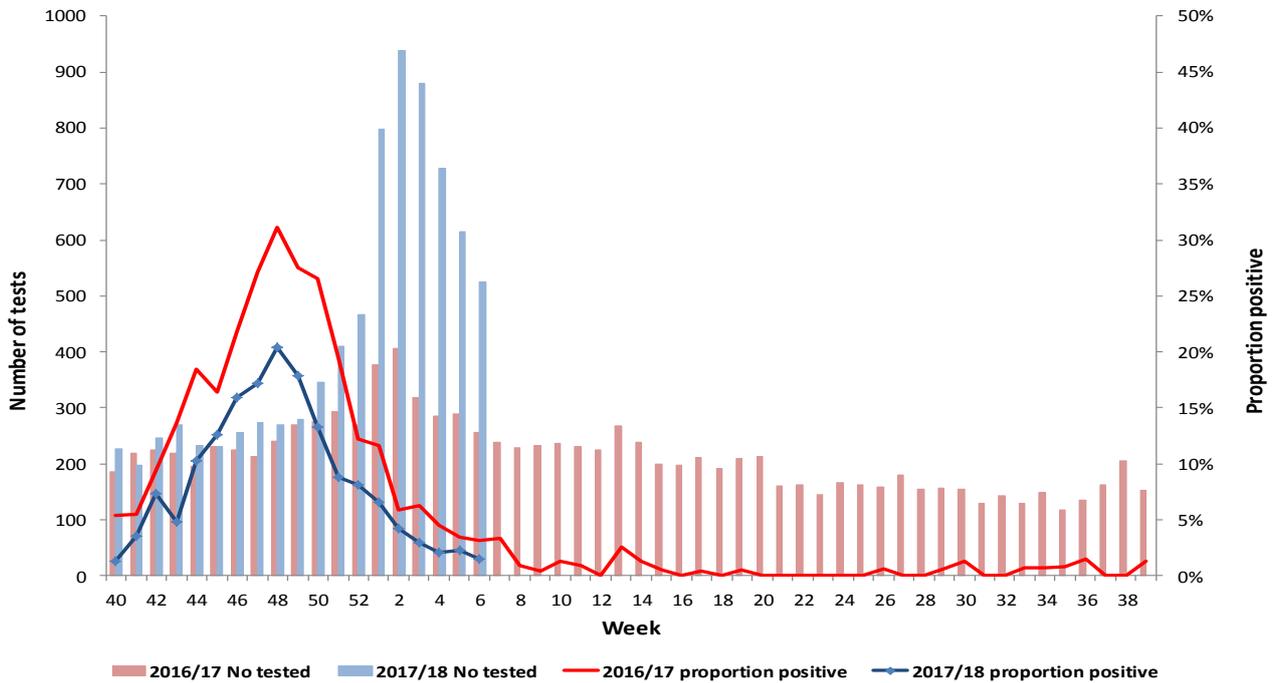

Additional virology testing has been undertaken at one local laboratory since week 2, 2018. This bulletin now includes this data along with the data from the Regional Virology Laboratory. Other local laboratories may begin undertaking influenza testing and this data will be included in later bulletins if applicable.

During week 6, 2018 there were 492 specimens submitted for virological testing. There were 166 detections of influenza in total (positivity rate of 34%), of which 56 were influenza A(H3), 94 influenza B, 14 influenza A (typing awaited) and there were two detections of influenza A(H1N1)pdm09 (Figure 7 and Table 1).

There were 23 samples submitted through the GP based sentinel scheme across Northern Ireland during this period, of which 11 (positivity rate of 48%) were positive for influenza. Of the 11 positive, one was reported as influenza A(H3), nine as influenza B and one as influenza A (untyped) (Tables 1, 2, 3; Figures 2 and 3).

Respiratory Syncytial Virus (RSV)

Figure 8. Number of samples tested for RSV and proportion positive, 2016/17 and 2017/18, all sources

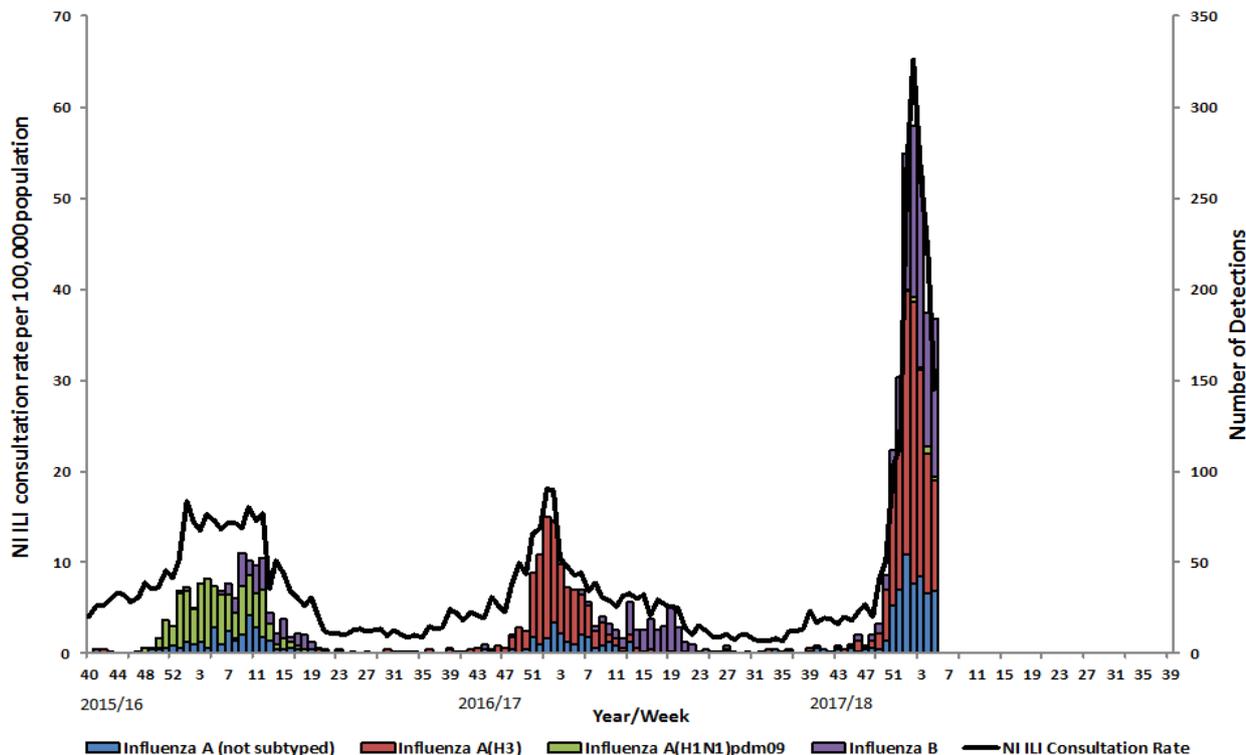

Comment

During week 6, 2018 there were eight positive detections of RSV giving a positivity rate of 2%, lower than the same period in 2016/17 (3%). To date there have been a total of 562 detections of RSV of which the majority (58%) were in those aged 0-4 years (Figure 8 and Table 2).

Hospital Surveillance (Non-ICU/HDU)

Figure 9. Confirmed influenza cases in hospital by week of specimen, with Northern Ireland ILI consultation rate, 2015/16 - 2017/18

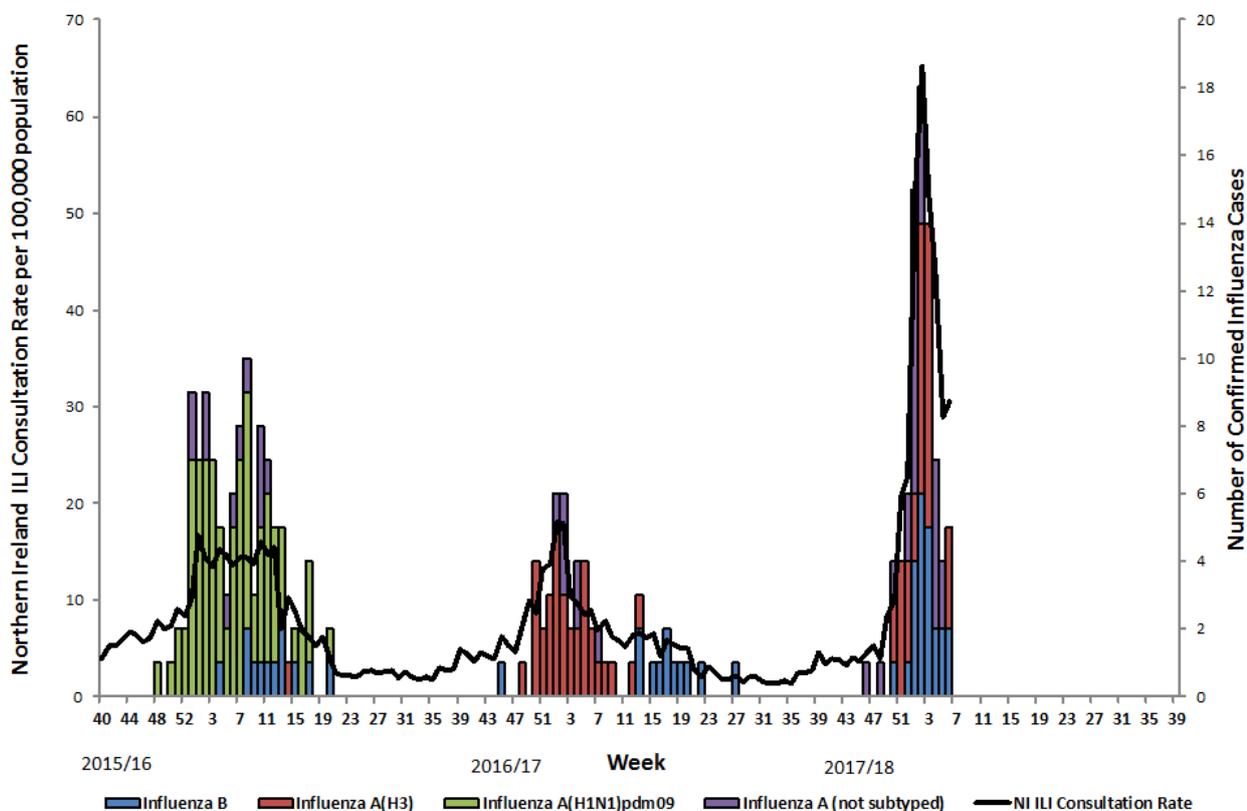

Comment

For the first time in 2017/18 the PHA will be reporting on detections of influenza from specimens taken in hospital wards across Northern Ireland, reported to PHA through the regional virology laboratory.

During week 6, 2018 there were a total of 129 detections of influenza from specimens taken in hospital settings across Northern Ireland. Of these there were 51 detections of influenza A(H3), 66 of influenza B, ten of influenza A (typing awaited) and two detections of influenza A(H1N1)2009. This represents a decrease from week 5 (184 positive reports); however, it should be kept in mind that not all positive specimens for week 6 may have been reported as this point.

ICU/HDU Surveillance

Figure 10. Confirmed ICU/HDU influenza cases by week of specimen, with Northern Ireland ILI consultation rate, 2015/16 - 2017/18

Comment

Data are collected on laboratory confirmed influenza patients and deaths in critical care (level 2 and level 3).

During week 6, 2018 five confirmed cases of influenza in ICU were reported to the PHA. There were three deaths reported in ICU patients with laboratory confirmed influenza in week 6. The total reported deaths in ICU this season with confirmed influenza to date are 15. There have been 80 confirmed case of influenza in ICU reported this season to date, of which 31 have been typed as influenza A(H3), 23 influenza B, 25 influenza A (typing awaited) and one confirmed case of both influenza A and B (not shown in figure 10).

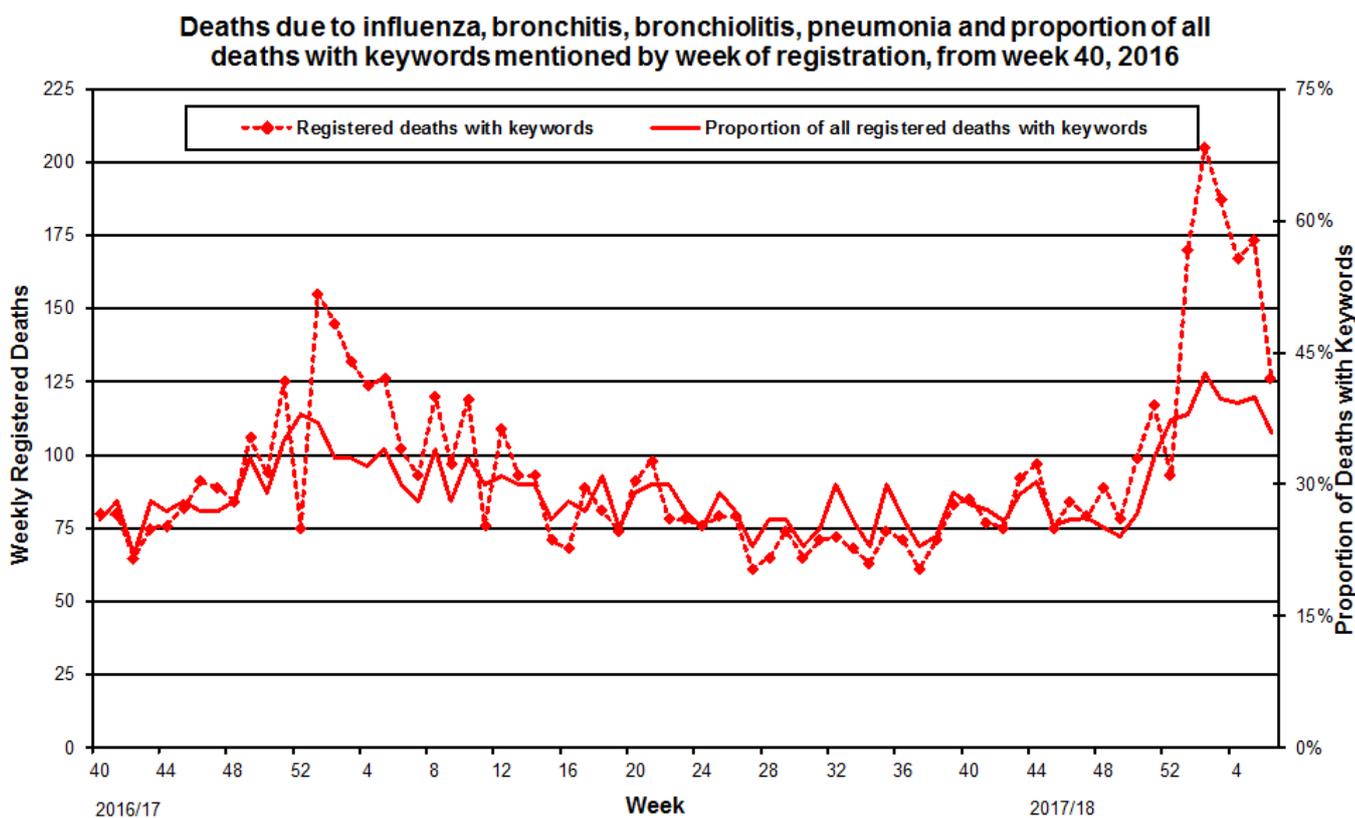

Outbreak Surveillance

During week 6, 2018 there were no influenza outbreaks in care homes. The total confirmed Influenza outbreaks to date remains at 33.

Mortality Data

Weekly mortality data is provided from Northern Ireland Statistics and Research Agency (NISRA). The data relates to the number of deaths from selected respiratory infections (some of which may be attributable to influenza, and other respiratory infections or complications thereof) registered each week in Northern Ireland. This is not necessarily the same as the number of deaths occurring in that period. Searches of the medical certificates of the cause of death are performed using a number of keywords that could be associated with influenza (bronchiolitis, bronchitis, influenza and pneumonia). Death registrations containing these keywords are presented as a proportion of all registered deaths.

Figure 11. Weekly registered deaths

Comment

During week 6, 2018 the proportion of deaths related to respiratory keywords decreased from 40% in week 5 to 36%. In week 6 there were 351 registered deaths, of which 126 related to specific respiratory infections (Figure 11). The proportion of deaths attributed to specific respiratory infections is higher at this point in the season to the same period in 2016/17 (30%) and in 2015/16 (33%).

EuroMOMO

Information on mortality from all causes is provided for management purpose from Public Health England. Excess mortality is defined as a statistically significant increase in the number of deaths reported over the expected number for a given point in time. This calculation allows for a weekly variation in the number of deaths registered and takes account of deaths registered retrospectively. Information is used to provide an early warning to the health service of any seasonal increases in mortality to allow further investigation of excess detections.

There is no single cause of 'additional' deaths in the winter months but they are often attributed in part to cold weather (e.g. directly from falls, fractures, road traffic accidents), through worsening of chronic medical conditions e.g. heart and respiratory complaints and through respiratory infections including influenza.

For more information on EuroMOMO and interactive maps of reporting across the season please see <http://www.euromomo.eu/index.html>.

There was an excess all-cause mortality reported in Northern Ireland in week 6, 2018. Including this week, there has been a total of eight weeks in the season to date where there has been excess all-cause mortality (weeks 51-6). This excess mortality was seen in the elderly (>65 years of age).

Please note this data is provisional due to the time delay in registration; numbers may vary from week to week.

Influenza Vaccine Uptake

	2017/18 (to Jan 30 th)	2016/17 (to Jan 30 th)
>65 years	68.5%	69.0%
<65 years at risk	50.4%	51.6%
Pregnant women	45.6%	45.9%
2 to 4 year olds	46.8%	49.4%
Primary School	75.8%	77.7%
Trust Frontline	31.6%	28.4%

*vaccine uptake data is provisional

International Summary

Europe

Week 5/2018 (29 January-4 February, 2018)

- Influenza activity was widespread in the majority of reporting countries.
- Both influenza virus types A and B were co-circulating with a higher proportion of type B viruses. Different proportions of circulating influenza virus types and A subtypes were

observed between countries. Proportions of specimens positive for influenza viruses were increasing in the eastern part of Europe.

- Of the individuals sampled, on presenting with ILI or ARI to sentinel primary healthcare sites, 57% tested positive for influenza viruses, a slight increase compared to the previous week (54%).

2017/18 season overview

- For the Region overall, a higher proportion of type B compared to type A viruses has been detected in sentinel and non-sentinel sources. Of the type A detections from sentinel sources, A(H1N1)pdm09 viruses have outnumbered A(H3N2) viruses, while in non-sentinel sources more A(H3N2) viruses were reported than A(H1N1)pdm09 viruses.
- For type B viruses from both sentinel and non-sentinel sources, B/Yamagata lineage viruses have greatly outnumbered those of the B/Victoria lineage. The current trivalent seasonal influenza vaccine does not include a virus from the B/Yamagata lineage.
- Different patterns of dominant type and A subtype were observed across the countries in the Region, which may be due to the relative weights of information being derived from sentinel, non-sentinel and severe influenza case sources of information.
- The majority of severe cases are in adults infected by influenza A(H1N1)pdm09 or type B virus.
- While low in number, 58% of the genetically characterized A(H3N2) viruses belonged to clade 3C.2a, the clade of the vaccine virus described in the [WHO recommendations for vaccine composition for the northern hemisphere 2017–18](#), and 38% to subclade 3C.2a1, with mammalian cell-cultured viruses in both clades being antigenically similar.
- A [situation analysis](#) that describes the early season evolving epidemiological pattern was published by WHO Regional Office for Europe in January. A high level of influenza B virus circulation is observed during the first half of the season, compared to previous seasons.
- An [early risk assessment](#) based on data from EU/EEA countries was published by ECDC on 20 December 2017.
- Interim or real-time vaccine effectiveness estimates from [Canada](#), [Stockholm County](#) and [Finland](#) suggest overall vaccine effectiveness of 17-31%, depending on proportion of circulating (sub)types. Effectiveness against influenza B is in the range of 37-55%, despite the circulating lineage not being included in the more commonly used trivalent vaccine.
- European mortality among the elderly has significantly increased over the past weeks, except in central and eastern Europe.
- Additional information on global influenza activity is available from [WHO's biweekly global updates](#).

<http://www.flunewseurope.org/>

Worldwide (WHO)

As at 05 February 2018 (based on update to 21 January 2018)

Influenza activity remained high in the temperate zone of the northern hemisphere while in the temperate zone of the southern hemisphere activity was at inter-seasonal levels. Worldwide,

influenza A accounted still for the majority of influenza detections but influenza B (mostly from the Yamagata lineage) increased in recent weeks.

Up to now, the majority of countries which are in the influenza season, reported influenza like illness reaching moderate levels in comparison with previous years, with few reaching levels exceeding those of previous years. Some countries however have reported levels of hospitalization and ICU admissions reaching or exceeding peak levels of previous influenza seasons. WHO recommends countries with current influenza activity or entering their season to adopt necessary measures for ensuring appropriate case management, compliance with infection control measures and seasonal influenza vaccination for high risk groups(see also the fact sheet given below).

- In North America, overall influenza activity remained high, with detections of predominantly influenza A(H3N2) viruses.
- In Europe, influenza activity remained high in Northern and Southwestern Europe, and peaked in few countries but started to increase in Eastern Europe. Influenza B remained the virus most frequently detected and the subtype of the influenza A viruses detected varied depending on the country and the surveillance system.
- In Western Asia, increasing influenza activity was reported in some countries, with influenza A(H1N1)pdm09 and B viruses present in the region.
- In Central Asia, influenza activity increased slightly, although it remained low across the region.
- In East Asia, high levels of illness indicators and influenza activity were reported in most of the countries. Influenza A(H1N1)pdm09 and influenza B-Yamagata lineage viruses were predominantly detected.
- In South East Asia, low levels of influenza activity were reported.
- In Southern Asia, influenza activity continued to be high in Iran and Pakistan, with detection of all seasonal influenza subtypes.
- In Northern Africa, influenza detections remained high in Algeria, Egypt and Morocco, while decreased in Tunisia. Influenza A(H1N1)pdm09 virus and influenza B were predominantly detected in the region.
- In Western Africa, little to no influenza activity was reported across the region. In Middle Africa, there were no updates available for this reporting period. In Eastern Africa, increased influenza activity was reported in Madagascar.
- In the Caribbean and Central American countries, respiratory illness indicators and influenza activity remained low in general.
- In the tropical countries of South America, influenza activity and respiratory illness indicators were generally low, with exception of Ecuador.
- In the temperate zone of the Southern Hemisphere, influenza activity remained overall at inter-seasonal levels.
- National Influenza Centres (NICs) and other national influenza laboratories from 101 countries, areas or territories reported data to FluNet for the time period from 08 January 2018 to 21 January 2018 (data as of 2018-02-01 18:02:14 UTC).The WHO GISRS laboratories tested more than 277231 specimens during that time period. 88612 were positive for influenza viruses, of which 53213 (60.1%) were typed as influenza A and 35399 (39.9%) as influenza B. Of the sub-typed influenza A viruses, 9745 (50.3%) were influenza

A(H1N1)pdm09 and 9642 (49.7%) were influenza A(H3N2). Of the characterized B viruses, 7778 (90.8%) belonged to the B-Yamagata lineage and 786 (9.2%) to the B-Victoria lineage.

Acknowledgments

We would like to extend our thanks to all those who assist us in the surveillance of influenza in particular the sentinel GPs, Out-of-Hours Centres, Apollo Medical, Regional Virus Laboratory, Critical Care Network for Northern Ireland and Public Health England. Their work is greatly appreciated and their support vital in the production of this bulletin.

The author also acknowledges the Northern Ireland Statistics and Research Agency (NISRA) and the General Register Office Northern Ireland (GRONI) for the supply of data used in this publication. NISRA and GRONI do not accept responsibility for any alteration or manipulation of data once it has been provided.

Further information

Further information on influenza is available at the following websites:
