1 Introduction

1.1 Background

1.1.1 Transport Northern Ireland (TNI) is proposing to upgrade the existing A5 Western Transport Corridor (A5WTC). Subject to consent, the proposal will involve the construction of a new 85km dual carriageway running between New Buildings and the border with the Republic of Ireland (ROI) south of Aughnacloy.

1.1.2 The proposed scheme constitutes Environmental Impact Assessment (EIA) development as defined by The Roads (Environmental Impact Assessment) Regulations (Northern Ireland) 1999 as amended by The Roads (Environmental Impact Assessment) Regulations (Northern Ireland) 2007. TNI as promoters of the proposed scheme will, therefore, be preparing and publishing an Environmental Statement (ES) describing the studies and assessments undertaken relative to the significant effects the proposed scheme will be likely to have on the environment in accordance with the requirements of the Regulations.

1.1.3 An ES for a proposed upgrading, the A5 Western Transport Corridor, Environmental Statement, November 2010 (A5WTC ES 2010) has previously been published, consulted on and considered at public inquiry. The environmental information provided in the A5WTC ES 2010 was found to be robust in scope and content such that, it enabled the Minister, as the competent authority, to make an informed decision regarding development consent based on the significant environmental effects likely to result from the construction and future use of the proposed scheme.

1.1.4 Time has elapsed since the completion of baseline studies and surveys which informed the previous assessments reported in the 2010 ES. It has also been confirmed the proposed scheme will no longer be constructed in its entirety within a three-year period as originally anticipated. The expectation now, is that it will be constructed in three phases comprising:

- Construction of junctions 1-3 (New Buildings – Strabane North) and junctions 13-15 (Omagh South – Ballygawley).
- Construction of junctions 3-13 (Strabane North – Omagh South).
- Construction of junction 15 (Ballygawley) to the border.

1.1.5 It has accordingly been concluded that any likely significant environmental effects which may result from the construction and future use of the currently proposed scheme should be re-assessed.

1.1.6 This scoping report identifies the studies and assessments which it is intended should form the focus of the ES for the currently proposed scheme. The report is being

issued to statutory consultees with a request for comments relating to the scope of the intended studies and assessments, and any recommendations they may have relative to works they consider appropriate in relation to the currently proposed scheme. All responses received will be considered as the ES is prepared.

1.1.7 Preliminary discussions have been held with Northern Ireland Environment Agency (NIEA), Loughs Agency (LA), Royal Society for the Protection of Birds (RSPB), National Parks and Wildlife Service (NPWS), and Department of Culture, Arts and Leisure (DCAL) regarding the scope of the ES. There is no presumption in this document that those discussions constitute an agreement on the part of those organisations to the studies and assessments identified in the report in advance of receipt of their formal responses to the consultation request.

2 The Proposed Scheme

2.1 Alignment

2.1.1 The proposed A5WTC comprises an 85km long dual carriageway, running largely through an agricultural landscape between New Buildings and the border with the Republic of Ireland (ROI), immediately south of Aughnacloy. The alignment and principal components of the proposed scheme and their environmental context are described below, and shown in Figure 1 – Regional context, and Figures 2.1-2.7 – Route alignment and environmental context, which are appended to this report.

New Buildings to south of Strabane

2.1.2 The proposed scheme commences on the northern fringe of New Buildings where a new roundabout (junction J1), located adjacent to the existing A5, connects the proposed scheme and the existing A5. An initial 1.2km section of 2+1 single carriageway would run in a south-westerly direction from the roundabout west of the settlement and close to the eastern bank of the River Foyle through a part of the valley which is designated as being of high scenic value. There would be a transition from wide single carriageway to dual carriageway at a second roundabout (junction J2) where an eastern spur off the roundabout would provide for access between the existing A5 and the proposed A5WTC, approximately 0.5km southwest of the settlement.

2.1.3 Continuing south-west from J2, the proposed dual carriageway would pass through a short section of deep cutting and then between Magheramason and the River Foyle in the vicinity of the northern limit of the River Foyle and Tributaries Special Area of Conservation (SAC) and Area of Special Scientific Interest (ASSI). It would cross Dunnalong Road immediately south of the village, the local road being realigned on embankment to the south of its existing alignment to enable it to be bridged over the dual carriageway. The alignment would continue in a south-westerly direction becoming more distant from the SAC and ASSI as the river follows a marked meander to the west. It would cross Meenagh Road which would be raised on embankment on-line to maintain access along the local road, and then follow a gentle curve to the south as it rises on high embankment to enable the proposed dual carriageway to be bridged over the existing the A5 Victoria Road, north of its junction with Cloghboy Road.

2.1.4 South of the new bridge, the alignment would encroach onto the lower western-facing slopes of Sollus Hill and would involve substantial cutting and regrading of the slopes as they rise to the east of the settlement of Bready.

2.1.5 The proposed dual carriageway would emerge from the cutting and follow an alignment at-grade, east of and roughly parallel with the A5. The two roads would be visually separated by a low, elongated rise in the local landform. It would cross Donagheady Road which would be re-aligned from its existing junction with the A5 Victoria Road to

the south of its existing alignment over an approximate 500m length east of Victoria Road. The re-aligned section would be raised on high embankment to provide required clearance for a new bridge over the proposed dual carriageway.

2.1.6 The proposed dual carriageway would then follow a gentle curve to the south-west, passing between Willow Farm and housing on the A5 Victoria Road. It would cross Willow Road in shallow cutting and rise on high embankment to enable it to be bridged over the A5 Victoria Road. Continued access from Victoria Road along Willow Road would be provided for by the introduction of a new section of single carriageway road running adjacent to the eastern boundary of the proposed dual carriageway and tying into the existing A5 Victoria Road at a new T-junction south of the proposed bridge over the existing road.

2.1.7 The dual carriageway would then descend from the bridge to cross Ash Avenue on low embankment before rising again onto high embankment and crossing Drumenny Road via a new bridge. This section of the proposed scheme would require the closure of Ash Avenue where the dual carriageway crosses the local road, and also result in the loss of land currently used by local sports teams, north of Drumenny Road. Continued access for property along Ash Avenue from the existing A5 would be available off the A5 along Drummeny Road and along a new section of local road which would run adjacent to the dual carriageway boundary from Drumenny Road, west of the proposed bridge over the local road, and Ash Avenue. The new road would continue on high embankment between Drumenny Road and Burn Dennet. A new open span bridge would carry the road over the watercourse with the span allowing for agricultural access along both river banks.

2.1.8 Beyond the watercourse, the alignment would curve from south to south-east to avoid encroachment into McKean's Moss ASSI. It would initially descend from the Burn Dennet crossing and then rise on high embankment to cross over Ballydonaghy Road and Moss Road. Existing access along Ballydonaghy Road would be closed. Access along Moss Road would be maintained on-line beneath the dual carriageway which would also cater for continued access to Ballydonaghy Road by way of a new section of link road between Moss Road and Ballydonaghy Road, some 250m east of the dual carriageway. As the proposed scheme travels east of McKean's Moss, it would be in deep cutting immediately below the existing A5 before emerging onto low embankment to access a new bridge over the Glenmornan River. The proposed open span bridge would be of sufficient width to accommodate agricultural access beneath the dual carriageway on both sides of the watercourse.

2.1.9 South of the river, the dual carriageway would remain on high embankment as it crosses Greenlaw Road and Park Road. Greenlaw Road would be closed at the crossing. An underbridge would provide for continued access on-line along Park Road with access to Greenlaw Road being provided by way of a new section of single carriageway road between Park Road and Greenlaw Road, running adjacent to the boundary at the foot of the embankment and west of the proposed scheme. Continuing

south, the dual carriageway would enter a cutting as it approaches the location of an extended all movements grade-separated junction (J3), southwest of Ballymagorry.

2.1.10 J3 would comprise an extended arrangement with a new roundabout on the line of the existing A5 linked to Park Road, west of the dual carriageway via a new 500m section of single carriageway road and a second roundabout on the line of the new link, some 150m east of Park Road. Southbound access from the local road network and the proposed A5WTC would be available via a south facing slip road off the new roundabout on the existing A5. Northbound exit from the A5WTC onto the local road network and onto the A5WTC from the local road network would be available from the second new roundabout west of the dual carriageway, as would southbound exit from the proposed A5WTC onto the local road network. The tie-in with Park Road for the link road would comprise a simple T-Junction and widening of the local road for some 200m north of the junction and to the south as far as Spruce Road to establish appropriate sightlines. Spruce Road would be closed each side of the landtake for the proposed scheme, access to property west of the landtake being made available from the existing A5 via the new link road and south along Park Road.

2.1.11 Continuing south, the dual carriageway would emerge from the cutting at J3 and transfer onto embankment as it curves to the southwest on an alignment between the A5 Victoria Road and the disused Strabane Canal. It would pass to the rear of housing on Victoria Road before crossing the line of the disused canal and following an alignment adjacent to the existing A5 rising on an increasingly high embankment before crossing over the A38 Lifford Road and Mourne River.

2.1.12 A complex junction arrangement (J4, J5 and J6) would provide for access and exit onto and off the new dual carriageway, and for continued access along Park Road and the A38. To the north of the river, J4 and J5 would comprise the existing roundabout at the northern end of the existing Mourne Bridge, and two new roundabouts. Southbound access off the A5WTC would be via a new slip road directly onto the existing roundabout. Northbound access from Strabane would be available via the existing roundabout and the A38 to a new roundabout on the line of the A38 beneath the new structure for the proposed new river crossing and a section of single carriageway road to a second new roundabout located to the west of the dual carriageway which would give access to a slip road merging with the northbound carriageway of the dual carriageway. Northbound access from Lifford would be via the A38 to the roundabout beneath the dual carriageway and then via the new link road and roundabout providing for access to the A5WTC and Park Road.

2.1.13 Northbound access to Strabane and soutbound access from Strabane onto the A5WTC would be available via J6 where two new slip roads would link the dual carriageway to the local road network via the existing roundabout located at the junction of the A5 Great Northern Link and Bradley Way. The dual carriageway would then follow a south-westerly alignment on 4-6m high embankment along a narrow corridor between the western edge of Strabane and the River Finn and close to the rear of property on Urney Road and Glenfinn Park.

2.1.14 A new junction (J7), comprising a large diameter roundabout would be located close to the river bank some 200m south of Glenfinn Park. Continued access along the A5WTC would be available via a southerly-orientated exit from the roundabout. A north-westerly orientated spur on the roundabout would also provide for future access to a proposed new bridge over the River Finn which would cater for a link between the A5WTC and a proposed upgrading of the N14 / N15 in Donegal. The new bridge and works associated with the N14 / N15 do not form part of the A5WTC proposal. Urney Road would be locally realigned through the junction via a bridge beneath the dual carriageway as it exits the roundabout to the south. New T- junctions off the realigned road would maintain access to Carrick Avenue.

2.1.15 As the dual carriageway runs south from J7, it would be in deep cutting, passing beneath Strahans Road and adjacent to a flooded disused quarry. It would emerge from the cutting close to the rear boundary of property on Knockroe Road, and cross Bog Lane Road and Knockroe Road close to existing levels before returning to deep cutting as it passes beneath Orchard Road. Bog Lane Road and Knockroe Road would be closed at the crossing points. Orchard Road would be locally raised on embankment and bridged over the dual carriageway maintaining access along the local road and providing for continued access between sections of Bog Lane Road and Knockroe Road either side of the dual carriageway. Access to the northern sections of Knockroe Road would be maintained by the introduction of a 300m length of single carriageway road from a T-junction on Orchard Road at the western end of the proposed crossing.

2.1.16 The cutting enclosing the dual carriageway would reduce in depth as it follows a marked curve south and emerges from the cutting to pass through a proposed junction (J8) on low embankment, north of Sion Mills. Access onto and exit from the A5WTC would be via a T- junction with each of the two carriageways feeding onto a link road which would tie into the existing A5 by way of a new roundabout on the line of the existing road. A bridge over the dual carriageway would provide for access along the link road to the existing A5 from the T junction with the northbound carriageway off the dual carriageway.

2.1.17 As the dual carriageway continues south of J8, it would cross Peacock Road and enter a short, deep, asymmetric cutting with the deeper of the cutting slopes being east of the carriageways. It would emerge briefly from the cutting and then enter a second, deep asymmetric cutting with the principal cutting slope on the west side of the carriageways as it runs between the settlements of Sion Mills and Glebe. Peacock Road would be closed with access to fields and property either side of the dual carriageway being via the existing T-junction between the local road and the existing A5 and from the A5 along Primrose Park to its existing junction with Peacock Road. A new bridge over the cutting between the two settlements would cater for continued access along Primrose Park.

2.1.18 South of Sion Mills and Glebe, the dual carriageway would continue in shallow, sidelong cutting along the east facing valley slopes of the Mourne River crossing

Bellspark Manor and High Road where it would curve to the south-east as it approaches and crosses Seein Road in shallow cutting. Seein Road would be re-aligned to the north to the rear of property fronting onto the local road to enable the local road to be raised on embankment and bridged over the dual carriageway.

2.1.19 The proposed scheme would then move onto a series of high embankments as it descends and crosses two small tributary valleys of the Mourne River, It would be bridged over Concess Road and Fyfin Road. A junction (J9) would be introduced on Fyfin Road providing for access to Victoria Bridge and the existing A5 to the east and Castlederg to the west. Access onto and exit from the A5WTC would be via T-junctions with each of the two carriageways and short link roads with T-junctions onto the local road.

South of Strabane to south of Omagh

2.1.20 South of J9, the proposed scheme would enter a deep cutting as it rises out of the tributary valley and curves to the south along the eastern slopes of the Mourne valley via a sequence of shallow cuttings and low embankments. Stone Road would be bridged over the deep cutting. Urbalreagh Road would be closed where it is crossed by the cutting, continued access being provided for via the new bridge on Stone Road and a short section of new single carriageway road linking the two local roads.

2.1.21 The dual carriageway would then descend the wide slopes of the Derg valley that frame the landscape at the confluence of the River Derg and Mourne River. It would be in shallow cutting as it crosses Derg Road which would be realigned for some 500m from its junction with Old Bridge Road and raised on embankment to the north of its current alignment to enable it to be bridged over the dual carriageway. A low open-span bridge would carry the dual carriageway over the River Derg. South of the river, the dual carriageway would be in deep cutting beneath the B164 Deerpark Road which would be raised on low embankment on its existing alignment to provide the required clearance between the dual carriageway and local road.

2.1.22 The dual carriageway would then follow a gentle curve to the southeast close to existing ground levels, crossing Milltown Road which would be stopped up. It would be raised on embankment to enable it be bridged over Magheracoltan Road and continue to a new junction (J10) providing for access to Newtownstewart west of Wood Hills and the existing junction between Drumlegagh Road North and the B84 Baronscourt Road. Some 500m of the B84 Baronscourt Road would be realigned to the north of its existing alignment west of its existing junction with Drumlegagh Road North. It would be raised on embankment to enable it be bridged over the dual carriageway. Access onto and exit from the proposed scheme would be via T-junctions with each of the two carriageways and short sections of single carriageway road tying into a new roundabout on the realigned Baronscourt Road east of the dual carriageway and into the realigned B-road via a T-junction west of the dual carriageway. Access along Drumlegagh Road North towards Newtownstewart would be catered for by way of a T-

junction on the new section of link road providing access to the northbound carriageway of the proposed scheme. Golf Course Road would be stopped up.

2.1.23 South of J10, the dual carriageway would climb towards Oldcastle Road passing close to and south of Harry Avery's Castle in a short, deep cutting. A new bridge over the cutting would maintain access along Oldcastle Road. The dual carriageway would then follow a defined descent through a number of cuttings crossing Glen Road, Gortgranagh Road, Castletown Road and Grange Road as it curves to the south to follow an alignment along the lower eastern slopes of the Strule Valley below Bessy Bell. Glen Road and Gortgranagh Road would be stopped up where the dual carriageway crosses them. Continued access for both roads would be provided via a new bridge on a realigned section of Gortgranagh Road and short sections of single carriageway each side of the dual carriageway between Glenn Road and the realigned Gortgranagh Road. Where the dual carriageway crosses Castletown Road and Grange Road, Castletown Road would be realigned to the west of the existing road and bridged over the cutting housing the dual carriageway. A short section of new single carriageway road would provide for access to Grange Road off the realigned road east of the dual carriageway.

2.1.24 There would be a number of embankments followed by asymmetric and sidelong cuttings as the dual carriageway follows an alignment reflecting that of the existing A5 close to the valley floor and passing uphill of the Mellon Country House Hotel. Access along West Road would be maintained via an underbridge beneath the dual carriageway. McCormacks Road would be realigned to enable a bridge to be located over one of the cuttings. Gordon's Lane would be realigned to improve the gradient on the narrow road and accommodate an underbridge to maintain access between Castletown Road and the existing A5.

2.1.25 Approximately 500m south of the hotel, the alignment would take a marked curve to the southwest crossing beneath Killynure Road and over Castletown Road. It would then return to a southerly alignment as it passes west of Mountjoy. A section of Killynure Road would be realigned south of its existing alignment to accommodate a new bridge carrying the road over the deep cutting.

2.1.26 Where the dual carriageway crosses Dunteige Road some 400m west of Mountjoy, it would be in deep cutting. The local road would be raised on low embankment and bridged over the cutting on its existing line. Continuing south, the proposed scheme would cross Lisnagirr Road on low embankment. The local road would be stopped up at each side of the dual carriageway.

2.1.27 The alignment would return to existing levels as it crosses Rash Road. Rash Road would be realigned over a 300m length and raised on embankment to enable it be bridged over the proposed dual carriageway. Access north along Tully Road would be maintained by the introduction of a new section of single carriageway road east of the proposed dual carriageway with a new T-junction onto Rash Road where a disused

railway line crosses the local road. Access south from Rash Road along Tully Road would be discontinued.

2.1.28 South of Rash Road, the alignment would enter a relatively deep cutting as it follows an alignment currently occupied by the disused railway line between the Tully Bog SAC and ASSI, and the A5 Beltany Road. At its nearest, the proposed dual carriageway would be some 200m east of the SAC / ASSI.

2.1.29 It would emerge from the cutting and return to grade as it passes through a proposed all-movements grade-separated junction (J11) north of Omagh. The junction would comprise a dumbbell of roundabouts and linking bridge raised on embankments. Slip roads off each roundabout and new sections of link road would tie Drumlegagh Road South into the western roundabout and the A5 Beltany Road into the eastern roundabout. Continued access to property along the southernmost section of Drumlegagh Road South would be maintained via a T-junction off the new section of link road running west from the junction and new section of single carriageway road linking Todds Road and the southern end of Drumlegagh Road South. Todds Road would be stopped up each side of the dual carriageway.

2.1.30 As the proposed scheme runs south from J11, it would curve to the south-west rising onto embankment to enable it to be carried on a low bridge over the Fairy Water some 400m west of its confluence with the River Strule.

2.1.31 South of the river, the proposed scheme would follow an alignment broadly reflecting that of the western edge of Omagh. It would be in the Green Belt for much of this length and vary in distance between 0.5km and 1.5km from the settlement boundary. It would initially be at-grade or on low embankment as it crosses the low-lying floodplain of the Fairy Water and would cross Mellon Park Drive and Gillygooly Road. The northern section of Mellon Park Drive would be stopped up. Continued access would be provided by way of the eastern arm of the drive and a new section of its southern arm which would be re-aligned to the north. Continued access along Gillygooly Road would be catered for by way of a new 800m-long section of road aligned to the south of the existing road. The re-aligned road would be raised on embankment and bridged over the proposed dual carriageway. A new T-junction off the realigned road east of the proposed dual carriageway would maintain access along Mullaghmena Road.

2.1.32 The proposed dual carriageway would then follow a southerly alignment through a local woodland block before entering deep cutting as it crosses beneath Aghnamoyle Road. Aghnamoyle Road would be raised on low embankment on-line and bridged over the cutting. A short section of new single carriageway road would provide a link between Aghnamoyle Road and Botera Road to maintain access along Botera Road which would be stopped up east of the proposed dual carriageway.

2.1.33 There would be a series of short, asymmetric cuttings as the proposed scheme travels through an area of low densely aggregated drumlins west of Omagh. A new bridge located on the existing line of Tamlaght Road would carry the local road over one of the

cuttings. Further south, Brookmount Road would be locally lowered on-line and the proposed dual carriageway would be elevated on embankment and bridged over the local road.

2.1.34 An all movements grade-separated junction (J12) would be introduced on the line of the A32 Clanabogan Road providing for access to and from the western part of Omagh and for access onto the proposed dual carriageway from areas to the west including Dromore and Enniskillen. The junction would comprise an elongated gyratory with on and off slip roads and a pair of bridges carrying the dual carriageway over the gyratory below.

2.1.35 South of J12 the alignment would emerge from the Green Belt and cross the Drumragh River. It would curve to the southeast negotiating a sequence of embankments and short, deep cuttings through the drumlins that frame the south-western parts of Omagh towards a new junction (J13) south of Omagh. Loughmuck Road would be re-aligned to the north to enable it to be continued beneath the dual carriageway where the south-east facing slip roads at J12 merge with the main carriageway. Access along Beagh Road and Ballynahatty Road would be continued, both roads being locally re-aligned and raised on embankment to enable them to be bridged over the proposed dual carriageway. Emerging from the deep cutting beneath Ballynahatty Road the dual carriageway would be on low embankment as it crosses the narrow Drumragh River Valley and floodplain. The channel of the watercourse would be culverted through the embankment.

2.1.36 The proposed dual carriageway would cross Blackfort Road and Drumragh Road south of the junction of the two roads. Access along the roads would be maintained via a bridge over the dual carriageway along Blackfort Road which would be re-aligned from its junction with Drumragh Road and a short section of new single carriageway road which would link the two local roads south of the proposed dual carriageway.

2.1.37 As the proposed dual carriageway approaches J13, it would enter a cutting through the junction to the north of the Doogary Bog. The proposed junction would be an all movements grade-separated junction with dumbbell roundabouts. A re-aligned section of the B83 Seskinore Road would .provide for access between the existing A5 Doogary Road and the A5WTC and for continued access south along the B83 Seskinore Road. The link between the existing and proposed A5 would be via a new roundabout on the existing road.

South of Omagh to south of Aughnacloy

2.1.38 South of J13, the alignment would curve to the south along the eastern margin of the Doogary Bog immediately west of the existing A5 Doogary Road and close to existing ground levels. The alignment would cross Tattykeel Road on the eastern margins of Doogary Bog requiring the closure of the local road to the north of the proposed dual carriageway and the introduction of a short section of new single carriageway road which would be bridged over the proposed dual carriageway to maintain access

between the A5 Doogary Road and Tattykeel Road. The proposed dual carriageway would cross Tattykeel Road for a second time, the local road being stopped up at both sides of the proposed scheme.

2.1.39 Continuing southeast towards Moylagh, the dual carriageway would diverge from the existing A5 as it passes through a series of deep cuttings and on long, low embankments to maintain an appropriate vertical profile through the dispersed low drumlins that typify the farmland landscape south of Omagh. Drumconnelly Road would be stopped up where the dual carriageway crosses the local road. A new section of single carriageway road would be introduced to the south of the existing road and would be bridged over the proposed dual carriageway to maintain access between the local road and the A5 Doogary Road. The dual carriageway would be bridged over Tullyrush Road. Rarone Road would be realigned slightly to the north of its existing alignment and bridged over the dual carriageway. Drumconnelly Road would then be stopped up where the dual carriageway crosses the local road for a second time.

2.1.40 A grade-separated junction (J14) would be provided adjacent to the western edge of Moylagh. Northbound and southbound access on and off the dual carriageway would be catered for by way of two short sections of link road onto a re-aligned section of the B46 Moylagh Road south of its existing alignment. The new section of B-road would be aligned beneath the dual carriageway which would be on high embankment. A new roundabout to the west of the dual carriageway would cater for continued access between the B-road and Augher Point Road. There would be a long, deep cutting through a large distinctive drumlin south of Moylagh.

2.1.41 The dual carriageway would then generally run close to existing ground levels, on low embankment or in shallow cutting as it gently curves towards the south in the direction of Newtownsaville. It would cross Killadroy Road and Greenmount Road adjacent to the existing crossing of the two roads. It would be raised on embankment to enable Greenmount Road to be continued beneath the dual carriageway. The local road would be locally realigned and lowered into cutting to provide the required clearance. Killadroy Road would be stopped up on the west side of the dual carriageway and a new section of single carriageway road would link the local road east of the dual carriageway with the re-aligned Greenmount Road. Some 500m south of the local roads the dual carriageway would cross the Routing Burn via an open span structure over the incised valley which houses the watercourse. Routing Burn Road, to the south of the watercourse, would be stopped up on both sides of the dual carriageway.

2.1.42 As the proposed scheme runs east of Newtownsaville, it would be raised on embankment to provide clearance for continued access along Springhill Road. Works would be required on the local road to maintain the existing access between Springhill Road and Rockmore Road. South of Newtownsaville, it would be in sidelong cutting and on low embankment as it runs between Newtownsaville Road and Tullanafoile Road. Cormore Road would be stopped up on both sides of the dual carriageway.

2.1.43 The alignment would curve and rise to the south-east as it is bridged over Tullanafoile Road and Tullycorker Road. There would be a deep cutting on the west-facing slopes of Tycanny Hill as it runs between Newtwonsaville Road and Tycanny Road before it begins to descend the prominent scarp slope of the Brogher Ridge. Existing access along the southern end of Tycanny Road to its junction with Newtownsaville Road would be stopped up and a new section of single carriageway road would link Tycanny Road east of the proposed dual carriageway with Rarogan Road. Access along Rarogan Road would be maintained beneath the dual carriageway via a 200m long re-alignment of the local road to a new T-junction on Newtownsaville Road.

2.1.44 There would be a sequence of high, sidelong cuttings as the dual carriageway descends the ridge and diverges east from Newtownsaville Road. It would emerge from the last of these cuttings west of and below Errigal Kerrogue Churchyard and pass through an area of moraines that mark the transition from the ridge to the Clogher Valley. It would cross Glenhoy Road, the local road being re-aligned to the north of its existing alignment to enable the local road to be raised on embankment and bridged over the dual carriageway.

2.1.45 Continuing on its eastern alignment the dual carriageway would follow a sequence of cuttings and embankments through the moraines. Ballynasaggart Road would be raised on embankment on line and bridged over the dual carriageway south of the settlement.

2.1.46 The dual carriageway would enter a cutting as it approaches and crosses the A4, Annaghilla Road. A new roundabout (J15) would provide for access along and movement between the A4 and A5WTC. The section of the A4 which runs north-east to the existing A4 / A5 roundabout southwest of Ballygawley would be upgraded to dual carriageway, requiring the modification of existing cutting slopes and crossings of Ballygawley Water.

2.1.47 As the dual carriageway exits south from J15 it would pass through a short, deep cutting, emerging onto an approach embankment and open span bridge over the Ballygawley Water. South of the bridge there would be a sidelong cutting where the dual carriageway passes north of housing on Tullywinny Road. As it approaches Tullywinny Road it would be on embankment. The local road would be continued on-line beneath the dual carriageway.

2.1.48 The dual carriageway would cross the rolling farmland which extends across a landscape of irregular low drumlins and moraines to the south via a number of cuttings and embankments. Lisginny Road would be re-aligned on embankment to the north of the existing road and bridged over the dual carriageway which would be close to existing ground levels. Old Chapel Road would be re-aligned on embankment to the west of the existing road and bridged over the dual carriageway. On the approach to the A5 Tullyvar Road and a proposed new junction (J16) there would be a deep sidelong cutting along the northern margin of the proposed dual carriageway. Movement between the existing road and proposed dual carriageway would be limited

to westbound access and eastbound exit via a pair of west facing slip roads with dumbbell roundabouts and a new bridge.

2.1.49 The proposed scheme would then follow a broad sweep around the eastern side of Aughnacloy terminating where it merges with the A5 south of the settlement. There would be a number of deep cuttings and high embankments as the proposed dual carriageway curves east to south and crosses the B35, Carnteel Road and Rehaghy Road. The B35 would be re-aligned on embankment and bridged over the dual carriageway to the south of the existing B-road. The dual carriageway would be bridged over the existing Rehaghy Road. A new roundabout (J17) would be provided where the dual carriageway would end at the A28 Caledon Road southeast of Aughnacloy.

2.1.50 The final section of the proposed scheme would comprise a 1.2km length of single carriageway road linking J17 and the merge with the A5 south of the town and west of the River Blackwater. Access would be available onto the single carriageway at Douglas Road via stepped T-junctions.

3 The proposed studies, surveys and assessments

3.1 Air quality

3.1.1 The A5WTC ES 2010 reported a number of studies, site surveys and assessments focused on impacts on local air quality, regional air quality and construction impacts on air quality.

3.1.2 They are studies, surveys and assessments which will need to be revisited in light of the time which has elapsed since the completion of the A5WTC ES 2010, changes to the anticipated construction period and changes in predicted traffic flows.

3.1.3 The ES for the proposed scheme will accordingly include the findings of the following updated or new studies and assessments:

- nuisance associated with construction related dust;
- impacts on local air quality associated with construction traffic;
- local air quality relative to public exposure receptors associated with parts of the road network where changes in traffic volumes and performance will be affected by the introduction of the proposed scheme into the network;
- local air quality relative to identified sites designated by virtue of their nature conservation value; and
- changes in greenhouse gas emissions (regional emissions) attributable to the introduction of the proposed scheme into the local road network.

3.1.4 The approach to the assessments will be informed by the guidance provided in Section 3, Part 1 of Volume 11 of the Design Manual for Roads and Bridges (DMRB) – HA207/07 Air Quality

Construction-related dust

3.1.5 The assessment of construction-related dust will be focused on sensitive receptors located within 200m of the working areas required for construction of the proposed scheme. It will involve:

- identification of the numbers of sensitive receptors located within 0-25m, 25-50m, 50-100m and 100-200m of the proposed working areas;
- identification of key construction activities which could involve generation of potentially significant volumes of dust;

- identification of locations along the proposed construction corridor where such activities would occur in relation to receptors;
- collection and evaluation of meteorological data;
- evaluation of the anticipated duration of such activities in relation to sensitive locations;
- description of the potential for nuisance; and
- identification of appropriate mitigation measures to reduce potential nuisance.

3.1.6 Mitigation measures will be informed by reference to DMRB and IAQM 'Guidance on the assessment of dust from demolition and construction' (2014).

Emissions associated with construction traffic

3.1.7 The assessment for construction- traffic-related emissions (nitrogen dioxide (NO_2) and PM_{10}) will focus on sections of existing roads and haul routes which would be extensively used by construction vehicles and on areas of concentrated construction activity such as site compounds and storage areas which are located within defined centres of population.

3.1.8 This assessment will be based on the identification of the principal access routes to the working areas, the prediction of the numbers of construction-related traffic delivering material to and transporting materials off-site provided by the contractor advisors to RS.

Local air quality and public exposure receptors

3.1.9 The assessment will involve an evaluation of the changes in concentrations of specific pollutants likely to be experienced by public exposure receptors associated with parts of the road network where it is predicted that changes detailed in the DMRB would occur (affected roads).

3.1.10 The specific pollutants considered will comprise NO_2 and PM_{10}, these being the two principal indicators of the effects of traffic related pollutants on local air quality.

3.1.11 Public exposure receptors considered will include:

- people living within 200m of affected roads as defined in the DMRB; and
- locations within 200m of affected roads where more vulnerable members of the public congregate (hospitals, schools, care homes etc).

3.1.12 Affected roads as defined in the DMRB which will determine the extent of the study area for the assessment will comprise sections of roads which are proposed or predicted to be subject to:

- a change in alignment of 5m or more; or
- a change in daily traffic flows of 1,000 annual average daily traffic (AADT) or more; or
- a change in heavy duty vehicle (HDV) flows of 200 AADT or more; or
- a change in daily average speed by 10km/hr or more; or
- a change in peak hour speed of 20km/hr or more.

3.1.13 The prediction of changes in the concentrations of NO_2 and PM_{10} for the identified public exposure receptors will involve the use of Advanced Dispersion Modelling System (ADMS) Roads, a dispersion modelling programme specifically developed for the assessment of proposed major road projects. A project specific model will be established to represent the affected roads. Meteorological data for the purposes of modelling will be obtained from the 2013 Castlederg data set.

3.1.14 A programme of additional diffusion tube monitoring will be undertaken to establish data for existing concentrations of NO_2 which will correlate to the timeframe for the traffic surveys being undertaken during late 2013 and early 2014 to inform the traffic forecasts for the proposed scheme. Existing concentrations and trends for the specified pollutants as well as the location of Air Quality Management Areas (AQMAs) relative to the proposed scheme will also be investigated. Information obtained from the existing and project specific monitoring data sources will be used for the purposes of model verification. Verification will be undertaken in accordance with the guidance provided in Local Air Quality Management Technical Guidance 09 using the data obtained for NO_2. Verification factors determined for NO_2 will be applied to PM10.

3.1.15 The significance of impacts will be described in terms of increases or reductions in the concentrations of the two pollutants relative to air quality objectives for annual mean concentrations for both, the one-hourly mean for NO_2, and the daily mean for PM_{10} as detailed in the Air Quality Standards Regulations (Northern Ireland) 2010 (S.R. 2010 No.188) and informed by the guidance provided in Interim Advice Note 174/13, "Updated advice for evaluating the significant local air quality effects of users of DMRB Volume 11, Section 3, Part 1 'Air Quality (HA207/07)".

3.1.16 The following tasks will be undertaken as part of the assessment:

- Baseline information relating to the local air quality will be collected which will include: five years' of local air quality monitoring data collected by relevant Local Authorities; site specific monitoring (at 88 locations) over a six-month

period to plug any gaps in Local Authority monitoring data; published air quality pollutant background levels and location, and the extent and status of AQMAs associated with the study area; and a review of the information presented within the 2010 ES previously prepared for the proposed scheme;

- identification of public exposure receptors based on the parameters described in 3.1.11 and 3.1.12 above;
- predicted concentrations of NO_2 and PM_{10} will be calculated for the specified assessment scenarios by complex dispersion modelling using ADMS Roads; and
- evaluation of the results of the modelling exercise against Air Quality Standards (AQS) and IAN 174/13 to determine the significance of changes in concentrations of the pollutants.

3.1.17 The assessment scenarios for calculating concentrations at identified receptors will comprise:

- Do-Minimum (DM) in the anticipated opening year for Phase 1;
- Do-Something (DS) in the anticipated opening year for Phase 1;
- DM in the anticipated opening year for Phase 2;
- DS in the anticipated opening year for Phase 2;
- DM in the opening year for the fully completed scheme assuming that none of the proposed scheme is operational; and
- DS in the opening year for the fully completed scheme once it is operational;

3.1.18 Comparison will be made between the DM and DS scenarios in the opening year for the fully completed scheme to evaluate the impact of the proposed scheme as a whole. The DM scenario will be based on traffic data reflecting forecast growth from the baseline survey years of 2013-2014 taking into account forecast traffic growth up until the opening year for the fully completed scheme and assuming that none of the proposed scheme is operational.

3.1.19 Comparison will also be made between the DM and DS scenarios in the opening years for each phase to provide an understanding of impacts potentially associated with the proposed prolonged construction period.

3.1.20 The DM scenario for the opening year of phases 1 and 2 will be based on traffic data reflecting forecast growth in the network between the baseline survey years of 2013-2014 and the relevant opening years for each phase.

Local air quality and designated sites

3.1.21 As indicated in the DMRB HA207/10 guidance (paragraph 3.13), the assessment will be focused on:

- European or nationally designated sites which are susceptible to air pollutants; and
- sites which are located either within 200m of the proposed scheme or affected road links in the existing network.

3.1.22 Nitrogen deposition (N-deposition) rates will be derived for the DM and DS scenarios for each phase of the proposed scheme by calculating the road NO_2 dry deposition rate using verified annual mean NO_2 concentrations and adding this to the existing 5 x 5 km square average N-deposition rate obtained from UK Air Pollution Information System (APIS).

3.1.23 Subject to the outcome of the traffic forecasts based on the 2013 / 2014 baseline surveys, it is anticipated two sites will be investigated, McKean's Moss ASSI and Tully Bog SAC and ASSI.

Regional emissions

3.1.24 The study area will comprise sections of road which it is predicted will be subject to:

- a change of more than 10% in AADT; or
- a change of more than 10% to the number of Heavy Duty Vehicles (HDVs); or
- a change in daily average speed of more than 20km/hr.

3.1.25 The assessment will involve calculation of the contribution the proposed scheme is likely to make to the total annual emissions of hydrocarbons (HCs), nitrogen oxides (NO_X), PM_{10} and carbon dioxide (CO_2) in the DM and DS scenarios for the opening year and design year for the fully completed scheme

3.2 Cultural heritage

3.2.1 The A5WTC ES 2010 reported studies, site surveys and assessments focused on archaeological and built heritage resources and historic landscapes.

3.2.2 Subsequent site-based investigations undertaken during 2012 and 2013 along the line of the proposed scheme have also established the presence of a number of previously unknown assets of cultural heritage value which will be subject to impact should the proposed scheme be implemented.

3.2.3 The ES for the currently proposed scheme will accordingly include the findings of the following updated assessments:

- archaeological assets and their setting;
- built heritage assets and their setting; and
- historic landscapes.

3.2.4 The conduct and presentation of the assessments will be informed by the guidance provided in relation to detailed assessments for all three aspects in Section 3, Part 2 of Volume 11 of the DMRB – HA208/07 Cultural Heritage.

3.2.5 In light of the information gained from the studies and investigations undertaken to inform the A5WTC ES 2010 and the site investigations undertaken during 2012 and 2013, the study area to be adopted for the assessments will generally extend 600m each side of the proposed scheme boundary. Consideration will, however, also be given to impacts on the settings of archaeological and built heritage assets beyond the 600m buffer where there is a visual relationship between the asset and the proposed scheme as the setting is an important factor in the understanding and value of the asset.

3.2.6 Each of the assessments will involve:

- establishment of the baseline environment and the cultural heritage value of the assets identified;
- identification and description of the form and magnitude of potential impacts on the assets;
- identification of mitigation which may take the form of further surveys and investigations, and / or design measures such as screen planting to reduce potential impacts on assets or their setting;
- identification of impact ratings for each asset taking into account mitigation; and
- description of any likely significant effects in light of the predicted impacts on individual assets or groups of assets.

3.2.7 Consultation will be undertaken with the archaeological inspectors at the NIEA, and Built Heritage (Historic Monuments Unit) relative to current baseline data, and the value of assets, identified impacts and proposed mitigation measures.

Archaeological assets

Establishment of the baseline

3.2.8 The following data sources will be referred to:

- Monuments and Building Record (MBR) held by NIEA;
- National Monuments Service Monument Database (ROI);
- specialist aerial photograph collections at NIEA;
- literary resources at the Belfast Central Library and Queen's University Library;
- historic maps at the Public Record Office of Northern Ireland (NI);
- aerial photographs and modern Ordnance Survey of Northern Ireland (OSNI) maps of the study area;
- A5 Western Transport Corridor, Environmental Statement, Mouchel, November 2010;
- intrusive archaeological investigations undertaken during 2012-2013 (Ref: A5 WTC Phase 1 Archaeological Evaluation Report, Cotswold Rubicon, July 2013); and
- geophysical survey undertaken during 2012 (Ref: A5 WTC Geophysical Survey, Archaeological Services Durham University, January 2012).

3.2.9 It is not intended that any further site surveys beyond the geophysical and intrusive works completed to date, will be undertaken. Further site visits will however be undertaken as appropriate, as part of the verification of the baseline environment and evaluation of the impacts for individual assets or groups of assets.

3.2.10 Individual assets and / or groups of assets identified within the baseline environment will be attributed a value with reference to the guidance provided in Table 5.1, Annex 5 of HA208/07, as replicated in Table 1 below.

Table 1: Factors for assessing the value of archaeological assets

Very high	• World Heritage Sites (including nominated sites). • Assets of acknowledged international importance. • Assets that can contribute significantly to international research objectives.

High	• Scheduled Monuments (including proposed sites). • Undesignated assets of schedulable quality and importance. • Assets that can contribute significantly to acknowledged national research objectives.
Medium	• Designated or undesignated assets that can contribute significantly to regional research objectives.
Low	• Designated and undesignated assets of local importance. • Assets compromised by poor preservation and / or poor survival of contextual associations. • Assets of limited value but with potential to contribute to local research objectives.
Negligible	• Assets with very little or no surviving archaeological interest.
Unknown	• The importance of the resource has not been ascertained.

Identification of impacts

3.2.11 The identification of impacts will involve a combination of quantification and description of the form and scale of change which individual assets and / or groups of assets will be subject to as a result of the introduction of the proposed scheme and its associated traffic into the baseline environment. A resultant magnitude of impact will be attributed to each asset / group of assets informed by the guidance provided in Table 5.3 of Annex 5 of HA208/07 as replicated in Table 2 below.

Table 2: Factors for assessing the magnitude of impact

Major	• Change to most or all key archaeological materials, such that the resource is totally altered. • Comprehensive changes to setting.
Moderate	• Changes to many key archaeological materials, such that the resource is clearly modified. • Considerable changes to setting that affect the character of the asset.
Minor	• Changes to key archaeological materials, such that the asset is slightly altered. • Slight changes to setting.
Negligible	• Very minor change to archaeological materials or setting.
No change	• No change

3.2.12 Subject to the form and value of the asset, and the likely nature and magnitude of the impact, proposals for mitigation will be investigated and selected following consultation with NIEA.

Evaluation of effects and description of significant effects

3.2.13 The evaluation of effects taking into account proposed mitigation will be initially identified in accordance with the guidance provided in the matrix detailed in Table 5.4, Annex 5 of HA208/07 as replicated in Table 3 below. The ratings will be subject to final review by the heritage assessment team. Should it be concluded the rating should vary from that indicted in the matrix, the new rating will be identified along with the reasons for the modification.

Table 3: Evaluation of effects

Value / Sensitivity	**Very high**	Neutral	Slight	Moderate / Large	Large or Very large	Very large
	High	Neutral	Slight	Moderate / Slight	Moderate / Large	Large / Very large
	Medium	Neutral	Neutral / Slight	Slight	Moderate	Moderate / large
	Low	Neutral	Neutral / Slight	Neutral / Slight	Slight	Slight / moderate
	Negligible	Neutral	Neutral	Neutral / Slight	Neutral / Slight	Slight
		No change	**Negligible**	**Minor**	**Moderate**	**Major**
		Magnitude of impact				

3.2.14 Once the ratings have been finalised for all identified assets, they will be reviewed to determine if the effect(s) relative to any single asset or group of assets constitutes a significant effect in terms of the EIA Regulations.

Built heritage

Establishment of the baseline

3.2.15 The following data sources will be referred to:

- MBR held by NIEA;
- National Monuments Service Monument Database (ROI);
- literary resources at the Belfast Central Library and Queen's University Library;
- historic maps at the Public Record Office of NI; and
- A5 Western Transport Corridor, Environmental Statement, Mouchel, November 2010.

3.2.16 Individual assets and / or groups of assets identified within the baseline environment will be attributed a value with reference to the guidance provided in Table 6.1, Annex 6 of HA208/07 as replicated in Table 4 below.

3.2.17 **Table 4: Factors for assessing the value of built heritage assets**

Very high	• World Heritage Sites (including nominated sites). • Buildings of acknowledged international importance.
High	• Scheduled Monuments with standing remains (including proposed sites). • Grade A and B+ listed buildings. • Other listed buildings that can be shown to have exceptional qualities in their fabric or historical associations not adequately reflected in the listing grade. • Conservation areas containing very important buildings. • Undesignated structures of clear national importance.
Medium	• Grade B listed buildings. • Historic (unlisted) buildings that can be shown to have exceptional qualities in their fabric or historical associations. • Conservation Areas containing buildings that contributes significantly to its historic character. • Historic Townscape or built-up areas with important historic integrity in their buildings, or built settings (e.g. including street furniture and other structures).
Low	• 'Locally Listed' buildings. • Historic (unlisted) buildings of modest quality in their fabric or historical association. • Historic Townscape or built-up areas of limited historic integrity in their buildings, or built settings (e.g. including street furniture and other structures).
Negligible	• Buildings of no architectural or historical note; buildings of an intrusive character.
Unknown	• Buildings with some hidden (i.e. inaccessible) potential for historic significance.

Identification of impacts

3.2.18 The identification of impacts will involve a combination of quantification and description of the form and scale of change which individual assets and / or groups of assets will be subject to as a result of the introduction of the proposed scheme and its associated traffic into the baseline environment. A resultant magnitude of impact will be attributed to each asset / group of assets informed by the guidance provided in Table 6.3 of Annex 6 of HA208/07 as replicated in Table 5 overleaf.

Table 5: Factors for assessing the magnitude of impact

Major	• Change to key historic building elements, such that the resource is totally altered. • Comprehensive changes to the setting.
Moderate	• Change to many key historic building elements, such that the resource is significantly modified. • Changes to the setting of an historic building, such that it is significantly modified.
Minor	• Change to key historic building elements, such that the asset is slightly different. • Change to setting of an historic building, such that it is noticeably changed.
Negligible	• Slight changes to historic buildings elements or setting that hardly affect it.
No change	• No change to fabric or setting of the asset.

3.2.19 Subject to the form and value of the asset, and the likely nature and magnitude of the impact, proposals for mitigation will be investigated and selected following consultation with NIEA.

Evaluation of effects and description of significant effects

3.2.20 The evaluation of effects taking into account proposed mitigation, will be initially identified in accordance with the guidance provided in the matrix detailed in Table 5.4, 6.4 and 7.4, Annex 5, 6 and 7 of HA208/07 as replicated in Table 9.3. The ratings will be subject to final review by the heritage assessment team. Should it be concluded the rating should vary from that indicated in the matrix; the new rating will be identified along with the reasons for the modification.

3.2.21 Once the ratings have been finalised for all identified assets, they will be reviewed to determine if the effect(s) relative to any single asset or group of assets constitutes a significant effect.

Historic landscapes

Establishment of the baseline

3.2.22 In relation to historic landscapes, the assessment will focus on areas associated with the proposed scheme corridor where social and economic activity will have served to shape landscapes in which there is a discernable awareness of their evolution. The study area for this assessment will be a corridor 1.5km either side of the proposed scheme alignment, deemed to be a wide enough area to enable decisions to be made with confidence about the effect of the proposed scheme on the historic landscape.

3.2.23 The following data sources will be referred to:

- historic maps at the Public Record Office of NI;
- A5 Western Transport Corridor, Environmental Statement, Mouchel, November 2010;

3.2.24 Historic landscapes identified within the baseline environment will be attributed a value with reference to the guidance provided in Table 7.1, Annex 7 of HA208/07 as replicated in Table 6 below.

Table 6: Factors for assessing the value of historic landscapes

Very high	• World Heritage Sites inscribed for their historic landscape qualities. • Historic landscapes of international value, whether designated or not. • Extremely well preserved historic landscapes with exceptional coherence, time-depth, or other critical factor(s).
High	• Designated historic landscapes of outstanding interest. • Undesignated landscapes of outstanding interest. • Undesignated landscapes of high quality and importance, and of demonstrable national value. • Well preserved historic landscapes, exhibiting considerable coherence, time-depth or other critical factor(s).
Medium	• Designated special historic landscapes. • Undesignated historic landscapes that would justify special historic landscape designation, landscapes of regional value. • Averagely well-preserved historic landscapes with reasonable coherence, time-depth or other critical factor(s).
Low	• Robust undesignated historic landscapes. • Historic landscapes with importance to local interest groups. • Historic landscapes whose value is limited by poor preservation and/or poor survival of contextual associations.
Negligible	• Landscapes with little or no significant historical interest.

Identification of impacts

3.2.25 The identification of impacts will involve a combination of quantification and description of the form and scale of change which historic landscapes will be subject to as a result of the introduction of the proposed scheme and its associated traffic into the baseline environment. A resultant magnitude of impact will be attributed to each asset / group of assets informed by the guidance provided in Table 7.3 of Annex 7 of HA208/07 as replicated in Table 7 overleaf.

Table 7: Factors for assessing the magnitude of impact

Major	• Change to most or all key historic landscape elements, parcels or components; extreme visual effects; gross change of noise or change to sound quality; fundamental changes to use or access; resulting in total change to historic landscape character unit.
Moderate	• Changes to many key historic landscape elements, parcels or components, visual change to many key aspects of the historic landscape, noticeable differences in noise or sound quality, considerable changes to use or access; resulting in moderate changes to historic landscape character.
Minor	• Changes to few key historic landscape elements, parcels or components, slight visual changes to few key aspects of historic landscape, limited changes to noise levels or sound quality; slight changes to use or access: resulting in limited changes to historic landscape character.
Negligible	• Very minor changes to key historic landscape elements, parcels or components, virtually unchanged visual effects, very slight changes in noise levels or sound quality; very slight changes to use or access; resulting in a very small change to historic landscape character.
No change	• No change to elements, parcels or components; no visual or audible changes; no changes arising from in amenity or community factors.

3.2.26 Subject to the form and value of the asset, and likely nature and magnitude of the impact, proposals for mitigation will be investigated and selected following consultation with NIEA.

Evaluation of effects and description of significant effects

3.2.27 The evaluation of effects, taking into account proposed mitigation, will be initially identified in accordance with the guidance provided in the matrix detailed in Table 5.4, 6,4 and 7.4, Annex 5, 6 and 7 of HA208/07 as replicated in Table 3. The ratings will be subject to final review by the heritage assessment team. Should it be concluded the rating should vary from that indicted in the matrix; the new rating will be identified along with the reasons for the modification.

3.2.28 Once the ratings have been finalised for all identified assets, they will be reviewed to determine if the effect(s) relative to any single asset or group of assets constitutes a significant effect.

3.3 Landscape effects

3.3.1 The A5WTC ES 2010 reported the findings of studies, site surveys and assessments focused on landscape character and visual impacts.

3.3.2 They are studies, surveys and assessments which will need to be revisited in light of the time which has elapsed since the completion of the A5WTC ES 2010, localised

modifications to the design proposals which are currently under review and changes to the anticipated construction period.

3.3.3 The ES for the proposed scheme will accordingly include the findings of updated studies and some new studies and assessments for landscape character and visual effects.

Both assessments will be informed by the guidance provided in the Highways Agency's Interim Advice Note (IAN) 135/10, and the Guidelines for Landscape and Visual Impact Assessment (Third Edition), published by the Landscape Institute and Institute of Environmental Management and Assessment (IEMA) (2013).

Landscape character

3.3.4 The landscape of the proposed scheme corridor remains largely unaltered in composition and character from that which was subject to assessment in the A5WTC ES 2010.

3.3.5 The currently proposed scheme also does not vary in any marked way in horizontal and vertical alignment from that assessed and reported in the A5WTC ES 2010. The relationship between the currently proposed scheme and the landscape of the area is not likely; therefore, to have changed in any marked way.

3.3.6 The assessment reported in the ES for the currently proposed scheme will, therefore, be substantially based on the baseline description detailed in the A5WTC ES 2010 subject to further site review and consultation with the Northern and Western regional offices of the Planning and Local Government Group (PLGG) and NIEA to ensure that any marked changes in components and composition or changes that are anticipated are reflected in the current assessment.

3.3.7 The information included in the A5WTC ES 2010 and gathered from the site review and further consultations reviewed and the impacts and proposed mitigation previously identified will be reassessed and either confirmed or modified in light of the current information and currently proposed scheme.

3.3.8 Updated assessments will be undertaken to represent the predicted impacts during the winter in the anticipated year of opening for each of the three phases and during the summer fifteen years following completion of each of the three phases. This will enable the impact of the fully completed scheme to be described and the effectiveness of the proposed mitigation to be described on a like for like basis.

Visual effects

3.3.9 In common with landscape character, the visual context of the area within which the proposed scheme is located remains largely unaltered such that the predicted

relationship of visual receptors considered in the A5WTC to the proposed scheme also remains largely unaltered.

3.3.10 The assessment reported in the ES for the currently proposed scheme will, therefore, be substantially based on the baseline description detailed in the A5WTC ES 2010.

Zone of Visual influence (ZVI)

3.3.11 The Zone of Visual Influence (ZVI) identified and adopted for the assessments reported in the A5WTC ES 2010 will be used as the basis for the assessments to be undertaken and reported in the ES for the currently proposed scheme. A review of the ZVI will be undertaken during the visual impact site surveys for the currently proposed scheme to determine if there should be any local modifications to the ZVI where variations in horizontal or vertical alignment to those originally assessed are proposed. Should local modifications, which are notable in nature to either emerge as details for the currently proposed scheme are finalised, that part of the ZVI will be revisited and modified if appropriate and a review of any new receptors which may warrant inclusion in the assessments will be undertaken.

Receptors

3.3.12 Receptors included in the assessments reported in the A5WTC ES 2010 will be reviewed and the findings will either be confirmed or modified in light of the currently proposed scheme. A further search will also be undertaken using address point data and site survey to establish the presence of any additional receptors for inclusion in the assessment for the currently proposed scheme.

Evaluation of effects

3.3.13 The evaluation of visual effects for the identified receptors will involve consideration of the sensitivity of the receptor and the magnitude of impact on their view. Winter and summer surveys will be undertaken for all receptors, and the data relating to the following will be recorded:

- receptor type and number (houses, footpaths, open space etc.);
- form and quality of the existing view;
- distance between receptor and the proposed scheme;
- angle of view towards the proposed scheme;
- elevation of receptor in relation to the proposed scheme (view up / view down / level view);
- extent of the existing view predicted to be influenced by the proposed scheme;

- location of the proposed scheme in the view (foreground / mid ground / background); and

- preliminary prediction of orders of impact during construction, in the opening years, and in the design year.

Sensitivity of receptors

3.3.14 Receptors will be attributed one of three sensitivity ratings as indicated below:

- High – residential receptors, schools and nurseries, retirement and sheltered accommodation and amenity areas and footpaths where the view is an important aspect of use;

- Medium – retail areas, offices and sports facilities; and

- Low – factories.

Magnitude of impact

3.3.15 Magnitude will be graded as follows:

- Major magnitude – the proposed scheme would appear as a significant new component in the view and result in a total loss of or major alteration to the existing balance of components in the view.

- Moderate magnitude – the proposed scheme would appear as a distinctly noticeable new component in the view and result in a partial loss of or alteration to the existing balance of components in the view.

- Minor magnitude – the proposed scheme would appear as a noticeable new component in the view and result in a minor loss of or alteration to the existing balance of components in the view.

- Negligible – only a very small part of the proposed scheme would be discernible, or it is at such a distance that it would form a barely noticeable feature or element of the view.

- No change – no part of the proposed scheme, or work or activity associated with it, is discernable.

Significance of visual effects

3.3.16 The evaluation of the significance of effect will be informed by the ratings indicated in Table 8 overleaf.

Table 8: Significance of effects

Landscape sensitivity to change	**High**	Neutral	Slight	Slight or moderate	Moderate or large	Large or very large
	Moderate	Neutral	Neutral or slight	Slight	Moderate	Moderate or large
	Low	Neutral	Neutral or slight	Neutral or slight	Slight	Slight or moderate
		No change	**Negligible**	**Low**	**Moderate**	**Major**
		Magnitude of impact				

3.3.17 Updated assessments will be undertaken to represent the predicted impacts during construction, in the winter in the anticipated year of opening for each of the three phases and during the summer fifteen years following completion of each of the three phases. This will enable the impact of the fully completed scheme to be described and the effectiveness of the proposed mitigation to be described on a like for like basis.

3.4 Ecology and nature conservation

3.4.1 The A5WTC ES 2010 reported studies, site surveys and assessments focused on:

- sites designated for their nature conservation and biodiversity value;
- habitats of nature conservation value; and
- species of fauna of nature conservation value.

3.4.2 The currently proposed scheme does not vary in any marked way in horizontal and vertical alignment from that assessed and reported in the A5WTC ES 2010. The relationship between the currently proposed scheme and designated sites, habitats and species of fauna is not likely, therefore, to have changed in any marked way. However, time has elapsed since the completion of the studies and surveys which informed the assessments reported in the A5WTC ES 2010. There may have been changes to sites and habitats as a result of land management, farming practice or development of sites and changes relative to the presence and use of habitats by species of fauna previously identified. The ES for the currently proposed scheme will, therefore, be informed by further studies and site surveys where appropriate to ensure that any marked changes that may have occurred inform the assessments

3.4.3 The conduct and presentation of the studies, surveys and assessments will be informed by the guidance provided in:

- Section 3 Part 4 of Volume 11 of the DMRB – Ecology and Nature Conservation as updated by IAN 130/10 (Ecology and Nature Conservation: Criteria for Impact Assessment); and

- Chartered Institute of Ecology and Environmental Management's Guidelines for Ecological Impact Assessment in the United Kingdom 2006 (CIEEM, 2006).

3.4.4 The identification of the studies and assessments considered to be appropriate has been informed by the information provided in the A5WTC ES 2010, other information submitted and considered during the A5WTC public inquiries held in 2011 and further discussions held with NIEA and LA during 2013 and 2014.

Designated sites

3.4.5 Designated sites for assessment have been selected following consultation with NEIA and examining potential impact pathways linking the scheme to the sites.

3.4.6 Designated sites identified, assessed and reported in the A5WTC ES 2010 comprised:

- Lough Foyle Special Protection Area (SPA);
- Lough Swilly SPA (which includes the former Inch Lough and Levels SPA);
- Lough Foyle Ramsar Site;
- The River Foyle and Tributaries SAC / ASSI;
- The River Finn SAC;
- Owenkillew River SAC / ASSI;
- Tully Bog SAC / ASSI;
- Strabane Glenn ASSI;
- McKean’s Moss ASSI;
- McKean’s Moss Part II ASSI; and
- Grange Wood ASSI.

3.4.7 Additional sites identified through consultation and in discussion with other parties include:

- Baronscourt ASSI;
- Lough Neagh & Lough Begg ASSI;
- Lough Neagh & Lough Begg SPA; and

- Lough Neagh & Lough Begg Ramsar Site.

3.4.8 Other non-statutory designated sites which will be considered comprise:

- Strabane Nature Reserve; and
- Ancient/Long-Established Woodland.

3.4.9 It is intended the ES for the currently proposed scheme should address impacts relative to the originally identified sites subject to a further review to identify any designated sites introduced since the publication of the A5WTC ES 2010 with NIEA and regional / local nature conservation bodies and agencies.

3.4.10 The information included in the A5WTC ES 2010 and gathered from the investigation regarding new designations will be reviewed and the impacts and proposed mitigation previously identified will be reassessed and either confirmed or modified in light of the current information and currently proposed scheme.

Habitats and flora

3.4.11 The A5WTC ES 2010 reported desk-based studies, site surveys and assessments undertaken for habitats and flora along the proposed scheme corridor. Site surveys comprised a Phase 1 (Joint Nature Conservation Committee (JNCC), 2010) habitat survey, National Vegetation Classification (NVC) surveys, aquatic macrophyte surveys along watercourses and bryophyte surveys for three woodland sites associated with riparian corridors and three bog sites.

3.4.12 The following surveys have also been undertaken during 2012, 2013 and 2014:

- aquatic habitat surveys for watercourses forming parts of River Foyle and Tributaries SAC, River Finn SAC, and Owenkillew River SAC which have provided additional information relating to macrophytes;
- bryophyte re-surveys at locations of known populations of conservation concern.

3.4.13 Further surveys will be undertaken as follows:

- a Phase 1 (JNCC, 2010) habitats survey for those habitats previously identified as being of greater than local nature conservation value, (March 2014);
- drive by surveys, walk over surveys or vantage point surveys as appropriate , for habitats of local or lower value to establish if there are indications of change relative to them subsequent to the publication of the A5WTC ES 2010 (March 2014);

- further NVC surveys for the sites and areas detailed in the A5WTC ES 2010 (April, May, June and July 2014);
- additional aquatic macrophyte surveys for all watercourses which are classified under the Water Framework Directive (WFD) and which will be located in close proximity to or crossed by the proposed scheme (during late June and late July 2014);
- additional bryophyte surveys for the six sites originally identified (between April and July 2014) ; and
- species rich hedgerow and veteran tree surveys (between April and July 2014).

3.4.14 The NVC surveys followed the methods outlined in British Plant Communities (Rodwell et al. 1991a, 1991b, 1992, 1995 and 2000). NVC surveys in April and May were focused on woodland vegetation and surveys in June and July were focused on other vegetative communities.

3.4.15 The extent of areas of homogeneous vegetation was mapped and sample quadrats (relevés) will be located within these areas to record the abundance and frequency of vascular plants, bryophytes and lichens within each compartment. The field data will then be analysed and each compartment was assigned, where possible, to a particular plant community.

3.4.16 Within each quadrat, a quantitative measure of the relative abundance of every vascular plant, bryophyte and lichen species was undertaken using the 10 point Domin scale. Cover was assessed by eye as a vertical projection on to the ground of all live, above-ground parts of the plants within the quadrant.

3.4.17 Frequency will be used in conjunction with abundance when determining the community type, either using dichotomous keys within British Plant Communities or the MATCH computer program (MATCH (v.2.16) from the Unit of Vegetation Science, Lancaster University).

Aquatic macrophytes

3.4.18 Aquatic macrophyte surveys were undertaken on all watercourses which are crossed by the proposed scheme. The field survey area will be predominantly confined to selected water course reaches within a 500m survey sites selected to include the crossing point of the proposed road and as much of the length of river within the vested land as possible. In areas where this was not possible sections of the river downstream of the scheme were favoured for survey. Aquatic macrophytes were identified and percentage cover for each species estimated within the survey reach.

Bryophytes

3.4.19 Surveys for bryophytes were undertaken by a systematic walkover, examining all suitable substrates, including features such as walls, fences and trees. Fieldwork was undertaken by experienced bryophyte surveyors. The relative abundance of each species within the different habitat types at each site was recorded and classified using a DAFOR scale (D = Dominant; A = Abundant, F = Frequent, O = Occasional, R = Rare).

Species rich hedgerow and veteran trees

3.4.20 The A5WTC ES 2010 reported desk-based studies, site surveys and assessments undertaken for species rich hedgerows and veteran trees.

3.4.21 Hedgerow coppicing and removal of some trees was undertaken for parts of the proposed scheme corridor between Newbuildings and J8, and J13 and J15 during 2012. In these areas the baseline survey information gathered for the A5WTC ES 2010 will be relied on.

3.4.22 Further surveys were undertaken for the proposed scheme corridor between J8 and J13, and J15 and south of Aughnacloy between April and July 2014 the focus being on those hedgerows originally identified in the A5WTC ES 2010. The surveys were based on the methods outlined in the Hedgerow Survey Handbook 2nd Ed. (Department for Environment, Food and Rural Affairs (Defra), 2007). They involved the recording of plant species, species diversity and the dominance of each species, and measurements of size and shape as important determinants of value. The location and species of veteran trees was recorded.

3.4.23 The information included in the A5WTC ES 2010, and gathered from the 2012, 2013 and 2014 surveys relating to habitats and flora, including hedgerows and veteran trees, will be reviewed and the impacts and proposed mitigation previously identified will be reassessed and either confirmed or modified in light of the current information and currently proposed scheme. This series of paragraphs need to be revised to reflect the correct tense for surveys which have been completed

Fauna

Otter

3.4.24 The A5WTC ES 2010 reported desk-based studies, site surveys and assessments for otter *Lutra lutra*. These were focused on locations where preliminary studies had identified habitat which potentially signalled presence of or use by the species including proposed crossings of watercourses.

3.4.25 Further surveys have been undertaken during 2012 and 2013 along all watercourses which will be crossed by the proposed scheme to establish the current status of evidence of the presence of or use by the species.

3.4.26 The 2012 and 2013 surveys involved recording of evidence along both banks of each watercourse by experienced otter surveyors following procedures detailed in the *Otter Surveys – NIEA Specific* Requirements (NIEA, 2013). In common with the surveys along watercourses reported in the A5WTC ES 2010, surveys were conducted 250m upstream and downstream from proposed scheme crossing points.

3.4.27 Searches were undertaken for potential holts, runs leading away from the water, couches, slides and otter spraints. Transects were also walked where practical, parallel to the waterways, to detect any potential otter runs which leading to den sites. Any potential runs were followed and searched for evidence of use by otter in the form of footprints and spraints.

3.4.28 The information included in the A5WTC ES 2010 and gathered from the 2012 / 2013 surveys will be reviewed and the impacts and proposed mitigation previously identified will be reassessed and either confirmed or modified in light of the current information and currently proposed scheme.

Badgers

3.4.29 The aim of the study is to determine the value of the survey area (land directly under the footprint of the scheme and in a 50m buffer around it) for badgers, in order to inform an assessment of the likely ecological effects upon this species. The study set out to:

- Undertake field surveys to record evidence of badgers within the study area, to identify and categorise badger setts as main, annexe, subsidiary or outlier setts and note the level of usage of each; and

- Map the locations of evidence of badgers.

3.4.30 The desk study undertaken for the original A5WTC ES 2010 revealed no records from the CEDaR and the Northern Ireland Badger Group. This data search was not updated due to the detailed field surveys undertaken by Mouchel between June 2009 and February 2013. Records from these surveys were consulted to identify the locations of any known badger setts and activity to inform the current surveys.

3.4.31 Field surveys were completed between the 3rd and 25th March 2014. Habitats within the survey area were surveyed for badgers where access was permitted. The survey area included all land within the scheme boundary and adjacent habitats within a 50m buffer where access permitted.

3.4.32 The surveys followed standard guidance in Harris et al. (1989) and in accordance with best practice guidance contained in the Badgers and Development (NIEA, 2011).

3.4.33 Surveys included a systematic search for setts and other signs of badger activity within the survey area, such as spoil, latrines or dung pits, bedding material, paths, footprints, hairs and feeding signs (holes in ground and scrapes in soil). Sett locations were recorded on maps along with a classification of the type of sett (Main, Annexe, Subsidiary and Outlier) and whether it is used (evidence of activity, such as fresh excavations and moulted hairs, are indicative of current use of a sett).

3.4.34 Eight setts were selected for the badger bait marking survey as these setts were assessed as either potential main setts or unclassified setts. The badger bait marking survey included a general survey for any signs of badger activity such as sett entrances, mammal paths, snuffle holes, badger guard hairs, fresh bedding and feeding signs. This element of the survey followed best practice guidance contained in the Badgers and Development (NIEA, 2011) guidance document.

3.4.35 The badger bait marking survey generally followed the methodology laid out by Delahay et al (2000). This standard methodology prescribes a 1km search area around a development site, and literature searches have shown this can be readily be reduced to a 500m buffer. However, given the linear nature of the road scheme and the length of the scheme a buffer of 250m around each main sett has been selected. Surveys excluded residential properties.

3.4.36 Over a three week period, from the 9th September 2013 to 27th September 2013, each sett was subject to the following survey methodology:

- Bait mixture, comprising peanuts, golden syrup and coloured pellets, was placed outside the sett entrances in the late afternoon under large stones (to protect from rain, and to prevent other wildlife eating it), using different coloured pellets at each sett;

- Bait mixture was placed for a minimum of ten days. Specific baiting locations around the sett entrances changed daily. Bait mixture was replaced during this 10 day period if it was found to have been consumed;

- A 250m radius around each sett was checked for latrines. Latrines were surveyed for the presence of pellets every two to three days during the three week period;

- The content of dung pits found was thoroughly searched for the presence of coloured pellets by removing the dung to a depth of 20cm and spreading it across a suitable flat surface;

- GPS coordinates of latrine sites were recorded, as was any evidence of coloured pellets within dung pits; and,

- A general survey for any signs of badger activity such as new sett entrances, mammal paths, snuffle holes, badger guard hairs, fresh bedding and feeding signs.

Bats

3.4.37 The A5WTC ES 2010 reported desk-based studies, site surveys and assessments for species of bat throughout the entire length of the originally proposed scheme.

3.4.38 Further surveys have been undertaken during 2012 and 2013 for the sections of the proposed scheme between Newbuildings and proposed J8, and J13 and J15. These surveys were focused on hedgerows that were being cut back, trees that were being removed at that time and buildings identified as having roost potential.

3.4.39 Additional site surveys are also planned for the full length of the proposed scheme between April and September 2014. These will involve walked transects, driven transects and static surveys with automated detectors carried out in accordance with methods outlined in the *Bat Conservation Trust's (BCT) Bat Surveys – Good Practice Guidelines (Hundt, 2012)*. Any potential roosts identified will be subject to further survey.

3.4.40 Walking transects commencing 15 minutes before sunset, and lasting between 2-3 hours will be conducted where there is habitat likely to be used by bats for foraging and commuting[1]. Automated bat detectors linked to Global Positioning System (GPS) units will be used to accurately record the location of calls made by passing bats. These data will be augmented by surveyor observations and recordings using BatBox Duet / Petterson D240x bat detectors. Each walked transect site will be visited monthly between April and September with at least one of the monthly transects comprising a dusk and pre-dawn survey.

3.4.41 Driven transects using vehicle mounted automated bat detectors will be used to survey the wider landscape beyond the boundaries and immediate vicinity of the proposed scheme. Two Anabat SD1 automated detectors will be mounted to the vehicle: the first will be mounted on the roof of the car on the hedgerow side of the vehicle at a 45 degree angle to the direction of travel, and the second will be linked to a microphone mounted on the top of the vehicle which will use the car roof as a reflector. Driven transects are undertaken following the current BCT guidelines.

3.4.42 Features of potential value to bats (e.g. hedgerows, watercourses and woodlands) will be subject to static surveys using automated detectors placed in-situ for five consecutive nights each month between April and September. The sites will be chosen to provide coverage of the proposed scheme.

3.4.43 Data recorded during all surveys will be analysed by suitably experienced ecologists using appropriate software.

[1] As identified by suitably experienced ecologists from Phase 1 survey mapping, aerial photography and site visits.

3.4.44 The information included in the A5WTC ES 2010 and gathered from the 2012, 2013 and 2014 surveys will be reviewed and the impacts and proposed mitigation previously identified will be reassessed and either confirmed or modified in light of the current information and currently proposed scheme.

Red squirrel

3.4.45 The A5WTC ES 2010 reported desk-based studies, site surveys and assessments undertaken to establish the presence of red squirrel *Sciurus vulgaris* in woodland within the potential zone of influence of the proposed scheme corridor. Seven locations were identified where there was evidence of presence, ranging in distance from 0.5-5km from the proposed alignment.

3.4.46 It is accordingly intended the ES for the currently proposed scheme will include studies and assessments for the species. These will involve:

- further survey of the sites identified and assessed in the A5WTC ES 2010;
- a review of records of red squirrel sightings provided by the Centre for Environmental Data and Recording (CEDaR), North West Red Squirrel Group and red squirrel habitat preferences as described in 'UK Biodiversity Action Plan (BAP) Mammals: Interim Guidance for Survey Methodologies, Impact Assessment and Mitigation' (The Mammal Society, 2013); and
- a review of habitat types 2km either side of the proposed scheme to establish if any additional locations should be included for further survey.

3.4.47 Walked transect surveys will be undertaken at the identified sites in April 2014 and will be repeated in July 2014. The method will be based on the survey methodology published by NIEA. The surveys will involve:

- Starting at dawn, walking transect lines of 500-1000m, stopping at intervals of approximately 100m for 2-5 minutes, taking about 5 minutes to walk the intervening 100m, visually searching the surrounding woodland for squirrels and squirrel evidence. If a positive sighting of a red squirrel is made the survey will be stopped;
- Where there are positive signs of squirrels (dreys and feeding remains) but no sightings, the site will be re-surveyed using camera trapping. This will involve the installation of a raised feeding platform at a chosen location (based on feeding evidence) which will be bated with maize and hazel nut mixture; and

- At each of these chosen locations three camera traps will be set up in order to maximise the chances of photographing red squirrels. Cameras will be left in place for a minimum of five days[2].

3.4.48 The information included in the A5WTC ES 2010 and gathered from the 2014 surveys will be reviewed and the impacts and proposed mitigation previously identified will be reassessed and either confirmed or modified in light of the current information and currently proposed scheme.

Pine marten

3.4.49 The A5WTC ES 2010 reported desk-based studies, site surveys and assessments undertaken to establish the presence of pine marten, *Martes martes* in woodland within the potential zone of influence of the proposed scheme. Fifteen locations were identified where there was evidence of presence, ranging in distance from 0.5-3km from the proposed alignment.

3.4.50 It is accordingly intended the ES for the currently proposed scheme will include studies and assessments for the species. These will involve:

- further survey of the sites identified and assessed in the A5WTC ES 2010;
- a review of records of pine marten sightings provided by CEDaR; and
- a review of habitat types 3km either side of the proposed scheme to establish if any additional locations should be included for further survey.

3.4.51 Walked transect surveys will be undertaken at the identified sites in June and July 2014. The method will be based on the survey methodology utilised by O'Mahony et al (2005) and The Mammal Society guidelines (2013). Camera trapping and hair-tube baiting will take place in July and August 2014. The surveys will involve:

- Walking transect lines of a minimum distance of 5km per survey site, along woodland rides, mammal tracks and other linear features, where surveyors will search for scat, footprints, potential den sites and direct sightings of pine marten;
- Where signs are found a GPS position and photograph will be taken. All potential scats found will be collected in plastic pots, clearly labelled with a reference number and sent for DNA analysis to confirm the species; and

[2] Mouchel are collaborating with the NIEA Red Squirrel Survey being coordinated with Dr Neil Reid, sharing methods and equipment to provide greater coverage for the National Survey.

- In sites where scats have been found during transects, c. 5 hair tubes will be erected and baited for a minimum period of 10 days at each site.

3.4.52 The information included in the A5WTC ES 2010 and gathered from the 2014 surveys will be reviewed and the impacts and proposed mitigation previously identified will be reassessed and either confirmed or modified in light of the current information and currently proposed scheme.

Irish hare

3.4.53 Studies and assessments for Irish hare, *Lepus timidus hibernicus* were reported in the A5WTC ES 2010. They were focused on habitats which potentially signalled presence of or use by the species, where sightings were recorded during other site surveys, in data obtained from CEDaR, and locations reported by landowners.

3.4.54 It is accordingly intended the ES for the currently proposed scheme will include studies and assessments for the species. These will involve:

- a review of habitats within 2km either side of the proposed scheme to establish the extent of habitat suited to the species with reference to Quercus (2009) and the A5 WTC ES 2010 ;

- a review of CEDaR data relative to the species; and

- recording of any sightings during the other site surveys being undertaken to inform the assessments for ecological resources.

3.4.55 The information included in the A5WTC ES 2010 and gathered from the reviews undertaken in 2014 and records of sightings obtained post production of the A5WTC ES 2010 will be reviewed and the impacts and proposed mitigation previously identified will be reassessed and either confirmed or modified in light of the current information and currently proposed scheme.

Deer

3.4.56 The A5WTC ES 2010 reported desk-based studies, site surveys and assessments undertaken to establish the presence of Red deer, *Cervus elaphus*, Fallow deer, *Dama dama*, and Sika deer, *Cervus nippon* in the vicinity of the proposed scheme.

3.4.57 It is accordingly intended the ES for the currently proposed scheme will include the findings of studies, surveys and assessments for the species. These will include a review of current data with CEDaR and further surveys undertaken within a 100m study area either side of the proposed scheme during May and June 2014. Any signs of deer, footprints, and hair, dung or shed antlers will be recorded and their locations marked with GPS equipment.

3.4.58 The information included in the A5WTC ES 2010 and gathered from the 2014 surveys will be reviewed and the impacts and proposed mitigation previously identified will be re-assessed and either confirmed or modified in light of the current information and currently proposed scheme.

Whooper swan and greylag goose

3.4.59 The A5WTC ES 2010 reported desk-based studies, site surveys and assessments undertaken for whooper swan *Cygnus cygnus* and greylag goose *Anser anser* in the River Foyle floodplain and nearby fields north of the Burn Dennet and west of the proposed scheme alignment. The area is used during the winter for foraging by large flocks of both species associated with three Nature 2000 sites; Lough Foyle, Lough Swilly and Lough Neagh SPAs. The assessments recognised that construction and future use of the proposed scheme may result in impact by virtue of disturbance of the two species during the wintering period and have an effect on the three Natura 2000 sites.

3.4.60 Further reviews of data held by CEDaR, the RSPB, and the Irish Whooper Swan Study Group were undertaken during late summer / early autumn 2013. Further bi-weekly site surveys commenced in October 3013 and completed by mid-March 2014 have been undertaken to establish information in the form of counts for both species for the current wintering period. The location of flocks foraging in fields in the floodplain, and counts of birds in each flock, have been determined by vantage point surveys from high ground to the east and by walkover surveys along public rights of way through the floodplain.

3.4.61 The information included in the A5WTC ES 2010 and gathered from the current surveys will be reviewed and the impacts previously identified will be reassessed and either confirmed or modified in light of the current information and currently proposed scheme.

Breeding birds

3.4.62 The A5WTC ES 2010 reported desk-based studies, site surveys and assessments undertaken for breeding birds. It was established there are no sites associated with the proposed scheme corridor which are designated in light of the breeding bird assemblages. Data obtained from the British Trust for Ornithology (BTO), The Ulster Wildlife Trust (UWT), Northern Ireland Raptor Study Group (NIRSG), and RSPB, and project specific transect surveys established one location along the corridor where species and assemblages are considered to be of county value and six of district value, all others being of local or lower value. Barn owl *Tyto alba* surveys will be undertaken following best practice at any appropriate feature in the landscape identified through the Phase 1 habitat survey, or noted during other survey works.

3.4.63 It is accordingly intended studies and assessments relative to breeding birds which will be reported in the ES for the currently proposed scheme will involve:

- review of the data included in the A5WTC ES 2010;
- further reference to data held by BTO, UWT, NIRSG, RSPB and Department of Agriculture and Rural Development (DARD) with particular focus on data recorded subsequent to receipt of the data which informed the A5WTC ES 2010;
- further review of the data received from the consultees above and the updated 2013 / 2014 Phase 1 habitat surveys to establish if any further locations should be added to the site survey locations reported in the A5WTC ES 2010; and
- further survey at each of the transects reported in the A5 WTC ES 2010 and any additional locations identified by the review of the data received from the consultees above and the updated 2013 / 2014 Phase 1 habitat surveys. The surveys will be undertaken in April and June 2014 and will broadly follow that used by the BTO in their nationwide Breeding Bird Survey. A transect will be walked through each site with a record being made of important habitats and the presence and numbers of bird species.

3.4.64 The information included in the A5WTC ES 2010 and gathered from the 2014 surveys will be reviewed and the impacts previously identified will be reassessed and either confirmed or modified in light of the current information and currently proposed scheme.

Wintering birds

3.4.65 The A5WTC ES 2010 reported desk-based studies and assessments undertaken for wintering birds. It was established there are no sites associated with the proposed scheme corridor which are designated in light of their use by wintering birds. Data obtained from BTO, UWT, NIRSG, RSPB and site specific surveys established seven locations along the corridor where wintering birds are considered to be of district value, one being a wetland habitat (the flooded Strahans Quarry) and six farmland habitats.

3.4.66 Further surveys have been undertaken at each of the sites reported in the A5WTC ES 2010 between October 2013 and the beginning of March 2014. The surveys for the farmland habitats were based on a method similar to that used by the BTO in their Farmland Bird Survey carried out between 1999 and 2003. They involved surveyors walking transects through and around the sites to identify species of birds present, their numbers and behaviour (e.g. foraging). The survey at Strahans Quarry was conducted from a vantage point at the south of the quarry in a similar manner to that undertaken in the BTO Wetland Bird Survey (WeBS) counts.

3.4.67 It is accordingly intended studies and assessments for wintering birds which will be reported in the ES for the currently proposed scheme will involve review of the data included in the A5WTC ES 2010; that gathered from the 2013 / 2014 surveys; and any further responses from the consultees identified above. The impacts and proposed

mitigation previously identified will then be reassessed and either confirmed or modified in light of the current information and currently proposed scheme.

Fish

3.4.68 The A5WTC ES 2010 reported desk-based studies and assessments undertaken for fish based on River Habitat Surveys for some 47 sites, 16 of which were also subject to Fisheries Habitat Surveys. Further studies have also been undertaken during 2012 and 2013.

3.4.69 Desk based studies, including reference to studies and investigations undertaken as part of the assessments reported in the A5WTC ES 2010, and subsequent site-based investigations undertaken during 2012 and 2013 along the line of the proposed scheme, will be undertaken to determine the historic presence of fish fauna species and any important fisheries habitat within the study area alongside consultation with the NIEA, LA and DCAL Inland Fisheries team.

3.4.70 The information included in the A5WTC ES 2010, gathered from the 2012 and 2013 surveys, and any further data provided by obtained from NIEA, LA and DCAL will be reviewed and the impacts previously identified will be reassessed and either confirmed or modified in light of the current information and currently proposed scheme.

Reptiles

3.4.71 Studies and assessments reported in the A5WTC ES 2010 noted an absence of common lizard, the only native reptile in Northern Ireland, from sites surveyed on the basis of habitat potential. It is accordingly not intended that any further surveys should be undertaken subject to further reference to data held by CEDaR with particular focus on data recorded subsequent to receipt of the data which informed the A5WTC ES 2010. Should no further evidence be obtained, then the information derived from the previous studies will be relied on for the purposes of the ES for the currently proposed scheme.

3.4.72 Subject to the proposed desk-based review of current data, the information included in the A5WTC ES 2010 will be relied to inform the findings of the assessment reported in the ES for the currently proposed scheme.

Smooth Newt

3.4.73 The A5WTC ES 2010 reported desk-based studies, site surveys and assessments undertaken to establish the presence of smooth newt, *Lissotriton vulgaris* associated with the proposed scheme corridor. Newt field surveys were undertaken on all ponds within 250m of the road corridor[3], under suitable climatic conditions between mid-

3 Fifty-two ponds were identified and surveyed.

March and mid-June 2014. The surveys are being conducted with reference to the requirements outlined by NIEA (2014). Each survey site is being visited on at least four separate occasions and if smooth newts are recorded during any of these visits, then a further two census visits will be completed. The surveys involve:

- Searching both live and dead submerged pond vegetation for newt embryos during daylight hours – this method will be used for presence and absence only, and once presence is determined this method will not have to be repeated in that specific water body;

- Searching any suitable and accessible refuge (e.g. logs, rocks, boards and debris) within a 250m radius of the water body – this method will be used for presence and absence only, and once presence is determined this method will not have to be repeated in that specific water body;

- Dip netting the margins of a water body – this method will be used for presence and absence only, and once presence is determined this method will not have to be repeated in that specific water body; and

- Searching for newts at night with a torch – this method can be used to undertake presence and absence surveys and population estimates. Once positive records of newts are recorded in a pond or the surrounding area then this is the only method that needs to be continued until all six visits have been concluded.

3.4.74 The information included in the A5WTC ES 2010 and gathered from the 2014 surveys will be reviewed and the impacts and proposed mitigation previously identified will be reassessed and either confirmed or modified in light of the current information and currently proposed scheme.

Aquatic invertebrates

3.4.75 The A5WTC ES 2010 reported desk-based studies, site surveys and assessments undertaken to establish the presence of white clawed crayfish, *Austropotomobius pallipes* and freshwater pearl mussel, *Margaritifera margaritifera.* The studies and surveys indicated there is limited presence of white clawed crayfish, the only location being along reaches of the River Blackwater and provided no evidence for the presence of freshwater pearl mussel. In the case of white clawed crayfish, the currently proposed scheme does not cross the watercourse whilst proximity to the watercourse is limited to the point at which the proposed single carriageway south of Aughnacloy merges with the existing A5.

3.4.76 In light of the established presence of white clawed crayfish in this limited location and the absence of freshwater pearl mussel throughout the proposed scheme corridor, it is not intended any further surveys should be undertaken subject to further reference to data held by CEDaR.

3.4.77 It is accordingly intended, that subject to the data review studies and assessments reported in the ES for the currently proposed scheme for these two species of aquatic invertebrate will be based on the data included in the A5WTC ES 2010.

Terrestrial invertebrates

3.4.78 The A5WTC ES 2010 reported desk-based studies, site surveys and assessments for terrestrial invertebrates. The findings of the studies and surveys demonstrated the assemblages of terrestrial invertebrate species associated with the various habitats along the proposed scheme corridor are typical of the habitats surveyed, there being a very small number of notable species recorded, and no species recorded which are afforded legal protection.

3.4.79 It is accordingly not intended any further site surveys should be undertaken, and that the assessment will be based upon updated desk study records and data collected for the A5WTC ES 2010.

Impact assessment

3.4.80 The evaluation of impacts will involve establishment of the biodiversity value for the designated sites, habitats and species and identification of impacts and appropriate mitigation during construction and future use of the proposed scheme.

Biodiversity value

3.4.81 The identification of value will be based on consideration of:

- rarity at various geographical scales;
- threat status and vulnerability at various geographical scales;
- diversity and/or it's synergistic associations;
- population size; and
- location in relation to its known geographical distribution and range at various geographical scales.

3.4.82 The institute of Ecology and Environmental Management (IEEM) (2006) provides further information on how the relative value and importance of a receptor can be determined and states that its biodiversity value should be measured against published

selection criteria where available. Reference will be made to UK and Local BAPs, national or county Red Data Books, and to conservation status (such as nationally notable/scarce, etc.). Distinction will be made between the biodiversity value of a receptor and its legal status.

3.4.83 Table 9 below describes criteria which will inform the identified biodiversity value for the resources included in the assessments. They are criteria which accord with IEEM (2006) guidance, and follow the Ratcliffe criteria (1977).

Table 9: Criteria for determination of biodiversity value of an ecological receptor

Value	Criteria
International	**Habitats** An internationally designated site or candidate site, i.e. SAC or candidate SAC (cSAC), or an area that would meet the published selection criteria for designation. A viable area of habitat that is essential to maintain the viability of a population or habitat in the wider area.
	Species Any regularly occurring population of internationally important species, threatened or rare in the UK, i.e. a UK Red Data Book species, UK BAP or of uncertain conservation status or of global conservation status. A regularly occurring, nationally significant population/number of an internationally important species.
National	**Habitats** A nationally designated site, i.e. ASSI or National Nature Reserve (NNR), or a discrete area that would meet the published selection criteria for national designation (e.g. ASSI selection criteria). A viable area of key habitat important in maintaining the viability of a population or habitat in the wider area.
	Species A regularly occurring, regionally or county significant population/number of an internationally / nationally important species. Any regularly occurring population of a nationally important species that is of threatened or rare conservation status in the region or county. A species identified as of critical importance in the UK BAP.
Regional	**Habitats** Sites that exceed the County-level designation but fall short of national designation criteria. Viable areas of habitat that is considered to be important in maintaining the viability of a population or habitat in the wider area.
	Species Any regularly occurring, locally significant population of a species listed as being nationally scarce which occurs in 16-100 10km squares in the UK BAP. A regularly occurring, locally significant population/number of a regionally important species. Sites maintaining populations of internationally/nationally important species that are not threatened or rare in the region or county.

County	**Habitats** Sites recognised by local authorities, e.g. Sites of Local Nature Conservation Interest (SLNCIs) or Local Nature Reserves (LNRs). A small area of habitat that is considered to be important in maintaining wider viability of a population or habitat.
	Species Any regularly occurring, locally significant population of a species listed in a Local BAP because of county rarity or localisation. A regularly occurring locally significant population of a County important species. Sites supporting populations of regionally important species that are not threatened or rare in the region or county and not integral to maintaining those populations.
District	**Habitats** Areas of habitat that enrich the local resource for species and are important to maintaining local viability of a population.
	Species Any regularly occurring, locally significant population of a species listed in a Local BAP due to district rarity or localisation. A regularly occurring, locally significant population of a District important species. Sites / features scarce in the District or which appreciably enrich the District habitat resource.
Local	**Habitats** Areas of habitat that enrich the local habitat resource or have been identified for designation at this level, i.e. Local Authority Nature Reserve (LANR). Sites that retain other elements of semi-natural vegetation that, due to their size, quality or distribution, are not considered for above classifications.
	Species Populations / assemblages of species that appreciably enrich the biodiversity resource within the local context. Site supporting populations of county / district important species that are not threatened or rare in the region or county and are not integral to maintaining those populations.
Immediate vicinity of the proposed scheme only	Habitats and species of limited ecological importance due to their size, composition or other factors.

Evaluation and description of impacts

3.4.84 The evaluation and description of impacts will involve consideration of:

- Magnitude, i.e. the size of an impact in quantitative terms where possible;
- Extent, i.e. the area over which an impact may occur;
- Duration, i.e. the time for which an impact is expected to last;

- Reversibility, i.e. a permanent impact is one that is irreversible within a reasonable timescale or for which there is no reasonable chance of action being taken to reverse it; a temporary impact is one from which short-term recovery is possible;

- Timing and frequency, i.e. whether impacts occur during critical seasons or life-stages; and

- Direct, indirect and cumulative impacts.

3.4.85 In accordance with IEEM (2006), confidence levels for the identified impacts and their consequent effects will be defined as follows:

- Certain / near-certain: probability estimated at 95% chance or higher.

- Probable: probability estimated above 50% but below 95%.

- Unlikely: probability estimated above 5% but less than 50%.

- Extremely unlikely: probability estimated at less than 5%.

3.4.86 Identification of likely significant effects will be based on the IEEM definition of a significant impact, as an impact (positive or negative) on the integrity of a defined site or ecosystem and / or the conservation status of habitats or species within a given geographic scale.

3.5 Geology and soils

3.5.1 The A5WTC ES 2010 reported a number of studies, focused on sites of geological interest, contaminated land, and background greenfield conditions to determine whether or not soils would be suitable for re-use within the works.

3.5.2 They are studies, surveys and assessments which will need to be revisited in light of the time which has elapsed since the completion of the A5WTC ES 2010.

3.5.3 The ES for the proposed scheme will accordingly include the findings of the following updated or new studies and assessments:

- impacts on statutory and non-statutory sites designated for their geological value;

- risks associated with contaminated land in the vicinity of the proposed scheme; and

- an assessment of background greenfield conditions to determine whether or not soils would be suitable for re-use within the works.

3.5.4 The assessments will be primarily informed by the guidance in Section 3, Part 11 of Volume 11 of the DMRB – Geology and Soils.

3.5.5 Further studies will involve a review of current data to verify the status of sites which have been previously considered and any new sites that may have emerged. Reference will be made to the following data sources:

- current and historical, geological and hydrogeological mapping;
- aerial photography;
- datasets held by the Geological Survey of Northern Ireland and the Geological Survey of Ireland;
- datasets held by NIEA;
- datasets held by the Northern Ireland Executive and Local Authorities;
- datasets held by the Public Records Office;
- A5 Western Transport Corridor, Environmental Statement, Mouchel, November 2010;
- A5 Western Transport Corridor Section 1 Preliminary Sources Study, Mouchel, June 2009;
- A5 Western Transport Corridor Section 2 Preliminary Sources Study, Mouchel, June 2009;
- A5 Western Transport Corridor Section 3 Preliminary Sources Study, Mouchel, June 2009;
- A5 Western Transport Corridor Section 1 Factual Report on Ground Investigation, Phases 1-4, Glover Site Investigation Ltd, 2010;
- A5 Western Transport Corridor Section 2 Factual Report on Ground Investigation, Phases 1-4, Soil Mechanics Ltd, 2010;
- A5 Western Transport Corridor Section 3 Factual Report on Ground Investigation, Phases 1-4, Soil Mechanics Ltd, 2010;
- A5 Western Transport Corridor Section 1 Ground Investigation Report, Phases 1-4, Volumes 1-13, Mouchel, June 2012;
- A5 Western Transport Corridor Section 2 Ground Investigation Report, Phases 1-4, Volumes 1-10, Mouchel, June 2012;

- A5 Western Transport Corridor Section 3 Ground Investigation Report, Phases 1-4, Volumes 1-11, Mouchel, June 2012;

- A5 Western Transport Corridor Section 1 Ground Investigation Report Supplement, Phase 5, Arup Atkins, November 2013; and

- A5 Western Transport Corridor Section 3 Ground Investigation Report Supplement, Phase 5, Volumes 1-13, URS Halcrow, January 2014.

3.5.6 The information included in the A5WTC ES 2010 and gathered from the 2014 desk-based data studies will be reviewed and the impacts and proposed mitigation previously identified will be reassessed and either confirmed or modified in light of the current information and currently proposed scheme.

3.5.7 Any material proposed for re-use within the scheme will be subject to chemical testing to determine it suitability prior to re-use. Any materials to be imported to the scheme will also be subject to chemical testing to ensure materials imported are suitable to use in such a scheme.

3.6 Noise and vibration

3.6.1 The A5WTC ES 2010 reported a number of studies, site surveys and assessments focused on impacts associated with noise and vibration during construction and traffic-related noise and vibration during use of the road.

3.6.2 They are studies, surveys and assessments which will need to be revisited in light of the time which has elapsed since the completion of the A5WTC ES 2010, changes to the anticipated construction period and changes in predicted traffic flows.

3.6.3 The ES for the proposed scheme will accordingly include the findings of the following updated or new studies and assessments:

- construction-related noise and vibration associated with working areas and compounds;

- construction-related noise and vibration associated with delivery and removal of materials, and movement of machinery and plant to and from the working areas and compounds;

- traffic-related noise and vibration associated with use of the proposed scheme and wider road network once it is open to use; and

- noise nuisance associated with use of the proposed scheme and wider road network once it is open to use.

3.6.4 The conduct and presentation of the studies and assessments will be informed by the guidance provided in the Section 3 Part 7 of Volume 11 of the DMRB – HD213/11 Noise and Vibration and will involve:

3.6.5 Receptors considered will comprise occupiers and users of residential dwellings, schools, churches, hospitals, community facilities, children's nurseries and care homes.

3.6.6 A programme of day and night time monitoring surveys will be undertaken to establish an understanding of the existing noise environment and inform the conduct of the assessment relating to construction and operational noise. The surveys will be undertaken in accordance with the guidance provided in British Standard (BS) 7445:2003 'Description and Measurement of Environmental Noise'.

3.6.7 Consultations will be undertaken with officers of the Environmental Health departments at Derry City Council, Strabane District Council, Omagh District Council, and Dungannon and South Tyrone Borough council in relation to:

- protocols and methodologies pertinent to the assessment;
- the identification of any reported instances of noise nuisance within the assessment study area; and
- noise policies currently adopted by the authorities.

Construction-related noise associated with working areas and compounds

3.6.8 The study area for the assessment relating to working areas and compounds will extend 600m from the boundary of the working areas and compounds. The studies and assessment will involve:

- identification and quantification of noise sensitive receptors located within the study area. Numbers of receptors will be quantified for distances up to 50m, between 50-100m, between 100-300m and between 300-600m from the boundary of the working areas and compounds;
- identification and description of areas where the nature of the construction activities would be likely to involve higher orders of noise, such as construction compounds and major structures (hot spots); liaisons with the engineering design team and the contractor advisors to RS to agree combinations of operating construction plant to represent principal noise generating activities at hot spots and representative locations for sections of the working areas beyond the hotspots;
- liaison with the engineering design team and the contractor advisors to RS to agree the anticipated frequency and duration of the principal noise generating activities;

- calculation of predicted construction-related noise based on the agreed combinations of operating construction plant, and production of noise contour plans where appropriate for the hot spots and other representative locations;

- prediction of individual noise levels for sensitive dwellings within 50m of working areas and compounds;

- a preliminary evaluation of indicative construction-related noise limits in the vicinity of the hot spots and representative locations based on the application of the ABC and/or +5dB(A) methods in BS 5228 'Code of Practice for Noise and Vibration Control on Construction and Open Sites' (the method which provides the most protection to sensitive receptors will be applied); and

- identification of mitigation as appropriate taking into account likely noise levels, duration and frequency, and the indicative noise limits derived from the application of BS 5228.

Construction-related noise associated with access routes

3.6.9 The study area for the assessment will comprise a 600m buffer either side of sections of roads which it is anticipated will be used by the contractors for the delivery and removal of materials, and machinery and plant to and from the working areas and compounds during construction.

3.6.10 The assessment will involve identification of anticipated routes and quantification of likely construction-related vehicle movements, and duration and frequency for each of the routes based on information provided by the engineering design team and the contractor advisors to RS.

3.6.11 The increase in local noise due to construction traffic movements using site access roads will be calculated using the "haul road" method detailed in section F2.5 of Annex F of BS 5228 to predict a worst case 1 hour L_{Aeq}. The assessment will involve:

- calculation of pre-construction traffic noise levels on the identified roads using 2013-2014 base traffic flow data;

- calculation of the traffic noise levels during construction using the 2013-2014 base traffic flow data and the construction phase Heavy Goods Vehicles (HGVs) forecasts; and

- comparison of the predicted levels prior to and during construction to establish anticipated changes in traffic related noise.

3.6.12 Noise contour plans will be produced to illustrate the extent of the identified change in levels. Predicted individual noise levels for sensitive dwellings within 50m of the identified access routes will also be reported.

3.6.13 Many of the access routes are small country roads which do not appear within the baseline traffic flow data. Where this occurs, expected noise levels due to HGV movements alone will be calculated, and compared with monitored L_{Aeq} values where available.

Traffic-related noise during use - daytime

3.6.14 The study area for the assessment will be established in accordance with the guidance provided in the DMRB guidance as described below:

i. Identify the start and end points of the physical works associated with the road project.

ii. Identify the existing routes that are being bypassed or improved, and any proposed new routes, between the start and end points.

iii. Define a boundary 1km from the carriageway edge of the routes identified in (ii) above.

iv. Define a boundary 600m from the carriageway edge around each of the routes identified in (ii) above and also 600m from any other affected routes within the boundary defined in (iii) above. The total area within these 600m boundaries is termed the 'calculation area'. An affected route is where there is the possibility of a change of 1dB $L_{A10,18h}$ or more in the short-term (year of opening) or 3 dB $L_{A10,18h}$ or more in the long-term (within 15 years after opening).

v. Identify any affected routes beyond the boundary defined in (iii) above.

vi. Define a boundary 50m from the carriageway edge of the routes identified in (v) above.

3.6.15 Affected routes will be identified by way of a review of the predicted DM and DS traffic forecasts for the proposed scheme for the short-term and long-term. An increase in flow of 25% or reduction of 20% in annual average weekly traffic (AAWT) 18-Hour (06:00 to 24:00 hours) is indicative of a 1dB $L_{A10,18h}$ increase or reduction in levels in the short-term. An increase of 100% or reduction of 50% is indicative of a 3dB $L_{A10,18h}$ increase or reduction in levels in the long-term.

3.6.16 The location and number of receptors within the assessment study area will be identified using NI Pointer data and Geographical Information System (GIS) ESRI ArcGIS 9.3 software.

3.6.17 Calculation of the predicted traffic-related noise levels within the study area will involve the use of NoiseMap Server Edition, a 3-D computer modelling software package which accurately follows the methodology contained within The Calculation of Road Traffic Noise (CRTN), published in 1988 and the advice contained in ANNEX 4,

HD213/11 – Revision 1, Section 3, Part 7, Volume11 DMRB.. Input data for the model which will be constructed using the software will include:

- affected road links;
- OSNI base mapping in DXF format;
- OS Landform Profile contours in DWG format;
- receptor locations in the form of Address Layer 2 Pointer data, giving building type information, in shape file format;
- AAWT for affected roads, broken down into flows for the following categories: Light vehicles including cars, car-based vans and LGVs with an unladen weight of 3.5 tonnes or less, and HGVs with an unladen weight of greater than 3.5 tonnes;
- the annual average speed of vehicles using each link;
- road type and road surface material[4];
- groundcover; and
- the distance from relevant receptors to each section of road included in the study area.

3.6.18 The assessment scenarios for calculating traffic-related noise levels will comprise:

- DM in the anticipated opening year for Phase 1;
- DS in the anticipated opening year for Phase 1;
- DM in the anticipated opening year for Phase 2;
- DS in the anticipated opening year for Phase 2;
- DM in the opening year for the fully completed scheme;
- DS in the opening year for the fully completed scheme;
- DM in the future assessment year for the fully completed scheme; and

[4] Road surfacing is assumed as Hot Rolled Asphalt (HRA) where no Low Noise Surfacing (LNS) is installed, with a CRTN correction of 0. Where LNS has been applied, a correction of -3.5dB has been applied. All existing roads are assumed to be HRA surfaced.

- DS in the future assessment year for the fully completed scheme.

3.6.19 Comparison will be made between the DM and DS scenario in the opening year for the completed scheme to evaluate the short-term impact of the proposed scheme in its fully completed form. TheDM scenario will be based on traffic data reflecting forecast growth from the baseline survey years of 2013-2014 without any allowance for the effect that the phased opening of the proposed scheme is anticipated to have on flows.

3.6.20 Comparison will be made between the DM scenario in the opening year for the fully completed scheme and the DS scenario in the future assessment year for the completed scheme to evaluate the long-term impact of the proposed scheme in its fully completed form. The DM scenario will be based on traffic data reflecting forecast growth from the baseline survey years of 2013 / 2014 without any allowance for the effect that the phased opening of the proposed scheme is anticipated to have on flows.

3.6.21 Comparison will also be made between the DM and DS scenarios in the opening years for each phase to provide an understanding of impacts potentially associated with the proposed prolonged construction period.

3.6.22 The DM scenario for the opening year of phases 1 and 2 will be based on traffic data reflecting forecast growth in the network between the baseline survey years of 2013-2014 and the relevant opening years for each phase.

3.6.23 Subject to the findings of the comparisons, consideration will be given to the inclusion of mitigation measures such as low noise surfacing and / or environmental barriers in the form of noise fences and earth bunds.

3.6.24 The magnitude of impact for short-term and long-term changes, allowing for mitigation, will be those defined in the DMRB guidance as scheduled in Table 10 below.

Table 10: Magnitude of impacts

Noise level change ($LA_{10,18h}$ dB) – for short term noise impacts	Noise level change ($LA_{10,18h}$ dB) – for long term noise impacts	Magnitude of impact
0	0	No change
0.1-0.9	0.1-2.9	Negligible
1.0-2.9	3.0-4.9	Minor
3.0-4.9	5.0-9.9	Moderate
5.0+	10.0+	Major

Traffic-related noise during use – night time

3.6.25 In accordance with the guidance in the DMRB guidance, the assessment for traffic-related noise during night time will be focused on long-term impacts provided it is predicted that $L_{night,outside}$ levels will be greater than 55dB in any scenario. The

assessment will accordingly be focused where it is anticipated that there is likely to be a change of 3dB $L_{night,outside}$ by virtue of the proposed scheme resulting in a doubling or halving of volumes of traffic using sections of road within the parts of the road network likely to be affected.

Traffic-related noise during use – nuisance

3.6.26 The study area for the assessment of noise related-nuisance will be that used for the assessment of increase and reductions in traffic-related noise during operation. The nuisance assessment will be conducted in terms of the percentage of the population as a whole that is bothered “very much” or "quite a lot" by virtue of a specific traffic-related noise level. The correlation between specific levels and the percentage population bothered for the purposes of the assessment has been developed from research studies / questionnaire surveys (a summary of which is provided in Section 3, Part 7 of Volume 11 of the DMRB) which have been focused on reported nuisance where traffic-related noise has remained steady over a relatively long period of time and also where.

Construction-related vibration

3.6.27 The assessment will involve:

- identification of areas where piling, ground stabilisation, demolition, blasting or extended periods of breaking out of hard ground may be required;
- description of sensitive receptors and their proximity to the identified areas; and
- description of the approach to mitigation for the identified locations of potential risk.

Traffic-related vibration during use

3.6.28 DMRB notes a correlation between the percentage of people bothered by vibration nuisance and the $L_{A10,18hr}$ statistical noise parameter experienced due to traffic noise. The correlation indicates that for a given level of noise exposure the percentage of people bothered “very much” or “quite a lot” by vibration is 10% lower than the corresponding figure for noise nuisance. Where noise levels are below 58dB $LA_{10,18hr}$, it can be assumed that the percentage of people bothered by vibration tends towards zero.

3.6.29 The assessment of the operational airborne vibration undertaken has been informed by the guidelines provided in the DMRB and is limited to a corridor 40m wide[5] on either side of the carriageway boundary.

3.7 Effects on all travellers

3.7.1 The A5WTC ES 2010 reported a number of studies, site surveys and assessments focused on impacts associated with increased and reduced severance for users of local roads, long distance footpaths, national cycle routes, local footpaths and scenic driving routes.

3.7.2 They are studies, surveys and assessments which will need to be revisited in light of the time which has elapsed since the completion of the A5WTC ES 2010.

3.7.3 The ES for the currently proposed scheme will accordingly include the findings of the following updated studies, surveys and assessments:

- impacts on users of long distance footpaths, local footpaths, local roads, national cycle routes and scenic driving routes;
- evaluation of driver stress relative to the existing A5 and the proposed A5WTC; and
- drivers' experience in terms of the view from the road which would be available for users of the Proposed Scheme.

3.7.4 The assessments for severance and impacts on amenity for users of Public Rights of Way (ProW), local roads, local footpaths, long distance cycleways and scenic driving routes will be informed by the guidance provided in Chapter 6 of Section 3 Part 8 of Volume 11 of the DMRB – Pedestrians, Cyclists, Equestrians and Community Effects. The assessments for driver stress and views from the road will be informed by the guidance provided in Chapter 4 of Section 3 Part 9 of Volume 11 of the DMRB – Vehicle Travellers.

Impacts on users of footpaths, local roads, national cycle routes and scenic driving routes

3.7.5 The assessments will include all roads which are scheduled for stopping up as part of the proposed scheme. Public Rights of Way (ProW) long distance footpaths, bridleways, long distance cycle routes and scenic driving routes identified as being affected by the currently proposed scheme comprise:

[5] The study area is limited to 40m as a result of the limitations of the empirical methodology of the studies into airborne vibration informing the DMRB methodology.

- The Ulster Way;
- a footpath between Bessy Bell and the Strule River which is coincident with Ulster Way;
- a circular riverside walk with access off Lifford Road to existing jetties on the eastern bank of the River Foyle;
- a walk from the junction of Urney Road and Finn View in Strabane along Finn View and the crest of the flood defences following the eastern and southern banks of the Rivers Finn and Mourne;
- National Cycle Routes (NCRs) 92, 93 and 95;
- Sperrins Cycle Route 6;
- Central Sperrins Scenic Driving Route; and
- South Sperrins Scenic Driving Route.

3.7.6 The studies and assessments for the ES for the currently proposed scheme will involve a review of:

- the findings of the assessments reported in the A5WTC ES 2010;
- further consultation with Derry City Council, Strabane District Council, Omagh District Council and Dungannon and South Tyrone Borough Council to identify any new data relative to them and any information relating to new or proposed facilities that may have become available since the publication of the A5WTC ES 2010.
- a review of side road assessments and completed as part of the development of the transportation model for the proposed scheme.

3.7.7 The updated assessments will involve:

- review and update of the location of the principal communal facilities in the vicinity of the existing A5 corridor and the proposed scheme, with reference to the A5WTC ES 2010;
- review and update of PRoW, local roads, local footpaths, long distance cycleways and scenic driving routes potentially affected by the proposed scheme, with reference to the A5WTC ES 2010, and consultation with planning authorities and bodies representing NMUs;
- estimation of changes in distance travelled and travel time for diverted routes;

- evaluation of the level of new severance based on combinations of criteria related to vehicle flows on new sections of road, the form of crossing provided and increases in journey length as detailed in Chapter 6 of Section 3, Part 8 of Volume 11 of the DMRB and replicated in Table 11 below;

- evaluation of the level of relief from severance based on consideration of the percentage reduction in traffic flows on existing roads as detailed in Chapter 7 of Section 3, Part 8 of Volume 11 of the DMRB; and replicated in Table 12 below; and

- description of changes in amenity associated with the identified routes.

Table 11: New severance impact ratings

Severance	Criteria
Slight	• pedestrian at-grade crossing of a new road carrying below 8,000 vehicles per day (AADT); • or a new bridge would need to be climbed or a subway traversed; • or journeys would be increased by 250m.
Moderate	• two or more of the hindrances set out under 'slight' applying to single trips; • or pedestrian at-grade crossing of a new road carrying 8,000-16,000 vehicles per day (AADT) in the opening year; or • journeys would be increased by 250-500m.
Severe	• pedestrian at-grade crossing of a new road carrying over 16,000 vehicles per day (AADT) in the opening year; • or journeys would be increased by over 500m; • or three or more of the hindrances set out under 'slight' or two or more set out under 'moderate'.

Table 12: Relief from existing severance impact ratings

	Level of relief from severance **Percentage reduction in existing traffic levels**		
	Slight	**Moderate**	**Substantial**
Built-up area	c. 30%	30-60%	60%+
Rural area	60-75%	75-90%	90%+

3.7.8 The information included in the A5WTC ES 2010 will be reviewed and the impacts previously identified will be reassessed and either confirmed or modified in light of the current information and currently proposed scheme.

Driver stress

3.7.9 Evaluation of driver stress for sections of the existing A5 and the proposed scheme will be based on consideration of the following factors:

- traffic flows;
- journey speed;
- frustration - the inability to drive at a speed consistent with the driver's wishes in relation to the general standard of the road;
- fear - the potential for accidents due to the presence of other vehicles, poor road standards and the possibility of pedestrians stepping into the road; and
- uncertainty - primarily due to signing that is inadequate for the driver's purpose.

3.7.10 In relation to traffic flows and journey speed, Tables 2 and 3 of Chapter 4 of Section 3, Part 9 of Volume 11 of the DMRB provide indicative driver stress levels based on the average hourly flow per lane and average journey speed for dual carriageways and single carriageways respectively. Tables 13 and 14 below detail the guidance provided in the tables in the DMRB. The existing road is a single carriageway, whilst, with the exception of short lengths at each end, the proposed scheme will be a dual carriageway.

Table 13: Levels of stress for dual carriageway roads

Average hourly flow per lane (flow units / 1 hour)	**Average journey speed (km/hr)**		
	Under 60	**60 – 80**	**Over 80**
Under 600	High*	Moderate	Low
600-800	High	Moderate	Moderate
Over 800	High	High	High

Table 14: Levels of stress for single carriageway roads

Average hourly flow per lane (flow units / 1 hour)	**Average journey speed (km/hr)**		
	Under 50	**50 – 70**	**Over 70**
Under 600	High*	Moderate	Low
600-800	High	Moderate	Moderate
Over 800	High	High	High

*Moderate in urban areas

3.8 Community and private assets

3.8.1 The A5WTC ES 2010 reported a number of studies, site surveys and assessments focused on impacts associated with impacts on private property and associated land, property and land used by communities, land where development has been consented, agricultural land quality and farms.

3.8.2 They are studies, surveys and assessments which will need to be revisited in light of the time which has elapsed since the completion of the A5WTC ES 2010.

3.8.3 The ES for the currently proposed scheme will accordingly include the findings of the following updated studies, surveys and assessments:

- an assessment of impacts on private property and associated land;
- an assessment of impacts on property and land used by the community;
- an assessment of impacts on development land – that being land where development consent has been approved but implementation is incomplete or has not been progressed;
- an assessment of impacts on agricultural land relative to land quality; and
- an assessment of impacts on individual farms.

3.8.4 The conduct and presentation of the assessments will be informed by the guidance provided in Section 3, Part 6 of Volume 11 of the DMRB – Land Use.

Non-agricultural land use and planning applications

3.8.5 The assessments will involve quantification and description of properties in private and public ownership which will be subject to demolition and of land associated with land uses other than agricultural use which will be taken to facilitate implementation of the proposed scheme.

3.8.6 They will also involve consideration of the extent to which the proposed scheme will affect future implementation of planning applications which have been approved but where implementation of the consent on the approved site has not been progressed. Application sites identified will be screened in light of the scale and nature of the proposed development to determine those sites which are to be considered. The results of the screening exercise will be reported in an Appendix to the Community and Private Assets chapter of the ES.

3.8.7 Establishment of the baseline environment will involve reference to the following data sources:

- A5 Western Transport Corridor, Environmental Statement, Mouchel, November 2010;
- Land Registry records from Land and Property Services;
- The Derry Area Plan 2011;
- Dungannon and South Tyrone Area Plan 2010;
- Omagh Area Plan 1987-2002;
- Strabane Area Plan 1986-2001; and
- information relating to approved and current planning applications via the Northern and Western regional offices of the PLGG.

3.8.8 Reference will be made to records of landowner meetings, consultations with officers of the Omagh and Londonderry regional offices of the Planning Service, and with Strabane District Council undertaken during the preparation of the A5WTC ES 2010.

3.8.9 Site surveys will be undertaken to confirm any changes in land use and the status of approved planning applications where implementation is being progressed but remains incomplete.

3.8.10 Further consultation will be undertaken with the Northern and Western regional offices of the PLGG to confirm the status of planned changes in land use and the status of approved planning applications which have not proceeded to implementation.

3.8.11 The identification of impacts will involve an overlaying of the permanent and temporary land take required for the construction of the proposed scheme to inform:

- the quantification of land which will be lost relative to existing land use and the function of the land that will be taken relative to the existing use;
- the description and quantification of impacts associated with the fragmentation / severance of the land use sites identified; and
- the description of impacts related to the proximity of the proposed scheme to an existing land use where amenity value of the environmental context is integral to the use.

3.8.12 Consultations will then be undertaken with landowners and / or parties responsible for operating existing land uses and currently consented planning applications. The consultations will be focused on establishing a clear understanding of the likely impacts relative to the magnitude of loss of property and land take, severance and fragmentation, likely changes in functional effectiveness, employment implications and

impacts on user experience. The consultations will involve consideration of potential mitigation measures.

3.8.13 Predicted impacts post mitigation will then be categorised using the ratings defined in Table 15.

Table 15: Impact ratings and assessment criteria for non-agricultural land use

Impact rating	Criteria
Negligible	• a barely discernable impact on use or amenity value.
Slight Adverse	• landtake peripheral to existing or intended use; • activity that temporarily compromises or precludes use; and • loss of amenity that does not compromise use or intended use.
Moderate Adverse	• landtake that compromises but does not preclude existing or intended use; • activity that compromises or precludes use for a protracted period; and • loss of amenity that compromises but does not preclude use or intended use.
Substantial Adverse	• landtake that precludes existing or intended use; • activity that permanently compromises or precludes use; and • loss of amenity that precludes use or intended use.

Agricultural land quality

3.8.14 The assessment of impacts relative to agricultural land quality will involve a review of land classification data provided by the DARD. The extent of land which will be taken relative to each grade in the classification will be quantified.

3.8.15 The impact will be described relative to the loss of grades 1, 2 and 3a representing land of higher quality. The total of the higher quality land which will be taken will be compared to the total extent to higher quality land in Northern Ireland and the combined totals in Derry / Londonderry and Tyrone to represent the regional context. The information will then be considered by the land use assessment team to determine if the loss at either level is considered to constitute a significant environmental effect relative to the EIA Directive and Regulations.

Impact on farms

3.8.16 The assessment relating to individual farms will involve the following tasks:

- identification of farms which will be affected by the loss, severance or fragmentation of agricultural land by virtue of the implementation of the proposed scheme;

- collection of data relevant to the status of the identified farms with reference to the total area of land farmed and nature of the farming activities undertaken;
- identification of predicted land take, fragmentation and severance;
- site-based meetings with landowners, with the exception of landowners where there will be no severance and the land take is small and along field boundaries;
- a review of design and mitigation measures taking into account preliminary impacts associated with land take / severance and further information gathered during site based meetings; and
- finalisation of impact ratings for all agricultural holdings.

3.8.17 Impact ratings for the farms included in the assessment will be based on the criteria described in Table 16.

Table 16: Impact ratings

Rating	Description
Minor adverse	• An inconsequential land take or minimal loss of agricultural production, relative to overall scale of the farm. • Insignificant severance or disruption to the present farm management routine, and infrastructure. • Insignificant impact on present farm output. • Little or no impact on overall operational viability of the farm.
Moderate Adverse	• Small to moderate land take relative to overall scale of the farm. • Small to moderate severance or disruption to the present farm management routine, and infrastructure. • Small to moderate impact on present farm output, arising from additional inputs associated with farming retained lands. • Moderate impact on overall operational viability of the farm.
Substantial Adverse	• A substantial Land take relative to overall scale of the farm. • Substantial severance or disruption of the present day to day management routine, and infrastructure • Significant impact on overall farm viability. • Significantly impact on farm output, arising from additional inputs associated with farming retained lands.

3.9 Road drainage and water environment

3.9.1 The A5WTC ES 2010 reported a number of studies, site surveys and assessments focused on impacts on surface water, groundwater and floodplains.

3.9.2 They are studies, surveys and assessment which will need to be revisited in light of the time which has elapsed since the completion of the 2010 ES, intended modifications to the drainage proposals, changes to the anticipated construction period and changes in predicted traffic flows.

3.9.3 The ES for the proposed scheme will accordingly include updated or new studies and assessments relative to the three aspects of the water environment.

3.9.4 The conduct and presentation of the assessments will be informed by the guidance provided in Section 3, Part 10 of Volume 11 of the DMRB – HD 45/09 Road Drainage and the Water Environment.

3.9.5 A catchment-based approach has been employed for the RDWE ES Chapter, taking account of locations adjacent to and downstream of the scheme which could be impacted by this development.

3.9.6 The criteria adopted for the assessments will comprise consideration of the importance of the surface water potentially affected as defined in Table 4.3 in HD45/09 and replicated in Table 18 and the magnitude of impact as defined in Table 4.4 in HD/09 and replicated in Table 19. The significance of the effect will be based on consideration of the two criteria as indicated in Table 4.5 of HD45/09 and replicated in Table 20.

Surface water

Construction related pollution

3.9.7 The A5WTC ES 2010 reported assessments undertaken relative to pollution of surface water which may arise as a result of the release of sediments and suspended solids and accidental spillage of pollutants such as oil, fuel and concrete during construction.

3.9.8 The ES for the currently proposed scheme will include assessments addressing these issues and will involve:

- a review of the currently proposed scheme to identify any changes relative to working areas and surface waters ;
- a review of the proposed construction activities, working methods and programming with the contractor advisors for RS.

3.9.9 The information included in the A5WTC ES 2010 and obtained through the reviews will be evaluated and the impacts and proposed mitigation previously identified will be

reassessed and either confirmed or modified in light of the current information and currently proposed scheme.

Pollution of surface water associated with routine runoff

3.9.10 Road-related runoff can contain pollutants, such as hydrocarbons (fuel and lubricants), fuel additives, metal from corrosion of vehicles, de-icer and gritting material which when washed off the road during rainfall events can pollute watercourses and water bodies which discharged to at outfalls.

3.9.11 The A5WTC reported the findings of studies and assessments undertaken relative to run-off where the drainage proposals for the proposed scheme involve discharges to watercourses. The ES for the currently proposed scheme will report the findings of new assessments for proposed discharges. These will be informed by updated traffic information for the currently proposed scheme and modified drainage proposals which are currently being developed.

3.9.12 Each discharge will be subject to:

- A Highways Agency Water Risk Assessment Tool (HAWRAT) assessment – HAWRAT is a Microsoft Excel application designed to assess the short-term risks related to the intermittent nature of road runoff. It assesses the acute and chronic pollution impacts on aquatic ecology associated with soluble and sediment bound pollutants respectively. The assessment follows a phased approach, estimating pollutant concentrations in raw road runoff, in-river after dilution and dispersion but without active mitigation, and finally with active mitigation.

- An Environmental Quality Standards (EQS) assessment – EQS are the maximum permissible annual average concentrations of potentially hazardous chemicals, as defined under the WFD. The long-term risks over the period of one year are assessed through comparison of the annual average concentration of pollutants discharged with the published EQS for those pollutants.

- A sediment assessment – the sediment assessment comprises two elements, firstly a calculation of the total suspended solids (TSS) concentration discharged from each road drainage outfall at the 'end of pipe' and secondly the annual average concentration of TSS in the receiving watercourses as a result of the road drainage discharges.

3.9.13 Flow data for the receiving watercourses will be collated from the National River Flow Archive (NRFA), where the watercourses are gauged. Flow data for the smaller watercourses which are not gauged will be derived from LowFlows software. Water quality data for the relevant watercourses will be collated from recent monitoring data collected by NIEA and LA. This will be supplemented by monitoring data collected by

Mouchel in 2013 and 2014. The WFD status will be collated from NIEA data available online. Information presented within the A5WTC ES 2010 will also be reviewed.

Hawrat assessments

3.9.14 The input data for the HAWRAT assessments will comprise:

- AADT volumes for each road drainage network, as provided by the A5WTC drainage design team, which will be derived from updated traffic models;
- use of rainfall datasets for the Carmoney rainfall site (8km north east of Londonderry/Derry) as embedded in the program;
- size of impermeable and permeable road areas drained in each road drainage network, as provided by the A5WTC drainage design team;
- Q95, the flow exceeded 95% of the time and baseflow index for each receiving watercourse, to be derived from the LowFlows software;
- water hardness for each receiving watercourse, to be derived from the baseline water quality monitoring data;
- data on whether the outfall locations are within 1km of a protected site, to be established from the baseline data collected;
- data on whether there are structures within 100m downstream of the outfall locations which could reduce flow velocity e.g. weirs, culvert or ponds, to be established from baseline data and site survey; and
- receiving watercourse dimensions (river width, bed width, side slope and long slope) and Manning's n (channel roughness coefficient) for each receiving watercourse, to be derived from site survey data.

EQS assessments

3.9.15 The EQS assessment will also use the above information to estimate the annual average concentrations of copper and zinc discharged from each outfall. These figures are then compared with the published EQS limits for these parameters.

TSS assessments

3.9.16 The first part of the sediment assessment will involve the calculation of the 'end of pipe' concentration of TSS at each outfall. Calculation parameters include the expected average raw TSS load from the road as derived from Highways Agency (HA) research, and the estimated treatment efficiency of any treatment systems included within each

road drainage network. The results will be evaluated against a 50mg/l TSS discharge limit, as agreed with the NIEA.

3.9.17 The second part of the sediment assessment will involve calculation of the median concentration of TSS in the receiving watercourses as a result of the road drainage discharges. This will take into account the baseline TSS concentration in the watercourses, as established from baseline water quality monitoring, and the expected TSS concentration in routine road runoff, based on average figures derived from HA research. Annual average runoff/flows for both the receiving watercourses and the road drainage networks will be estimated using the Standard Annual Average Rainfall (SAAR) as obtained from the Flood Estimation Handbook (FEH) and estimated catchment areas. The calculation of annual average river flow will also take into account potential evapotranspiration. The results for each outfall will be evaluated against an annual average sediment limit of 25mg/l TSS as per the previous Freshwater Fish Directive (FFD), now considered subsumed into the Water Framework Directive.. A limit of 10mg/l TSS will be applied for watercourses identified as having Atlantic Salmon spawning and/or nursery ground potential, in line with the JNCC Common Standards Monitoring Guidance, and as agreed with LA.

3.9.18 Should any of the assessments indicate outfalls will fail to meet the acceptance criteria, appropriate mitigation measures will be identified. The effectiveness of these measures at reducing the various pollutants will be determined based on updated DMRB guidance, due to be published in the near future and currently available in draft format. The relevant assessments will be re-run with these treatment efficiencies applied to confirm that adequate mitigation is proposed.

3.9.19 The above assessments will be carried out for each proposed road drainage outfall. Combined[6] assessments will also be carried out where multiple road drainage outfalls discharge to a single reach of a watercourse. Combined assessment is required for the soluble metal elements of HAWRAT where multiple outfalls are located within 1km of each other on a single reach of a watercourse i.e. where there is no significant change in the river flow between the outfall locations (such as would occur where a tributary joins the main watercourse). Combined assessment of the sediment elements of HAWRAT is required where the outfalls lie within 100m of each other on a single reach.

3.9.20 The proposed phasing of construction is likely to result in temporary variations in the traffic flows in discrete areas. It is possible these temporary flows may be greater than the final permanent flows, with a corresponding temporary increase in pollutant build-up rates in the affected road drainage networks. To ensure that the proposed scheme adequately treats the potential for temporary increases in traffic flows, the traffic data for each of the construction phases and the final design year will be compared and the highest flows for each network shall be used in the routine run off assessments.

[6] DMRB uses the term Cumulative Assessment, however, to avoid confusion with assessments of Cumulative Effects with other schemes.

3.9.21 The significance of the predicted operational construction pollution impacts will be evaluated using the criteria and ratings detailed in Tables 18, 19 and 20.

Pollution associated with operational accidental spillage

3.9.22 The DMRB document HA 45/09 specifies mandatory procedures for the assessment of pollution impacts from accidental spillage, known as Method D. The assessment takes the form of a risk assessment, where the risk is expressed as the annual probability of a serious pollution incident occurring. This risk is the product of two probabilities:

- The probability that an accident will occur, resulting in a serious spillage of a polluting substance on the carriageway; and
- The probability that, if such a spillage did occur, the polluting substance would reach the receiving watercourse and cause a serious pollution incident

3.9.23 The probability of a serious spillage occurring is dependent on a variety of factors: traffic volumes, percentage of heavy goods vehicles in the traffic volumes, whether the road is motorway, rural or urban trunk road, the road type categories within the road drainage network under assessment i.e. 'no junction', 'slip road', 'cross road' or 'roundabout', and the length of each road type within the network. The traffic data will be derived from updated traffic models, while the road type categories and length will be determined using the project GIS.

3.9.24 The probability of a serious spillage causing a serious pollution incident is dependent on the receiving waterbody type, i.e. surface water or groundwater, and the response time of the emergency services, i.e. less than 20 minutes, less than one hour or greater than one hour. The response times for each network will be determined based on the proximity of the nearest fire station and the travel time between, as determined from the traffic model.

3.9.25 Typically, an annual probability of 1% (i.e. a 1 in 100 chance of a serious pollution incident occurring in any one year) is considered an acceptable risk. However where a road drainage outfall discharges within 1km of a sensitive receptor, such as a protected conservation site, a higher level of protection is required such that the risk has an annual probability of 0.5% (i.e. a 1 in 200 chance of occurring in any one year).

3.9.26 The pollution risk will initially be assessed assuming there are no measures in place to mitigate the risk. Where the initial calculations indicate that the risk exceeds the annual probability threshold, potential pollution control measures will be considered and probabilities re-calculated taking into account proposed mitigation with appropriate risk reduction factors, as specified in HD 45/09 Method A's 3 step process.

3.9.27 As with the routine runoff assessment, the construction phasing may result in temporary increases in traffic flows, % HGVs and travel times for discrete networks.

The traffic data will be analysed and data selected that represents the worst case for the accidental spillage calculations.

3.9.28 The significance of the predicted operational pollution impacts will be evaluated using the criteria and ratings detailed in Tables 18, 19 and 20.

Changes in the geomorphological regime

3.9.29 Changes in the geomorphological regime, such as erosion, deposition and channel migration as a result of proposed watercourse diversions, culverts or bridges and outfall structures. A reduction in morphological diversity can subsequently impact on water quality and biodiversity.

3.9.30 The qualitative geomorphological assessment reported in the A5WTC ES 2010 will be reviewed and revised as necessary. The assessment will be carried out using data collated through desk studies and field surveys for the A5WTC ES 2010. Aerial photography and historic mapping have been studied for evidence of historic channel instability in the relevant river reaches. Field investigations have taken a river reconnaissance or fluvial audit approach, which identify channel morphology, bed and bank material, degree of vegetation, areas of erosion and deposition, historic channel change and land use.

3.9.31 From this baseline assessment a qualitative estimation will be made of how active the river is and the likely effect the development proposals (such as culverts, bridges, outfalls and watercourse realignments) may have on the existing geomorphology of the relevant watercourses.

3.9.32 The significance of the predicted construction impacts will be evaluated using the criteria and ratings detailed in Tables 18, 19 and 20.

Changes to the WFD status of water bodies

3.9.33 The WFD Assessment will be informed by the guidance provided in the NIEA document 'Carrying out a Water Framework Directive Assessment on EIA Developments' and through consultation with the NIEA Water Management Unit (WMU).

3.9.34 The potential impact on individual WFD water bodies and their component watercourse reaches, from the various components of the scheme that may interact with the waterbodies i.e. culverts, bridges, watercourse diversions and road drainage discharges, will be assessed in light of the following WFD objectives:

- To prevent deterioration in the ecological status of the water body;
- To prevent the introduction of impediments to the attainment of Good WFD status of the water body;

- To ensure that the attainment of the WFD objectives for the water body are not compromised; and

- To ensure the achievement of the WFD objectives in other water bodies within the same catchment are not permanently excluded or compromised.

3.9.35 The NIEA guidance advocates assessing the impact for each individual scheme component on the WFD status of the relevant waterbody separately; with a summary datasheet, detailing the assessment, produced for each individual scheme component. However, given the scale of the A5WTC scheme, the number of individual scheme components, and the likely repetition of baseline watercourse data where multiple scheme components are located within a single watercourse reach (as is often the case there may be a culvert, diversion and one or more outfalls at a single location), it is proposed that an alternative watercourse specific approach is used. This approach would involve taking an individual watercourse reach, identifying all the scheme components that will interact with that reach and assessing the overall impact that these will have on the reach. This approach is considered to better illustrate the combined impacts on the watercourse and overall WFD waterbody.

3.9.36 The assessment will involve identifying each watercourse reach the scheme will interact with and collating baseline data on their hydromorphological regime, water quality and WFD ecological status. The sources for this data will be as described for the routine runoff pollution assessment.

3.9.37 All scheme components impacting an individual watercourse reach will be identified and details provided e.g. for each culvert the culvert dimensions, gradient and type (such as box or pipe).

3.9.38 The impact on the watercourse reach from the scheme components will then be assessed against the relevant WFD classification elements e.g. fish, invertebrates, chemistry, hydromorphology, etc. The results of the various assessments described above will feed into this process. Where a scheme component is found to be not compliant with the WFD objectives, appropriate and design mitigation measures shall be employed to ensure the objectives are met.

3.9.39 The significance of the predicted construction pollution impacts will be evaluated using the criteria and ratings detailed in Tables 18, 19 and 20.

Groundwater

Construction related pollution

3.9.40 Assessment of the potential for pollution of groundwater / aquifers will involve a review of locations where cuttings or deep foundations are proposed which would be close to or potentially penetrate the water table, locations where there are permeable drift

deposits; and the proposed mitigation measures targeted at avoiding or minimising the risk of construction pollution.

3.9.41 The significance of the predicted construction pollution impacts will be evaluated using the criteria and ratings detailed in Tables 18, 19 and 20 below.

Pollution of groundwater associated with routine runoff

3.9.42 A groundwater routine runoff assessment is required where drainage proposals include either full or partial discharge to groundwaters via soakaways, infiltration basins or other sustainable drainage systems (SuDS) features with an infiltration component. Subject to finalisation of the detailed drainage proposals it is anticipated that such an assessment will be required for some 26 outfalls for which wetlands have been proposed.

3.9.43 The assessment comprises a risk assessment procedure informed by the source-pathway-receptor model, which is detailed in Method C of the DMRB document HD 45/09. A number of parameters are considered in turn and assigned a risk category as reproduced in Table 17 below.

Table 17: Groundwater routine runoff assessment parameters

	Weighting	Parameter	Low Risk (1)	Medium Risk (2)	High Risk (3)
Source	15	Traffic density	< 50,000 AADT	50,000 to <100,000 AADT	> 100,000 AADT
	15	Ann. Ave. Rainfall and intensity	< 740mm rainfall	740 – 1060 mm rainfall	> 1060 mm rainfall
Pathway	15	Soakaway geometry	Continuous linear (e.g. ditch, grassed channel)	Single point, or shallow soakaway (e.g. lagoon) serving low road area	Single point, deep serving high road area (>5,000m2)
	20	Unsaturated zone	Depth to water table >15m and unproductive strata	Depth to water table 5-15m	Depth to water table <5m
	20	Flow type	Unconsolidated or non-fractured consolidated deposits (i.e. dominantly intergranular flow)	Consolidated deposits (i.e. mixed fracture and intergranular flow)	Heavily consolidated sedimentary deposits, igneous and metamorphic rocks (dominated by fracture porosity)

	Weighting	Parameter	Low Risk (1)	Medium Risk (2)	High Risk (3)
	7.5	Effective grain size	Fine sand and below	Coarse sand	Very coarse sand and above
	7.5	Lithology	>15% clay minerals	1-5% clay minerals	<1% clay minerals

3.9.44 The parameter characteristics at each groundwater discharge location will be determined from the results of the traffic modelling, rainfall data from the Flood Estimation Handbook (FEH), geological and hydrogeological data available from the Geological Survey of Northern Ireland (GSNI), ground investigation data and the results of groundwater abstraction surveys and monitoring.

3.9.45 The risk of adverse impact at each of the proposed discharges will be determined by multiplying the risk factor attributed to each parameter by the weighting factor and adding the resultant scores to establish a total for the discharge. This has then been evaluated against the following risk ratings, as per the DMRB assessment procedure:

- Overall risk score < 150 – low risk of impact.
- Overall risk score 150-250 – medium risk of impact.
- Overall risk score > 250 – high risk of impact.

3.9.46 The significance of the predicted impacts of routine runoff to groundwater will be evaluated using the criteria and ratings detailed in Tables 18, 19 and 20. Mitigation will be proposed where a significant impact has been identified.

Pollution of groundwater related to accidental spillage

3.9.47 The groundwater accidental spillage assessment will be identical to that described above for surface water accidental spillage.

Groundwater drawdown related to deep cuttings

3.9.48 The groundwater drawdown assessment will comprise an assessment of the impact of road cuttings on groundwater flows and levels on the aquifers and abstractions in the vicinity of each of the cuttings.

3.9.49 To determine the likely impact of de-watering of cuttings on groundwater flows and levels the drawdown distance / area of influence will be calculated for each cutting. There is no published formula for the distance of influence from linear features such as

cuttings, therefore the empirical formula of Sichardt for calculating the radius of influence of groundwater abstractions will be used:

$$L = C(H-h)\sqrt{K}$$

where, L = distance / radius of influence, K = permeability, H-h = groundwater table drawdown i.e. penetration of the cutting beneath the water table and C = 2000, where C is a constant.

3.9.50 The permeability of the aquifer and existing groundwater levels will be estimated from available ground investigation data and the results of groundwater abstraction surveys and monitoring. To account for the uncertainties of the method described in 3.9.48-49 above, groundwater dependant receptors that are just outside the radius of influence will be included in the monitoring along with those identified as being likely to be impacted or possibly affected.

3.9.51 A qualitative assessment will then be made of the magnitude of the impact on the groundwater aquifer and nearby groundwater dependent receptors, such as private water supply boreholes and wetlands, identified through desk study and site survey. The proposed mitigation previously identified will be reassessed and either confirmed or modified in light of the current information. The significance of the predicted construction pollution impacts will be evaluated using the criteria and ratings detailed in Tables 18, 19 and 20.

Change in groundwater infiltration

3.9.52 The change in groundwater infiltration due to the impermeable surface of the carriageway will be assessed by considering the likely loss of rainfall infiltration and comparing this to the overall volume of abstractions for public and private water supplies in the vicinity of the proposed scheme. A qualitative assessment will then be made of the impact on the abstractions.

3.9.53 The significance of the predicted construction pollution impacts will be evaluated using the criteria and ratings detailed in Tables 18, 19 and 20.

Flood risk

3.9.54 A Flood Risk Assessment (FRA) will be carried out using methods informed by HD 45/09, Method E – Hydrological Assessment of Design Floods and Method F – Hydraulic Assessment. The FRA studies will be undertaken in accordance with PPS15: Planning and Flood Risk.

3.9.55 The objectives will be to:

- assess the risk to the development from all potential sources of flooding;

- assess the risk of increasing flooding elsewhere as a consequence of the development; and

- determine appropriate mitigation measures to limit the impact of flooding on the development and off-site flooding due to increased runoff. The use of sustainable drainage techniques and the use of floodplain connectors shall be discussed in the ES submission.

3.9.56 The results of the FRA will be reported separately in a standalone document, however the findings will be summarised in the ES.

Impact assessment criteria

3.9.57 The criteria relating to the importance of surface water, groundwater and floodplains is that described in Table 18 below.

Table 18: Importance criteria

Importance	Criteria
Very High	• Large or medium watercourses with pristine / near pristine water quality. • High WFD Overall Status Watercourses. • Watercourse supporting major/critical public water supplies. • Designated Salmonid fisheries. • Sites protected under EU or UK wildlife legislation (SAC, SPA, Ramsar, ASSI sites). • Water dependent ecosystems of international/national biodiversity value. • Watercourses supporting a wide range of significant species and habitats sensitive to changes in suspended sediment concentrations and turbidity such as salmon or freshwater pearl mussels. • Watercourses with diverse morphological features such as pools and riffles. • Dynamic watercourses showing evidence of channel migration and other morphological changes such as bar evolution. • Watercourses or floodplains, with direct flood risk to adjacent populated areas and/or presence of critical infrastructure such as schools and hospitals etc, which are highly sensitive to increased flood risk by the possible increase in water levels. • Watercourses or floodplains that provide critical flood alleviation benefits. • Principal groundwater aquifer supporting public water supply. • Good WFD Overall Status Groundwaters.

High	• Medium or small watercourses with minor degradation of water quality as a result of anthropogenic factors. • Good WFD Overall Status Watercourses. • Watercourses supporting minor/non-critical public drinking water supplies. • Designated Cyprinid fisheries with imperative and guideline limit passes. • Water dependent ecosystems of regional / county biodiversity value. • Watercourses supporting some species and habitats sensitive to changes in suspended sediment concentrations and turbidity. • Watercourses with some morphological features such as pools and riffles. • Watercourses showing some evidence of historic channel migration and other morphological changes. • Watercourses or floodplains, with a possibility of direct flood risk to less populated areas without critical infrastructure, which are sensitive to increased flood risk by the possible increase in water levels. • Watercourses or floodplains that provide significant flood alleviation benefits. • Principal groundwater aquifer supporting private water supply or secondary groundwater aquifer supporting public/private water supply. • Good WFD Overall Status Groundwaters.
Medium	• Small watercourses with degradation of water quality as a result of anthropogenic factors. • Moderate WFD Overall Status Watercourses. • Watercourses supporting private drinking water supplies or for agricultural / industrial use. • Designated Cyprinid fisheries with imperative limit passes but guideline limit failures. • Water dependent ecosystems of county/district biodiversity value. • Watercourses supporting limited species and habitats sensitive to changes in suspended sediment concentrations and turbidity. • Watercourses with limited morphological diversity. • Watercourses showing limited evidence of historic channel migration and other morphological changes. • Watercourses or floodplains, with a possibility of direct flood risk to high value agricultural areas, which are moderately sensitive to increased flood risk by the possible increase in water levels. • Watercourses or floodplains that provide some flood alleviation benefits. • Principal / secondary A groundwater aquifer not currently supporting a drinking water supply. • Poor WFD Overall Status Groundwaters.

Low	• Small heavily modified watercourses or drains with poor water quality as a result of anthropogenic factors. • Poor / bad WFD Overall Status Watercourses. • Watercourses not supporting water abstractions. • Water dependent ecosystems of local/less than local biodiversity value. • Watercourses which do not support any significant species and habitats sensitive to changes in suspended sediment concentrations and turbidity. • Watercourses with no morphological diversity. • Watercourses showing no evidence of active fluvial processes and unlikely to be affected by modification to boundary conditions. • Watercourses or floodplains passing through low value agricultural areas, which are less sensitive to increased flood risk by the possible increase in water levels. • Watercourses or floodplains that provide limited flood alleviation benefits. • Secondary B aquifers / unproductive strata / no aquifers. • Poor WFD Overall Status Groundwaters.

3.9.58 The criteria relating to the magnitude of impacts on surface water, groundwater and floodplains is that described in Table 19 overleaf.

Table 19: Magnitude criteria

Magnitude	Criteria
Major Adverse	• High risk of pollution during construction, significant temporary or long-term change in water quality, resulting in a permanent change in WFD status. • Failure of both soluble and sediment bound pollutants in HAWRAT and EQS compliance failure. • Failure to meet both the 'end of pipe' and annual average sediment limits. • Risk of pollution from accidental spillage during operation > 2% annually. • Major change in geomorphological conditions ie major changes in sediment patterns due to deposition or erosion, major reduction in morphological diversity, or major interruption to fluvial processes such as channel planform evolution, all with significant consequences for ecological quality. • Major groundwater flow changes with significant consequences on nearby groundwater dependent habitats/abstractions. • Increase in the peak flood level of >100mm for the 1% annual probability (1 in 100 year) flood. • Significant increase in extent of flood risk areas as defined on the Rivers Agency (RA) strategic flood maps.
Moderate Adverse	• Moderate risk of pollution during construction, moderate temporary change in water quality, resulting in a temporary change of WFD status. • Failure of both soluble and sediment bound pollutants in HAWRAT but compliance with EQS limits. • Failure to meet the 'end of pipe' sediment limits but compliance with the annual average sediment limits. • Risk of pollution from accidental spillage during operation > 1% annually. • Moderate change in geomorphological conditions ie moderate changes in sediment patterns due to deposition or erosion, moderate changes in morphological diversity, or moderate interruption to fluvial processes such as channel planform evolution, all with moderate consequences for ecological quality. • Moderate groundwater flow changes with minor consequences on nearby groundwater dependent habitats/abstractions. • Increase in the peak flood level of >50mm for the 1% annual probability (1 in 100 year) flood. • Moderate increase in extent 3 flood risk areas as defined on the RA strategic flood maps.

Minor Adverse	• Minor risk of pollution during construction, relatively minor temporary changes in water quality such that ecology is temporarily affected. Equivalent to a temporary minor, but measurable, change within WFD status class. • Failure of either soluble and sediment bound pollutants in HAWRAT but compliance with EQS limits. • Failure to meet the annual average sediment limits but compliance with the 'end of pipe' sediment limits. • Risk of pollution from accidental spillage during operation > 0.5% annually. • Minor change in geomorphological conditions ie minor changes in sediment transport, minor changes in morphological diversity, or minor interruption to fluvial processes such as channel planform evolution, all with minimal impact on ecological quality. Any changes are likely to be highly localised. • Minor groundwater flow changes with minimal impact on nearby groundwater dependent habitats / abstractions. • Increase in the peak flood level of >10mm for the 1% annual probability (1 in 100 year) flood. • Minor increase in extent of flood risk areas as defined on the RA strategic flood maps, magnitude of change similar to the errors associated with the estimate of the extent.
Negligible	• Negligible risk of pollution during construction, very slight temporary change in water quality with no discernible effect on watercourse ecology. • All elements of HAWRAT and EQS assessments passed. • Both 'end of pipe' and annual average sediment limits met. • Risk of pollution from accidental spillage during operation <0.5% annually. • Negligible change in geomorphological conditions ie No discernible changes in sediment patterns, negligible changes in morphological diversity, no change to fluvial processes, all with no discernible impact on ecological quality. Any changes are likely to be highly localised. • Negligible groundwater flow changes with no discernible impact on nearby groundwater dependent habitats/abstractions. • Increase in the peak flood level of <10mm for the 1% annual probability (1 in 100 year) flood. • No discernible increase in extent of flood risk areas, as defined on the RA strategic flood maps, the magnitude of change being much less than errors associated with the estimate of the extent.

3.9.59 Impact significance ratings which wil be adopted are indicted in Table 20 below.

Table 20: Impact significance matrix

Importance of waterbody	Magnitude of impact			
	Major	**Moderate**	**Minor**	**Negligible**
Very high	Very large	Large / Very large	Moderate / Large	Neutral
High	Large / Very large	Moderate / Large	Slight / Moderate	Neutral
Medium	Large	Moderate	Slight	Neutral
Low	Slight / Moderate	Slight	Neutral	Neutral

3.10 Cumulative effects

3.10.1 The ES for the currently proposed scheme will include assessments focused on cumulative effects. These will relate to a combination of impacts on a particular receptor associated with the proposed scheme, or a combination of impacts associated with the proposed scheme and other development which has received development consent but which has not been implemented.

3.10.2 Subject to responses to the scoping report, the following developments have been identified as ones which it would be appropriate to include in the cumulative assessments:

- N15/N15 Lifford Link Road;
- Hazardous Substances Consent A/2011/0686/HSC Carkeel Industrial Park;
- An 11kv powerline spur crossing the River Strule near Bunderg Road (J/2013/0048/F);
- Erection of a 250kw Wind Turbine north of Bunderg Road (J/2013/0269/F);
- A footbridge linking Meeting House Street and the Melvin recreational grounds in Strabane (J/2008/0612/F); and
- The 3 Rivers Development at Strabane.

4 Indicative structure for the Environmental Statement

4.1 The structure

4.1.1 The Environmental Statement will be presented in three volumes:

Volume 1: Environmental Statement

Volume 2: Figures

Volume 3: Appendices

4.1.2 A Non-Technical Summary, as required by Article 67 of the Roads (Northern Ireland) Order 1993 will be included in the front of Volume 1 and will also be available as a separate brochure.

4.2 Volume 1

4.2.1 It is intended Volume 1 will comprise:

Chapter 1 – Introduction

4.2.2 This chapter will include a brief introduction to the proposed scheme, the scheme objectives, the statutory context for the EIA and the ES, and the required content of the ES.

Chapter 2 – The need for the scheme

4.2.3 This chapter will include an overview of the policy context together with the aspects associated with the existing A5 (including safety, accidents, access and traffic flows) which the proposed scheme will address.

Chapter 3 – Consultation

4.2.4 This chapter will include an overview of the consultations (including public exhibitions, liaisons and discussions) held throughout the scheme development and the EIA process with statutory consultees, landowners and other stakeholders.

Chapter 4 – Alternatives

4.2.5 This chapter will describe the alternatives considered during identification of the preferred corridor and consideration of route options and outline the factors leading to the choice of the currently proposed scheme.

Chapter 5 – The existing environment

4.2.6 This chapter will provide an overview of the existing environment in which the proposed scheme will be located.

Chapter 6 – The proposed scheme

4.2.7 This chapter will describe the key design components, construction activities, anticipated programme and operational characteristics associated with the proposed scheme.

Chapter 7 – Scoping and introduction to the assessments

4.2.8 This chapter will explain the scope of the studies and assessments reported in the ES.

Chapters 8 – 17 – The studies and assessments

4.2.9 These chapters will report the findings of the studies, surveys and assessments which have been undertaken and describe any significant effects which have been identified including cumulative impacts and effects.

Chapter 18 – Schedule of environmental commitments

4.2.10 This chapter will schedule the design and mitigation measures proposed in relation to the various environmental impacts identified.

4.3 Volume 2

4.3.1 Volume 2 will contain figures, referred to in Volume 1, in support or explanation of the description of the existing environment and the proposed scheme and the evaluation and assessment of the predicted impacts.

4.4 Volume 3

4.4.1 Volume 3 will contain appendices, referred to in Volume 1 and will include relevant detailed reports of the assessments and supporting detail and documentation relevant to the individual assessments.

APPENDIX 9A STATUTORY AND PLANNING CONTEXT

Legislation

The Historic Monuments and Archaeological Objects (Northern Ireland) Order 1995

Purpose

The above order is one of the primary pieces of legislation used to protect archaeological sites and built heritage.

State Care sites and monuments are those in the ownership of NIEA. The Order (Article 13) provides the statutory remit for NIEA to acquire historic monuments to secure their protection and manage them for the benefit of present and future generations, by providing public access.

The Order (Article 3) allows NIEA to schedule monuments for protection. These monuments remain in their existing ownership, but give NIEA powers to control works through Scheduled Monument consent, help to look after sites through Management Agreements or pursue prosecution where damage has been caused.

Issues

Under Article 4 of the Order, it is an offence to carry out the following works to a scheduled monument without Scheduled Monument Consent (SMC):

- Any works resulting in the demolition, destruction or disturbance of, or any damage to, a scheduled monument
- Any works for the purpose of removing or repairing a scheduled monument or any part of it or of making any alterations or additions thereto
- Any flooding or tipping operations on land in, on or under which there is a Scheduled Monument

The Order also requires NIEA to licence and regulate excavations on archaeological sites under Article 41.

There is also an obligation under Article 42 of the Order for finders of archaeological objects to report these to a relevant authority.

Responsibility

The Northern Ireland Environment Agency: Built Heritage Directorate (NIEA) take the lead on advising on, and implementing, the Government's monuments and archaeological objects policy

© Mouchel 2016

and strategy in Northern Ireland. The Order requires NIEA to grant Scheduled Monument Consent, licence and regulate archaeological excavations.

The Historic Monuments Council was established under Article 22 of The Historic Monuments and Archaeological Objects (Northern Ireland) Order 1995. This body advises NIEA on the exercise of its powers under the Order.

The Planning (Northern Ireland) Order 1991

Purpose

Article 42 of the Order places a duty on the Department of the Environment (DoE) to compile lists of buildings of special architectural or historic interest. The order gives the Department powers to influence change to these structures through Listed Building Consent, grant aid and enforcement against unauthorised works.

Issues

Listed buildings are afforded protection as an extension of planning control. This means that a developer cannot, without risk of penalty, demolish, alter or extend a listed building in any way that affects its architectural or historic character, unless listed building consent has been obtained from the local planning authority.

In Northern Ireland listing is carried out by the Northern Ireland Environment Agency (NIEA), which is an Agency within the Department of the Environment, under Article 42 of The Planning (Northern Ireland) Order 1991. Such buildings are important for their intrinsic value and for their contribution to the character and quality of settlements and the open countryside. In selecting buildings for listing, particular attention is given to the importance a built heritage asset plays in illustrating economic and social history, their architectural quality, their association with well-known historical events, characters or works of literature, and their group value. Listed buildings are classified into three grades (in descending order of importance). .

- Grade A – buildings of outstanding architectural or historic interest
- Grade B+ – buildings of significant architectural or historic interest.
- Grade B – buildings of local importance.

Since 1987 the Department has been banding Grade B buildings into two groups – B1 and B2. As the NIEA are currently in the process of carrying out building surveys and resurveying the stock of historic buildings within Northern Ireland both pre-1987 and post-1987 grading systems are currently being used, and are therefore both referred to within this report.

© Mouchel 2016

- Grade B1 – buildings of local importance that qualify for listing by virtue of a relatively wide selection of attributes.

- Grade B2 – buildings of local importance that qualify for listing by virtue of only a few attributes.

Responsibility

In Northern Ireland it is the responsibility of the Northern Ireland Environment Agency: Built Heritage Directorate (NIEA), which is an Agency within the Department of the Environment, to enforce powers under the Order for Listed Building Consent, grant aid and enforcement against unauthorised works.

Planning Policy

Planning Policy Statement 6: Planning, Archaeology and The Built Heritage

Purpose

The Policy outlines the criteria that the Planning Service employ in assessing proposals which affect archaeological remains or built heritage. It covers issues affecting archaeological monuments, built heritage, conservation areas and historic parks and gardens.

Issues

In all cases the desirability of preserving an archaeological site or monument and its setting, whether scheduled or otherwise, is a material consideration in determining planning applications.

The Planning Service will operate a presumption in favour of the physical preservation in situ of archaeological remains of regional importance and their settings. These comprise monuments in State Care, Scheduled Monuments and other important sites and monuments which meet scheduling criteria.

Development proposals which would adversely affect archaeological sites or monuments which are of local importance or their settings will only be permitted where the Planning Service considers the importance of the proposed development or other material considerations outweigh the value of the remains in question.

The Planning Service will require those proposing any development which threatens elements of the historic environment to prepare an assessment and/or evaluation of the heritage assets within the proposed site and surrounding area.

It is within Planning Services remit to impose conditions to ensure that appropriate measures are taken for the identification and mitigation of the archaeological impacts of a development, including where appropriate the completion of a licensed excavation and recording of remains before development commences.

© Mouchel 2016

The Planning Service will not normally permit development which could lead to the loss of, or cause harm to, the character, principal components or setting of parks, gardens or demesnes of special historic interest.

The Planning Service will operate a general presumption in favour of the preservation of listed buildings. Applicants for listed building consent or planning permission affecting a listed building must therefore be able to justify their proposals and will need to show why they are desirable or necessary.

The Planning Service will normally permit the change of use of a listed building where this secures its upkeep and survival and the character and architectural or historic interest of the building would be preserved or enhanced. Proposals for a change of use should incorporate details of all intended alterations to the building and its cartilage to demonstrate their effect on its appearance, character and setting.

There will be a presumption in favour of retaining listed buildings. The Department will not permit the demolition of a listed building unless there are exceptional reasons why the building cannot be retained in its original or a reasonable modified form. Where, exceptionally, listed building consent is granted for demolition this will normally be conditional on prior agreement for the redevelopment of the site and appropriate arrangements for recording the building before its demolition.

The Planning Service will not normally permit development which would adversely affect the setting of a listed building. Development proposals will normally only be considered appropriate where all the following criteria are met:

- The detailed design respects the listed building in terms of scale, height, massing and alignment.
- The works proposed make use of traditional or sympathetic building materials and techniques which respect those found on the buildings; and
- The nature of the use proposed respects the character of the setting of the building.

Responsibility

The Planning Service is responsible for the implementation of the Planning Policy Statement. They take advice on archaeological and historic buildings issues from Northern Ireland Environment Agency: Built Heritage Directorate.

Local Plans

Purpose

The applicable Area Plans for the districts covered by the Scheme are Derry, Dungannon and South Tyrone, Omagh and Strabane. The relevant local planning policies related to built heritage are summarised in Table 9A.1 below.

© Mouchel 2016

Issues

Table 9A.1 Planning Policy Relating to Heritage Assets

Area Plan	Relevant Policy
Derry Area Plan 2011	BE 2 – Listed Buildings: General presumption in favour of the preservation of all listed buildings BE 7 - Archaeological Sites and Monuments and Historic Landscape: Development which would be likely to alter, damage or destroy individual sites or monuments, or result in inappropriate change to the setting of such sites or monuments or to the historic landscape will not normally be permitted. BE 9 – Industrial Archaeology: The Department will encourage the beneficial reuse of historic industrial buildings and sites where they make a significant contribution to the townscape of the locality
Dungannon and South Tyrone Area Plan 2010	CON 3 - Areas of Archaeological Potential: Areas of Archaeological Potential are designated in Dungannon and within the following villages: Augher, Ballygawley, Caledon, Carnteel, Castlecaulfield, Clogher, Donaghmore and Newmills. Within these areas, developers will normally be required to submit an archaeological assessment or an archaeological evaluation in association with planning applications. CON 5 – Areas of Townscape Character: Planning Permission will only be granted to development proposals in these areas where they are sympathetic to the historic built form in terms of scale, form, massing, design detailing and materials and will not detract from the overall character and appearance of the area.
Omagh Area Plan 1987-2002*	Part 8. Policy Statements and Maps – Rural Area: 115.0 'Aims & Objectives' states that the aim of the rural strategy for Omagh District is to maintain an economically and socially vital and environmentally attractive countryside by protecting *"where possible, buildings and sites of archaeological, architectural or historic interest."* Section 115.6 also states that *"development will not normally be given permission where it would be likely to prejudice the essential character of areas within the District which contain historic monuments or buildings of architectural or historic interest."*
Strabane Area Plan 1986-2001*	Part 8. Policy Statements and Maps – Rural Area: 115.0 'Aims & Objectives' states that the aim of the Rural Strategy for Strabane District is to maintain the essential character of the rural area by protecting and *"where possible […] buildings or sites of archaeological, architectural or historic interest."* Section 125.0 also states that *"no development which would result in the destruction or disturbance of [buildings of architectural or historic interest] will be acceptable."*
*** The Omagh and Strabane Area Plans remain statutory instruments for their particular plan areas. A new development plan covering this area is being prepared which will be the West Tyrone Area Plan 2019.**	

© Mouchel 2016

Responsibility

The Planning Service is responsible for planning control, as an agency of the Department of the Environment, under The Planning (Northern Ireland) Order 1991 for planning matters. They are advised by NIEA: Built Heritage Directorate with regard to archaeological remains and historic buildings.

© Mouchel 2016

APPENDIX 9B METHODS

Introduction

The following sections describe the criteria for evaluating the cultural heritage assets and the criteria for evaluating the magnitude of impact on those assets, which have been used for the assessment of the scheme. These criteria are described in DMRB Volume 11, section 3, Part 2, HA 208/07 Cultural Heritage.

Archaeological Assets

The importance of designated and undesignated archaeological sites, monuments and artefact findspots is judged upon statutory and non-statutory designations as well as utilising the modified criteria for Scheduled Monuments published in Planning Policy Statement 6 (PPS 6): Planning, Archaeology and The Built Heritage. Taking these criteria into account, each feature is assigned to a level of importance in accordance with a six point scale as indicated in Table 9B.1.

Table 9B.1 Factors for Assessing the Value of Archaeological Assets

Value	Example
Very High	World Heritage Sites (including nominated sites) Assets of acknowledged international importance Assets that can contribute significantly to acknowledged international research objectives
High	Scheduled Monuments (including proposed sites) Undesignated assets of scheduled quality and importance Assets that can contribute significantly to acknowledged national research objectives
Medium	Designated or undesignated assets that contribute to regional research objectives
Low	Designated and undesignated assets of local importance Assets compromised by poor preservation and/or poor survival of contextual associations Assets of limited value, but with potential to contribute to local research objectives
Negligible	Assets with very little or no surviving archaeological interest
Unknown	The importance of the resource has not been ascertained

Impacts of the Proposed Scheme are considered in terms of direct, indirect and cumulative impacts. The sources of impact may arise during construction and/or operation of the Proposed Scheme. The assessment of impact may arise during construction and/or operation of the

© Mouchel 2016

Proposed Scheme. The assessment of impact includes a consideration of an archaeological site's setting where relevant – this varies form case to case and cannot be generically defined. The magnitude of an impact on the archaeological resource is judged on a five-point scale as detailed in Table 9B.2.

Table 9B.2 Factors for Assessing the Magnitude of Impact for Archaeological Assets

Magnitude of Impact	Example
Major	Change to most or all key archaeological materials, such that the resource is totally altered Comprehensive changes to setting
Moderate	Changes to many key archaeological materials, such that the resource is clearly modified Considerable changes to setting that affect the character of the asset
Minor	Changes to key archaeological materials, such that the asset is slightly altered Slight change to setting
Negligible	Very minor changes to archaeological materials, or setting
No Change	No change

The magnitude of impact (with appropriate mitigation) has been assessed independently without reference to the importance of the feature. The findings of the impact assessment have been combined in a matrix with the importance rating of the feature to establish the significance of effect that is likely if the Proposed Scheme is constructed (refer to Table 9B.1 Factors for Assessing the Value of Archaeological Assets) The significance of effect description ranges from Very Large adverse to Very Large beneficial.

Built Heritage

The importance of a building or structure is judged on an individual basis. It is assessed in relation to architectural and historic importance, statutory and non-statutory designations and contribution to local character. Taking this into account, each identified feature has been assigned to a value in accordance with a six point scale below Table 9B.3:

Table 9B.3 Criteria for Establishing the Value of Built Heritage Assets

Value	Status and Definition
Very High	International importance i.e. World Heritage Sites.
High	National importance i.e. listed buildings Grade A+/A, and B+, Scheduled Ancient Monuments with standing remains, conservation areas containing very important buildings and undesignated structures of clear national importance.
Medium	Regional importance

© Mouchel 2016

Value	Status and Definition
	i.e. listed buildings Grade B/B1/B2, conservation areas containing buildings that contribute significantly to its historic character, historic townscape with important integrity in their buildings, or built settings and undesignated structures of clear regional importance.
Low	Local importance i.e. undesignated assets of modest quality in their fabric or historical association and historic townscape of limited historic integrity.
Negligible	Assets of no architectural or historical note
Unknown	Assets with some hidden i.e. inaccessible potential for historic or architectural significance.

Impacts of the Proposed Scheme on built heritage features are considered in terms of direct, indirect and cumulative impacts. A direct impact is considered to constitute a direct physical impact upon a structure, such as damage or demolition. An indirect impact, although not physically affecting the feature, would impact upon the setting or context (appreciation) of the feature, such as the severance of an agricultural building from its rural setting. A secondary impact is taken to constitute a remote or complex impact, such as a change in amenity that would endanger the future maintenance and survival of a historic building.

The listed buildings that occur within, or in close proximity to the Proposed Scheme, are a key element in the historic environment and an analysis of their setting is necessary so as to appraise the nature and extent of any impact. Neither PPS 6 nor any NIEA guidance defines ‘setting’, as it varies from building to building, but it is accepted that the landscape environment of a listed building may include elements that are of importance to it.

Impact upon setting has been considered in the following terms:

- **Historic relationship:** the historic relationship of a building to its setting, the development and alteration of this setting, its relationship to the building’s function and the extent to which this is preserved or survives;
- **Setting elements**: individual and groups of features which form and contribute to the setting of the building; and
- **Setting character**: the character and appearance of the building’s setting.

The magnitude of impact has been assessed on the five point scale as detailed in Table 9B.4.

© Mouchel 2016

Table 9B.4 Criteria for the Assessment of the Magnitude of Impact for Built Heritage Assets

Magnitude	Factors in the assessment of the magnitude of impacts
Major	Change to key elements of the built heritage asset(s), such that the resource is totally altered Comprehensive changes to the setting
Moderate	Change to many key elements of the built heritage asset(s), such that the resource is significantly modified Changes to the setting of a built heritage asset, such that it is significantly modified
Minor	Change to key elements of the built heritage asset(s), such that the asset is slightly different. Change to setting of a built heritage asset, such that it is noticeably changed.
Negligible	Slight changes to elements of the built heritage asset(s) or setting that hardly affect it
No change	No change to fabric or setting

Historic Landscape Character types

Criteria for assessing the value of historic landscape types are as follows

Table 9B.5:

Table 9B.5 Criteria for Establishing the Value of Historic Landscape

Value	Status and definition
Very High	World Heritage Sites inscribed for their historic landscape qualities; Historic landscapes of international value, whether designated or not; Extremely well preserved historic landscapes with exceptional coherence, time-depth, or other critical factor(s)
High	Designated historic landscapes of outstanding interest; Undesignated landscapes of outstanding interest; Undesignated landscapes of high quality and importance, and of demonstrable national value; Well preserved historic landscapes, exhibiting considerable coherence, time-depth or other critical factor(s)
Medium	Designated special historic landscapes; Undesignated historic landscapes that would justify special historic landscape designation, landscapes of regional value; Averagely well-preserved historic landscapes with reasonable coherence, time-depth or other critical factor(s)

© Mouchel 2016

Low	Robust undesignated historic landscapes; Historic landscapes with importance to local interest groups; Historic landscapes whose value is limited by poor preservation and/or poor survival of contextual associations
Negligible	Landscapes with little or no significant historical interest

Criteria used during the assessment for determining the magnitude of impacts are as follows

Table 9B.5:

Table 9B.6 Criteria for the Assessment Magnitude of Impact for Historic Landscape Types

Magnitude	Factors in the assessment of the magnitude of impacts
Major	Change to most of all key historic landscape elements, parcels or components; extreme visual effects; gross change of noise or change to sound quality; fundamental changes to use or access; resulting in total change to historic landscape character unit
Moderate	Changes to many key historic landscape elements, parcels or components, visual change to many key aspects of the historic landscape, noticeable differences in noise or sound quality, considerable changes to use or access; resulting in moderate changes to historic landscape character
Minor	Changes to few key historic landscape elements, parcels or components, slight visual changes to few key aspects of historic landscape, limited changes to noise levels or sound quality; slight changes to use or access; resulting in limited changes to historic landscape character
Negligible	Very minor changes to key historic landscape elements, parcels or components, virtually unchanged visual effects, very slight changes in noise levels or sound quality; very slight changes to use or access; resulting in a very small change to historic landscape character
No change	No change to elements, parcels or components; no visual or audible changes; no changes arising from in amenity or community factors

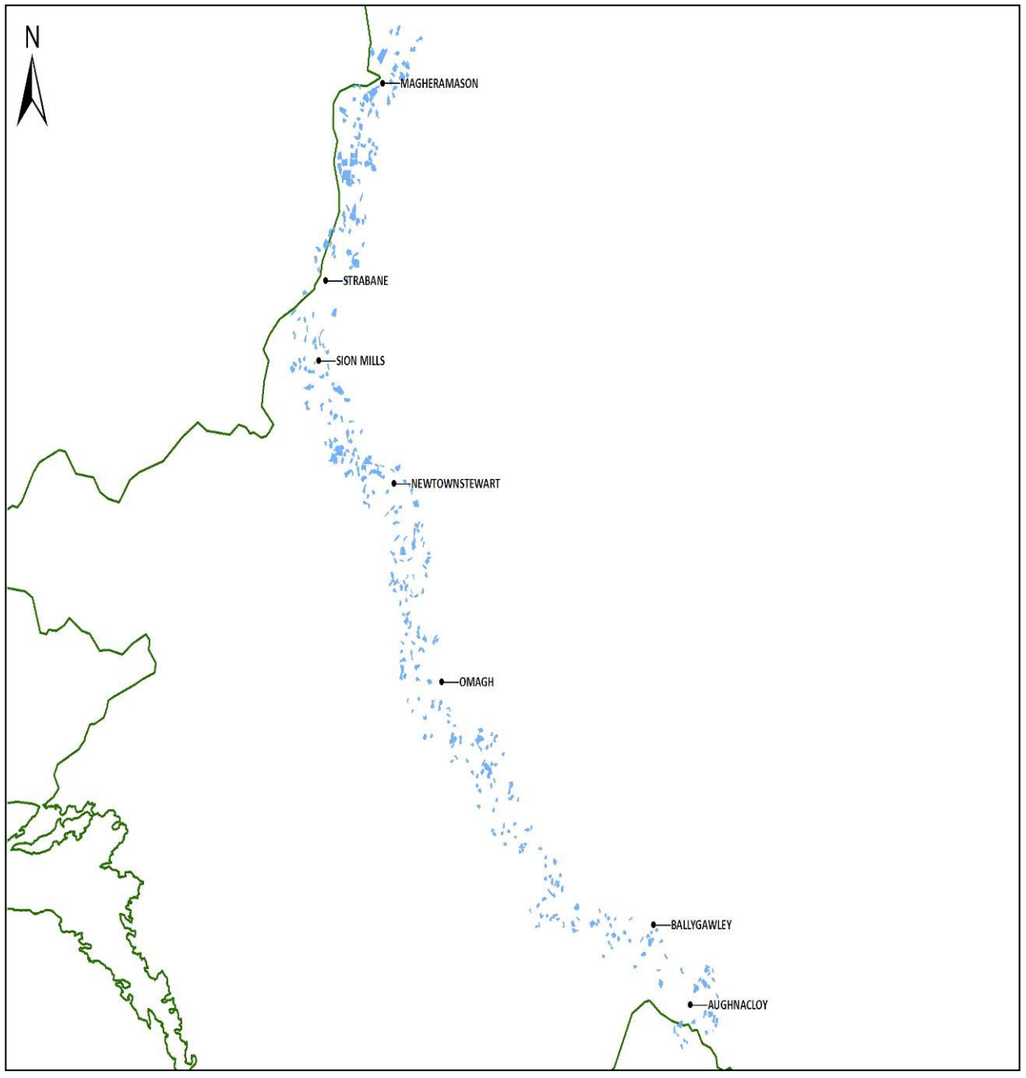
APPENDIX 9D HISTORIC LANDSCAPE CHARACTERISATION UNIT DATA SHEETS

Enclosed Land

Large Regular Field Division, Late 19th- 20th Century



- Description: Patterns of similar sized, straight-boundary fields of varying orientation, laid out using 19th-20th century survey techniques. Some elements of irregular boundaries scattered throughout the units however the predominant feature is that of regular boundaries. Occasional boundaries correspond to earlier pre-1840s field boundaries however none of these form full fields today and cannot be said to influence the historic landscape on a large scale. This HL unit occurs frequently along the Foyle floodplain to the north of Strabane and to the north of Baronscourt.

- Period: Majority 19th-20th century most likely a result of the Land Acts 1880-1910 with changes throughout the 20th century

- Factors influencing change: Potential for the fields to be sub-divided in the future depending on land ownership and agricultural needs. Those located next to Strabane may be affected if the town continues to expand.

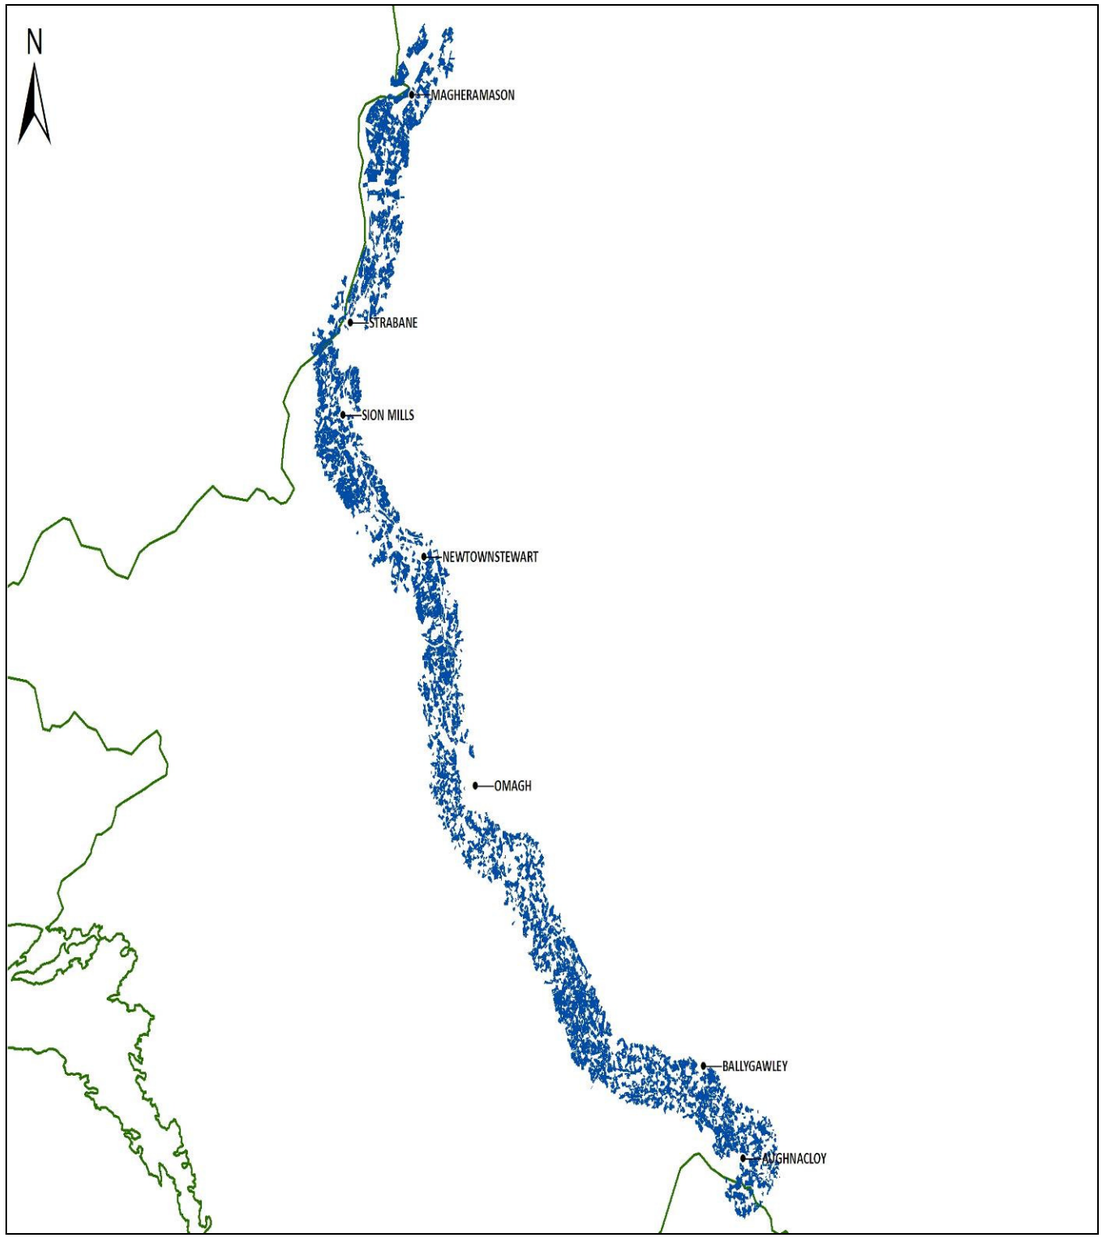
- Capacity to absorb change: High

- Value: Medium. Although they largely date to the late 19th – early 20th century they do represent the physical manifestation of a significant shift in Irish social and economic organisation. This, together with its uniformity, frequency and common historic origin has led to a value rating of medium i.e. an averagely well-preserved historic landscape unit with reasonable coherence and time-depth.

Plate 9D.1 Foyle Floodplain North of Strabane Facing South-West

© Mouchel 2016

Medium Regular Field Divisions, Late 19th- 20th Century



- Description: Pattern of similar sized fields arranged in a predominantly regular pattern. Most boundaries are straight however a scattering of more sinuous boundaries does occur within many of the units. These units are the most common enclosure unit within the study area, occurring very frequently throughout the length of the scheme, with a very dense concentration just north of the Brougher ridge. As with the other units they are likely to have been created using modern survey techniques and show a consistent regular patterning in their layout. Some irregular boundaries are scattered throughout the units however the predominant feature is that of regular boundaries. Occasional boundaries correspond to earlier pre-1840s field boundaries however none of these form full fields today and cannot be said to influence the historic landscape on a large scale.

- Period: Majority 19th - 20th century most likely a result of the Land Acts 1880-1910 with changes throughout the 20th century

- Factors influencing change: Potential for the fields to be sub-divided in the future depending on land ownership and agricultural needs.

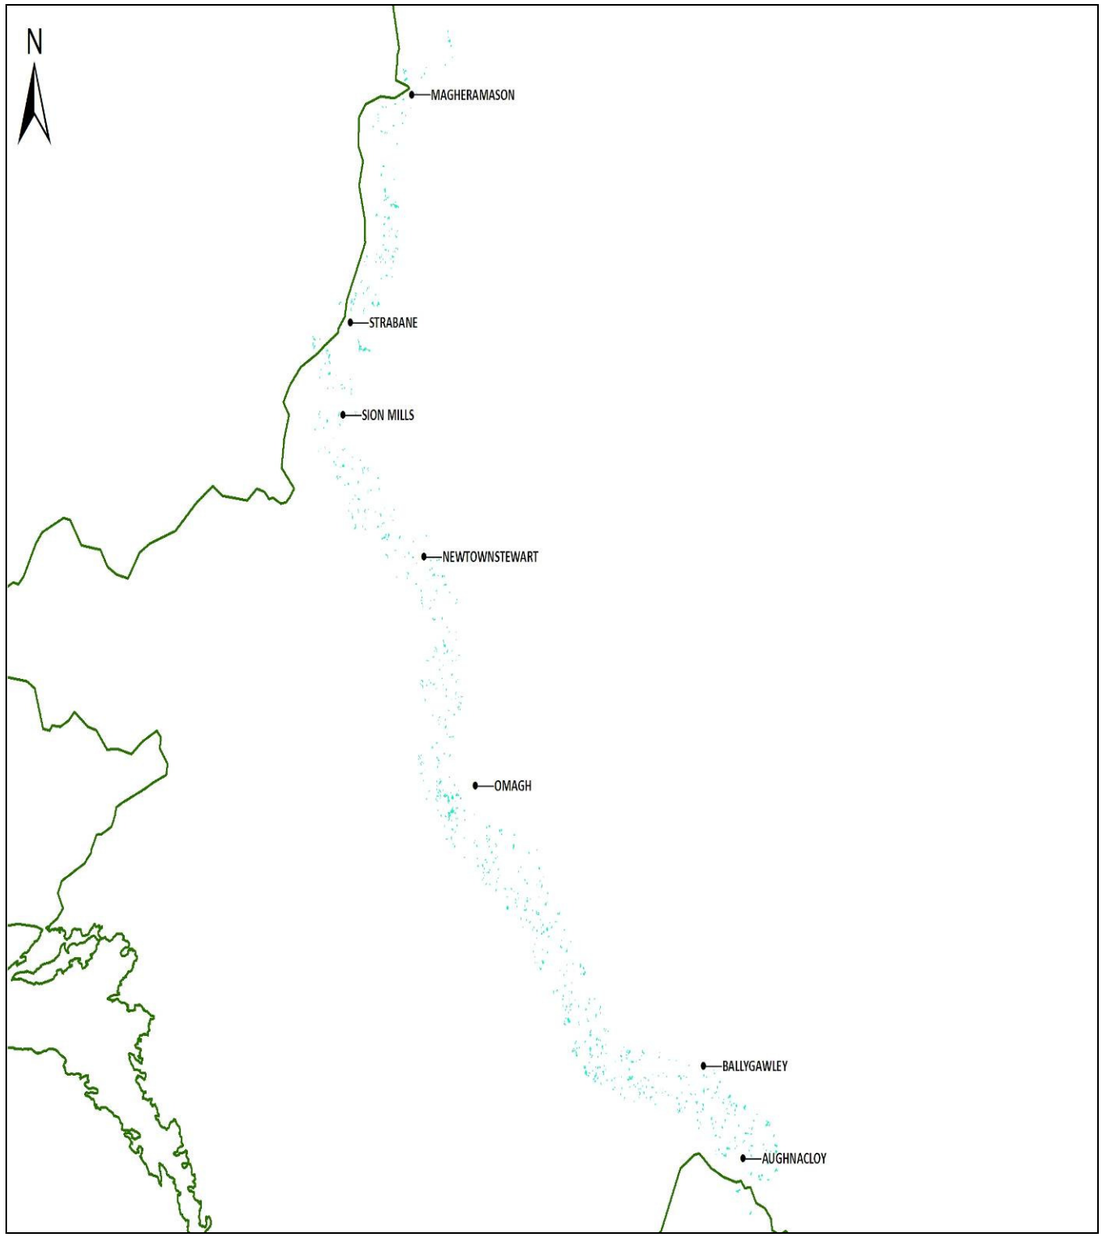
- Capacity to absorb change: High

- Value: Medium. Although they largely date to the late 19th – early 20th century they do represent the physical manifestation of a significant shift in Irish social and economic organisation. This, together with its uniformity, frequency and common historic origin has led to a value rating of medium i.e. an averagely well-preserved historic landscape unit with reasonable coherence and time-depth

Plate 9D.2 View of Sion Mills Facing East

© Mouchel 2016

Small Regular Field Division, late 19th- 20th Century



- Description: Patterns of similar sized, straight-boundary fields, laid out using 19th-20th century survey techniques. Some elements of irregular boundaries scattered throughout the units however the predominant feature is that of regular boundaries. Occasional boundaries correspond to earlier pre-1840s field boundaries however none of these form full fields today and cannot be said to influence the historic landscape on a large scale. Often occurring around the summits of hills and small mountains and adjacent to isolated settlements. This unit increases in frequency as you move north to south.

- Period: Majority 19th - 20th century most likely a result of the Land Acts 1880-1910 with changes throughout the 20th century

- Factors influencing change: Reclamation of land around mountains, change in land ownership.

- Capacity to absorb change: High

- Value: Medium. Although they largely date to the late 19th – early 20th century they do represent the physical manifestation of a significant shift in Irish social and economic organisation. This, together with its uniformity, frequency and common historic origin has led to a value rating of medium i.e. an averagely well-preserved historic landscape unit with reasonable coherence and time-depth.

Plate 9D.3 North of Omagh Facing East

© Mouchel 2016

Large Irregular Field Divisions, 19th-20th Century

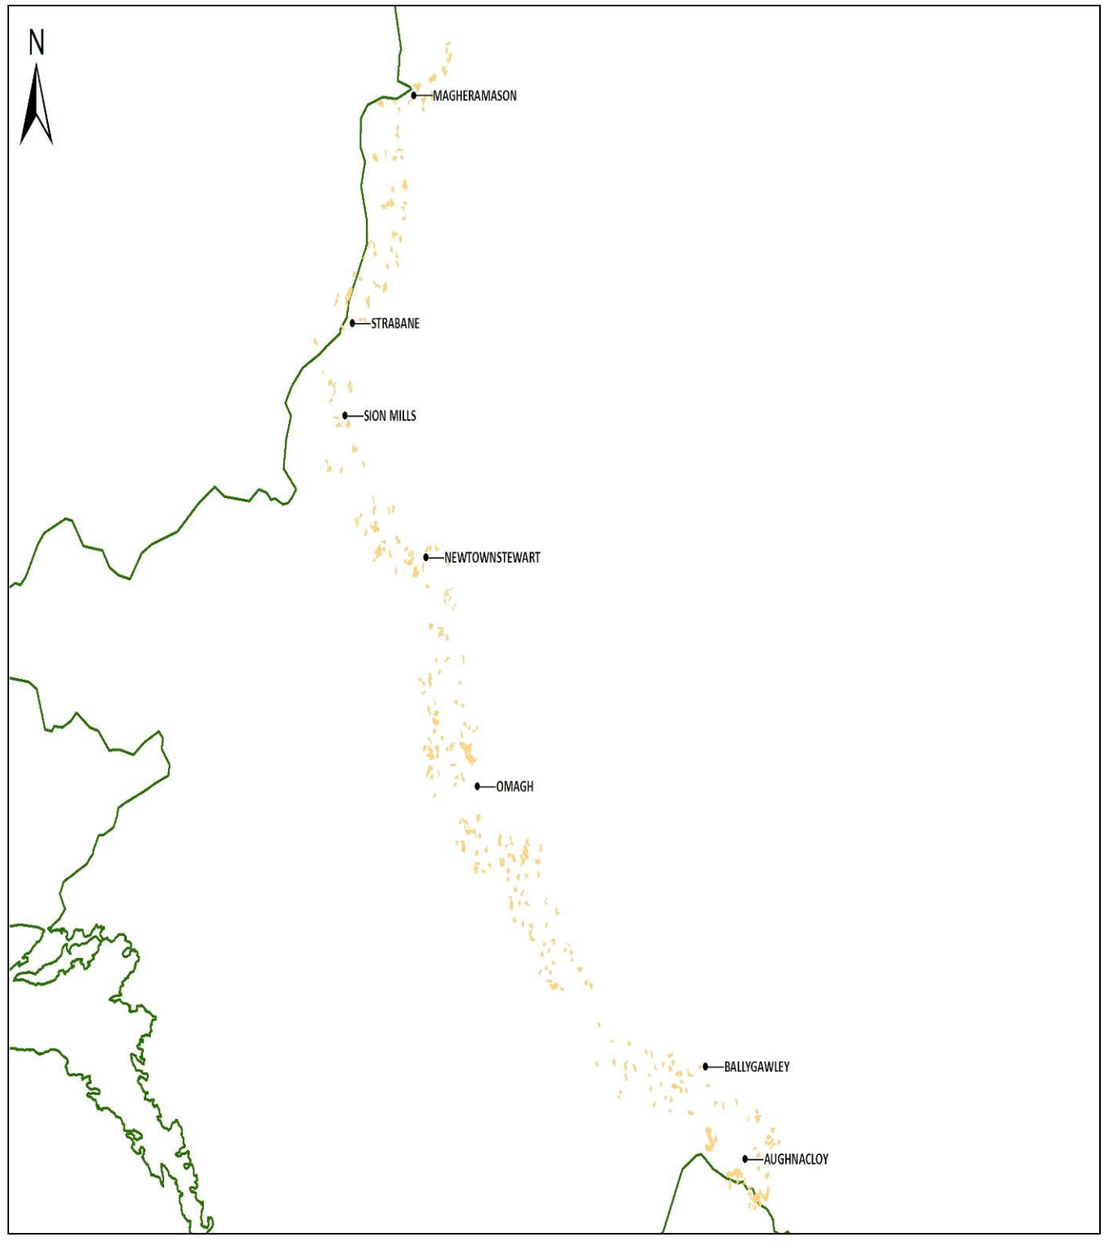


Plate 9D.4 West of Ballygawley Facing North

- Description: Patterns of similar sized, straight-boundary fields of varying orientation, laid out using 19th - 20th century survey techniques. This unit type is one of the less frequent units to occur within the study area as may of them have been subdivided in the late 19th and 20th century. Concentrations of these are found just to the south of Omagh and at the very southern end of the study area. Occasional boundaries correspond to earlier pre-1840s field boundaries however none of these form full fields today and cannot be said to influence the historic landscape on a large scale.

- Period: Majority 19th - 20th century most likely a result of the Land Acts 1880-1910 with changes throughout the 20th century

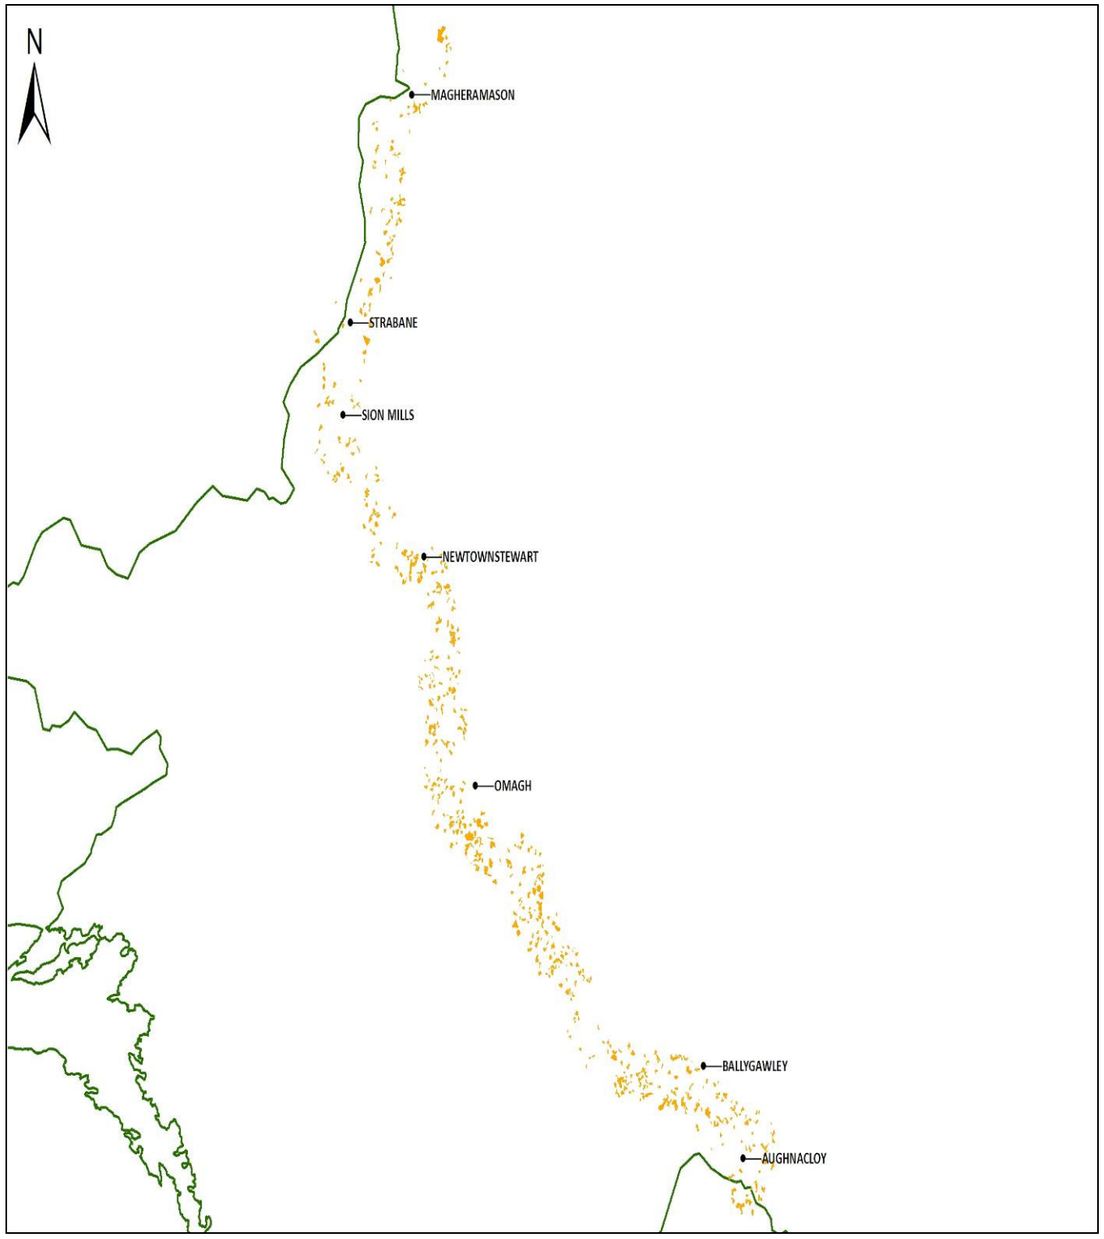
- Factors influencing change: The size of these enclosures may lend themselves to further sub-division if changes in land ownership of agricultural practices occur.

- Capacity to absorb change: High

- Value: Medium. Although they largely date to the late 19th – early 20th century they do represent the physical manifestation of a significant shift in Irish social and economic organisation. This, together with its uniformity, frequency and common historic origin has led to a value rating of medium i.e. an averagely well-preserved historic landscape unit with reasonable coherence and time-depth.

© Mouchel 2016

Medium Irregular Field Divisions, late 19th - 20th Century



- Description: Pattern of similar sized fields arranged in an irregular pattern. Most boundaries are curved and sinuous however a scattering of straight boundaries does occur within many of the units. These units increase in frequency towards the middle and southern end of the study area. As with the other units they are likely to have been laid out using modern survey techniques however they show little regular patterning. This may result from the Drumlin landscape which they occupy in the southern area. Occasional boundaries correspond to earlier pre-1840s field boundaries however none of these form full fields today and cannot be said to influence the historic landscape on a large scale.

- Period: Majority 19th-20th century most likely a result of the Land Acts 1880-1910 with changes throughout the 20th century

- Factors influencing change: Given the frequency of this enclosure unit it is unlikely that significant change will occur which would alter its historic character.

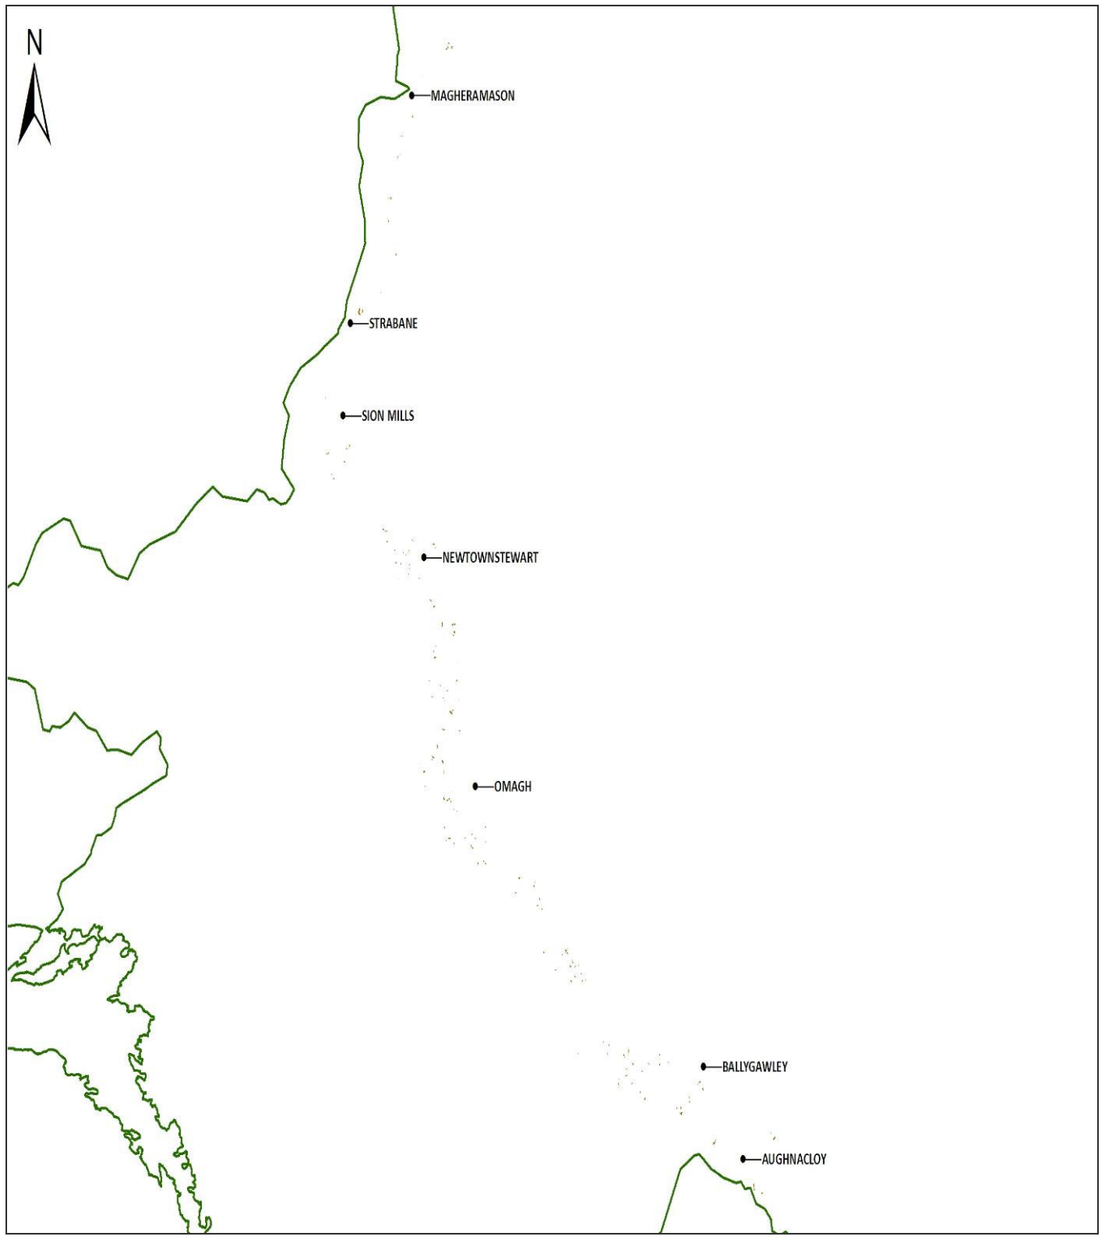
- Capacity to absorb change: High due to its frequency and consistent historic legibility

- Value: Medium. Although they largely date to the late 19th – early 20th century they do represent the physical manifestation of a significant shift in Irish social and economic organisation. This, together with its uniformity, frequency and common historic origin has led to a value rating of medium i.e. an averagely well-preserved historic landscape unit with reasonable coherence and time-depth.

Plate 9D. 5 North of Strabane Facing North-East

© Mouchel 2016

Small Irregular Field Divisions, Late 19th - 20th Century



- Description: Patterns of similar sized, curving-boundary fields, laid out using 19th-20th century survey techniques in an irregular pattern. Some elements of regular boundaries scattered throughout the units however the predominant feature is that of irregular boundaries. Occasional boundaries correspond to earlier pre-1840s field boundaries however none of these form full fields today and cannot be said to influence the historic landscape on a large scale. This unit occurs only occasionally at the northern end of the study area, it features more prominently at the centre of the study area and begins to peter out towards the southern end.

- Period: Majority 19th-20th century most likely a result of the Land Acts 1880-1910 with changes throughout the 20th century

- Factors influencing change: Infrastructural development connected to the expansion of Omagh.

- Capacity to absorb change: High

- Value: Medium. Although they largely date to the late 19th – early 20th century they do represent the physical manifestation of a significant shift in Irish social and economic organisation. This, together with its uniformity, frequency and common historic origin has led to a value rating of medium i.e. an averagely well-preserved historic landscape unit with reasonable coherence and time-depth.

© Mouchel 2016

Boggy/Marshy Land

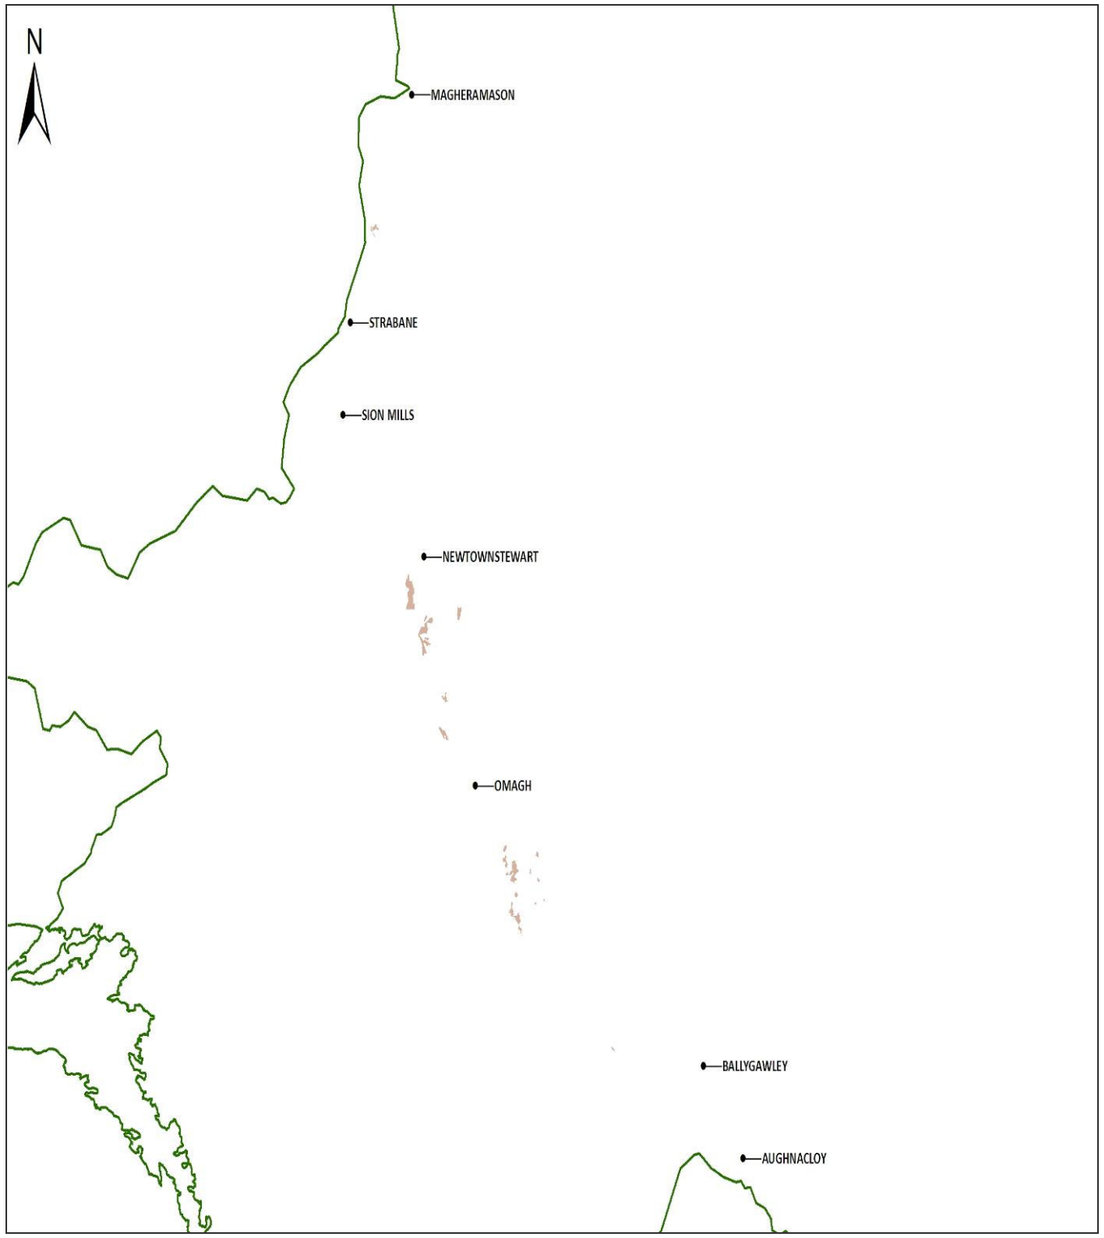


Plate 9D.6 Land to south of Omagh Facing South-West

- Description: Areas which have not been reclaimed for agricultural purposes. These are mainly featured between Baronscourt and the south of Omagh
- Period: 19th – 20th century
- Factors influencing change: Land improvement schemes, commercial forestry.
- Capacity to absorb change: High
- Value: Medium. Although they largely date to the late 19th – early 20th century they do represent the physical manifestation of a significant shift in Irish social and economic organisation. This, together with its uniformity, frequency and common historic origin has led to a value rating of medium i.e. an averagely well-preserved historic landscape unit with reasonable coherence and time-depth.

© Mouchel 2016

Settlement

Nucleated Settlement

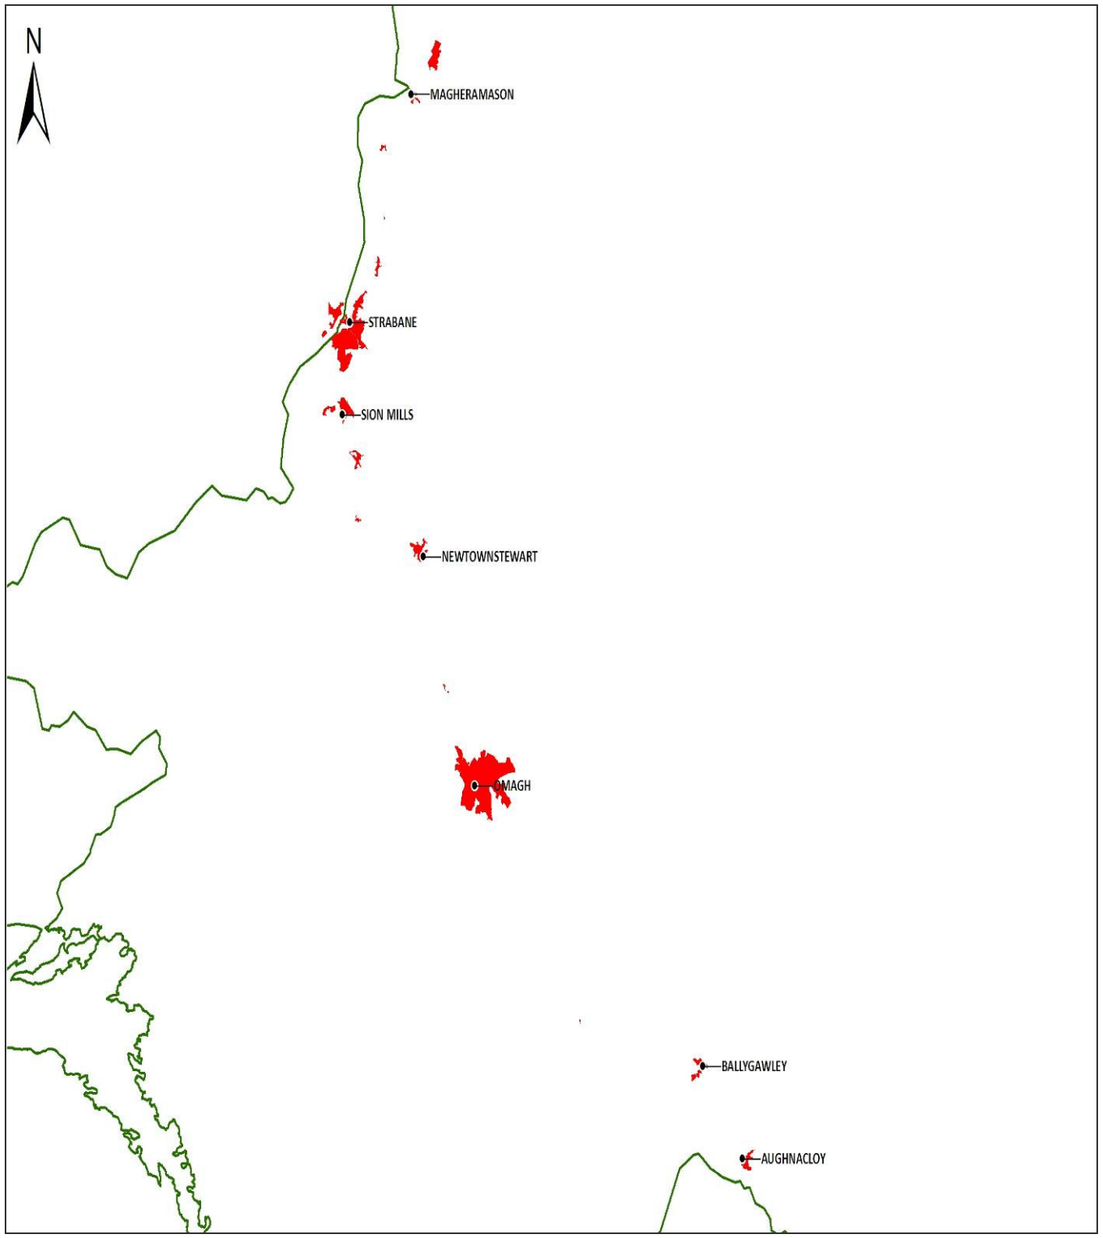

Plate 9D.7 Newtownstewart Facing North-East

- Description: These settlements are featured on the 1st edition ordnance survey maps and are generally regularly laid out collections of structures arranged along a main street. All are extremely small settlements which grew substantially from the 1830s onwards. Modern, 20th century housing, commercial and industrial developments, radiating from historic settlement cores are the feature of the larger settlements such as Omagh and Strabane. Modern settlements can often show how urban expansion has affected the surrounding landscape while also being an indicator of both economic prosperity and social conditions of different periods during the 20th century.

- Period: 17th - 21st century

- Factors influencing change: Increasing population, infrastructural development, business developments and need for space within town centres.

- Capacity to absorb change: Low

- Value: Medium. The nucleated settlements within the study area are considered to be of medium value given their historic legibility and time depth.

© Mouchel 2016

Dispersed Settlement

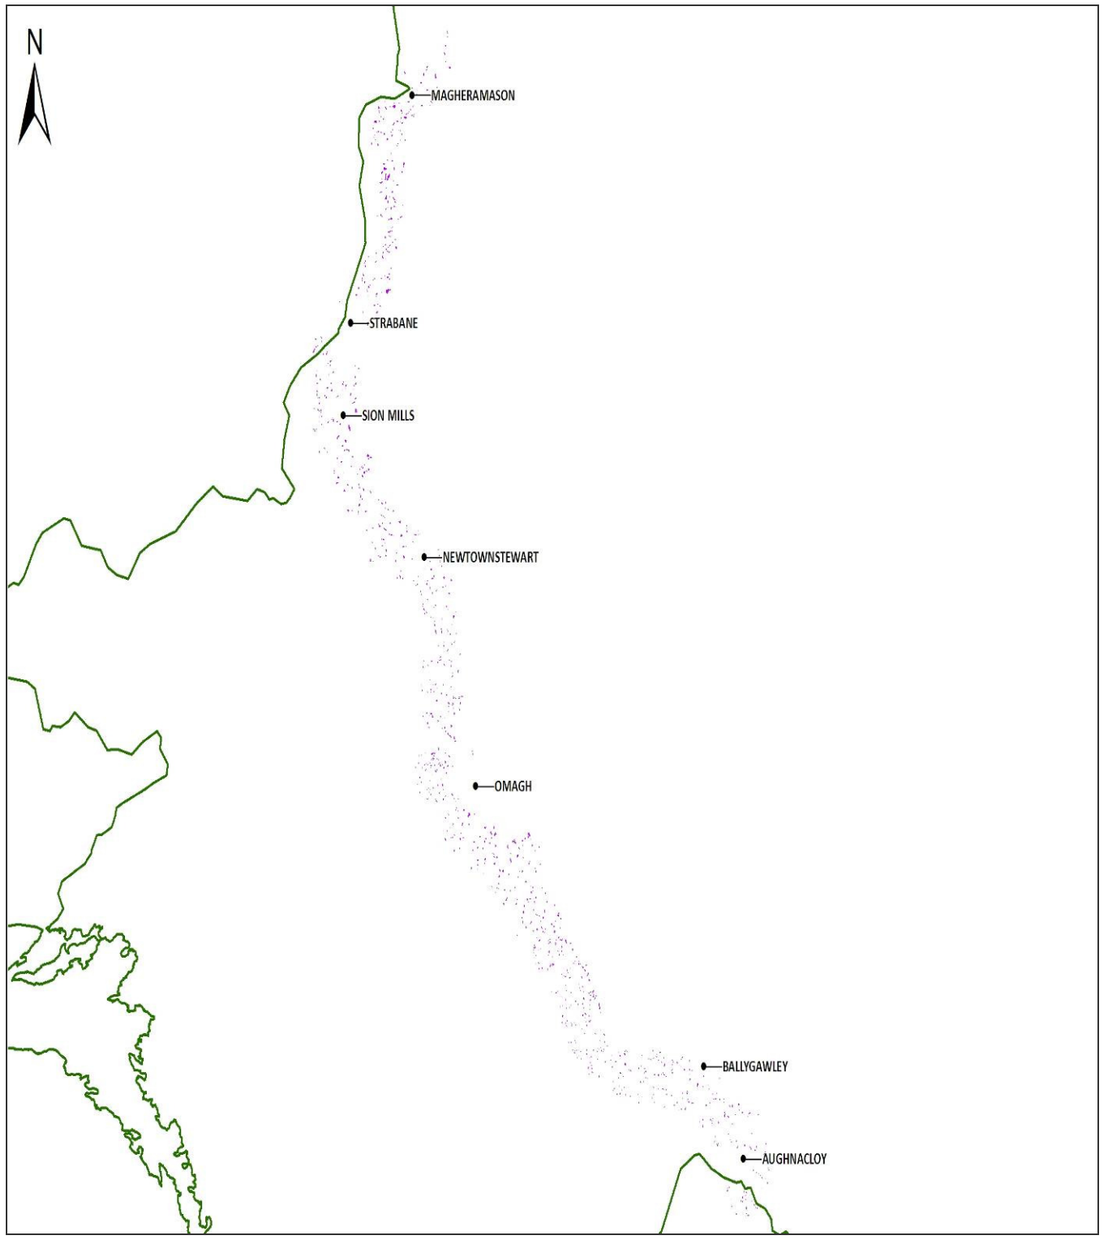

Plate 9D.8 West of Newtownstewart Facing North

- Description: Like all counties in Ireland there is a high proportion of dispersed rural settlement with isolated houses, often associated with small parcels of land. During the 20th century these dispersed houses continued to be constructed however their association with farmsteads is less so. They do not form coherent settlement nuclei but are dispersed relatively evenly throughout the study area. They add to the historic landscape character in that they reflect a settlement pattern which has dominated in Ireland for hundreds of years.

- Period: pre -19th - 21st century

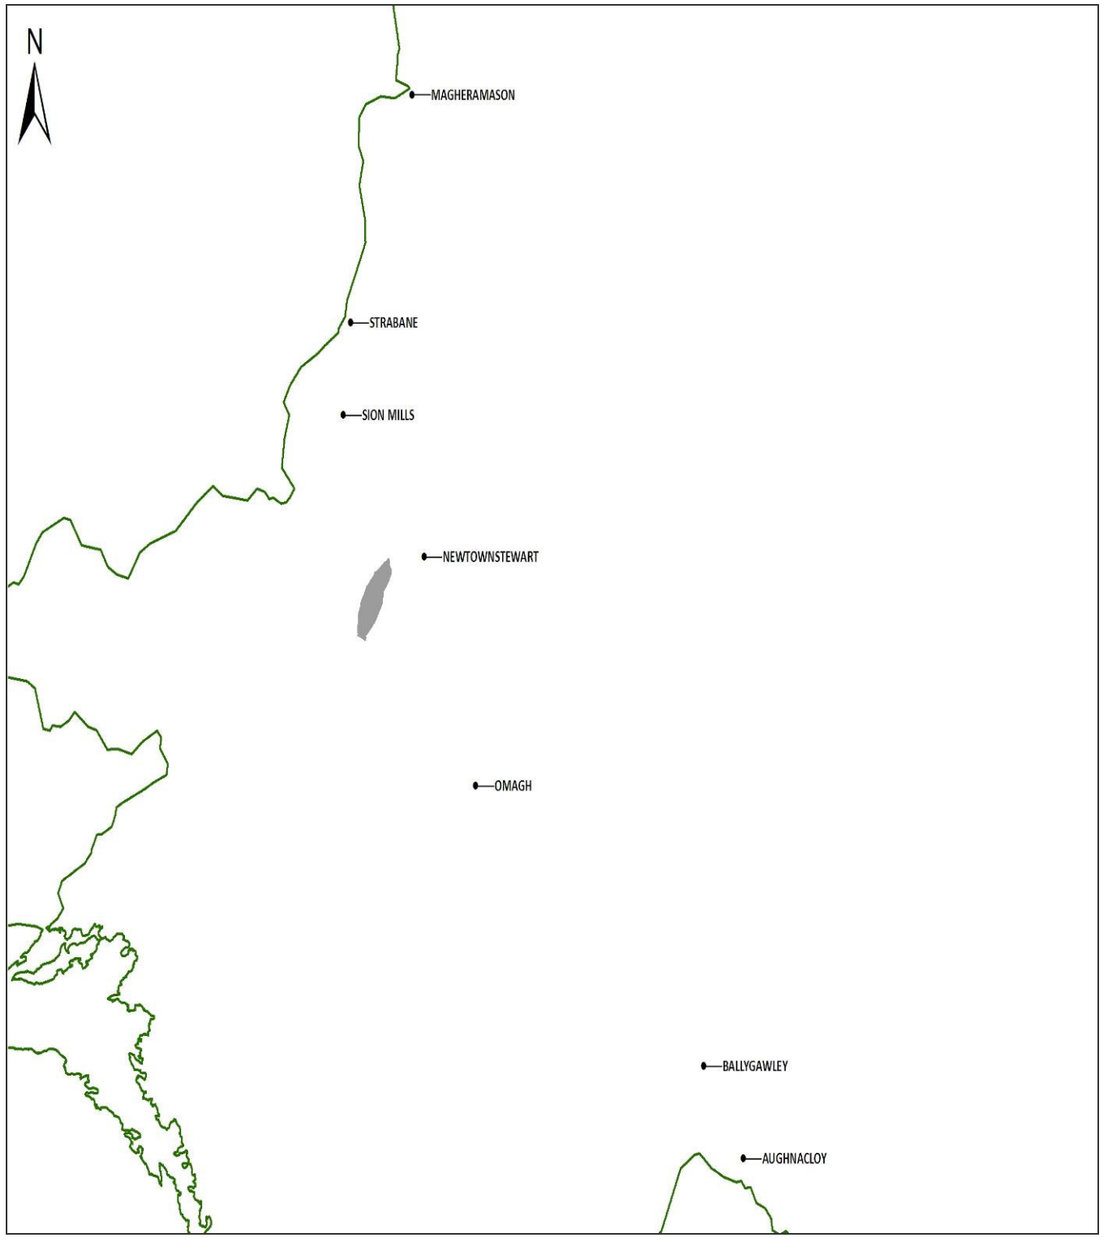
- Factors influencing change: Increasing population resulting in the need for more housing.

- Capacity to absorb change: High

- Value: Medium. Dispersed settlement within the study area is considered to be of medium value given their historic legibility and time depth.

© Mouchel 2016

Estates



- Description: Areas of land, concentrated around a grand estate house. The only surviving example is Baronscourt located at the centre of the study area. It contains long established woodland, a landscape park and several archaeological and built heritage assets. Estates would have had a large impact on the landscape of the 18th and 19th century when they were the homes of the landowning class.
- Period: 18th century
- Factors influencing change: Many estates are in danger of being broken up and sold off due to high running costs.
- Capacity to absorb change: Low
- Value: High. Estates are considered to be of high value due to their rarity and quality of survival of historic elements.

© Mouchel 2016

Communications and Industry

Roads

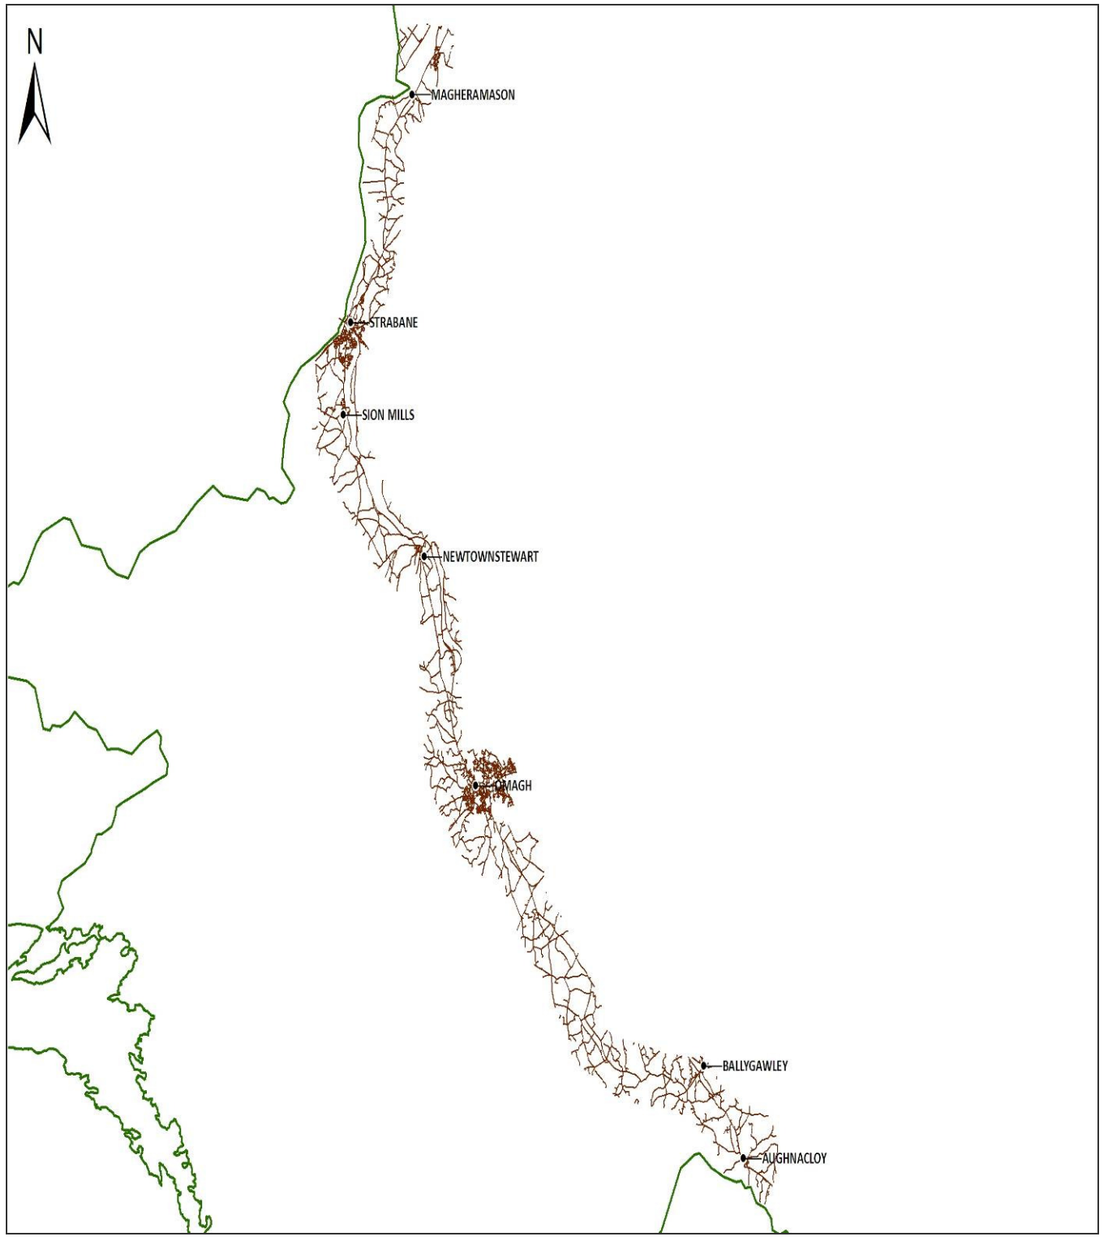


Plate 9D.9 Spout Road South-East of Strabane Facing North

- Description: The intricate road network transects the study area throughout its length. The roads have a greater time depth than many of the other units within the historic landscape, their exact origin cannot however be pinned down. 20th-21st century road construction has added to this unit. The pattern of the road network is a reflection of the human impact upon the landscape through time.
- Period: pre - 19th-21st century
- Factors influencing change: Construction of road upgrades.
- Capacity to absorb change: High
- Value: Low. Roads are considered to be of low value within the historic landscape with a high capacity to absorb change.

© Mouchel 2016

Industry

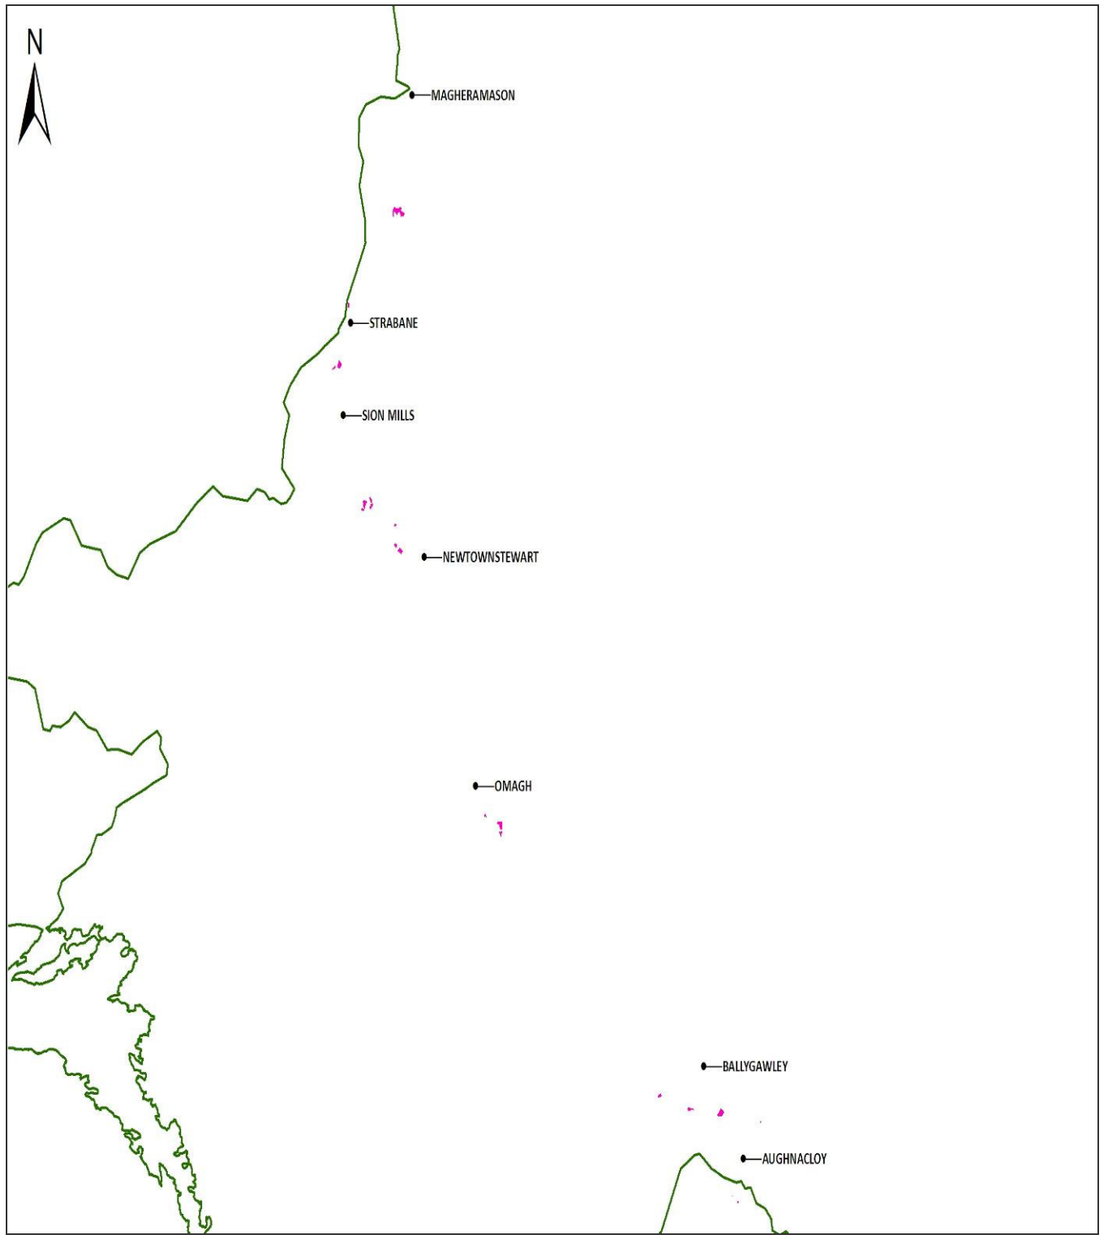

Plate9D.10 Quarry to the South of Omagh Facing North

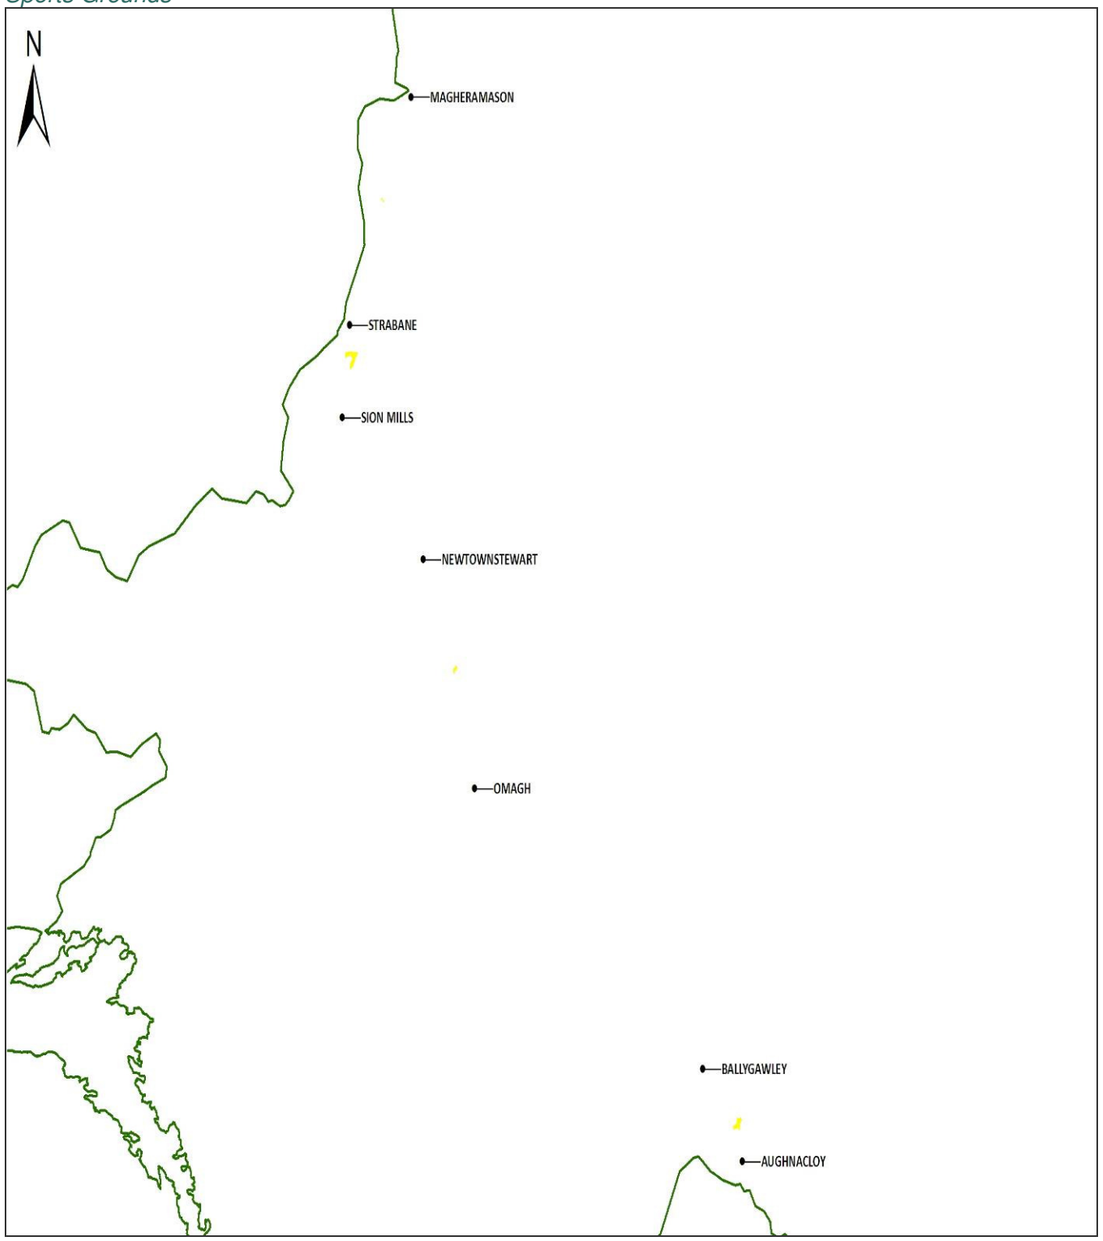
- Description: Industry within the study area mainly consists of quarries. There are a number of modern quarries located in the study area. Historic quarries were on a very small scale and have not left a significant mark on the landscape, nor have the historic linen industry which was widespread during the 19th century. Evidence of this industry survives at Sion Mills but not at other areas of the study area. The identified areas of industry within the study area occur mainly in clusters north of Newtownstewart and at the south near Aughnacloy.
- Period: 20th century
- Factors influencing change: Economic down turn resulting in slow down in business.
- Capacity to absorb change: High
- Value: Low. Industry is considered to be of low value within the historic landscape due to its largely modern date and sparse occurrence.

© Mouchel 2016

Recreation

Sports Grounds



- Description: This HL unit consists mainly of golf courses, with occasional cricket and football grounds also featuring. It is essentially a 20th century feature as there were no golf courses within the study area during the 19th century and feature very rarely throughout the study area.
- Period: 20th century
- Factors influencing change: N/A
- Capacity to absorb change: High
- Value: Low due to their modern origins and lack of impact on a landscape scale.

© Mouchel 2016

Woodland

Long Established Woodland

Plate 9D.11 Grange Forest Facing East

- Description: Long established woodland is classified as areas of woodland which feature on the 1st edition OS maps and which can still be identified today. These areas of woodland are most commonly found within the grounds of houses associated with estates such as Baronscourt and Mountjoy. There are other scattered areas of long established woodland throughout the study area, with small concentrations along the banks of the River Strule. Most other areas of woodland which were identified as occurring within the preferred corridor on the 1st edition maps have been removed in the years since.
- Period: pre-1834
- Factors influencing change: Land clearance for agricultural purposes
- Capacity to absorb change: Low
- Value: Low as it does not have a presence within the historic landscape on a large scale

© Mouchel 2016

Modern Woodland

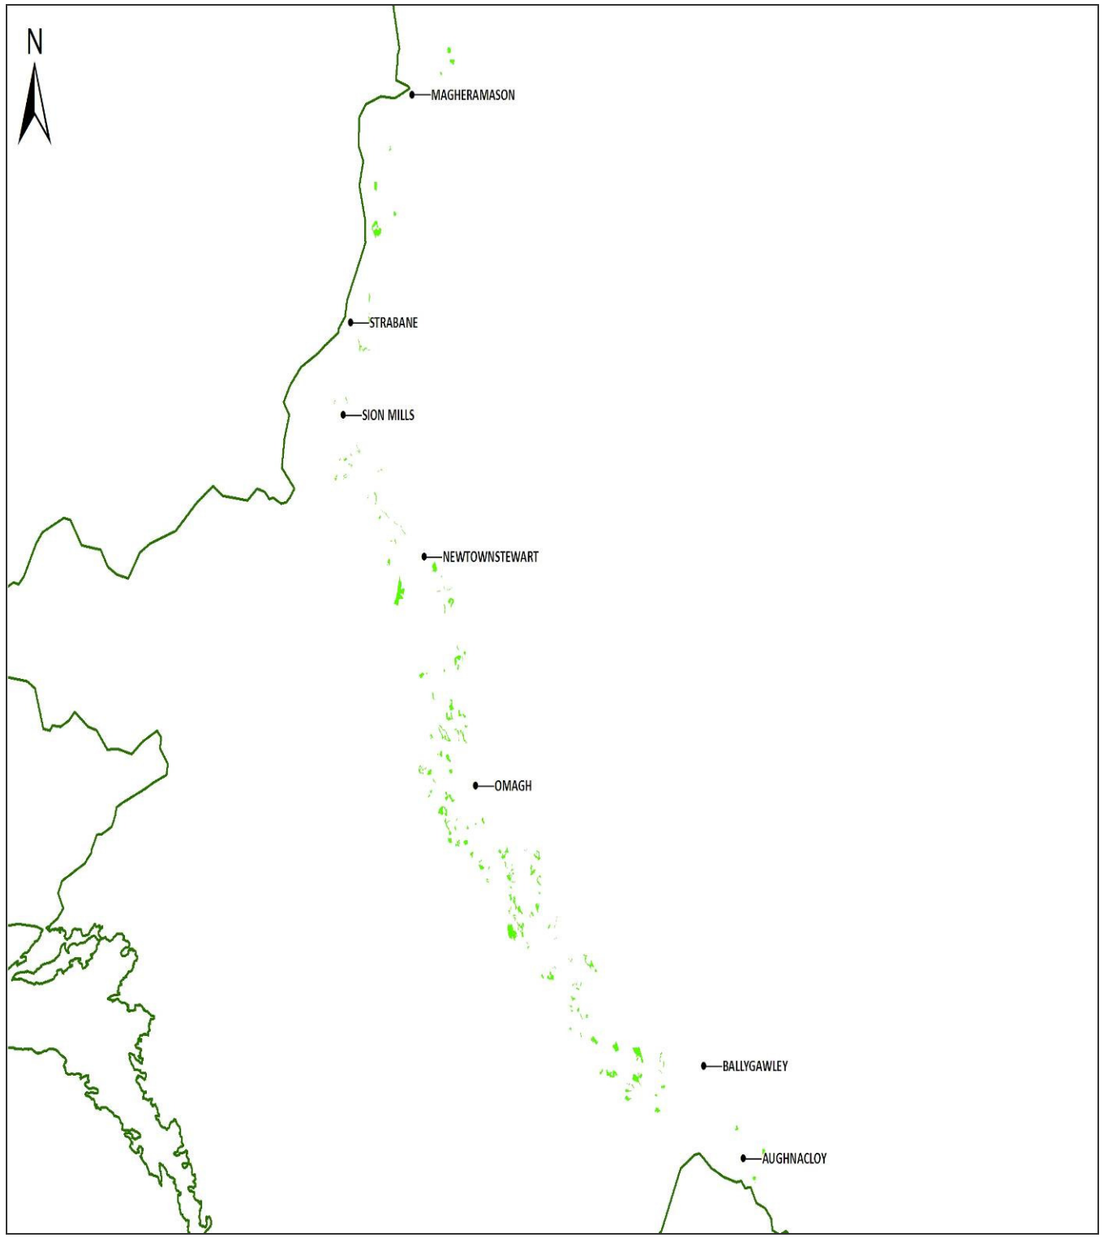


Plate 9D.12 North-West of Omagh Facing North-East

- Description: Modern woodland is classified as areas of woodland not featured on the 1st edition OS mapping, which can be identified from aerial photographs and identified in the field today. These areas of woodland are largely commercial forestry planted during the 20th century with concentrations on the formerly boggy and upland areas around Omagh and further south.
- Period: 20th century
- Factors influencing change: Expansion of commercial forestry
- Capacity to absorb change: High
- Value: Low due to its lack of time depth.

Detailed Descriptions of Impacts on Archaeological Sites

Site 230: This site, Errigal Keerogue, is a State Care monument. The present site dates from the later medieval period but it has much earlier origins. The site is noted in the Annals in 810 AD & 839 AD, indicating that a monastic site was founded here by Dachiarag or Ciaran (Kieran) prior to 810 AD. The monastic site was replaced at a later date by a church and graveyard. The present site is still in use as a graveyard while the church lies in ruins. The implementation of the Proposed Scheme would result in the road running approximately 65m from the south-west boundary of the graveyard, introducing a prominent element into the setting of the site and impacting on any below ground remains associated with the earlier monastic site. There would be impacts on views from and to the monument, the sound environment, the approaches to and the context of the monument, all of which contribute to the setting of the monument. The proposed planting scheme would provide screening to the road, reducing impacts on views from the monument**.**

Errigal/Gort A (Site 278): This site was present to the south of **Site 230** and was Preserved by Record under excavation licence AE/13/57 between 02 April and 17 May 2013. Errigal/Gort A was a previously unknown archaeological site which was identified during Phase 1 archaeological work on the scheme. Full archaeological excavation was undertaken at Errigal/Gort A. The preliminary evaluation of the findings of the excavation suggests that 278 archaeological features were present, comprising a burnt mound, six burnt spreads, eleven occupation/habitation layers, two charcoal rich deposits, 77 pits, 14 linear features (including slot trenches), 44 post-holes and 123 possible stake-holes. For clarity and ease of discussion the site was divided into five areas, A, B, C, D and E.

A burnt mound was identified in Area A. It comprised a burnt mound (008) with an associated underlying layer of peat (007), a trough (004) and pits (009), (012), (014) and (016). In addition, two further deposits or spreads of burnt material (018) and (038) were identified. A further burnt spread or possible palaeochannel (087) was also noted to the north of burnt mound (008). A blade/arrowhead and a flint core were recovered during the initial hand cleaning of the area.
A prehistoric settlement site, currently interpreted as being Late Neolithic/Early Bronze Age in date, was identified in Area B. The site was located at the base of a south-east facing slope with an area of wetland to the southeast, and the Glenhoy stream situated approximately 100 m to the east. The excavated archaeological features consisted of a habitation or occupation spread (084) and associated pit (085), eleven slot trenches/linear features, 15 pits, 22 possible postholes and 14 stake-holes.

The initial archaeological clean-back of Area C identified the truncated remains of a burnt mound, associated pits and possible evidence of a structure. The excavated archaeological features consisted of a spread of burnt mound material (059), three occupation spreads (029), (077) and (080), 6 postholes, 44 stake-holes, 22 sub-circular pits, 6 irregularly shaped pits and three modern land drains.
Further evidence of prehistoric activity was revealed within Areas D.1 to D.3. The excavated archaeological features consisted of a burnt spread (050) within Area D.1; four pits (039), (190), (193) and (199), two charcoal rich deposits (189) and (200), 4 possible postholes (186), (187),

© Mouchel 2016

(191) and (196) and 6 stake-holes within D.2; and five possible occupation areas, 15 pits, 8 postholes and 14 stake-holes within Area D.3.
Area E identified a cluster of stake-holes, two large irregular shaped deposits (155) and (165), nine pits and four postholes (178), (179), (180) and (181) of uncertain date.
Further analysis of the results of the excavation is underway which shall refine the interpretation of the site.

Cloghcor A (Site 269): An excavation license- AE/13/43- was issued to CotswoldRubicon for the purpose of undertaking archaeological excavation at Cloghcor A. This was a previously unknown archaeological site which was identified during Phase 1 archaeological work on the scheme. Full archaeological excavation was undertaken at Cloghcor A in June 2013. The preliminary evaluation of the findings of the excavation suggests that the site related to prehistoric activity which was represented by a burnt mound, a hearth and associated stake-holes. Burnt mounds or *fulachtaí fia* are the most common site type identified and excavated in Ireland and are typical of the Bronze Age.
Located toward the centre of the site and at the top of a slight rise was a hearth (14006). It consisted of an area of intense oxidisation and measured 2 m in length by 0.80 m in width. The hearth was surrounded and cut by numerous stake-holes. It is unlikely all these stakes would have been in use at the same time and as such it is not possible to ascertain any particular alignment. It is possible that they represent the remains of a mix of light wind breaks and supports for cooking activity e.g. spits for roasting.
Located approximately 2.50 m to the east were 13 other stake-holes which were also probably related to the activity around the hearth. Located 1.20 m to the west of the hearth (14006) was a shallow rectangular pit (14004). It had gradual breaks of slope, gently sloping sides and an irregular base. It measured 2.02 m in length, 0.59 m in width and had depth of 0.20 m. It contained two distinct fills; the basal fill (14126) consisted of light grey clayey silt with occasional charcoal flecking which had a depth of 0.07 m. The upper fill (14125) consisted of greyish brown clayey silt with occasional charcoal flecks and had a depth of 0.13 m.

Overlying the hearth, stake-holes and the pit was a burnt mound deposit (14003) consisting of charcoal and heat-shattered stone in a dark grey silty matrix. It measured 10.80 m in length, 8.10 m in width and had a depth of 0.42 m. The fills of the stakeholes were indistinguishable from the overlying burnt mound material.
No trough was identified in the area of excavation which may mean that there is one present outside of the roadtake, possibly to the east.
Further analysis of the results of the excavation is underway, which shall refine the interpretation of the site.

Sollus A (Site 270): An excavation license- AE/13/61- was issued to CotswoldRubicon for the purpose of undertaking archaeological excavation at Sollus A. An area of 500 m² was excavated at Sollus A during Phase 1 archaeological works, revealing a large burnt mound which corresponded with the geophysical anomaly identified at this location. The total area was increased to c. 1943m²

© Mouchel 2016

during Phase 2 archaeological works between 15 April and 7 June 2013 due to the presence of further archaeology encompassing the burnt mound site. Full archaeological excavation was undertaken at Sollus A. Archaeological features were identified which were indicative of at least three phases of activity. The preliminary assessment of the findings of the excavation suggests that 20 archaeological features were present with the earlier phases of activity identified at the site related to the prehistoric period. For clarity and ease of discussion the main features at the site are identified as follows: Henge A - northern ditch (Ditch 1) and southern ditch (Ditch 2), Burnt Mound B, Burnt Spread C, Burnt Spread D and Burnt Spread E and Post-Medieval Trackway (Ditch 3).

The first phase at Sollus A was represented by a possible embanked enclosure / ditched enclosure / henge monument (Henge A) with a northern curvilinear ditch (Ditch 1) and southern curvilinear ditch (Ditch 2). The enclosure also comprised an east and west entrance and (by spatial association) a number of stakeholes / postholes, one of which contained the remains of a substantial worked timber post. Late Neolithic, as well as later pottery was recorded in the northern and southern ditch fills of the enclosure. A second phase of activity was represented by a fulacht fiadh (Burnt Mound B) which was located within the confines of and post-dated Henge A. Burnt Mound B contained two types of wood-lined troughs, and other spreads of burnt material were located in the south-east (Burnt Spread C & D) and south-west (Burnt Spread E) of the site. Ceramic evidence associated with this phase of activity encompasses possible Middle and mainly Late Bronze Age material from Burnt Mound B and spreads. Waterlogged and peat deposits were present in parts of the site, including two phases of peat formation within Burnt Mound B and a considerable assemblage of palaeo-environmental material was recovered including waterlogged worked wood. Located to the south-west of Burnt Mound B, was a linear alignment of worked stakes and brushwood, possibly utilised as a platform. A much later phase of activity comprising a post-medieval trackway (Ditch 3) and an extensive land drainage system was also in evidence at the site. Further analysis of the results of the excavation is underway, which shall refine the interpretation of the site.

Magherareagh A (Site 271): Archaeological field work was carried out at trench group TT027 (Ch.8205 – Ch.8595) on 8th February 2013. Two potential archaeological features were identified, a possible charcoal production pit (006) and a ditch (003). These features have been provisionally interpreted as being industrial in nature. The site is currently preserved *in-situ.* As the site would be impacted by the scheme full site mitigation would be required.

Magherareagh B & C (Site 272): Field work was carried out at trench group TT030 (Ch.8800 – Ch.9140) between the 5th and 7th February 2013. Archaeological features were identified in two discrete areas, recorded as Magherareagh B and Magherareagh C.
Magherareagh B consisted of a spread of burnt mound material. The spread measured 30.6m x 9.4m x 0.14m and was comprised of four deposits of heat shattered stone and charcoal, (009) (010) (011) (012), which overlay a deposit of peat and natural subsoil. Two wooden pegs were identified in deposit (009). The pegs measured 0.10m in diameter. The mound was sealed by topsoil and a stone axe fragment was recovered from the topsoil.
Magherareagh C comprised of a series of pits from which prehistoric pottery sherds were recovered.

© Mouchel 2016

A total of sixteen pits were revealed and these features varied in size and shape. The pits ranged in size from 0.10m in diameter to 2.16m in length and 2.16m in width. The smaller pits in the group were circular to sub-circular in plan, the larger pits were irregular in shape.

Pit (010) was dumbbell shaped and pits (011) and (016) were keyhole shaped in plan. Based on their shape in plan, these pits may represent kilns. Pottery sherds were collected from the fills of pits (010) and (016). All of these features are currently preserved *in-situ*. As the site would be impacted by the scheme full site mitigation would be required.

Drumenny Little/Grange Foyle A-D (Site 273): Archaeological fieldwork was carried out at trench group TT031 (Ch. 9250 –Ch. 9650) on the 14th February 2013. A total of eight archaeological features were identified. These features occurred in four discrete areas; now named Drumenny Little/Grange Foyle A to Drumenny Little/Grange Foyle D:

Drumenny Little/Grange Foyle A A burnt spread (025)
Drumenny Little/Grange Foyle B Pit (035) and hearth (022)
Drumenny Little/Grange Foyle C Ditches (003), (006), (009), (019) and pit (010)
Drumenny Little/Grange Foyle D Burnt spread (037)

These remains have been provisionally interpreted as domestic in character. Two sherds of pottery were recovered from hearth 022 and these have been provisionally dated to the mid Neolithic and early Bronze Age. All of the above features are currently preserved *in-situ*. As the site would be impacted by the scheme full site mitigation would be required.

Ballydonaghy A-D (Site 274): Archaeological fieldwork was carried out at TT037 (Ch. 10510 –Ch. 10855) at the southern end of the route on the 8th February 2013. A total of nine archaeological features were identified. These features occurred in four discrete areas; now named Ballydonaghy A to Ballydonaghy D inclusive:

Ballydonaghy A Pits (035), (038), and ditch (027)
Ballydonaghy B Pit (031), burnt spread (029) and scorched deposit (034)
Ballydonaghy C Stakehole (024)
Ballydonaghy D Hearth (020) and stakehole (022)

These remains have been provisionally interpreted as domestic and/or industrial in character and may represent past activity associated with previously unidentified archaeological activity within the townland of Ballydonaghy, or indeed with the undated and unclassified enclosure in the adjacent townland of Drumenny Big (TYR002:016). The above features are currently preserved *in-situ*. As the site would be impacted by the scheme full site mitigation would be required.

Desert A & B (Site 275): Field work was carried out at trench group TT050 (Ch. 14070 –Ch. 14525), at the southern end of the New Buildings to South of Strabane section between 6th and 7th February 2013. Three pits, one stakehole and a hearth of unknown date were identified. Pit (012) and associated stakehole (014) were discovered in isolation to the north of the other group of features and were recorded as Desert A.

The second group of features consisted of two of pits (006); (009) and hearth (011). These features were located in close proximity and may be related features. This site was recorded as

© Mouchel 2016

Desert B and as with Desert A is currently preserved in-situ. As the site would be impacted by the scheme full site mitigation would be required.

Feddan/Drumcorke A-D (Site 276): An excavation license- AE/13/32- was issued to CotswoldRubicon for the purpose of undertaking archaeological excavation at Feddan/Drumcorke A-D. Full archaeological excavation was undertaken of four areas at Feddan/Drumcorke A-D: total area of 2376 m²) between 4th March and 3rd April 2013. The preliminary evaluation of the findings of the excavation suggests that 70 archaeological features were present indicating prehistoric activity at two of the areas, including the remnants of a possible roundhouse and several hearths (Area A) and two ring ditches (one with a truncated central cremation grave), and pits and postholes (Area B). Both these areas produced assemblages of prehistoric pottery. Area D contained a probable charcoal production pit, and Area C contained a keyhole-shaped kiln in which evidence of firing, remnants of charcoal and layers of lime were preserved. Two ditches were also recorded at the latter site, one of which was cut by the kiln and was thus presumably earlier in date than the kiln, and the second of which contained modern artefacts and can be seen on the 1st Edition OS map of the area. Further analysis of the results of the excavation is underway which shall refine the interpretation of the site.

Tycanny A (Site 277): Archaeological field work was carried out at prescribed trench groups TT097 (Ch. 76170 – Ch. 76295) and TT098 (Ch. 76425 – Ch. 76630) at the southern end of the route between 05 February and 06 February 2013. One archaeological feature was identified; a burnt mound spread broadly oval in plan measuring approximately 12m x 3m x 0.2m. This burnt mound spread was discovered within TT097 and is currently preserved *in-situ*. As the site would be impacted by the scheme full site mitigation would be required.

Tullanafoile A (Site 279): An excavation license- AE/13/38- was issued to CotswoldRubicon for the purpose of undertaking archaeological excavation at Tullanafoile A. Full archaeological excavation was undertaken at Tullanafoile A between 19 and 21 March 2013, where a total area of 100 m² was excavated.

Two phases of activity were identified at Tullanafoile A consisting of a possible kiln of uncertain date and a series of north/south orientated furrows associated with agricultural activity. The kiln, which was located within the central area of the site, was key-hole shaped in plan and orientated east/west. The kiln bowl measured 2.8m in diameter with a maximum depth of 0.57m and had steep to gently sloping sides with a rounded flat base. There were two possible flues, one of which extended eastwards from the kiln bowl and the other was located on the south side of kiln bowl. The exact function and date of the kiln is still unknown. No artefactual evidence was recovered from the site. Further analysis of the results of the excavation is underway which shall refine the interpretation of the site.

Legacurry A (Site 280): An excavation license- AE/13/111- was issued to CotswoldRubicon for the purpose of undertaking archaeological excavation at Legacurry A. This was a previously unknown archaeological site which was identified during Phase 1 archaeological work on the scheme. Full archaeological excavation was undertaken at Legacurry A between 10 and 11 June 2013. The preliminary evaluation of the findings of the excavation suggests that the one phase of

© Mouchel 2016

activity at the site related to prehistoric activity which was represented by a burnt mound. Burnt mounds or fulachtaí fia are the most common site type identified and excavated in Ireland and are typical of the Bronze Age.
The larger of the two burnt spreads identified (003) consisted of dark greyish brown/black clayey silt with heat-affected stone and frequent charcoal inclusions. It measured 3.5 m in length, 5.30 m in width and had a depth of 0.10 m.
Located 0.76 m to the west was the second smaller spread (004) which overlay a single stake-hole (005). The stake-hole was circular in plan with sharp breaks of slope, steep sides and a slightly concave base. It measured 0.08 m in diameter and had a depth of 0.12 m. It contained a single fill (006) of soft mid grey brown sandy silt with frequent charcoal flecks.
The smaller spread (004) which overlay the stake-hole consisted of dark greyish brown/black clayey silt with heat-affected stone and frequent charcoal inclusions. It measured 1.60 m in length, 1.10 m in width and had a depth of 0.11 m.
It is likely that both spreads were originally joined and have been truncated over time by later agricultural activity.
Further analysis of the results of the excavation is underway, which shall refine the interpretation of the site.

Killadroy A (Site 281): An excavation license- AE/13/110- was issued to CotswoldRubicon for the purpose of undertaking archaeological excavation at Killadroy A. This was a previously unknown archaeological site which was identified during Phase 1 archaeological work on the scheme. Full archaeological excavation was undertaken at Killadroy A between 10 and 11 June 2013. The preliminary evaluation of the findings of the excavation suggests that only a single phase of activity was identified at Killadroy A represented by a possible kiln of uncertain date.
A possible kiln (003) was identified towards the centre of the excavation area. This feature was key-hole shaped in plan with gradual breaks of slope at the top and base. The kiln bowl had steep to gently sloping sides and a rounded base. There is evidence of oxidisation at the base of the bowl. The flue was linear in plan with gently sloping sides and a nearly flat base. The kiln measured 3.90 m in length (NW/SE), between 1 m and 1.85 m in width and had an average depth of 0.22 m. There were five deposits present within the cut. The basal fill (004), located in the bowl of the kiln only, and consisted of moderately compacted greyish black charcoal-rich silt clay. It measured 0.03 m in depth. A deposit of moderately compacted silty sand (007) with occasional charcoal flecks was found at the junction of the bowl and the flue of the kiln. Above both of these lay moderately compact pinkish grey silty clay (005) which had a depth of 0.13 m. The uppermost fill located in the bowl of the kiln was moderate to firmly compacted orangey grey clay (006). It had a depth of 0.10 m. A single deposit of moderately compacted greyish brown sandy clay (008) was located in the flue of the kiln. It measured 1.84 m in length, 1 m in width and had a depth of 0.12 m. The shape of the feature is consistent with a corn-drying kiln however the absence of grain from the environmental samples casts doubts on this interpretation.
Further analysis of the results of the excavation is underway, which shall refine the interpretation of the site.

Moylagh A & B (Site 282): An excavation license- AE/13/60- was issued to CotswoldRubicon for the purpose of undertaking archaeological excavation at Moylagh A & B. Excavation of this site

© Mouchel 2016

was undertaken between 03 and 11 April 2013 with a total area of 1204 m² excavated at Moylagh A and 270 m² excavated at Moylagh B. Fourteen archaeological features were identified.

Moylagh A contained an undated burnt spread, and a shallow irregular pit located on a north-facing slope possibly representing a first phase of activity on the site. Three undated ditches (one of which remained unexcavated) represented a second phase. A series of modern furrows, land drains and an undated tree throw hole identified a further phase of activity. No archaeological artefactual evidence was recovered from Moylagh A. The presence of modern artefacts was noted, and they were left in situ.
At Moylagh B, a large burnt spread was the main focus of the site. Several post-holes and a stake-hole lay beneath the burnt spread, as well as a shallow sub-rectangular possible trough with a flat base. Towards the eastern end of the trough base a large oval shaped post-hole or pit with vertical sides and a flat base was identified, itself cut by a small post-hole and although the physical relationship between these features was difficult to determine, it is likely that the large post-hole or pit cut the trough. The burnt spread and associated features mark a first phase of activity.

In addition, a second phase of activity was identified, comprising an undated field boundary ditch with a modern re-cut and two modern land drains. No artefactual evidence was recovered from Moylagh B.
Further analysis of the results of the excavation is underway, which shall refine the interpretation of the site.

SMA015 (Site 283): Fieldwork was carried out at Strip and Map Area (SMA) 015 (Ch. 67080 - Ch. 67175) on the 27 February 2013. An isolated pit was discovered during the topsoil stripping and clean-back of this area. As no other features were present it was decided to excavate this feature rather than return at a later date. The pit was sub-rectangular in plan and measured 1.35m x 0.95m x 0.17m. The pit contained evidence of in-situ burning as the sides and base were heavily oxidised. It is possible that the pit would have functioned as a charcoal production pit. The fill of this pit contained charred material, which was sampled. Further analysis of the results of the excavation is underway, which shall refine the interpretation of the feature.

SMA018 (Site 284): Fieldwork was carried out at Strip and Map Area (SMA) 018 (Ch. 74010 - Ch. 74130) on the 11 February 2013. An isolated pit was discovered during the topsoil stripping and clean-back of this area. As no other features were present it was decided to excavate this feature rather than return at a later date. The pit was oval in shape and measured 1.38m x 0.7m x 0.25m. A deposit of small sub-angular stones was located at the base of the pit and was sealed by a sterile mid grey sandy silt. No further work is required in relation to this feature.

Site 262: This large hilltop enclosure is located in the townland of Dernabane. The dating of this site is unknown however the location may suggest that this site is an Iron Age hillfort; further investigation would be required to confirm this.

The Proposed Scheme would run approximately 100m from the boundary of the site, in a deep cutting on the south-east of the site boundary, removing part of the side of the hill on which the fort

© Mouchel 2016

is located. Given the location of the monument (which utilised the local topography) and its wide open views of the surrounding landscape, there would be impacts on its approaches and context, which would be partially mitigated through the proposed planting scheme, providing screening to the road, reducing impact on the monuments setting

Site 260: This enclosure site is located in an inter-drumlin hollow. It is well preserved. The Proposed Scheme would run very close to the south-west corner of the site and it likely that there would be below ground remains associated with the enclosure within the scheme footprint, as well as impacts on views, approaches and context of the monument. Mitigation would be through excavation, resulting in the production and retention of an archive and dissemination of the results (preservation by record). The proposed planting scheme would provide screening to the scheme, reducing the impact on its setting.

Site 259: This oval enclosure is located on high ground overlooking the Proposed Scheme. The site is largely destroyed with the only surviving remains being incorporated into a field boundary. The implementation of the Proposed Scheme would result in the road being visible from the site but as there are only minor remains at the site no mitigation would be required.

Site 255: The Proposed Scheme would run across the south-west edge of the scheduled zone of this platform rath at Lisdoart. Scheduled Monument Consent would be required prior to work being undertaken on the site. Mitigation would be preservation by record through archaeological excavation, which is likely to uncover further remains associated with the rath and may uncover previously unknown ditches from the monument. The proposed planting scheme would provide screening to the scheme, reducing the impact on the monuments setting.

Site 240: There a few upstanding remains of this enclosure site. Beneath the topsoil there are likely to be remains of large enclosing ditches and evidence of occupation. The scheme would run directly through the monument. Mitigation would be through preservation by record.

Site 182: This platform rath, which is a scheduled monument, is located on top of a drumlin with a clear view to the north, but limited views in other directions. The setting of the rath is part of the site's significance and value. The Proposed Scheme would run approximately 110m to the east of the site boundary. The proposed planting scheme would provide screening to the scheme, reducing the impact on the setting. It should be noted that as the primary view to the north would remain the same the impact on the setting would be lessened. During the construction phase of the Proposed Scheme, an area to the south of the monument would be used for one or more of the following: temporary contruction works; deposition of unsuitable building material; settlement ponds. The use of this land during construction would cause a further impact on the setting of this scheduled monument.

Site 199: This enclosure site is located at one end of a ridge. Although there are no visible remains, there are likely to be remains of substantial enclosing ditches and evidence of occupation beneath the subsoil. The Proposed Scheme would run directly through the area where this monument once stood. Mitigation would be through preservation by record.

© Mouchel 2016

Site 142: Harry Avery's Castle is located on high ground above Newtownstewart. This site is an important State Care monument dating to the thirteenth century. The surrounding views and commanding position of the castle within the landscape are key to the castle's heritage value. The Proposed Scheme would run in cutting approximately 120m to the south of the site and would introduce a prominent new element into the setting of the monument including impacts on the views, topography, sound environment, approaches and context of the monument, all of which are factors which contribute to the setting of the monument. The proposed planting scheme, and the road being in cutting, would reduce the impacts on the setting of the monument.

Site 212: This is a Scheduled rath on the summit of a drumlin with good views. The site had been eroded by livestock and is overgrown with gorse and hawthorn. The Proposed Scheme would run approximately 55m to the east of the site and would impact on the setting of the monument. The proposed planting scheme would provide screening to the scheme, reducing the impact on the setting.

Site 150: This wedge tomb has a single chambered tomb facing south-west. It was roofed over with large stone lintels, one of which is dislodged. The site is closely associated with site 368 which is a court tomb. The setting of the site is adversely affected by the current A5 road. The Proposed Scheme would run approximately 15m west of the site boundary, impacting on its setting. The proposed planting scheme would provide screening, reducing the impacts. There would also be impacts on the setting of the monument from an attenuation pond and a private track to the east.

Site 151: The site is a scheduled court tomb and is located on the lower slopes of Bessy Bell. The site has been partially destroyed and excavated but there are still three partial chambers visible. The site is closely associated with site 367 which is a wedge tomb. The setting of this monument is currently adversely affected by the A5 road.

The Proposed Scheme would run approximately 70m west of the site boundary. The proposed planting scheme would provide screening to the site, reducing the impact on the setting.

Site 188: This site is a well preserved scheduled rath. It is defined by a platform over a steep slope, at the north, and by a ditch and counterscarp dug into the uphill side of the site. A slight perimeter bank is traceable around the site making it a bivallated rath. The Proposed Scheme would run approximately 170m to the west of the site. The proposed planting scheme, and the fact that the road would be in cutting along the edge of the drumlin that the site is located on, would reduce the impact on the setting of the site.

Site 186: This scheduled counterscarp rath site is well preserved but extremely overgrown. The western side of the rath is defined by a laneway which is also tree lined. The Proposed Scheme would result in the road running approximately 50 m to the west of the site. The current dense vegetation surrounding the rath would create a buffer between the road and the site, although there would still be impacts on the monuments setting through increased noise. The proposed planting scheme would provide further screening to the site, minimising the impact on the setting.

© Mouchel 2016

Site 49: Strabane Canal was constructed between 1791 and 1796 by the Marquis of Abercorn at a total cost of £11,858. It extended from the town of Strabane for a distance of just over four miles to a junction with the Foyle, on the extreme northern edge of the Parish of Leckpatrick. The canal had a total length of 4 miles and 6 chains. There were two large locks in the lower reaches. From 1944 onwards efforts were made to have the canal made redundant. In December 1962, the section from the basin, in the centre of Strabane to the site of the former swing bridge, in the townland of Desert, was officially closed. Technically, the rest of the canal remains open. The implementation of the Proposed Scheme would result in the road running between 20m and 300m from the boundary of the section of the canal known as 'Reach 2'. The proposed planting scheme would provide screening to the scheme, reducing the impact on the setting. At 'Reach 3' the road would cross over part of the former canal and Scheduled Monument Consent would be required prior to construction. Mitigation for Reach 3 would be through preservation by record.

Site 141: The area surrounding Harry Avery's Castle has a high potential for archaeological remains. The area surrounding Harry Avery's Castle has a high potential for archaeological remains. The Proposed Scheme would run directly through this area. An archaeological evaluation possibly followed by a full excavation would be undertaken to identify any remains and mitigate any impacts.

Site 222: Tycanny Hillfort is located on a high hill (utilising the local topography in its construction) with good views across the landscape. The Proposed Scheme would result in the road running over 300m away from the site. The road would be visible from the fort and would cut into the hillside on which tycanny is situated, thus having an impact on the topography, sound environment and context of the monument, which all contribute to its setting. The proposed planting scheme would provide some screening, reducing the impact on the setting of the monument.

Detailed Descriptions of Impacts on Built Heritage Sites

Site 176: The bridge carries Todds Road over the former railway line that ran from Omagh to Londonderry from c.1850 – c.1950. The 4th edition OS mapping labels the bridge as 'Todd's Bridge'. The line of the railway embankment is still discernible although land to the north of the bridge has been in-filled. The structure of the bridge remains intact. The implementation of the Proposed Scheme would result in the demolition of the structure. A full building recording would be undertaken to create a permanent record of the building through annotated plans, written descriptions and digital photographs.

© Mouchel 2016

Plate 9E.1 Site 176: Looking East

Site 169: The bridge carries Tully Road over the former railway line that ran from Omagh to Londonderry from c.1850 – c.1950. The 4th edition OS mapping labels the bridge as 'Clark's Bridge.' The railway embankment is still discernible and very deep in this location; as a result the structure and arch of the bridge is of considerable size. The implementation of the Proposed Scheme would result in the demolition of the structure. A full building recording would be undertaken to create a permanent record of the building through annotated plans, written descriptions and digital photographs.

Plate 9E.2 Site 169: South Side of the Bridge

© Mouchel 2016

Site 173: Unlike sites 176 and 169, site 173 is the remains of a former railway bridge which carried the former railway line, which ran from Omagh to Londonderry, over a small road and stream. The 4th edition OS mapping labels the bridge as 'McClay's Bridge.' The arch of the bridge has collapsed and the former railway embankment either side of the structure has been flattened. The implementation of the Proposed Scheme would result in the total demolition of the structure. A full building recording would be undertaken to create a permanent record of the building through annotated plans, written descriptions and digital photographs.

Plate 9E.3 Site 173, West Side of the Bridge

Site 12: The isolated former mill building, to the north-west of Magheramason, is derelict and only the exterior walls are intact. Within the interior there are the remains of various mechanisms from its use as a mill. The structure is set down hill from the adjacent farm and is next to the Blackstone Burn.

The farm buildings and farm house adjacent to the IHR site are all undesignated. The farm and farmhouse are currently in active use. Historic map regression depicts buildings on the site of the current farm yard from the 1st edition OS. In the 3rd edition OS mapping footprints of farm buildings and a farm house as existing are depicted, dating the structures to circa late nineteenth century. The implementation of the Proposed Scheme would result in the demolition of the farm buildings and farm house, but not the IHR site.

The Proposed Scheme would severe the relationship between the mill building and the farm. The principle relationship between the mill and the Blackstone Burn would not be impacted however and the proposed planting would ensure that the immediate setting of the IHR site is maintained.

© Mouchel 2016

A full building recording of the farm buildings and farm house would create a permanent record of the building through annotated plans, written descriptions and digital photographs.

Plate 9E.4 Site 12, West Elevation of the North Eastern Farm Building

Site 200: This undesignated single storey vernacular dwelling sits in fields north-east of the Seskinore Forest. Identifiable on the 1st edition OS mapping, the structure is still visible in the landscape today with its distinctive red corrugated iron roof and rear outshoot. The implementation of the Proposed Scheme would result in the total demolition of the structure. A permanent record of the building would be created, through annotated plans, written descriptions and digital photographs

© Mouchel 2016

Plate 9E.5 Site 200, West Elevation of the Vernacular Building

Site 256: Palymira Lodge, which is situated off Lisdoart Road, south of Ballygawley, is well screened from the existing public highway by mature vegetation and this vegetation extends along all of the site's boundaries. Implementation of the Proposed Scheme would result in the road running approximately 180m north-east from the boundary of the site. The proposed planting scheme would provide further screening to the site, reducing the visual impact on the setting of the house.

Plate 9E.6 Site 256, the South Elevation of Palymira Lodge

© Mouchel 2016

Site 266: The Manse is set back from the current A28 where the house is currently viewed from. The north, west and east sides of the building are very enclosed, due to an adjacent outbuilding and mature hedges/ vegetation. The building can not currently be viewed from within the landscape, to the east. Implementation of the Proposed Scheme would result in the road running approximately 130m south-east from the boundary of the site. The proposed planting scheme to the east of the site, and west of the Proposed Scheme, and the fact that the road would be in cutting, would reduce visual impacts on the setting of the building.

Plate 9E.7 Site 266, the South Elevation of The Manse

Site 85: The site of Castletown House appears on the 1st edition OS map of c.1830 as two separate buildings with large footprints. On the 4th edition OS mapping the footprint of the site has been reduced to one building, which was presumably a result of the construction of the County Donegal Railway line in the 1860s which ran in-front of the house. Although it is not known what the house looked like originally, the house as it appears today seems to have been largely remodelled. The list description for the house, however, states that there are still interior elements from the 18th century. It has not been possible to access the interior of the building so assessment of the building has been restricted to what can be seen of the exterior and its current setting.

The implementation of the Proposed Scheme would result in the total demolition of the building. A Listed Building Consent application would need to be submitted to the NIEA for permission to demolish the building. Guidance set out in Policy Planning Statement 6 (PPS 6): Planning, Archaeology and The Built Heritage states that there is a general presumption in favour of the retention of built heritage assets, and whilst the loss of designated built heritage assets (i.e. listed buildings) is not envisaged in the legislation or guidance, it is recognised that in some exceptional cases it may be necessary. In cases where the built heritage asset can not be retained in its original or reasonably modified form it would be necessary to arrange agreements for recording. A

© Mouchel 2016

permanent record of the building would be created, through annotated plans, written descriptions and digital photographs.

Plate 9E.8 Site 85, Looking West at the South and East Elevations of Castletown House

Site 89: The Red House is located on the south side of Urney Road, to the north-west of Strabane, and is heavily screened by existing mature vegetation on all sides. The implementation of the Proposed Scheme would result in the road running approximately 70m west of the house. The proposed planting scheme would reduce the visual impacts on the setting of the house.

© Mouchel 2016

Plate 9E.9 89, the north-easterly elevation of Red House

Site 90: The Gate Lodge is located on the south side of Urney Road, to the north-west of Strabane. The principal elevation of the Gate Lodge faces west, marking the entrance to the Carricklee House estate. The north, east and south boundaries are all screened with mature vegetation. The implementation of the Proposed Scheme would result in the road running approximately 50m east of the house. The proposed planting scheme would reduce the visual impacts on the setting of the house.

Plate 9E.10 Site 90, The West Elevation of The Gate Lodge

© Mouchel 2016

Site 20: Bready Reformed Presbyterian Church is located adjacent to the current A5, to the north of the village. Originally built in 1786 it was then rebuilt in 1823; the footprint of the building is discernible on the 1st edition OS mapping and labelled as a 'Meeting House', and then on the 3rd edition OS mapping as a 'Presb. Church.' The implementation of the Proposed Scheme would result in the road running 70m east of the building. The proposed planting scheme to the north of the site, and east of the Proposed Scheme, and the fact that the road would be in cutting, would reduce the visual impacts on the setting of the building.

Plate 9E.11 Site 20, Looking South at the North and West Elevations of Bready Reformed Church

Site 101: Gallany House is located approximately 1km north of Glebe. Due to the commanding position of the house, which affords views across to the foothills of the Sperrins in the east, it has a large setting. The implementation of the Proposed Scheme would result in the road running approximately 600m to the east of the building, within the wider setting of the house. The proposed planting scheme on the section of the road directly east of the house would reduce the visual impacts on the setting of the building.

© Mouchel 2016

Plate 9E.12 Site 101: The East Elevation of Gallany House

Site 53: Woodend Cottage is set back approximately 30m south-east from the existing A5, north-east of Strabane. Due to its existing position, the implementation of the Proposed Scheme would not result in the setting of the site being affected.

Plate 9E.13 Site 53: The North Elevation of Woodend Cottage

© Mouchel 2016

Site 257: This site is located off the Lisginny Road, approximately 2km south of Ballygawley. Access to this undesignated site was only available during the 2nd walkover survey when it was recorded as being 'a well preserved two storey farm building of cut stone blocks and a slate roof. Arched ground level entrance and two 1st floor windows on SW side. Additional building attached to NW gable. Two storey stone farmhouse across the lane.' From aerial photographs the site appears to be a small farm, and historic mapping from the 2nd edition OS maps illustrates a number of buildings of similar footprint as seen today. The heritage value of the setting of the buildings is restricted to the grouping of buildings and is therefore 'self-contained' in nature. The implementation of the Proposed Scheme would result in the road running approximately 110m north of the buildings. The proposed design of the road which would be in cutting along with the associated planting scheme would reduce any visual impact.

Plate 9E.14 Site 257: Looking West Across the Farm Site

Site 135: This undesignated large two storey farm building, which is approximately 3km north-west of Newtownstewart, is set within a large farm yard. The heritage value of the setting of the buildings is restricted to the group of buildings and is therefore 'self-contained' in nature. The implementation of the Proposed Scheme would result in the road running approximately 240m of the building. The proposed planting scheme would reduce any visual impact.

© Mouchel 2016

Plate 9E.15 Site 135: The East Elevation of the Farm Building

Site 168: Located south of the U1517 road, west of Mountjoy, this former farm building appears to have had some restoration work carried out on it in the past. The site is uninhabited at present. Dating to pre-1840, 1st edition OS mapping suggests that there were at one time three structures within the site. The implementation of the Proposed Scheme would result in the road running approximately 90m to the east of the building. The design of the route, which would be in cutting, along with the planting scheme would reduce visual impacts on the setting of the building.

Plate 9E.16 Site 168: The North Elevation of the Farm Building

© Mouchel 2016

Site 185: Situated west of Omagh, this single storey stone vernacular building is a good example of a vernacular dwelling that has been extended along its longitudinal axis to include a byre for agricultural use (often called byre-dwellings). The building is evident on the 1st edition OS mapping and probably dates to the early part of the nineteenth century. The building has a squared projecting central porch, which is a characteristic feature of the area, and a modern corrugated iron roof has been added. The building is set within a small dense area of trees and vegetation and is well screened. The implementation of the Proposed Scheme would result in the road running approximately 70m to the west of the building. Due to the secluded nature of the site visual impact on the setting of the building is highly unlikely. The proposed planting scheme would ensure there is no visual impact on the setting of the building.

Plate 9E.17 Site 185: The East Elevation of the Vernacular Dwelling

Site 145: Located east off the C671, south of Newtownstewart, only one gable end of this former two-storey dwelling is still extant. First edition OS mapping illustrates a structure on the same site which is labelled as being a 'Ruin'. The implementation of the Proposed Scheme would result in the demolition of the remaining structure. A full building recording would be undertaken to create a permanent record of the building through annotated plans, written descriptions and digital photographs.

© Mouchel 2016

Plate 9E.18 Site 145: The South Gable End of the Former Dwelling

Site 112: Situated between Glebe and Sion Mills, this vernacular dwelling is in an extremely dilapidated state. The structure is not evident on the 1st edition OS map, and probably dates to the late nineteenth century. The implementation of the Proposed Scheme would result in the total demolition of the structure. A full building recording would be undertaken to create a permanent record of the building through annotated plans, written descriptions and digital photographs.

Plate 9E.19 Site 112: The East Elevation of the Former Vernacular Dwelling

© Mouchel 2016

Site 108: Identified from the walkover survey, Ballyfatten House is a large undesignated dwelling possibly dating to the late nineteenth century. It is situated alongside the existing A5, north of Sion Mills. Historic mapping (1st edition OS c.1840) depicts a building with an 'L'- shaped footprint on the same site and it is possible that the current building could be a remodelling of this earlier building. The 3rd edition OS mapping, which dates to the early 20th century, depicts an enlarged footprint and labels the building as 'Ballyfatten House.'

The implementation of the Proposed Scheme would result in the road running approximately 70 m round the house from the north side to the west. The proposed planting scheme would reduce visual impacts on the setting of the house.

Plate 9E.20 Site 108: The East Elevation of Ballyfatten House

Site 106: North of site 108; Ballyfatten House; alongside the existing A5, this vernacular building was identified from the walkover survey. Only a few courses of stone structure remain and the site is very overgrown. The implementation of the Proposed Scheme would result in the demolition of the structure. A permanent record of the building would be created, through annotated plans, written descriptions and digital photographs.

© Mouchel 2016

Plate 9E.21 The Remains of Site 106, Looking South

Site 100: This undesignated single storey building appears to be a gate lodge associated with Gallany House (site 676). The gate lodge does not appear on the 1st edition OS mapping but is labelled as 'Lodge' on the 3rd edition mapping making it date to the circa the late nineteenth century. The implementation of the Proposed Scheme would result in a new access route to the north of the structure; currently there is an established hedge to the north of the structure and as long as this is retained there would not be an impact on the setting of the building.

Plate 9E.22 Site 100: The West Elevation of the Lodge

© Mouchel 2016

Site 23: Located on the western slope of Gortmonly Hill overlooking the Foyle floodplain, two/three single storey stone vernacular buildings have been adapted for modern agricultural use. 1st edition OS mapping depicts 15 separate structures on the site whilst the 3rd edition OS mapping depicts a reduction in structures to around 8. The 3rd edition OS mapping labels the area as Tamnasollus and the Townland name of Sollus. The adjacent quarry to the south was known as the 'Tamnasollus Quarry.' These buildings could therefore be the remains of a small settlement associated with the quarry which means there is the potential for further buried remains to be present around the site (see Appendix 9C for the archaeology baseline).

The implementation of the Proposed Scheme would result in the demolition of the structures. A permanent record of the building would be created through annotated plans, written descriptions and digital photographs.

Plate 9E.23 Site 23: Looking West at the South and East Elevations of the Former Vernacular Buildings

Site 170: The bridge carried the former railway line that ran from Omagh to Londonderry from c.1850 – c.1950 over a small stream. The 4th edition OS mapping does not label the bridge. The bridge is buried in heavy vegetation within the former railway embankment and appears to be in a poor condition. The implementation of the Proposed Scheme would result in the demolition of the structure. A full building recording would be undertaken to create a permanent record of the building through annotated plans, written descriptions and digital photographs. Due to the conditions of the site, it is not possible to obtain a clear photo of the structure.

APPENDIX 14A NEW SEVERANCE

Road/Route	Approximate Chainage	Change in journey length	Impact	Comments
A5 Victoria Road - National Cycle Route 93	100	Negligible	Negligible	Continued connectivity along the A5 Victoria Road. Introduction of a roundabout.
A5 Victoria Road	1750	Negligible	Negligible	Introduction of a roundabout.
Dunnalong Road	3950	Negligible	Negligible	Continued access along Dunnalong Road.
Meenagh Road	4930	Negligible	Negligible	New overbridge across A5 WTC.
Cloghboy Road	6500	Negligible	Negligible	Existing road severed and realigned immediately south.
Donagheady Road	7870	Negligible	Negligible	Existing road severed and realigned immediately south.
Willow Road	8850	200m	**Slight Adverse**	Existing road severed and realigned immediately south.
Ash Avenue	9600	600m	**Slight Adverse**	Road severed to A5. Provision for users through a diverted road linking to Drumenny Road
Drumenny Road	10020	Negligible	Negligible	No change in alignment.
Ballydonaghy Road	10900	100m	Negligible	Severed. Provision made via a new link road to Moss Road
Moss Road	11900	Negligible	Negligible	No change in alignment.
Greenlaw Road	13000	450m	**Slight Adverse**	Severed. Provision made via a new footpath for NMUs.
Park Road	13500	Negligible	Negligible	No change in alignment.
A5 Victoria Road	14800	Negligible	Negligible	Introduction of new roundabout.
B49 Woodend Road	14800	Negligible	Negligible	Traffic required to use new T Junction to continue along the B49.
Spruce Road	14980	400m	**Moderate Adverse**	Road severed. A5 Victoria Road and Park Road link closed and alternate route proved across the new junction 3. Introduction of 3 roundabouts.

© Mouchel 2016

Road/Route	Approximate Chainage	Change in journey length	Impact	Comments
Park Road/A5 Barnhill Rd junction	17650	Negligible change in distance to reach A5	**Moderate Adverse**	Park Road severed. Detour along new road running south to new junction connecting to Barnhill Road. Introduction of 3 roundabouts.
Lifford Road	17800	Negligible	Negligible	New roundabout introduced.
Urbey Road/ Carrick Road	19500	Negligible	Negligible	Slight change in alignment.
Strahans Road	20380	Negligible	Not Significant	Slight change in alignment.
Knockroe Road	21200	70m	Negligible	Severed. Provision for users along Orchard Road.
Orchard Road	21400	Negligible	Negligible	No change in alignment
Melmount Road	22100	Negligible	Negligible	Introduction of new roundabout.
Peacock Road	22380	570m	**Moderate Adverse**	Severed. Diversion along Primrose Park to A5 Melmount Road.
Primrose Road	27240	Negligible	Negligible	No change in alignment
Bells Park Road Sperrin Cycle Route 6	28000	Negligible	Negligible	Slight change in alignment. Continued access for cyclists
Garden Road	28000	Negligible	Negligible	Severed. Diversion via Bells Park Road.
High Road	28600	800m	**Slight Adverse**	Road severed. Slight adverse as does not link community facilities.
Seein Road	29090	100m	Negligible	Slight change in alignment.
Concess Road	30150	Negligible	Negligible	No change in alignment
Fyfin Road	31430	Negligible	Negligible	No change in alignment
Stone Road	31920	Negligible	Negligible	Slight change in alignment.
Urbalreagh Road	32200	200m	Negligible	Road severed. Provision made along Stone Road to the north.
Stone Road	32930	Negligible	Negligible	Slight realignment to join to Urbalreagh Road
Derg Road	33970	Negligible	Negligible	Slight change in alignment.
Deerpark Road	34670	Negligible	Negligible	No change in alignment

APPENDIX 16A LEGISLATIVE CONTEXT

Statutory & Planning Context

Whilst assessing the impacts and designing mitigation measures, the following legislation, policies and plans have been taken into account. The main requirements of the documents are summarised in the following sections:

- Directive 2000/60/EC establishing a framework for Community action in the field of water policy (the Water Framework Directive) implemented in Northern Ireland by The Water Environment (Water Framework Directive) Regulations (Northern Ireland) 2003;
- Directive 2006/118/EC on the protection of groundwater against pollution and deterioration, the "Daughter Directive" to the Water Framework Directive;
- Council Directive 80/68/EEC on the protection of groundwater against pollution caused by certain dangerous substances (as amended) (the Ground Water Directive dangerous substances (consolidated));
- Council Directive 91/676/EEC concerning the protection of waters against pollution caused by nitrates from agricultural sources as amended (the Nitrates Directive (consolidated));
- Council Directive 91/271/EEC concerning urban waste water treatment as amended (UWWT Directive (consolidated));
- The Groundwater Regulations (Northern Ireland) 2009 (as amended);
- Control of Pollution (Oil Storage) Regulations (Northern Ireland) 2010;
- The Water (Northern Ireland) Order 1999;
- The Pollution Prevention and Control Regulations (Northern Ireland) 2003;
- The Groundwater (Amendment) Regulations (Northern Ireland) 2014;
- Originally Planning Policy Statement 15 'Planning and Flood Risk' (2006); superseded by the Revised Planning Policy Statement 15 ‘Planning and Flood Risk’ (September 2014); and
- Schedule 6 of the Drainage (Northern Ireland) Order 1973 with regards to discharging to watercourses.

© Mouchel 2016

Directive 2000/60/EC establishing a framework for Community action in the field of water policy (the Water Framework Directive) implemented in Northern Ireland by The Water Environment (Water Framework Directive) Regulations (Northern Ireland) 2003

The main requirements of the Water Framework Directive (WFD, 2000/60/EC) which are relevant to the construction of the Proposed Scheme are "to establish a framework for the protection of inland surface waters, transitional waters, coastal waters and groundwater which:

- Prevents further deterioration and protects and enhances the status of aquatic ecosystems and, with regard to their water needs, terrestrial ecosystems and wetlands directly depending on the aquatic ecosystems;
- enhances protection and improvement of the aquatic environment through the progressive reduction of discharges, emissions and losses of priority substances and the cessation or phasing-out of discharges, emissions and losses of the priority hazardous substances; and
- ensures the progressive reduction of pollution of groundwater and prevents its further pollution.

Through the Water Environment (Water Framework Directive) Regulations (Northern Ireland) 2003, a duty is placed upon the Department of the Environment and other specified Northern Ireland departments including NIEA to exercise relevant functions in ensuring that the requirements of the directive are met.

The WFD commits European Union Member States to achieve a 'good' status of all waterbodies by 2015 and defines how this should be achieved through the establishment of environmental objectives and ecological targets for waters.

New monitoring programmes and classification systems have been developed and applied for the first time across Northern Ireland to assess the impacts on the whole water environment, including rivers, lakes, transitional and coastal waters, and groundwaters. The majority of waterbodies throughout Northern Ireland have been reclassified according to the system outlined in the WFD. The overall emphasis of the WFD is the ecological health of the hydrological system.

The ecological quality of surface water reflects:

- Biological quality elements (invertebrates, plants and fish);
- general chemical quality elements (toxic substances, nutrients, dissolved oxygen, temperature and pH); and
- hydromorphological quality elements (water flow and physical modifications).

© Mouchel 2016

Council Directive 80/68/EEC on the protection of groundwater against pollution caused by certain dangerous substances (as amended - the Groundwater Directive dangerous substances (consolidated))

The Groundwater Directive (80/68/EEC) was introduced in 1980 with the aim of protecting groundwater against pollution from a number of dangerous substances. This directive was implemented in Northern Ireland through the Groundwater Regulations (Northern Ireland) 1998 and supplements previous water pollution legislation. In conjunction with the Water (Northern Ireland) Order 1999, these Regulations require the Department of the Environment (DOE) to prevent the direct or indirect discharge of List I substances to groundwater and to control pollution resulting from the direct or indirect discharge of List II substances.

Following the introduction of the Water Framework Directive, the Groundwater Daughter Directive (2006/118/EC) was introduced with the aim of clarifying objectives for groundwater quality within the WFD. It is implemented in Northern Ireland through the Groundwater (Amendment) Regulations (Northern Ireland) 2014. The directive includes criteria for the assessment of good chemical status, for identifying and reversing upward trends in pollution, details measures to prevent or limit pollutant entry into groundwater and amendments to general naming conventions.

Licensing Requirements

Under the WFD, water abstractions are required to be subject to regulation. In Northern Ireland, this process is regulated under the Water Abstraction and Impoundment (Licensing) Regulations (Northern Ireland) 2006 and is governed by the NIEA. Water abstractions used for private water supplies are also regulated under the Private Water Supplies Regulations (Northern Ireland) 2009.

Abstractions are subject to authorisation at a variety of levels, determined principally by the volume of water abstracted. Abstractions of 10m3 per day or more, or that serve more than 50 people, are required to notify NIEA or apply for a licence, depending on the volume to be abstracted. Supplies serving more than one dwelling are subject to at least annual monitoring by the Department of the Environment.

All discharges to the water environment are regulated under the Water (Northern Ireland) Order 1999; discharge consents are governed by NIEA for water quality and the Rivers Agency for discharge volumes.

© Mouchel 2016

APPENDIX 16B METHOD OF ASSESSMENT

Introduction

There are a number of assessments required for the Road Drainage and Water Environment Chapter:

- Outfall discharge assessments as part of DMRB:
    - Highways Agency Water Risk Assessment Tool (HAWRAT) - Method A;
    - Environmental Quality Standards (EQS) - Method B;
    - Groundwater Risk – Method C;
    - Accidental Spillage – Method D;
- Water Framework Directive Assessment;
- Flood risk assessment – DMRB Method E & Method F;
- Fluvial Geomorphology Assessment;
- Road Cuttings Assessment;
- Water Abstractions Survey.

Outfall Discharge Assessment

The Design Manual for Roads and Bridges (DMRB) outlines the procedures to be used in the assessment of impacts from road drainage outfalls. The assessment methodology has involved:

- Collation of data on existing baseline conditions within the affected watercourses through desk study, consultation and field surveys;
- Assessment in relation to the Proposed Scheme, including information on the drainage design, proposed water quality treatment and predicted traffic volumes;
- Assessment of pollution impacts from routine road runoff – this assessment includes the use of the Highways Agency Water Risk Assessment Tool (HAWRAT) & Environmental Quality Standard (EQS) assessments;
- Assessment of the risk to groundwater quality from the road drainage treatment ponds and/or wetlands;

© Mouchel 2016

- Assessment of pollution impacts from accidental spillage; and
- Assessment of the overall significance of the impact from each outfall, taking into account the results of the above assessments and a qualitative assessment of the physical impact of the outfall structure and the peak discharge on fluvial geomorphology and flood risk.

Further details on the assessment methods listed above are provided in the following sections.

Outfall Impact Assessment Routine Runoff – Method A

The Highways Agency Water Risk Assessment Tool (HAWRAT) is a Microsoft Excel application which has been developed to assess the acute and chronic pollution impacts on aquatic ecology associated with soluble and sediment-bound pollutants respectively. To assess the water quality impacts from routine runoff on receiving watercourses, the following assessments were carried out for each outfall location.

Highways Agency Water Risk Assessment Tool (HAWRAT)

For soluble pollutants HAWRAT calculates the available dilution in the receiving watercourse under low flow conditions. For the sediment-bound pollutants the ability of the receiving watercourse to disperse sediments is considered and, if sediment is expected to accumulate, the potential extent of sediment coverage is also considered. HAWRAT estimates the river velocity under low flow conditions and assumes that sediment arriving in the river when the velocity is less than 0.1 m/s accumulates. A basic estimation of velocity is calculated iteratively using the cross sectional area of the river channel and the flow volume at low flow conditions.

HAWRAT is a tiered consequential system which involves up to three assessment stages:

- Step 1 uses statistical models to determine pollutant concentrations in raw road runoff prior to any treatment or dilution in the receiving watercourse.
- Step 2 assesses in-river pollutant concentrations after dilution and dispersion but without active mitigation.
- Step 3 considers the in-river pollutant concentrations with active mitigation. For an individual outfall to pass the HAWRAT assessment, it must pass both soluble pollutant and sediment pollutant impacts.

Diagram 16B.1 displays the HAWRAT process and stages of assessment.

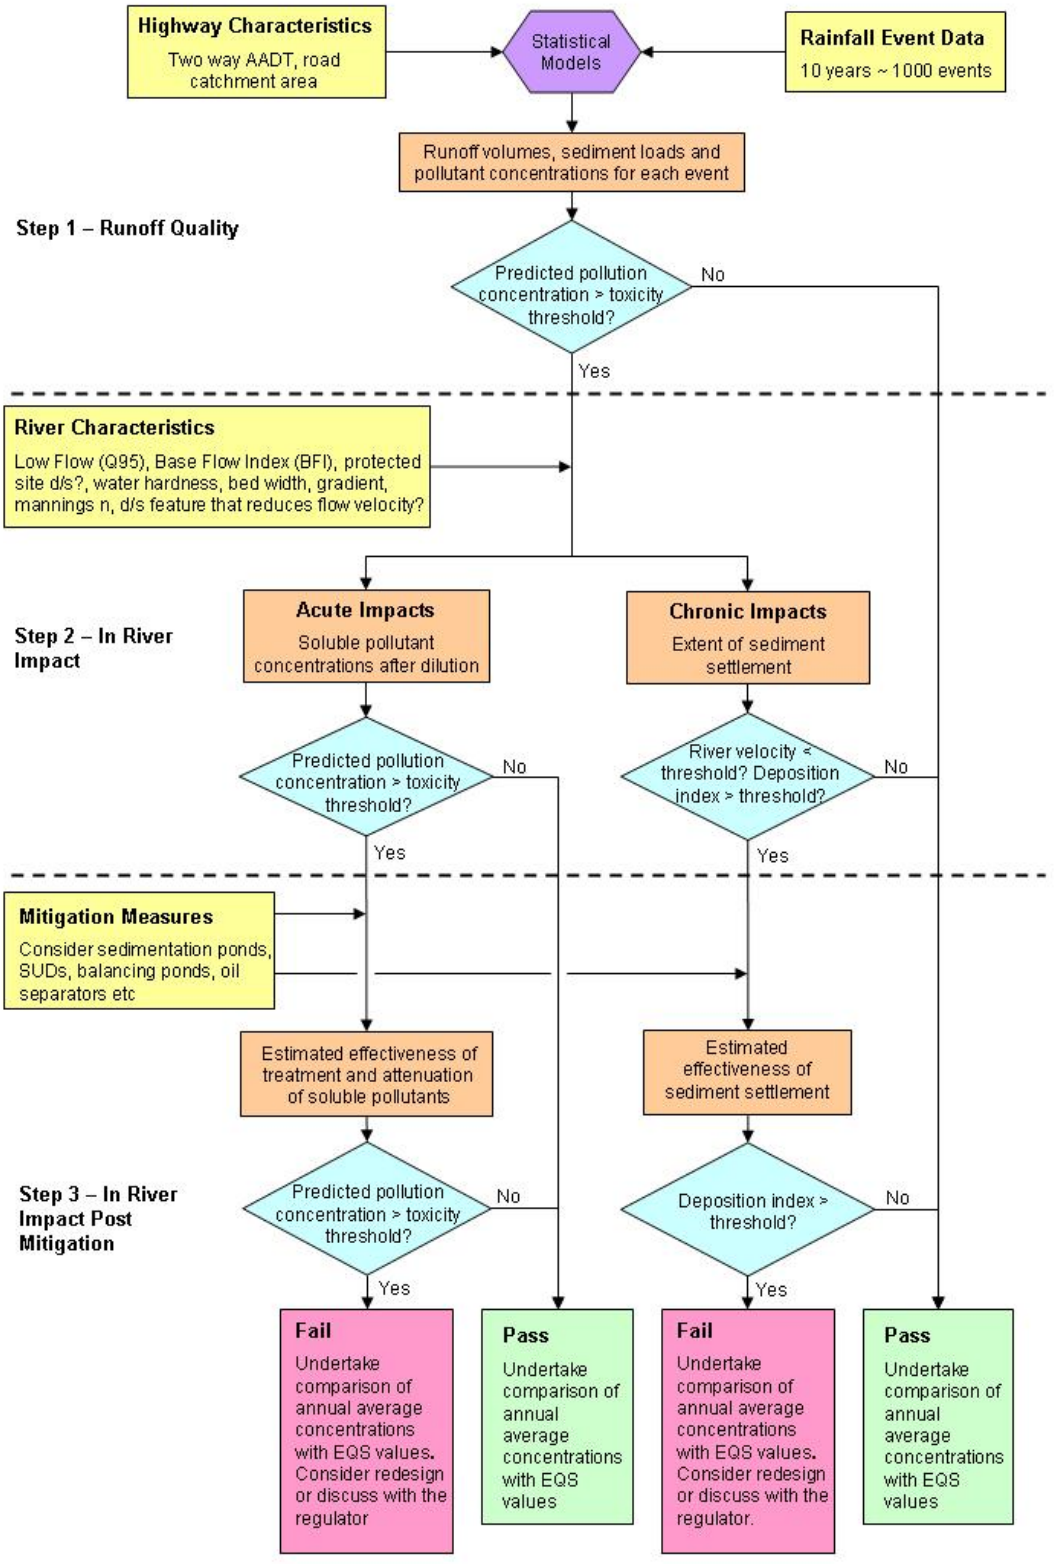
The underlying algorithms for assessing pollutant concentrations are based on research undertaken by the Highways Agency and the Environment Agency on road runoff quality under a range of traffic and weather conditions. Ecological research has determined the toxicity thresholds for the typical pollutants in road runoff, and this is used in the tool to evaluate whether predicted concentrations are acceptable or not.

© Mouchel 2016

Full details on the development and use of HAWRAT can be found in DMRB 11.3.10 HD 45/09 and in the HAWRAT User's Manual, which includes background information on the research programme behind the tool, derivation of the toxicity thresholds used and explanation of the background calculations. The key stages and user inputs specific to HAWRAT for the A5WTC are summarised below.

© Mouchel 2016

Diagram 16B.1 HAWRAT Tiered Flow Diagram



© Mouchel 2016

Step 1 – Road Runoff Quality

Rainfall series for 21 reference sites across the UK are built into HAWRAT to characterise the different rainfall patterns for the different climatic regions (colder wet, colder dry, warmer wet, warmer dry) across England, Scotland, Wales and Northern Ireland.

There are 2 reference sites in Northern Ireland, the Carmoney rainfall site (Climatic Region: colder wet), located approximately 7.5km north-east of Londonderry/Derry, has been used in the A5WTC assessment. For the Carmoney rainfall site, 10 years of hourly rainfall data has been stochastically generated, resulting in approximately 1,000 individual rainfall events over this period. For each rainfall event, data on the total rainfall, event duration, intensity and antecedent dry weather period has been calculated.

The mean concentration of each pollutant in the raw road runoff is calculated for each rainfall event. HAWRAT tests for a suite of pollutants identified through the Highways Agency and Environment Agency research programme as the key contaminants in road runoff, either because of their abundance and/or their potential harm in terms of species sensitivity in the water environment. Research has identified the concentration of any particular pollutant in road runoff from any particular rainfall event is related to the climatic region, traffic volume within the road drainage catchment, month, maximum hourly intensity of the rainfall event and antecedent dry weather period. These pollutants are:

- Soluble pollutants associated with acute pollution impacts, expressed as Event Mean Concentrations (EMCs in µg/l) for dissolved copper and zinc, and;

- Sediment related pollutants associated with chronic pollution impacts, expressed as Event Mean Sediment Concentrations (EMSCs in mg/kg) for total copper, zinc, cadmium, and (in µg/kg) for pyrene, fluoranthene, anthracene, phenanthrene and total PAH (Polycyclic Aromatic Hydrocarbons).

The calculated pollutant EMCs and EMSCs for each rainfall event are compared with the toxicity thresholds for each pollutant. The toxicity thresholds have been derived from the HA and EA research programme. For soluble pollutants Runoff Specific Thresholds (RSTs), a six hour threshold (RST6hr) and a 24 hour threshold (RST24hr), have been developed for dissolved copper and dissolved zinc to protect receiving organisms from short-term exposure, as shown in Table 16B.1. It should be noted that the toxicity of dissolved zinc is dependent on water hardness; therefore, there are three sets of RSTs for dissolved zinc built into HAWRAT, which correspond to low, medium or high water hardness.

© Mouchel 2016

Table 16B.1 Runoff Specific Toxicity Thresholds for Soluble Pollutants

Runoff Specific Threshold	Copper (µg/l)	Zinc (µg/l)		
		Water Hardness (mg $CaCO_3$/l)		
		Low (<50)	Medium (50-200)	High (>200)
RST24hr	21	60	92	385
RST6hr	42	120	184	770

For sediment-bound pollutants, Threshold Effects Levels (TELs) and Probable Effects Levels (PELs) have been developed for metal and PAH concentrations, as shown in Table 16B.2. The TEL is the concentration below which toxic effects are extremely rare. The PEL is the concentration above which toxic effects are observed on most occasions.

Table 16B.2 Toxicity Thresholds for Sediment-Bound Pollutants

Thresholds	Metals			Polycyclic Aromatic Hydrocarbons (PAH's)				
	Copper (mg/kg)	Zinc (mg/kg)	Cadmium (mg/kg)	Total PAH (µg/kg)	Pyrene (µg/kg)	Fluoranthene (µg/kg)	Anthracene (µg/kg)	Phenanthrene (µg/kg)
TEL	35.7	123	0.6	1684	53	111	46.9	41.9
PEL	197	315	3.5	16770	875	2355	245	515

In comparing the pollutant concentrations with the relevant toxicity thresholds, the number of rainfall events that result in an exceedance can be calculated. At Step 1 the maximum number of exceedances allowed per year has been set at a single event.

If the average number of exceedances per year is a single event or less, HAWRAT will return a 'Pass' result and no further assessment is required for the outfall being assessed. If the number of exceedances is greater than one, HAWRAT will return a 'Fail' result and the assessment should proceed to Step 2.

Step 2 – In-River Impact

Step 2 takes the road runoff soluble pollutant concentrations calculated for each of the approximately 1,000 rainfall events, calculates the diluted in-river concentrations and again compares these with the toxicity thresholds to calculate the number of exceedances. To do this HAWRAT calculates the road runoff flow rate and watercourse flow rate for each event.

© Mouchel 2016

To calculate the road runoff flow, HAWRAT requires impermeable area data to be entered for each road drainage catchment. These areas are individually multiplied by the event total rainfall and an appropriate runoff coefficient. The two values are added together to give the total runoff volume, which is then divided by the rainfall event duration to give the mean road runoff flow rate.

HAWRAT calculates the river flow rate for each event, the rainfall series is passed through a soil and groundwater model to attenuate the flows and create a river flow series. To generate an accurate river flow series for the watercourse in question, data on the groundwater contribution to river flow must be entered into the model in the form of the catchment base flow index (BFI). At this stage the river flow data is based on an arbitrary catchment area and must be scaled to represent the river flow in the actual watercourse of interest. To do this, the 95% exceedance (Q95) low flow is calculated for the river flow series (i.e. the flow exceeded 95% of the time), while the user enters the actual Q95 river flow for the site. The ratio of these two 95%iles provides the factor to scale the river flow series. Finally, the actual river flow assigned to a particular rainfall event, and used in the pollutant concentration calculations, is taken as the scaled river flow just before the start of the event.

The in-river soluble pollutant concentrations are then calculated for each event by a simple mass balance of river flow and runoff flow:

In-River Pollutant Concentration = [(road runoff pollutant concentration x road runoff flow rate) + (upstream river pollutant concentration x river flow rate)] / (road runoff flow rate + river flow rate)

As with Step 1, the number of events for which the in-river soluble pollutant concentrations exceed the toxicity thresholds are calculated and compared with the exceedance frequency thresholds. At this stage the sensitivity of the watercourse is taken into account. Normally the exceedance frequency thresholds are two per year for the RST24hr and one per year for the RST6hr. However, if a protected conservation site such as a SAC or ASSI is within 1 km downstream of the discharge point, the frequency thresholds are halved in order to provide a greater level of protection to these watercourses, which are considered more sensitive.

If the average number of exceedances per year is less than the relevant exceedance frequency threshold, HAWRAT will return a ‘Pass’ result and no further assessment of soluble pollutants is required for the outfall being assessed. If the number of exceedances is greater than the relevant exceedance frequency threshold, HAWRAT will return a ‘Fail’ result and the assessment of soluble pollutants should proceed to Step 3.

The Step 2 assessment of the sediment-bound pollutants is determined in a different manner. The in-river sediment impacts are determined by considering the likelihood and probable extent of sediment deposition.

The extent of sediment deposition is represented by a Deposition Index (DI), which is 100 times the ratio of the estimated annual volume of sediment in the road runoff to a volume represented by

© Mouchel 2016

a layer 0.01m thick, spread across the full width of the river at low flow conditions and down a 10m length of the river, i.e. using the equation:

Deposition Index = 100 x [annual road runoff sediment volume / (0.01 x 10 x low flow river width)]

Where the annual road runoff sediment volume is calculated using the annual road runoff volume calculated earlier, HAWRAT applies a median suspended solids concentration of 139mg/l derived from the research programme and an assumed sediment density of 2000 kg/m3.

There are two stages (tiers) of sophistication to the HAWRAT sediment accumulation calculation, with varying site specific user entry data requirements:

- Tier 1 is a simplified method using river flow and cross-sectional area data to determine potential for sediment accumulation. User entry data requirements are the Q95 and river width values. River width values can be estimated from mapping or aerial photography, to enable HAWRAT to calculate an approximate the flow velocity. If Tier 1 outcome indicates a 'Pass', no Tier 2 calculation is required. If Tier 1 outcome indicates a 'Fail', Tier 2 will be prompted to be undertaken using additional receiving watercourse data.

- Tier 2 is a more detailed procedure, requiring the watercourse bed width, side slope, longitudinal slope (or gradient) and Manning's roughness coefficient (Manning's n), which are determined from site survey, to iteratively estimate the velocity with greater accuracy. If the calculated flow velocity is greater than 0.1m/s, the site is considered to disperse sediment and HAWRAT reports a 'Pass' result for chronic sediment impacts. If the velocity is less than 0.1m/s the site is assessed as accumulating sediment and further assessment of the extent of deposition is required. For smaller watercourses Tier 2 is typically required.

If the calculated DI is less than 100, the sediment accumulation is not considered extensive and HAWRAT returns a 'Pass' result for chronic sediment impacts. If the DI is greater than 100 the accumulation is considered extensive and HAWRAT returns a 'Fail' result and the assessment of chronic impacts from sediment-bound pollutants should proceed to Step 3 (and appropriate mitigation identified to reduce sediment accumulation).

In addition to the 'Pass' and 'Fail' results HAWRAT can also return an 'Alert' result. In this case the outfall may pass the assessment but the presence of a downstream conservation site that requires greater protection, or a downstream structure, lake, pond or canal that may reduce flow velocity, means that additional care should be given to the design and assessment of the drainage network. Information on such downstream considerations is entered into HAWRAT by the user.

A number of the outfall locations in this assessment discharge directly into the River Foyle and lower Finn River, which are transitional watercourses with tidal influence. In these instances, the sediment calculations undertaken by HAWRAT are inappropriate as they assume there is no tidal influence. Given the size and flow of the River Foyle and, to a lesser extent, the Finn River, it was not anticipated that sediment accumulation would be an issue. However, to provide further

© Mouchel 2016

confidence, basic estimations of sediment input from road outfalls compared with natural processes have been carried out for the relevant outfalls and are reported in the Transitional Waters Section of this technical appendix.

Step 3 – In River Impact with Mitigation

Step 3 provides an assessment of the in-river impacts with mitigation in place. HAWRAT is designed to allow different types of treatment to be applied, these are;

- Treatment of road runoff to reduce soluble pollutant concentrations. The mitigation effect is quoted as a percentage reduction in pollutant concentration;
- Settlement of road runoff sediments to reduce the annual sediment volume release into the receiving watercourse. Again, the mitigative effect is quoted as a percentage reduction in sediment load; and
- Attenuation of the soluble pollutants through restriction of the road runoff discharge rate.

All three types of mitigation are likely to be provided by the use of sustainable urban drainage systems (SUDS) within the road drainage network. The calculation for the mitigated in-river concentration of soluble pollutants incorporates the treatment percentage reduction and restricted discharge rate values.

In the Proposed Scheme, attenuation of the road runoff discharge rate has not been used as a mitigation measure for the A5WTC outfalls. Where the assessment found that mitigation was required, the receiving watercourses were often very small with associated very low Q95 (95%ile) flows. In these instances the discharge rate would have had to be restricted to an impracticably low rate for attenuation to be effective. Therefore, every road drainage outfall would be treated via sustainable drainage system treatment methods, either as a single component or a combination of components, dependent upon local network and receiving watercourse conditions.

The water quality mitigation put in place at each outfall has been dictated by the type and level of treatment required, for soluble and/or sediment-bound pollutants and/or sediment load, as indicated at Step 2 of the HAWRAT assessment. Therefore, each highway drainage network incorporates the requirement to meet the minimum treatment level to pass all aforementioned standards.

Data on the effectiveness of these various systems at removing pollutants have been based on the Highways Agency's current understanding of performance efficiencies of drainage treatment systems, as agreed with the Environment Agency via an agreed Memorandum of Understanding, February 2012, with selected treatment efficiencies reproduced with Highways Agency permission on Table 16B.3. The performance and effectiveness of these systems are dependent upon correct installation and regular and appropriate maintenance techniques.

© Mouchel 2016

Table 16B.3 Expected Pollutant Removal Performance of Treatment Components (Highways Agency)

SUDS Component (Mitigation)	Pollution Removal Effiiency %		
	Suspended Solids and Sediment-Bound Pollutants	Dissolved Copper	Dissolved Zinc
Swales and Grassed Channels	80	50	50
Dry/Detention Ponds	50	0	0
Wet/Retention Ponds	60	40	30
Wetlands	60	30	50
Vortex Grit Separators	40	0	15
Sediment Tanks	40	0	0
Oil Separators	0	0	0
Porous Paving	50	0	0
Vegetated Filter Strips	25	15	15
Filter Drains	60	0	45
Ditches	25	15	15

In most networks, treatment will be achieved by the installation of an appropriately-sized and designed wet/retention pond. A wet/retention pond is a basin which is kept permanently wet and designed to allow suspended solids to settle out of the runoff prior to its discharge into the receiving watercourse. For optimum performance the design of the pond needs to ensure a long slow flow path, providing a generous retention time, but avoiding stagnant areas. However, during a rainfall event the build-up of pollutants on the road surface is generally washed off the road first, and the runoff from the first 10mm of rain is often the most seriously polluted. This is referred to as the 'first flush' effect. The design should aim to detain the first inflows for the longest period and allow subsequent inflows (when the level of the pond is higher) to flow out at a quicker rate. This approach has been adopted in the design of the A5WTC drainage system.

Outfall mitigation techniques determined for each network are provided in Appendix 16E. In the majority of networks a single wet/ retention pond provides a sufficient reduction in pollutant concentrations, however, there are a small number of specific locations where more efficient treatment techniques or secondary treatment are required. Typically, increased levels of treatment has been necessary where there outfalls discharge to small receiving watercourses, with associated low flow values, limiting dilution potential. Where a secondary level of treatment is required, two or more SUDS treatment methods in series are proposed. Where combinations of treatment are applied, the treatment efficiency value applied (derived from Table 16B.3) takes account of treatment from the preceding stage. For example, should a swale initially treat sediment, followed by a wet/retention pond; the resulting sediment treatment will initially be 80%

© Mouchel 2016

from the swale and subsequently increased to an overall 92% sediment treatment (80% + 12%) downstream of the secondary treatment provided by the wet/retention pond, prior to discharge.

The same exceedance thresholds are applied in Step 3 as in Step 2, now taking account of the mitigation measures entered. If HAWRAT returns a 'Pass' result the user should move onto the Environmental Quality Standard (EQS) assessment of chronic impacts from soluble pollutants, as described below (DMRB Method B). If a 'Fail' result is returned the user should consider re-designing the road drainage network and/or the mitigation measures.

For chronic sediment impacts the deposition index is recalculated using the annual sediment volume after settlement measures and the sediment risk impact is then re-estimated using the same procedure as in Step 2. A 'Pass' result requires no further assessment, while if a 'Fail' result is returned, the user should consider re-designing the road drainage network and/or the mitigation measures.

User Parameters

The HAWRAT parameters that must be entered by the user at each stage of the assessment are summarised in Table 16B.4, with details of the respective data sources.

Cumulative Assessment

Where more than one outfall discharges into the same reach of a watercourse, the combined impacts could be more significant. In these circumstances the outfalls should be aggregated for the purposes of aggregate assessment in HAWRAT.

To aggregate the outfalls discharges, the drained areas are simply added together. The location on the watercourse used for the cumulative assessment should be positioned downstream of the last outfall in the reach. For this purpose a reach is defined as a length of watercourse between two confluences, the reason being that the available dilution and stream velocity will naturally change at confluences and influence the assessment. Therefore, two outfall locations on a watercourse, with an intervening confluence, would not require cumulative assessment, as they would not be considered to be in the same reach.

However, watercourse reaches can vary greatly in length, therefore, for the assessment of the impacts of soluble pollutants, only outfalls within 1km of each other along the length of a watercourse were aggregated for cumulative assessment. When assessing the combined impact of sediment-bound pollutants, outfalls within 100m of one another are assessed. Beyond 100m the road runoff sediment, if it settles at all, is likely to be sufficiently diluted with natural sediments so as not to be considered to have an adverse impact.

As with the assessment of individual outfalls, if the cumulative assessment fails, mitigation should be applied to one or more of the outfalls and the calculations re-run. Typically the outfall draining

© Mouchel 2016

the greater surface area drained would be expected to be the primary contributor to a failing cumulative assessment.

Table 16B.4 HAWRAT Parameter User Entry Data

Parameter	Data Source
Step 1	
AADT	Annual Average Daily Traffic flow data has been provided by the A5WTC Traffic Team for each road drainage catchment. One of three broad ranges of AADT must be selected within HAWRAT. The majority of road drainage catchments within the Proposed Scheme have an AADT in the range of >10,000 and < 50,000 vehicles (the lowest band). There are a small number of road drainage catchments which have an AADT of slightly less than 10,000. The HAWRAT manual suggests that the tool may not be suitable for the assessment of such lightly trafficked road drainage catchments. However to ensure a thorough and consistent approach across the entire Proposed Scheme it was felt that HAWRAT was the most appropriate assessment method for the road catchments, although it may slightly overestimate the pollutant build-up and provide an overly conservative assessment.
Climatic Region	Four options are available to choose from: Colder Wet, Colder Dry, Warmer Wet and Warmer Dry. The Colder Wet climatic region was selected as this includes Northern Ireland.
Rainfall Site	Having selected a Climatic Region a restricted list of rainfall site are available to choose from. The Carmoney rainfall site was chosen due to its geographical location (close to Londonderry) in relation to the Proposed Scheme.
Step 2	
Impermeable road area drained (ha)	The A5WTC Drainage Design Team have provided details of the individual road drainage catchment area, at this stage in the Proposed Scheme design the catchments have not been divided into impermeable and permeable areas. The impermeable road area within each drainage catchment has been provided and it has been assumed that there is no permeable area drainage contributing to any outfall. This approach is conservative, as any permeable area drainage would increase the dilution and thereby reduce the pollutant loading from the impermeable area in the combined runoff.
Permeable road area drained (ha)	

© Mouchel 2016

Parameter	Data Source
Annual 95%ile river flow (m^3/s)	Q95 Low flow values have been calculated for each outfall location using Wallingford Hydro Solutions Lowflows 2 ™ Software. Derivation of the Q95 requires the upstream catchment of the receiving watercourse to be defined. This has been done based on data from the Flood Estimation Handbook CD-ROM, OS mapping and professional judgement. HAWRAT assessment requires a Q95 value of greater than 0 m^3/s to be entered to derive impact results. For outfalls where a result of 0 m^3/s was calculated a value of 0.001 m^3/s was entered, in line with guidance set out in HD 45/09.
Baseflow Index (BFI)	The base flow index (BFI) values have been calculated for each outfall location using Wallingford Hydro Solutions Lowflows 2 ™ Software.
Conservation Area Proximity	The locations of downstream conservation sites were provided by the A5WTC Ecology Team. This data has been assessed in GIS software and the distance from the road drainage outfalls determined. Where a conservation site lies within 1km downstream of an outfall this was identified.
Water Hardness	Data on the water hardness of the receiving watercourses, which is required for the assessment of soluble zinc only, has been collated from NIEA WFD classification information and Mouchel Water Quality Surveys. One of three broad ranges must be chosen within HAWRAT.
Downstream Structure Proximity	The location of downstream structures, lakes, ponds and canals has been determined from aerial photo interpretation and site survey work undertaken by the A5 WTC Drainage Design and Ecology teams.
Estimated River Width (m)	Used in the Tier 1 assessment of chronic sediment impacts; this was derived primarily from watercourse survey data supported by aerial photo interpretation.
Bed Width (m) / Manning's n / Side Slope (m/m) / Long Slope (m/m)	Used in the Tier 2 assessment of chronic sediment impacts; this information was provided by the Drainage Design Team who have provided topographic survey results for all watercourse interactions. Mannings's n is the coefficient for bed roughness, determined for each channel based on site photography and HAWRAT guidance notes.

© Mouchel 2016

Parameter	Data Source
Step 3	
Proposed Mitigation Measures	Text description of the proposed mitigation measures. Appropriate mitigation measures have been identified through an iterative design & assessment process undertaken by the Drainage Design and Water Environment teams. The Highways Agency have provided anticipated treatment levels for soluble pollutants and sediment from various installed techniques (Table 16B.1), where appropriate, these mitigation details have been entered for specific outfall locations.
Treatment for Solubles (%)	An estimate of the probable effectiveness of the mitigation measures in reducing soluble pollutant concentrations is entered.
Restricted Discharge Rate (l/s)	Restriction of the road runoff discharge rate has not been used as a mitigation measure for the A5WTC outfalls. Where the assessment found that mitigation was required, the receiving watercourses were generally very small with very low Q95 flows. In these instances the discharge rate would have had to be restricted to an impracticably low rate for attenuation to be effective. Treatment of soluble pollutants was considered the only practical solution in these cases.
Settlement of Sediments (%)	An estimate of the probable effectiveness of the mitigation measures in reducing sediment concentrations is entered.

'In-River' Sediment Standard

The Loughs Agency have stated that total suspended solids value downstream of new operational outfalls should not exceed 25 mg/l, as per the Freshwater Fish Directive (which, since January 2014, is subsumed within the over-arching Water Framework Directive).

The river annual runoff volume and average suspended solid volume has been combined to derive annual sediment load, with the same process undertaken for each outfall discharge. These values have been combined at outfall locations, in order to establish 'in river' sediment loading values immediately downstream of each outfall based on the following calculation:

$$\text{Outfall 'In River' Total Suspended Solids (mg/l)} = \frac{(RF \times WTSS) + (OF \times OTSS)}{WF + OF}$$

Where:

RF - River Annual Flow (m^3/s)
WTSS - Watercourse Total Suspended Solids (mg/l)
OF – Outfall Annual Flow (m^3/s)
OTSS – Outfall Total Suspended Solids (mg/l)

© Mouchel 2016

The calculation for annual river runoff volume, taking of account of evapotranspiration effects over the wider catchment area, is calculated as:

$$Annual\ River\ Runoff\ Volume\ (m^3) = \frac{[SAAR\ (mm) - pe\ (mm)] \times Catchment\ Area\ (m^2)}{1000}$$

Where SAAR is the standard annual average rainfall as derived from the FEH CD-ROM, potential evapotranspiration (pe) for the area is 493 mm as quoted by the Meteorological Office Rainfall and Evapotranspiration Calculation System (MORECS), and catchment area is the river catchment area upstream of the road outfall locations.

For the River Foyle and Finn River, given tidal influence, locations upstream on freshwater sections were selected for runoff calculations. These locations exhibit lower flow conditions than the downstream tidal stretches and are therefore conservative in terms of flow volumes. The Mourne River at Strabane was selected to represent the River Foyle, with the upstream Flushtown Bridge location selected on the Finn River.

Suspended solid values were assigned to each watercourse using average values from local monitoring undertaken by NIEA and Mouchel. Watercourses without available data had data extrapolated from similar watercourses in the local area. The average suspended solid values for watercourses ranged from 2 to 15 mg/l.

Annual road runoff volumes were established for each outfall assessment (both individual and cumulative). The annual runoff volume for each outfall was calculated using:

$$Annual\ Runoff\ Volume\ (m^3) = \frac{SAAR\ (mm) \times Road\ Catchment\ Area\ (m^2)}{1000}$$

Where SAAR (mm) data for the receiving watercourse was used

For outfalls a pre-treatment total suspended solid value of 139 mg/l was used. This value is based on Highways Agency research.

Outfalls with calculated in river sediment values above 25 mg/l were identified. Sediment treatment was applied, where appropriate, using treatment values provided by the Highways Agency (See Table 16B.3) to ensure that sufficient treatment has been planned to meet the downstream 25 mg/l 'in river' suspended solid standard alongside other water quality standards.

© Mouchel 2016

Transitional Waterbodies Sediment Input

The HAWRAT method has been used to assess the impact of the road drainage outfalls throughout the A5WTC corridor. However, the DMRB guidance highlights that the HAWRAT tool may not be suitable for assessing outfalls where the receiving watercourse is tidal, particularly in relation to the assessment of sediment-bound pollutant impacts. Under tidal conditions the river flow velocity calculation used for HAWRAT may not be appropriate as the river flow may be stratified with water at different depths flowing at different velocities and even in different directions.

To fully assess the sediment impacts under these conditions, detailed sediment transportation modelling would be required. This can be a difficult and time-consuming process which, given the relative scale of Proposed Scheme discharges in relation to the large size of the River Foyle and the Finn River, is likely to be inappropriate and unnecessary.

However, to provide an approximation, the HAWRAT methodology has been supplemented with basic estimations of sediment input from road outfalls compared with natural processes.

The annual sediment volume discharged from each outfall can be calculated as:

$$Annual\ Sediment\ Volume\ (m^3) = \frac{SS\ Conc\ (mg/l) \times Annual\ Runoff\ Volume\ (m^3)}{Sediment\ Density\ (kg/m^3) \times 1000}$$

Where:

SS Conc (mg/l) - 139 mg/l
Sediment Density - 2000 kg/m^3

The above formula has then been used to also derive an estimated annual sediment volume for the River Foyle and Finn River, substituting with local river sediment data and river runoff volumes.

This enables sediment discharge inputs from outfalls to be compared to the sediment volume within these transitional waterbodies and determine the relative scale of the additional sediment load.

Detailed assessment of in-river annual average concentrations of soluble pollutants – Method B

The EQS assessment considers the long-term chronic impacts associated with soluble pollutants. The in-river annual average concentrations for soluble pollutants, including the contribution from road runoff are calculated and compared with published Environmental Quality Standards (EQS), to assess whether there is likely to be a long-term impact on ecology.

The Environmental Quality Standards (EQS) assessment provides an assessment of the long-term risks to receiving water ecology from soluble pollutants. The annual average concentrations for dissolved copper and zinc are calculated through HAWRAT and compared with the published

© Mouchel 2016

EQS. Current EQS threshold values for dissolved zinc and dissolved copper are detailed within assessment Method A of DMRB 11.3.10 HD 45/09. These values are shown in Table 16B.5.

Table 16B.5 Environmental Quality Standards for Dissolved Copper and Zinc

Water Hardness Bands (mg/l CaCO3)	EQS for Dissolved Copper (µg/l)	EQS for Dissolved Zinc* (µg/l)
0-50	1	7.8
>50-100	6	
>100-250	10	
>250	28	

**Proposed value*

The UK Technical Advisory Group (UKTAG) on the WFD published in November 2013 (with minor amendments in January 2014) updated recommendations on Environmental Standards (UKTAG, 2013), which included revised standards for dissolved copper and zinc, as given below:

- Dissolved Copper - 1 µg/l of bioavailable dissolved copper;
- Dissolved Zinc - 10.9 µg/l of bioavailable dissolved zinc plus the Ambient Background Concentration of dissolved zinc.

The term 'bioavailable' refers to the fraction of the dissolved metal concentration likely to result in toxic effects, as determined using a Metal Bioavailability Assessment Tool (MBAT) developed by UKTAG. This approach recognises that a proportion of the dissolved metals are bound up in forms that do not pose a risk of toxic effects on aquatic species. In practice, a tiered approach is used when comparing the calculated annual average concentrations of dissolved copper and zinc with the relevant EQS values. Tier 1 assumes that the entire annual average concentration is bioavailable. If this value is less than the relevant EQS then no further assessment is required. If the value is greater, a Tier 2 assessment is required using the relevant MBAT.

Including the 'Ambient Background Concentration' (ABC) for the zinc EQS provides recognition that zinc is a naturally occurring substance in aquatic environments, with natural concentration varying across the UK. The ABC of dissolved zinc has been defined by UKTAG for individual catchments or groups of catchments throughout the UK. For Northern Ireland, the ABC value is 1 µg/l, which, combined with the bioavailable 10.9 µg/l, provides an overall standard of 11.9 µg/l.

Mouchel approached WFD UKTAG for guidance on proposed EQS standards for Northern Ireland and potential consultation timescale. Mouchel has been informed that guidelines were due to be issued for consultation mid-2014, with a July 2014 publication available, with the potential for such

© Mouchel 2016

standards becoming applicable to schemes within Northern Ireland by late 2014. In July 2014 the WFD UKTAG website published a further guidance document but the corresponding spreadsheet was not available at time of writing (November 2014) and no alteration was made to the suggested values discussed above.

Annual average concentrations of copper and zinc were assessed under EQS standards set out in both DMRB 11.3.10 HD 45/09 and proposed values set out by UKTAG. Following the precautionary principle, the more conservative value from both published standards has been taken and applied to this assessment. Therefore, for the purposes of this assessment, the following EQS standards for copper and zinc have been evaluated against:

- Dissolved Copper, Derived EQS Standard, Proposed 2014 EQS - 1 µg/l across all water hardness bands;
- Dissolved Zinc, Derived EQS Standard, Current EQS - 7.8 µg/l.

Assessment of Pollution Impacts from Routine Runoff on Groundwater – Method C

The road drainage system of the A5WTC has been designed to discharge to surface waters via wet/retention ponds. These ponds would provide a dual purpose of water quality treatment attenuating flow to the receiving watercourse for a number of hours, alleviating flood risk.

Impacts of infiltration of routine road runoff on the quality of the underlying groundwater at surface water drainage networks have been assessed in accordance with the assessment method set out in Method C of DMRB Vol. 11, Section 3, Part 10 Road Drainage and the Water Environment.

The DMRB (Table C1.2) sets out a matrix that has been designed to assess the potential overall risk to groundwater and to highlight any sites at high risk, where additional measures may be required. The risk assessment matrix uses the Source-Pathway-Receptor (S-P-R) protocol developed for use in risk assessment procedures for contaminated land evaluation. For road systems, the road drainage provides the source term. The pathway is represented by the processes by which road drainage is transported and discharged. The receptor is the groundwater. The parameters used in the risk assessment matrix are shown in Table 16B.6.

Table 16B.6 Pathway and Source Descriptions

S-P-R	Weighting Factor	Parameter	Low Risk (Score 1)	Medium Risk (Score 2)	High Risk (Score 3)
SOURCE	15	Traffic Density	< 50,000 AADT	50,000 to <100,000 AADT	> 100,000 AADT
	15	Annual Average	< 740mm rainfall	740 – 1060 mm	> 1060 mm rainfall

© Mouchel 2016

		Rainfall		rainfall	
		Rainfall Intensity	Even (<35mm FEH 1hr rainfall)	Uneven (35-47 mm FEH 1hr rainfall)	Concentrated (>47mm FEH 1hr rainfall)
PATHWAY	15	Soakaway Geometry	Continuous Linear (e.g. ditch, grassed channel)	Single point, or shallow soakaway (e.g. lagoon) serving low road area	Single point, deep serving high road area (>5,000m^2)
	20	Unsaturated zone	Depth to water table >15m and unproductive strata	Depth to water table 5-15m	Depth to water table <5m
	20	Flow type	Unconsolidated or non-fractured consolidated deposits (i.e. dominantly intergranular flow)	Consolidated deposits (i.e. mixed fracture and intergranular flow)	Heavily consolidated sedimentary deposits, igneous and metamorphic rocks (dominated by fracture porosity)
	7.5	Effective grain size	Fine sand and below	Coarse sand	Very coarse sand and above
	7.5	Lithology	>15% clay minerals	1-5% clay minerals	<1% clay minerals

To enable completion of this assessment, information was gained from the Proposed Scheme traffic and drainage design teams, geological mapping and results from the ground investigation (GI) works undertaken in 2010 (GI locations are typically within 100m of each pond, often closer). Each parameter is considered and assigned a risk category.

The corresponding category risk score (low risk – 1, medium risk – 2, high risk – 3) is multiplied by the weighting factor for each parameter, then summed. The overall risk of impact to groundwater is determined as:

- Overall risk score <150 – Low Risk of Impact;
- Overall risk score 150 - 250 – Medium Risk of Impact; and#

© Mouchel 2016

- Overall risk score >250 – High Risk of Impact.

Assessment of Pollution Impacts from Accidental Spillages – Method D

Spillages resulting from road traffic accidents or other causes could occur anywhere along the A5WTC road network. Although the A5WTC has been designed to minimise the risk of collision, it is important to assess the risk of serious pollution incident occurring. This assessment has been carried out in accordance with Method D of DMRB Vol. 11, Section 3, Part 10 Road Drainage and the Water Environment.

The accidental spillage assessment determines, for each road drainage catchment, the overall probability of a serious pollution incident as a result of a spillage accident. This is done in two stages, which can be carried out within HAWRAT.

- Firstly the method estimates the probability that there will be a collision involving a spillage of potentially polluting substance somewhere within the road drainage catchment being assessed.

- It then calculates the probability, assuming a spillage has occurred, that the pollutant will reach and impact on the receiving watercourse.

These two probabilities are multiplied together to give the overall annual probability of such an event occurring. Factors which influence the overall probability within a road catchment area are:

- The type of road i.e. motorway, rural trunk road or urban trunk road. In this case the A5WTC route has been assessed as rural trunk road;

- The road components within each road catchment area i.e. no junction, slip road, roundabout, crossroad and side road. This data has been provided by the A5WTC Highways Team;

- The length of each road component within the road drainage catchment, again provided by the A5WTC Highways Team;

- The AADT (annual average daily traffic) two way flow, provided by the A5WTC Traffic Team;

- The percentage of the AADT flow that comprises Heavy Deliveries Vehicles (HDV), also provided by the A5WTC Traffic Team;

- The response time of the emergency services; and

- The receiving waterbody, in this case all outfalls are designed to discharge to surface watercourses.

© Mouchel 2016

The annual probability of a spillage occurring on any road component within the drainage catchment is calculated as:

Spillage Probability = road length x spillage rate x (AADT x 365 x 10^{-9}) x (percentage HGVs / 100)

Where the spillage rate is determined from Table 16B.7.

Table 16B.7 Spillage Rates for Serious Spillages (Billion HGV km/year)

Road Component	Road Type		
	Motorway	Rural Trunk Roads	Urban Trunk Roads
No Junction	0.36	0.29	0.31
Slip Road	0.43	0.83	0.36
Roundabout	3.09	3.09	5.35
Crossroad	-	0.88	1.46
Side Road	-	0.93	1.81

The spillage probabilities for each road component type within the road drainage catchment are calculated to give the overall spillage probability for the road drainage catchment under assessment.

The probability of a serious pollution incident occurring as a result of a serious spillage is determined from Table 16B.8.

Table 16B.8 Probability of a Pollution Incident Occurring as a Result of a Serious Spillage

Receiving Waterbody	Urban (response time to site < 20 mins)	Rural (response time to site < 1 hour)	Remote (response time to site > 1 hour)
Surface Water	0.45	0.6	0.75
Groundwater	0.3	0.3	0.5

Using data from the A5WTC Traffic Team on the travel time for each section of the road, the travel times from the fire stations in the vicinity to the furthest reaches of the proposed road have been estimated. In each case the maximum travel time was less than 20 minutes, indicating an 'Urban' response time throughout the Proposed Scheme. However, it was felt that a more conservative approach may be advisable, as the first priority of the emergency services will be ensuring human safety, which may delay the containment and clean-up of any pollutants. Therefore a 'Rural' response time has been used throughout the Proposed Scheme.

© Mouchel 2016

Finally the overall annual probability of a serious pollution incident as a result of accidental spillage is calculated by multiplying the spillage probability and response time probability together. Within HAWRAT this probability is expressed as a return period such as 1 in 50 years i.e. there is a 1 in 50 (2%) probability of such an event occurring in any one year.

The DMRB guidance recommends that the receiving watercourses are protected such that the risk of a serious pollution incident has an annual probability of less than 1% (or 1 in 100 year return period). However, where outfalls are to discharge within 1km of a protected site a higher level of protection will be required such that the annual probability is less than 0.5% (or a 1 in 200 year return period).

If any outfalls are found to fail these criteria then mitigation, such as (wet/retention) ponds and pollution control (shut-off) valves prior to discharge to receiving water, should be designed into the drainage network, which would capture and contain any potential pollutant before it reaches the watercourse. The accidental spillage calculations should be re-run applying the appropriate risk reduction factors from Table 16B.9.

Table 16B.9 Risk Reduction Factors for Drainage Systems

Drainage System	Optimum Risk Reduction Factor
Filter Drain	0.6
Grassed Ditch / Swale	0.6
Pond	0.5
Wetland	0.4
Soakaway / Infiltration Basin	0.6
Sediment Trap	0.6
Unlined Ditch	0.7
Penstock / Valve	0.4
Notched Weir	0.6
Oil Separator	0.5

© Mouchel 2016

Transitional Waterbodies

The northernmost part of the Proposed Scheme runs approximately parallel with the River Foyle and Finn River from New Buildings to just south of Strabane. A number of the A5WTC road drainage outfalls would discharge directly into these rivers, where there is a tidal influence. They are therefore classified as Transitional Waters under the Water Framework Directive.

There are four outfalls discharging directly into the River Foyle, in and around New Buildings (S1-OF-1.1, S1-OF-2.1A, S1-OF-2.1B, S1-OF-25) and four discharges directly into the Finn River, immediately south of Strabane (S1-OF-36, S1-OF-37, S1-OF-41, S1-OF-22.2), all of which enter into transitional waterbodies.

The HAWRAT method has been used to assess the impact of the road drainage outfalls throughout the A5WTC corridor. However, the DMRB guidance highlights that the HAWRAT tool may not be suitable for assessing outfalls where the receiving watercourse is tidal, particularly in relation to the assessment of sediment-bound pollutant impacts. Under tidal conditions the river flow velocity calculation outlined above is not appropriate as the river flow may be stratified with water at different depths flowing at different velocities and potentially in different directions. To fully assess the sediment impacts under these conditions detailed sediment transportation modelling would be required. This can be a difficult and time-consuming process which, given the size of the Foyle and the Finn, the number and scale of outfall locations and the low probability of significant impacts, is likely to be inappropriate and unnecessary.

To provide comfort and to enable a conservative outfall assessment of such transitional locations, surrogate watercourse locations upstream and without tidal influence have been selected both the River Foyle and the Finn River. The selected River Foyle surrogate location uses data for the Mourne River at Strabane (NGR 233632, 398030), with the surrogate for the Finn River at Flushtown Bridge (NGR 231199 395867). These surrogate locations provide a conservative approach to HAWRAT, EQS and 'in river' sediment standards, given that greater flow values would be expected at transitional locations downstream due to the larger catchment areas (including contributory flows from additional tributaries) and the additional tidal influences encountered. Discussions with NIEA confirmed that the approach outlined above was appropriate for the scale of activities proposed.

Flood Risk Assessment

A phased approach has been taken to the assessment of flood risk impacts. A preliminary assessment was undertaken to determine where there was a potential for impact from flooding. The following data has been collated from consultation with the statutory consultees and from desk study and has informed the preliminary assessment:

- Flood Mapping; including historical flooding, predicted flooding and flood defences – published by the Rivers Agency;

© Mouchel 2016

- Existing flood risk assessment reports and models;
- Recorded river flow and tidal data;
- Topographic data – high resolution DTM and LIDAR data has been utilised;
- Detailed aerial photography;
- Hydrological catchment boundaries and descriptors - taken from the Flood Estimation Handbook.

Using this data, potential floodplains that would be crossed or impinged upon by the proposed route were identified. The A5WTC study area incorporates both fluvial and tidal systems; therefore, within the FRA, the limits of the 'design' floodplains assessed are:

- Rivers – the extent of a flood risk event with a 1% annual exceedance probability (1 in 100) of exceeding the peak floodwater level;
- Coastal – the extent of a flood risk event with a 0.5% annual probability (1 in 200) of exceeding the peak floodwater level.

Where potential flood risk impacts have been identified, further assessment of these areas was then carried out through hydraulic modelling as required by DMRB HA45/09 Method F – Hydraulic Assessment. Flooding mechanisms and impacts are specific to each individual floodplain location and thus the application of a variety of hydraulic modelling techniques has been used. Hydraulic models may be one or two dimensional with steady or unsteady flows and built using software packages such as HEC-RAS, ISIS, ICM or MIKE. In general the hydraulic modelling has involved:

- site inspections of all proposed modelling locations were undertaken to confirm the location and nature of the various watercourses, gain an appreciation of catchment characteristics (steepness, land use, etc), confirm model extents and determine the appropriate channel and coefficients to be applied to the hydraulic model;
- detailed topographical survey of model cross sections and any hydraulic control (bridges, culverts, etc.);
- catchment analysis and design flow estimation;
- model build, calibration and sensitivity analysis.

Twenty-five hydraulic models were used to determine the extents of various flood events, but specifically the 'design' event; 1% Annual Exceedance Probability (1% AEP) or 0.5% AEP in the case of tidal floodplains. From the models the effect that the Proposed Scheme could have on the existing floodplains was deduced. This information was the basis for creating flood mitigation

© Mouchel 2016

measures and ensuring the design complies with the recommendations set out in Method E of DMRB Vol. 11, Section 3, Part 10 Road Drainage and the Water Environment.

Through comparison of these results, the following potential impacts can be identified:

- Afflux – Afflux is the increase in upstream water level caused by a restriction in flow;
- Loss of Floodplain Storage - In relation to the location of a road within a floodplain;
- Impediment of Water Flows - The construction of a new road forms a barrier that may cross existing drainage routes, causing potential blockage and altering local catchment areas and boundaries;
- Potential Increase in Flood Risk – it is identified that there is a potential to impact flood water levels, thus increasing flood risk both within the vicinity of the development and elsewhere in the catchment.

The purpose of mitigation measures within a floodplain is to manage floodwater levels in a way that reduces the potential impact of flooding on the Proposed Scheme itself and also elsewhere in the catchment.

Various iterations with regards to the mitigation measures have been undertaken to find the optimum mitigation solution, within practical / feasible bounds. These iterations have run alongside the multidisciplinary evolution of the Proposed Scheme and have been discussed with Rivers Agency throughout.

Hydraulic models were utilised to inform the route development and to assist in the avoidance and/or reduction of impacts arising from the road alignment as far as reasonably practicable. The models facilitated the testing of various crossing structure sizes and floodplain impacts. Generally, flood impacts would be mitigated using measures which include some, or all, of the following:

- Avoidance of floodplains as far as reasonably practicable and whilst incorporating multi-discipline engineering and non-engineering factors;
- Minimisation of road footprint as far as reasonably practicable and whilst incorporating multi-discipline engineering and non-engineering factors;
- Appropriately sized culverts;
- Large span structures where feasible;
- Provision of floodplain connectivity structures to maintain floodplain conveyance where floodplains are bisected by the road alignment;

© Mouchel 2016

- Provision of compensatory storage where material volumetric floodplain encroachment remains.

The various mitigation measures where tested within the model and impacts were assessed for the 'design' floodplain extents.

Flood risk has been assessed using the specified 'design' flood event. To assist in the determination of residual, post scheme flood risk associated with the Proposed Scheme, assessment methodologies identified within appendices of the DMRB were used; whereby the importance of the floodplain, the magnitude of the impact and the significance of the potential effects have been defined as per the guidance tables A4.3 HD 45/09, A4.4 HD 45/09 and A4.5 HD 45/09. Finally, the qualifying conditions for the overall assessment score for residual, post mitigation flood risk from Table A4.6 HD 45/09 have been applied.

Water Framework Directive Assessment

WFD Regulatory Background

The Water Framework Directive (2000/60/EC) (known as WFD) was established in law in Northern Ireland in December 2003 through the Water Environment (WFD) Regulations (Northern Ireland) 2003 (SR 2003 No.544). The WFD advocates a catchment-wide approach to surface water management, with River Basin Management Plans (RBMP) published in December 2009. These documents provide strategic information on the various water body parameters, issues and pressures. The main purpose of identifying waterbodies is so that their status can be described accurately and compared with environmental objectives.

Monitoring programmes and classification systems have been developed and applied across Northern Ireland to assess the impacts on the whole water environment, including rivers, lakes, transitional and coastal waters, and groundwater. The overall emphasis of the WFD is the ecological health of the hydrological system.

The components planned and surface water drainage design for the Proposed Scheme identifies surface waterbodies as the key concern relating to WFD, as these are the waterbodies with much greater potential for adverse impact upon status. There is very limited potential of impact on the large groundwater bodies crossed by the Proposed Scheme.

Surface water bodies are defined as per the Water (Northern Ireland) Order 1999 as "any river, stream, watercourse, inland water (whether natural or artificial) or tidal waters and any channel or passage of whatever kind (whether natural or artificial) through which water flows".

The ecological quality of surface water reflects:

- Biological quality elements (invertebrates, plants and fish);

© Mouchel 2016

- General chemical quality elements (toxic substances, nutrients, dissolved oxygen, temperature and pH); and
- Hydromorphological quality elements (water flow and physical modifications).

This risk-based system highlights issues such as stream morphology and existing artificial structures in addition to chemical water quality. Heavily modified waterbodies (or artificial waterbodies), which cannot be considered to be natural, are classified on the basis of 'ecological potential'.

WFD Objectives

A key objective of the WFD is the achievement of at least 'good' (or for heavily modified or artificial waterbodies; 'good ecological status') of all natural water bodies by 2015 and that deterioration in the status of waters is prevented.

Any new development must demonstrate that these requirements are met. Any new development which could adversely effect the ecological status of WFD classified water bodies should clearly identify components or activities with potential impact on water bodies. These components and activities should be assessed against the following 4 objectives:

1. *To prevent deterioration in the ecological status of the water body;*
2. *To prevent the introduction of impediments to the attainment of Good WFD status for the water body;*
3. *To ensure that the attainment of the WFD objectives for the water body are not compromised;*
4. *To ensure the achievement of the WFD objectives in other water bodies within the same catchment are not permanently excluded or compromised.*

Developments require to provide information on the current status of the applicable water body and justification for there being no change to WFD status. If mitigation is required to meet the above objectives, suitable details on the proposed measures must be provided.

Any development which cannot meet these requirements, or have failed to successfully justify or demonstrate effective mitigation would be determined as requiring a further level of assessment.

WFD Article 4.7 Exemption

Developments which cannot meet the above WFD Objectives, require an exemption for a deterioration in status caused as a result of a physical modification to the water body, such as a new modification for construction. This is known as an exemption under Article 4.7 (new modifications) of the WFD, to summarise, such exemptions must meet the following conditions:

- All practicable mitigation measures are taken;

© Mouchel 2016

- The reasons for modifications are explained in the appropriate River Basin Management Plan;#

- There are reasons of overriding public interest and/or the benefits to the environment, human health, safety or sustainable development outweigh the benefits in achieving the WFD objective;

- The beneficial objectives served by the modifications cannot for reasons of technical feasibility or disproportionate cost be achieved by other means, which are a significantly better environmental option;

- Activities that prevent the future achievement of good status through restoration activities have been defined.

WFD Assessment Methodology

Road schemes involve the construction of linear construction sites, along the route corridor. Typical features include watercourse crossing structures, watercourse diversions and drainage outfalls. These scheme components, individually or cumulatively, could potentially impact upon local waterbodies and may influence WFD status and objectives, either by downgrading the current status or preventing improvements to reach target status during the construction or operational phase.

The approach taken uses the local receiving watercourse as the receptor, then identifies development components that could interact with each watercourse receptor sequentially along the route corridor. This technique is considered to better illustrate the cumulative issues from various components of the Proposed Scheme, in both a local and wider catchment context (including catchment and wider Local Management Area), reducing the repetition of baseline water body data for each individual component.

A screening methodology was employed to focus attention upon receiving watercourses where there would be the potential for greater potential impact upon watercourses and/or WFD status. The screening process was undertaken in a number of steps, as outlined below.

- Screening Step 1 - Removal of watercourse locations where the only surface water interactions are pre-earthworks drainage and side road drainage outfalls. These features are essentially re-routing of existing drainage features and are not contaminated by new A5 carriageway runoff. These are not materially changing the existing baseline conditions for the respective receiving watercourses.

- Screening Step 2 - Removal of watercourse locations where all of the following three criteria were met:

    - Annual mean flow of less than 0.1m^3/s at interaction location;

© Mouchel 2016

  - Upstream catchment size of less than 5km^2; and
  - Watercourse type categorised by survey team and photographic evidence as 'field drain' or 'minor watercourse'.

- Screening Step 3 - Identifying those watercourses screened out at Step 2 which meet any of the following criteria, retaining these locations for further assessment:
  - Named WFD surface waterbody;
  - Watercourse within 1km of designated area;
  - Watercourse with identified ecological sensitivities, including fisheries; or
  - Watercourse with identified geomorphological sensitivity.

The Water Framework Directive (WFD) Assessment, Appendix 16D, provides details of watercourses with potential Proposed Scheme interactions and a summary table of the outcomes of the screening process, based on local interactions and wider interactions within hydrological catchment and Local Management Plans areas.

Note that all screened out locations remain subject to good practice design and site environmental management, including sediment discharge consents.

For locations that failed to meet the screening out criteria, WFD Assessment Datasheets have been provided. Each WFD Assessment Datasheet provides more detailed watercourse baseline information, aerial photography, site photography, Proposed Scheme component identification and discusses interaction with Proposed Scheme components, standard good practice design and any applicable site-specific mitigation.

Each component of the Proposed Scheme, which may interact with a surface water body, required assessment. It was also important to assess the cumulative nature of multiple components on local water bodies. The components with potential interactions identified for the Proposed Scheme, for both construction and operation phases, are as follows:

- Bridge structures;
- Watercourse diversions;
- Culvert structures; and
- Mainline (highway carriageway) drainage outfalls.

© Mouchel 2016

The outcome enables the reader to relate all watercourse interactions to the individual and combined effect of Proposed Scheme components on the local watercourse and also the larger hydrological catchment.

This methodology has been prepared with reference to the NIEA's EIA Scoping Guidance for Road Schemes (NIEA, 2012a), Road Schemes and Protection of the Water Environment (NIEA, 2012b) and WFD Assessment guidance (NIEA, 2012c). Specific methodologies involved in the WFD Assessment for the A5WTC have been discussed and agreed with NIEA in advance of submission.

Data Sources for WFD Assessment

Data on the existing baseline conditions and the Proposed Scheme components have been collated through consultation, desk study and field surveys as summarised below:

- A review of published maps and information;
- Information provided by the Rivers Agency, NIEA Water Management Unit and other branches of the NIEA;
- Information from and discussions with the A5WTC Highways and Environment teams, particularly the Drainage, Structures and Ecology disciplines;
- Desk-based and field-based fluvial geomorphological assessments.

Applicable data sources are detailed on Table 16B.10.

This data has subsequently been entered into a Geographical Information System (GIS), this enables effective evaluation and analysis of Proposed Scheme components with respect to features of the water environment.

Table 16B.10 Data Sources for WFD Assessment Datasheets

Datasheet Field	Data Source
WFD Assessment ID	Assigned by the A5 Water Quality Team, generally following a sequence starting from chainage 0m.
Watercourse Name	General naming convention as used by the A5 Drainage Design Team for cross-referencing purposes, there is occasional deviation in watercourse naming in order to follow WFD naming convention for specific surface waterbodies.

© Mouchel 2016

Datasheet Field	Data Source
Grid Reference / Chainage	Irish grid reference of datasheet location, typically centred on highway watercourse crossing, or other significant drainage component, of the relevant watercourse. Approximate chainage of the carriageway as defined by the A5 Drainage Design Team.
Watercourse description and geomorphology	Watercourses descriptions are based on watercourse survey data provided by the A5 Drainage Design team and the Fluvial Geomorphology Report (Appendix 16F).
Watercourse Data	Catchments have been derived using the Flood Estimation Handbook (FEH) software and available Digital Terrain Model (DTM) data where required. Annual mean flows and Q95 low flows have been derived using Wallingford HydroSolutions LowFlows2 software. Other watercourse survey data including bed width and channel gradient, has been provided by the A5 Drainage Design Team.
Ecology Features	Data have been provided by the Project Ecology Team comprising details of significant species' presence for each surveyed watercourse, including information from the 2014 Habitats Regulations Assessments.
Protected Areas (<1km)	Details of protected area designations (SAC, SPA, RAMSAR, and ASSI) were sourced from the NIEA website.
Abstractions (<1km)	Surface water abstraction data have been provided on request by NIEA. These comprise records of both licensed abstractions and completed licence applications.
Component Type & ID	Assigned by the Project Drainage Design Team and Structures Team.
Component Description	Drainage Design Team and Structures Team provided specific component details. Descriptions of watercourse interactions were based on professional judgement and experience.
Potential Impacts on WFD Status	Potential impacts on WFD status are summarised based on professional judgement and experience.
Mitigation	Mitigation has been described where required. Hydromorphological sensitivities and mitigation have been sourced from the Fluvial Geomorphology Report (Appendix 16F) and Ecology information from ES Chapter 11.
Aerial Photograph	Each datasheet has an aerial image of relevant components. Superimposed on the aerial image is the highways alignment, drainage design and watercourse centrelines.

© Mouchel 2016

Datasheet Field	Data Source
Watercourse Photograph	Each datasheet features an image provided by the A5 Drainage Design team from the watercourse surveys conducted.
WFD Waterbody Name / ID	Unique ID assigned by NIEA under the Water Framework Directive, taken from the NIEA River Basin Management Plan (RBMP) Interactive Map website. Multiple outfalls, culverts and diversions may be within a single waterbody area.
Current Overall Status - 2013 **Objectives 2015 / 2021 / 2027**	Current WFD Classification and objectives were taken from the NIEA RBMP Interactive Map website. For the purposes of this assessment it has been assumed that the classification of a river can be extrapolated and applied to all its tributary streams and drains. The status of heavily modified rivers is quoted in terms of ecological potential, in line with the WFD classification system used by the NIEA.
Local Management Area (LMA) Action Plan Summary	LMA documents were obtained via the NIEA RBMP Interactive Map website, with summarised LMA-wide plans and local plans specific to each surface waterbody noted.
Current and Assessed Post Works WFD Status	Current WFD Classification taken from the NIEA RBMP Interactive Map website have been reported, together with a post works status for each of the WFD Elements listed, based on the outcomes of this assessment. Note that current data refers to the latest available on NIEA website at time of writing; 2013 data.
Proposed Scheme Influence on WFD Status	A brief statement has been made for each WFD element summarising the influence of the Proposed Scheme on WFD status, referring to good practice and whether further mitigation is required. This is based on professional judgement and experience, and the outcomes of this assessment.
Does the Proposed Scheme comply with WFD Objectives 1, 2, 3 and 4?	Compliance with objectives 1 – 4, as set out in 'Carrying Out A Water Framework Directive (WFD) Assessment On EIA Developments' (NIEA Water Management Unit 2012), is demonstrated together with an indication of where justification (standard good practice) or further mitigation measures has been provided.

Fluvial Geomorphological Assessment

An initial desk-based fluvial geomorphological assessment of all watercourse crossings, discharge points and diversions affected by the Proposed Scheme was undertaken by reviewing aerial and ground-based photographs and maps to assess the potential impact to the morphology of the watercourses and the geomorphological processes operating within them. This exercise was undertaken to reduce the number of sites to be visited in the field. Sites assessed as having no significant impact to the fluvial geomorphology of the watercourses and no impact to the Proposed

© Mouchel 2016

Scheme, such as small field drains with minimal flow and no evidence of instability, were ruled out from further investigation.

Sensitive watercourse locations were walked upstream and downstream from the potential point of impact. The distance walked being dependent on the size of the watercourse, its geomorphological sensitivity and the nature of the potential impact. Typically, a distance of 100 metres up and downstream was walked for small watercourses with low geomorphological sensitivity, while for larger watercourses, with greater geomorphological sensitivity, a distance of 500 metres up and downstream was walked. Investigation up and downstream of the point of interest allowed it to be put in context in relation to the whole watercourse.

A detailed digital photographic library was taken at each site and the nature of the watercourse and surrounding land recorded including the channel morphology, bed and bank material, degree of vegetation, sinuosity, braiding, evidence of erosion and deposition and land use. Any evidence of historic channel change was recorded including palaeochannels, terraces and raised bars. These features provide an indication of the sensitivity and dynamism of the watercourse.

In the case of diversions, the area in which the new diversion channel is to be created was investigated to determine if the slope was similar to the existing channel and how the local topography and material may respond to the presence of a watercourse. Any slight change to the nature of the watercourse could result in erosion or deposition, which could have significant impacts on how the watercourse may behave in proximity to the road and impact downstream.

Road Cuttings Assessment

Road cuttings have the potential to affect groundwater flow, groundwater levels and an increased vulnerability to pollution as overlying material is removed. An assessment was therefore undertaken on each cutting in the proposed route to assess the potential impacts.

The location of each road cutting along the route was identified and the maximum depth, geology and depth to groundwater of each was established using GIS, GI and monitoring data. The receptors in the vicinity of each cutting which could be effected were identified, with primary concern being groundwater vulnerability and abstractions but also with regard to groundwater interactions with local surface waters, contaminated land and quarries locations.

In order to determine the likely impact of the cuttings on groundwater receptors, a distance/area of influence was estimated for each cutting. Permeability of the superficial geology and bedrock geology was estimated using a combination of field test data, information from logs and generic hydrogeological properties of rock types. Where a cutting penetrated both drift and bedrock, the more permeable stratum was used for the assessment.

There is no published formula to calculate a distance of influence of road cuttings. The method for estimating the distance of influence of individual road cuttings was based on the empirical formula

© Mouchel 2016

for calculating the radius of influence of groundwater abstractions from CIRIA guidance 515, Sichardt equation (Powers, 1992):

$$L = \sqrt{K*(H-h)*x}$$

Where:

L – distance/radius of influence, K = permeability, H-h = groundwater table draw-down, i.e. penetration of cutting beneath water table, x = 2000

Only approximate distance of influence, and not predicted input of flow, has been calculated as detailed ground investigation has not been undertaken to enable estimation of flow.

To assess the potential risks to groundwater an approach similar in format to other DMRB assessments was used, as DMRB does not provide this within HD45/09. This enabled the assignation of a significance rating for each cutting. This significance rating relates the importance of the groundwater receptors against the magnitude of the change of groundwater flow conditions.

The impact of the cuttings on the groundwater abstractions identified from the abstractions survey was then determined. In order to be conservative, or where no hydrogeological information was available for a cutting, a buffer zone was defined for each cutting based on location specific professional judgement using conservative distances of possible impacts. It was also taking into account that road cuttings may have the effect of removing parts of the catchment of groundwater receptors (wells, wetlands, pond), which could lead to a reduced or a more variable water supply.

Water Abstractions Survey

Public and private water abstraction data was requested from NIEA in October 2014 via a data request and a follow-up visit to the Lisburn Water Management Unit office.

This information was used alongside information gathered from a 2010 questionnaire survey issued to land owners in the Proposed Scheme corridor where groundwater abstraction was considered feasible. Questionnaires were issued dependent upon the hydrogeology of each land parcel and local road construction components (principally cuttings). Information was requested from landowners on the type of abstraction they had, if any, water volumes, quality and uses.

785 survey questionnaires were issued in April 2010 and responses were collated until 6th August 2010. This information was supplemented by information gathered during mitigation meetings during the same period. Where the information in the returned survey forms was unclear or incomplete; follow-up phonecalls were made. When the 2010 data was reviewed in 2014 there was only one altered land ownership location in the locations identified as being of concern, which was a split from a land parcel that had been included in the 2010 survey. Prior to construction the outcomes of all surveys shall be confirmed with landowners.

© Mouchel 2016

The information received from the survey forms, follow-up phone calls and mitigation meetings gave 40% coverage of the original area of interest. This data was then used to update the historical abstraction information in the GIS to enable assessment. Further information on abstractions was gained during meetings, from ground investigations and groundwater monitoring conducted during 2011 and 2012. Targeted well inspections were undertaken in 2011, followed by 3 rounds of further inspections and water sampling at the northern and southern ends of the Proposed Scheme in 2012. This validated a large part of the abstractions survey results and generated a first set of baseline data.

Assessment of Significance

The predicted significance of impacts in relation to surface waters, groundwater, abstractions and peatlands has been based on the importance of the relevant attribute and the magnitude of the impact.

Attribute Importance Criteria

The predicted significance of impacts in relation to surface and groundwater has been based on the importance of the relevant watercourse and its attributes and the magnitude of the impact from the proposed discharge diversion.

The importance (or sensitivity) has been evaluated taking into account quality, rarity, scale, substitutability and sustainability of the attribute. Table A4.3 in the DMRB, Volume 11, Section 3, Part 10 provides guidance relating to the estimation of importance, this guidance is adapted and criteria presented in Table 16B.11.

Table 16B.11 Criteria for Estimating the Importance of Water Environment Attributes

Importance	Criteria	Examples
Very High	Attribute with a high quality and rarity on an international or national scale	**Water Quality & Biodiversity** Large or medium watercourses with pristine / near pristine water quality High WFD Surface Water Overall Status Good WFD Groundwater Overall Status, high vulnerability of groundwater Hydrologically-connected site protected under EU or UK wildlife legislation (SAC, SPA, ASSI, Ramsar sites) Watercourses with identified sensitive ecology features, e.g. Atlantic salmon, otter **Water Resources** Surface water abstraction supporting major / critical public water

© Mouchel 2016

Importance	Criteria	Examples
		supplies with hydrological linkage to Proposed Scheme Principal aquifer providing regionally important resource or public water supply Surface water or groundwater bodies considered to be directly supporting and maintaining water conditions of designated wetland or peatland sites with hydrological linkage to Proposed Scheme Providing dilution, dispersion and downstream transport for consented discharges **Fluvial Geomorphology** Dynamic watercourses showing evidence of channel migration and recent morphological changes, channels with regular morphological features such as pools and riffles **Flood Risk** Watercourses or floodplains, with direct flood risk to adjacent populated areas and/or presence of critical infrastructure such as schools and hospitals etc, which are highly sensitive to increased flood risk by the possible increase in water levels Floodplain or defence protecting more than 100 residential properties from flooding

© Mouchel 2016

Importance	Criteria	Examples
High	Attribute with a high quality and rarity on a regional scale	**Water Quality & Biodiversity** Medium or small watercourses with minor degradation of water quality as a result of anthropogenic factors Good (or Good Ecological Potential) WFD Surface Water Overall Status Good WFD Groundwater Overall Status, high vulnerability of groundwater Watercourses with identified sensitive ecology features, e.g. Atlantic salmon, otter **Water Resources** Surface water abstraction supporting minor / non-critical public water supplies with hydrological linkage to Proposed Scheme Principal groundwater aquifer supporting large numbers of domestic private water supplies or secondary groundwater aquifer supporting public/private water supply Surface water or groundwater bodies considered to be indirectly supporting or contributing to water conditions in designated wetland or peatland sites with hydrological linkage to Proposed Scheme Providing dilution, dispersion and downstream transport for consented discharges **Fluvial Geomorphology** Dynamic watercourses showing limited evidence of channel migration and historic morphological changes, channels with some morphological features such as pools and riffles **Flood Risk** Watercourses or floodplains, with a possibility of direct flood risk to less populated areas without critical infrastructure, which are sensitive to increased flood risk by the possible increase in water levels Floodplain or defence protecting between 1 and 100 residential properties or industrial premises from flooding

© Mouchel 2016

Importance	Criteria	Examples
Medium	Attribute with a medium quality and rarity on a local scale	**Water Quality & Biodiversity** Small watercourses with degradation of water quality as a result of anthropogenic factors Moderate (or Moderate Ecological Potential) WFD Surface Water Overall Status Good WFD Groundwater Overall Status, low vulnerability of groundwater **Water Resources** Surface water abstraction requirements for private water supply with hydrological linkage to Proposed Scheme Aquifer providing abstraction water for small number of domestic private water supplies, or agricultural or industrial use Surface water or groundwater bodies considered to be directly supporting or maintaining water conditions in non-designated wetland or peatland sites with hydrological linkage to Proposed Scheme Providing dilution, dispersion and downstream transport for consented discharges **Fluvial Geomorphology** Watercourses showing limited evidence of historic channel migration and other morphological changes, channels with limited morphological diversity **Flood Risk** Watercourses or floodplains, with a possibility of direct flood risk to high value agricultural areas, which are moderately sensitive to increased flood risk by the possible increase in water levels Floodplain or defence protecting 10 or fewer industrial properties from flooding

© Mouchel 2016

Importance	Criteria	Examples
Low	Attribute with a low quality and rarity on a local scale	**Water Quality & Biodiversity** Small, heavily modified watercourses or drains with poor water quality as a result of anthropogenic factors Poor/Bad (or Poor/Bad Ecological Potential) WFD Surface Water Overall Status Poor WFD Groundwater Overall Status, high/low vulnerability of groundwater **Water Resources** No surface water abstraction activity with hydrological linkage to Proposed Scheme Non aquifer Surface water or groundwater bodies not considered to contribute or maintain water conditions in any wetland or peatland sites Providing dilution, dispersion and downstream transport for consented discharges **Fluvial Geomorphology** Defined as a heavily modified waterbody Watercourses showing no evidence of active fluvial processes, channels with no morphological diversity **Flood Risk** Watercourses or floodplains passing through low value agricultural areas, which are less sensitive to increased flood risk by the possible increase in water levels Floodplain with limited constraints and a low probability of flooding of residential and industrial properties

© Mouchel 2016

Magnitude Criteria

Impact Magnitude has been evaluated taking into account the quality, rarity, scale and sustainability of the attribute. Table A4.4 in the DBRB, Volume 11, Section 3, Part 10 provides guidance relating to the estimation of importance, this guidance is replicated in Table 16B.12.

Table 16B.12 Estimating the Magnitude of an Impact on a Water Environment Attribute

Magnitude	Criteria	Examples
Major Adverse	Results in loss of attribute and/or quality and integrity of the attribute	Large number or large scale in-channel interactions (diversions and culverts) on named WFD watercourse channel Failure of both soluble and sediment-bound pollutants in HAWRAT and compliance failure with EQS values Risk of pollution from accidental spillage >2% annually High risk of pollution to groundwater from construction or routine runoff Loss or extensive change to a fishery Permanent or medium-term impact upon a public surface water supply or aquifer preventing use Increase in peak flood level (1% annual exceedance probability) >100mm
Moderate Adverse	Results in loss of part of attribute, or effect on quality and integrity of the attribute	Small number of small scale in-channel interactions (diversions and culverts) on named WFD watercourse channel Failure of both soluble and sediment-bound pollutants in HAWRAT but compliance with EQS values Risk of pollution from accidental spillage >1% annually Partial loss in productivity of a fishery Medium risk of pollution to groundwater from construction or routine runoff Short-term impact upon a public surface water supply or aquifer, or permanent impact upon private water supply Increase in peak flood level (1% annual exceedance probability) >50mm

© Mouchel 2016

Magnitude	Criteria	Examples
Minor Adverse	Results in some measurable change in attributes quality or vulnerability	Large numbers of in-channel interactions (diversions and culverts) on minor tributary watercourses (non-WFD named channels) Failure of either soluble or sediment-bound pollutants in HAWRAT Risk of pollution from accidental spillage >0.5% annually Low risk of pollution to groundwater from construction or routine runoff Short-term impact upon a private water supply Increase in peak flood level (1% annual exceedance probability) >10mm
Negligible Adverse	Results in effect on attribute, but of insufficient magnitude to affect the use or integrity	Small numbers of in-channel alterations (diversions and culverts) on minor tributary watercourses (non-WFD named channels) No risk identified by HAWRAT Risk of pollution from accidental spillage <0.5% annually No anticipated measurable impact upon surface water supply or aquifer in terms of water quality or yield Negligible effect in peak flood level (1% annual exceedance probability) +/- 10mm

Significance Criteria

The prediction of the significance of the identified impacts has been arrived at by combining the estimated importance of the affected attributes and the magnitude of the impacts using the matrix recommended in Table A4.5 of the DBRB, Volume 11, Section 3, Part 10, which is replicated in Table 16B.13. Where the significance is shown as being one of two alternatives a single description is provided based upon reasoned judgement.

© Mouchel 2016

Table 16B.13 Estimating the Significance of Potential Effects

Importance of Attribute	Magnitude of the Impact			
	Major	**Moderate**	**Minor**	**Negligible**
Very High	Very Large	Large / Very Large	Moderate / Large	Neutral
High	Large / Very Large	Moderate / Large	Slight / Moderate	Neutral
Medium	Large	Moderate	Slight	Neutral
Low	Slight / Moderate	Slight	Neutral	Neutral

Typical examples of potential beneficial/adverse effects are described in Table 16B.14. This table is based upon Table A4.6 taken from the DMRB Volume 11, Section 3, Part 10 Annex IV and indicates appropriate qualifying conditions for overall assessment scores to maintain consistency with other highway scheme EIA.

© Mouchel 2016

Table 16B.14 Re-produced Table A4.6, DMRB Volume 11, Section 3, Part 10, Annex IV 'Qualifying Conditions for Overall Assessment Scores'

Score	Comment
Very Large Adverse	Where the proposal would result in degradation of the water environment because it results in predicted very significant adverse impacts on at least one water attribute. More than one attribute may be affected by a single project and each should be assessed and reported separately. For example: **Surface water** • Potential failure of both soluble and sediment-bound pollutants in a high or good watercourse or in an EC designated salmonid fishery, for both short-term and long-term assessment (methods a and b); • Loss or extensive change to a site/habitat protected under EC or UK legislation (SAC, SPA, RAMSAR SITE, SSSI, WPZ salmonid water); and • Calculated risk of pollution from spillages is >2% when discharging into a good watercourse, >1% for a high watercourse. **Flood risk** • An increase in peak flood levels (1% annual exceedance probability) >100 mm increasing the risk of flooding to >100 residential properties **Groundwater** • Potential high risk (risk score >250) of pollution in the groundwater assessment (method c, annex I) to a principal aquifer providing a regionally important resource or supporting a site protected under habitat legislation or a medium to high risk (risk score >150) to a spz1; • Calculated risk of pollution from spillages is >1% when discharging into a SPZ1 or principal aquifer; • Potential loss or extensive change to a site/habitat protected under EC or UK legislation (s SAC, SPA, RAMSAR SITE, SSSI, WPZ salmonid water) through interception of groundwater flow or significant change to groundwater level.

© Mouchel 2016

Score	Comment
Large Adverse	Where the proposal would result in a degradation of the water environment because it results in predicted highly significant adverse impacts on a water attribute. More than one attribute may be affected by a single project and each should be assessed and reported separately. For example: **Surface water** • Potential short-term (HAWRAT) failure of both soluble and sediment-bound pollutants in a high or good watercourse or in an EC designated salmonid fishery; • Calculated risk of pollution from spillages is >1% for a good watercourse (or one of lower ecological class) and >0.5% for a high watercourse; • Loss or extensive change to a cyprinid fishery; and • Loss or extensive change to a local nature reserve; **Flood risk** • An increase in peak flood levels (1% annual exceedance probability) >50 mm increasing the risk of flooding to >100 residential properties or an increase of >100 mm increasing the risk of flooding to 1-100 residential properties. **Groundwater** • Potential high risk (risk score >250) of pollution to a secondary aquifer providing water for a small number of dwellings, agricultural or industrial use and/or supporting local nature reserves aquifer or medium risk (risk score 150-250) of pollution of a principal aquifer providing a locally important resource or supporting a site protected under habitat legislation, or medium to high risk (score >150) to a SPZ2, or potential low risk (score <150) to a SPZ1: • Calculated risk of pollution from spillages is >0.5% when discharging to a principal aquifer or SPZ1; and • Loss or extensive change to a local nature reserve through interception of groundwater flow or change to groundwater level.

© Mouchel 2016

Score	Comment
Moderate Adverse	Where the proposal may result in the degradation of the water environment because it results in predicted moderate adverse impacts on at least one attribute. More than one attribute may be affected by a single project and each should be assessed and reported separately. For example: **Surface water** • Potential short-term (HAWRAT) failure of either soluble or sediment-bound pollutants in a high or good watercourse; • Calculated risk of pollution from spillages is >0.5% for a good watercourse or >1% for a moderate or poor watercourse; • Partial loss or change to a fishery; and • Effect on the integrity of the existing flora and fauna. **Flood risk** • An increase in peak flood level (1% annual exceedance probability) >10 mm resulting in an increased risk of flooding to >100 residential properties or an increase of >50 mm resulting in an increased risk of flooding to 1-100 residential properties. **Groundwater** • Potential medium risk (score 150-250) to a secondary aquifer providing water for a small number of dwellings, agricultural or industrial use and/or supporting local nature reserves or potential low risk (score <150) of pollution to a principal aquifer providing a regionally important resource or supporting a river ecosystem or medium to high risk (score >150) to a SPZ3, or potential low risk (score <150) to a SPZ2, or high risk (score >250) for a discharge to unproductive strata: • Calculated risk of pollution from spillages is >1% for an aquifer or SPZ3; and • Effect on the integrity of the existing flora and flora through interception of groundwater flow or change to groundwater level.

© Mouchel 2016

Score	Comment
Slight Adverse	Where the proposal may result in a degradation of the water environment because it results in a predicted slight impact on one or more attributes. More than one attribute may be affected by a single project and each should be assessed and reported separately. For example: **Surface water** • Potential short-term (HAWRAT) failure of either soluble or sediment-bound pollutants in a moderate or poor watercourse; • Calculated risk of pollution from spillages is >0.5% for a moderate or poor watercourse; and • Temporary loss to, or loss in productivity of, a fishery. **Flood risk** • An increase in peak flood level (1% annual exceedance probability) >10 mm resulting in an increased risk of flooding to fewer than 10 industrial properties. **Groundwater** • Potential low risk of pollution (score <150) to a secondary aquifer with limited agricultural use and connectivity to surface waters and local ecology or low to medium risk (score <250) for a discharge to unproductive strata, or low risk (score <150) to a SPZ3; and • Calculated risk of pollution from spillages is >0.5% for an aquifer or SPZ3.
Neutral	Where the net impact of the proposals is neutral, because it results in no appreciable effect, either positive or negative, on the identified attribute. More than one attribute may be affected by a single project and each should be assessed and reported separately. For example: **Surface water** • No risk identified by Method A or Method B assessment (pass both soluble and sediment-bound pollutants); and • Calculated risk of pollution from spillages <0.5% annually. **Flood risk** • Negligible change in peak flood (1% annual exceedance probability) <+/- 10 mm **Groundwater** • No predicted change in quality of any type of aquifer and/or its use as a resource; and • Calculated risk of pollution from spillages <0.5% annually.

© Mouchel 2016

Score	Comment
Slight Beneficial	All other situations where the proposal provides an opportunity to enhance the water environment or provide an improved level of protection to an attribute. More than one attribute may be affected by a single project and each should be assessed and reported separately. For example: **Surface water** • Method A assessment of either soluble or sediment-bound pollutants becomes pass from previous fail condition for **existing** discharges; and • Reduction by 50% or more in **existing** pollution risk from spillages into high to poor watercourses (when existing spillage risk is <1%). **Flood risk** • A reduction in peak flood level (1% annual exceedance probability) >10 mm resulting in a reduced risk of flooding to 1-100 residential properties **Groundwater** • Reduction by 50% or more in **existing** pollution risk from spillages into an aquifer (when existing spillage risk is <1%)
Moderate Beneficial	Where the proposal provides an opportunity to enhance the water environment because it results in a moderate improvement for an attribute. More than one attribute may be affected by a single project and each should be assessed and reported separately. For example: **Surface water** • Method A assessment of both soluble and sediment-bound pollutants becomes pass from previous refer or fail condition for **existing** discharges • Reduction by 50% or more in likelihood of pollution to watercourses from spillages from **existing** discharges through retrofitting of pollution control to outfalls into a high to poor watercourse (existing risk >1%); and • Recharge of aquifer through provision of treated discharges to ground resulting in measurable improvements to a connected site/habitat of local nature conservation value i.e. local nature reserve. **Flood risk** • A reduction in peak flood level (1% annual exceedance probability) >10 mm resulting in a reduced risk of flooding to >100 residential properties or a reduction of >50 mm resulting in a reduced risk of flooding to 1-100 residential properties. **Groundwater** • Reduction by 50% or more in **existing** likelihood of pollution arising from a spillage to an aquifer through retrofitting of pollution control (existing risk >1%).

© Mouchel 2016

Score	Comment
Large Beneficial	It is extremely unlikely that any proposal incorporating the construction of a new or improved trunk road would fit into this category. However, proposals could have a large positive impact if it is predicted that it will result in a 'very' or 'highly' significant improvement to a water attribute(s), with insignificant adverse impacts on other water attributes. More than one attribute may be affected by a single project and each should be assessed and reported separately. for example: **Surface water** • Removal of an existing polluting discharge through provision of pollution prevention measures, or any other measure, affecting a site/habitat protected under EC or UK legislation (SAC, SPA, RAMSAR SITE, SSSI, WPZ salmonid water); and • Reduction by 50% or more in the existing likelihood of pollution arising from a spillage affecting a site/habitat protected under EC or UK legislation (SAC, SPA, RAMSAR SITE, SSSI, WPZ, salmonid water) where existing risk >1% **Flood risk** • Reduction in peak flood levels (1% annual exceedance probability) >50 mm reducing the risk of flooding to >100 residential properties or a reduction of >100 mm resulting in a reduced risk of flooding to 1-100 residential properties. **Groundwater** • Removal of an existing polluting discharge within zone 1 and 2 of a SPZ and/or a principal aquifer; • Reduction by 50% or more in the existing likelihood of pollution arising from a spillage at discharge points within zone 1 or 2 of a SPZ principal aquifer and/or a site supporting a habitat protected under habitat legislation (existing risk >1%); and • Recharge of aquifer through provision of treated discharges to ground resulting in measurable improvements to a connected site/habitat protected under EC or UK legislation (SAC, SPA, RAMSAR SITE, SSSI, WPZ, salmonid water).

APPENDIX 16C BASELINE DATA

Surface Water

Designations

There are a number of areas in close proximity to the proposed route which support important habitats and wildlife, including areas requiring special protection under national or European legislation. A number of these designated sites are dependent on the quality of the water environment and are detailed in Table 16C.1

Table 16C.1 Designated Sites Dependent on the Quality of the Water Environment

Name	Basis of Designation
River Foyle & Tributaries SAC	The SAC is designated for its habitats of plain to montane levels with the Ranunculion fluitantis and Callitricho-Batrachion vegetation and the largest population of Atlantic Salmon in Northern Ireland (15% of the estimated national spawning numbers). The river is notable for the physical diversity and naturalness of the banks and channels, especially in the upper reaches, and the richness and naturalness of its plant and animal communities. The presence of otter is a subsidiary qualifying feature.
River Finn SAC	The River Finn SAC is located adjacent to the River Foyle & Tributaries SAC, within the same watercourse, comprising the designated area on the Republic of Ireland side of the border. The SAC is designated for its habitats of Oligotrophic Waters, Wet heath, Blanket Bogs, Transition Mires, as well as its Atlantic Salmon and Otter species. The northern section of this site also comprises the River Foyle, Mongavlin to Carrigans Proposed Natural Heritage Area (pNHA).
McKeans Moss ASSI	The most north-western example of lowland raised bog in Northern Ireland. The intact bog surface exhibits a well defined dome with characteristic vegetation and structural features, including hummock and lawn complexes and small shallow pools. Sphagnum species are well represented. The periphery of the bog has been extensively cut for turf in the past. The cutover area is now dominated by mature woodland and scrub.
Strabane Glen ASSI	Strabane Glen is a narrow valley supporting a calcareous wet woodland which is atypical of this region and its presence is related to the underlying geology.
Tully Bog SAC & ASSI	Tully Bog is an isolated lowland raised bog lying in a shallow hollow within the former floodplain of the Fairy Water River. The central intact dome supports a small pool system with a good hummock and hollow development on the bog plain. The centre of the bog has a small raised drumlin, with birch woodland growing on it. The rare bog-mosses Sphagnum imbricatum and S. fuscum are present.

© Mouchel 2016

Name	Basis of Designation
Grange Wood ASSI	Grange Wood is a calcareous wet woodland occurring on the north-eastern flank of Bessy Bell Mountain and partially overlying an isolated outcrop of Dungiven limestone. The wood is largely comprised of a low, multi-stooled Hazel canopy with occasional Ash standards over a diverse base-rich ground flora. Frequent exposed rocky outcrops and boulders are covered by a luxuriant growth of mosses, particularly on the upper slopes. The lower slopes are waterlogged with extensive flushing and in these areas Willow and Alder predominate.

Under the Water Framework Directive the major rivers and their tributaries have also been classified in terms of their ecological status, with classifications ranging from 'Good' to 'Poor'.

Surface watercourse catchments

The main surface water catchments with which the Proposed Scheme would interact, are described below. These are shown on Figure 16.1 and in more detail on Figures 16.2-16.18.

Lower Foyle Catchment

The River Foyle catchment area is approximately 2,890km2 and extends into the counties of Londonderry, Tyrone and Donegal. The major tributaries of the Foyle include the Burn Dennet, Glenmornan, Finn, Mourne, Strule, Owenkillew, Derg, Fairy Water, Camowen and Drumragh Rivers.

The northern section of the proposed route lies within the Lower Foyle Catchment, where the Mourne River and the Finn River converge at Strabane to form the River Foyle. From Strabane, the Foyle flows north to Londonderry and Lough Foyle. The lough is tidal and exerts a tidal influence up the River Foyle as far as Strabane. The tidal reach of the Foyle, shown in Photograph 16C.1 has a tidal range of approximately 3m and is up to 750m wide in places.

© Mouchel 2016

Photograph *16C.1* *River Foyle, looking upstream from Drumenny*

The main tributaries to the Foyle in the vicinity of the route are discussed in the following sections. However, there are also a substantial number of smaller tributaries which the route crosses. These tributaries are generally large man-made field drains and small streams which have been heavily modified / straightened where they pass through villages and agricultural land as shown in Photograph 16C.2.

Classified as a heavily modified water body by NIEA due to flood defences.

Photograph 16C.2 Left - Typical field drain/modified stream running through agricultural land. Right - Upstream view of the culverted/channelised section of the Blackstone Burn in Magheramason.

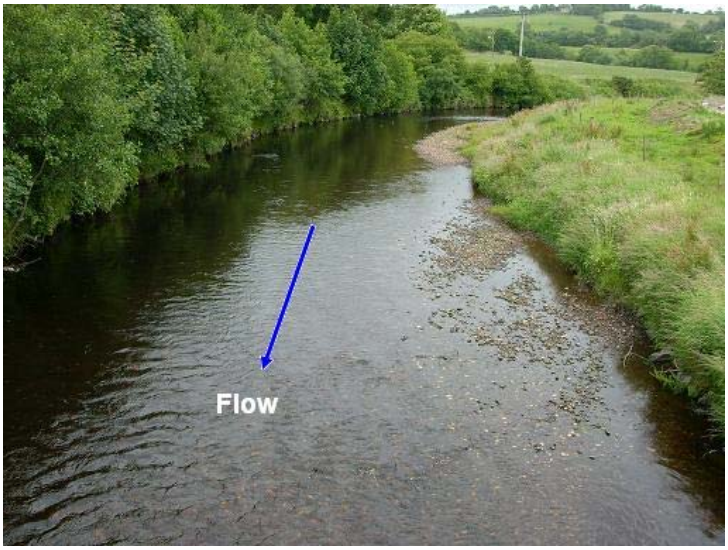
© Mouchel 2016

Burn Dennet Catchment

The Burn Dennet has a catchment area of approximately 150km2 and rises in the Sperrin Hills, flowing 35km west to the River Foyle. The catchment is predominantly agricultural, although there are significant sand and gravel quarrying sites close to the lower reaches of the river.

The route crosses the Burn Dennet in the vicinity of Burn Dennet Bridge, in this area the river is approximately 15m wide with typical transitional (piedmont) river characteristics i.e. lower gradient, relatively unconfined valley, wider floodplain, riffle/pool sequences and meandering channel pattern (see Photograph 16C.3).

Photograph 16C.3 Burn Dennet Approx 2km Upstream of Burn Dennet Bridge, Looking Upstream



© Mouchel 2016

Glenmornan Catchment

The Glenmornan River has a catchment area of approximately 35km2 and rises in the foothills of the Sperrin Hills. From source the river is approximately 16km long and drains westwards to the River Foyle. Although the river rises on peat-covered hills the majority of the catchment is agricultural, with some sand and gravel workings adjacent to the middle reaches of the river. The river, shown in Photograph 16C.4, also passes through Artigarvan and Ballymagorry villages.

Where the route crosses the catchment the river channel is between 4m and 20m wide and displays typical transitional characteristics (as described above for the Burn Dennet).

Photograph 16C.4 Glenmornan River at Ballymagorry, Looking Upstream

Finn Catchment

The Finn River headwaters are in the upland area surrounding Lough Finn in County Donegal, flowing from Lough Finn eastward for 60km to Strabane, where it joins with the Mourne River. The Finn River becomes tidal upstream of Strabane, the Finn has a catchment area of 495km2, upstream of tidal influence.

The route runs along the eastern bank of the lower reaches of the river, which by this point is a mature lowland river, with a wide unconfined valley and floodplain that is relatively deep and slow

Photograph 16C.5 Finn River Immediately Upstream of Strabane, Looking Upstream

© Mouchel 2016

Mourne Catchment

The Mourne River forms the middle section of the main spine of the Foyle Catchment and has a catchment area of 1,860km2. The Mourne, shown in Photograph 16C.6, is formed at the confluence of the River Strule and Derg River near Ardstraw. The river flows north to Strabane where it merges with the Finn River to form the River Foyle. The existing A5 crosses the Mourne River in Strabane, where the channel width is approximately 80m.

The Mourne is a transitional river with numerous riffle and pool sequences, which flow in a relatively unconfined valley within a large floodplain. At Sion Mills the river channel and has been heavily modified, where a large weir was historically constructed. As the Mourne River passes through Strabane the channel has been modified by various flood defences.

The route runs parallel with the western bank of the Mourne River.

Photograph 16C.6 Mourne River at Victoria Bridge, Looking Downstream.

Classified as a heavily modified water body by NIEA due to flood defences.

© Mouchel 2016

Derg Catchment

The Derg River rises in the Killeter Uplands and flows eastwards to its confluence with the River Strule near Ardstraw. The upper reaches of the catchment are characterised by peatlands, while the lower reaches flow predominantly through farmland. The main stream length of the Derg River is 53km, with a catchment of approximately 440km2

The route crosses the lower reaches of the Derg close to the confluence, see Photograph 16C.7. Within the vicinity of the Proposed Scheme the Derg River is a transitional (piedmont) river characterised by a well developed valley, reasonably large floodplain and variable substrate with riffle and pool sequences.

Photograph 16C.7 Downstream View of Confluence Between Derg River (Foreground) And River Strule.

Strule Catchment

The River Strule forms the upper section of the main spine of the Foyle Catchment, and has a catchment area of 1,340km2. The Strule is formed by the confluence of the Camowen and Drumragh rivers in the centre of Omagh. The Strule flows northwards for approximately 21km before merging with the Derg River to form the Mourne River. The Strule has two major tributaries, the Owenkillew which joins the Strule from the east at Newtownstewart and the Fairy Water which joins to the north of Omagh.

The Strule is a transitional river with variable bed materials, riffle and pool sequences, an unconfined valley and floodplain (Photograph 16C.8). The catchment is predominantly agricultural, although peat bog is present in the upper reaches of the large tributaries and sand and gravel quarrying is present in the Strule valley, particularly north of Newtownstewart.

© Mouchel 2016

The entire length of the Strule runs parallel to the route. As the proposed route passes to the west of Newtownstewart the Owenkillew is unlikely to be affected by the Proposed Scheme. The route also crosses numerous small tributaries on the western slopes of the Strule valley.

Photograph 16C.8 Downstream View of the River Strule, Looking Towards Newtownstewart.

Classified as a heavily modified water body by NIEA due to flood defences.

Fairy Water Catchment

The Fairy Water rises on the slopes of Bolaght Mountain in west Tyrone and flows eastwards to its confluence with the River Strule to the north of Omagh. It has a catchment area of 180km2 and a main stream length of 30km. The catchment is predominantly agricultural (grassland pasture), however there are significant areas of peat throughout the catchment, particularly on the valley floor.

The Proposed Scheme crosses the Fairy Water approximately 500m upstream of the confluence with the Strule. In this area the river is approximately 16m wide and has typical transitional characteristics with a meandering channel pattern and riffle and pool sequences, see Photograph 16C.9.

© Mouchel 2016

Photograph 16C.9 Upstream from the Fairy Water/Strule Confluence

Drumragh Catchment

The Drumragh River lies in the upper reaches of the Foyle Catchment and is formed to the south of Omagh by the confluence of the Ballynahatty Water and Quiggery Water, as shown on Photograph 16C.10, flowing north through Omagh before merging with the Camowen to become the River Strule. The Drumragh River catchment is approximately 321km2. Due to the nature of the topography in the Drumragh catchment there is an intricate dendritic drainage network, with a large number of tributary streams. Many of the streams have been straightened or otherwise modified, with the exception of the Routing Burn, which is largely unmodified as shown in Photograph 16C.11.

Photograph 16C.10 Drumragh River Downstream of the Ballynahatty-Quiggery Confluence.

© Mouchel 2016

Photograph 16C.11 Routing Burn at Barony Bridge.

The route crosses the Drumragh approximately 2.5km downstream of the Ballynahatty-Quiggery confluence. At this point the river is approximately 10-15m wide and has typical transitional characteristics with variable bed material, riffle and pool sequences and an unconfined valley and floodplain.

The route skirts around the eastern extent of the upper Drumragh catchment, crossing a number of small streams / large field drains within the Routing Burn and Eskragh Water sub-catchments.

Camowen Catchment

The Camowen River rises in the hills to the west of Pomeroy and flows westwards to Omagh, where it joins with the Drumragh to form the River Strule. The Camowen River catchment area is approximately 276km2. The Camowen headwaters generally rise in the low-lying peatlands which have formed between the drumlins that characterise this area.

The Proposed Scheme passes through the western extent of the Camowen watershed, crossing the headwaters of a minor tributary to the Camowen River, namely the Ranelly Drain. The reaches that the route pass over range from small semi-natural streams a few metres wide with good flow to very narrow ditches with limited flow as shown in Photograph 16C.12.

© Mouchel 2016

Photograph 16C.12 Left - Ranelly Drain 350m Upstream of Confluence with Camowen River. Right - Small Field Drain with Likely Ephemeral Flow.

Classified as a heavily modified water body by NIEA due to drinking water storage features.

Blackwater Catchment

The River Blackwater rises to the west of Fivemiletown and flows eastwards to Aughnacloy, then north-east to Lough Neagh. The Blackwater catchment area is approximately 1,493km2.

The Proposed Scheme crosses the eastern part of the Upper Blackwater catchment, passing through the major tributary sub-catchments of the Roughan Burn and Ballygawley Water, before the Proposed Scheme's southern boundary on the northern bank of the River Blackwater immediately south of Aughnacloy.

The Roughan Burn rises on the southern slopes of Slievemore and flows south through Ballymackilroy before joining the River Blackwater downstream of Augher. Where the Proposed Route crosses the Roughan Burn, it is a small, shallow stream with gravel and cobble bed, as shown in Photograph 16C.13. Although this reach is generally unmodified, the lower reaches have been extensively straightened.

The Ballygawley Water rises on the slopes of Eshmore Hill approximately 12.5km northeast of Ballygawley. The river flows through the town before joining the river Blackwater at Lismore Bridge, approximately 6km downstream. The Proposed Scheme crosses the Ballygawley Water approximately 2km downstream of the town, at this point the river is approximately 10m wide with a shallow cobble and gravel bed, as shown in Photograph 16C.14.

© Mouchel 2016

Photograph 16C.13 Roughan Burn Downstream of Ballynasaggart.

Photograph 16C.14 Ballygawley Water Immediately Downstream of Ballygawley

The remainder of the Proposed Scheme crosses a number of smaller tributaries of the River Blackwater in and around Aughnacloy, namely the Tullyvar, Ravella and Lissadavil. The Tullyvar and Ravella are narrow, shallow, fast flowing, cobble and gravel bedded streams, while the Lissadavil is a narrow, deep, heavily vegetated, sluggish channel that has been heavily modified and meets the Aughnacloy River before flowing south west to the confluence with the Blackwater.

Geomorphologically Sensitive Watercourses

A number of watercourses with Proposed Scheme interactions were identified as being potentially geomorphologically sensitive based on a combination of mapping and aerial photography evidence. These locations were then visited by a geomorphologist who recorded geomorphological features and sensitivities. Further details, methodology and scope of this exercise are provided in Appendix 16F, Fluvial Geomorphology.

Such features may be impacted by the construction and/or operation of the Proposed Scheme or, alternatively, could cause impacts upon the Proposed Scheme during construction and/or operation. The specific watercourses identified are discussed individually below.

© Mouchel 2016

Blackstone Burn

The Blackstone Burn flows north west through Magheramason towards its confluence with the River Foyle.

The Blackstone Burn is a 1-1.5m wide channel with 1m high banks which are steep and predominantly well vegetated. The channel has large cobbles and boulders protruding above the surface of low flow conditions. Deposition of material within the channel has led to lateral and point bar development. There is evidence of small-scale bank undercutting and poaching, both of which have exposed the sandy alluvial soil. The channel has incised into the floodplain and sits within an area of hummocky ground. Small sections of the channel have eroded down to the underlying bedrock. There is a mature riparian zone with a dense cover of trees before reaching open pasture.

Photograph 16C.15 A Typical Section of the Blackstone Burn.

© Mouchel 2016

Burn Dennet

The Burn Dennet meanders west towards its confluence with the River Foyle approximately 3km downstream from the existing Burndennet Bridge.

The Burn Dennet is a mature, meandering, 10-15m wide, 2-3m deep watercourse. There are no obvious palaeochannels, but the channel is sinuous, which suggests historic channel planform instability. The bed material comprises gravel and cobble and the bank material is composed of cobbles and sand, with sand becoming more dominant higher up the bank. The banks are steep and well vegetated with trees, Japanese Knotweed and Giant Hogweed. There are point bars and evidence of small-scale erosion on some of the banks. There is a large levee on the south side, which is c. 2m high and set back 5m from the channel edge. The crossing will be immediately downstream of a tight meander bend that exhibits historic erosion features on its 7-8m high southern bank. The meandering nature of the channel suggests that erosion of this bend and lateral migration of the channel could continue. Boulders have been placed along the bank as erosion toe protection to defend the adjacent farmland. Within the channel, along the straight where the proposed crossing point is, two small ad-hoc boulder weirs have been created to keep the main thalweg, the fasting moving and most erosive part of the flow, away from the channel banks.

Photograph 16C.16 Looking Upstream at the Crossing Point of Burn Dennet

© Mouchel 2016

Glenmornan

The Glenmornan River (also known as Ballymagorry Burn) flows north west through Ballymagorry towards its confluence with the River Foyle, approximately 3km downstream of the existing Ballymagorry Bridge.

Access to the main crossing point was not possible, so the channel was viewed at Ballymagorry. The channel has large levees (1.5-2m) on either side set back 3-4m from the channel edge. The channel has incised 1-1.5m into the floodplain. The channel is 2.5-3m wide with a gravel/cobble bed and a sandy alluvial bank that is well vegetated with grass. The channel is heavily modified with inconsistent stone toe protection along its length. There are lateral bars, indicating that sediment is mobilised, resulting in a concentration of flow, which could lead to bank erosion and meander development. The channel has incised through a flat, low gradient floodplain. The channel has a pool-riffle sequence. At the point of the crossing, the channel is sinuous. Palaeochannels are visible on aerial photographs. The control of lateral movement of the channel has resulted in incision of the bed becoming the dominant erosion process.

Photograph 16C.17 Glenmornan Looking Downstream at Ballymagorry.

© Mouchel 2016

Mourne River

The Mourne River flows north west through the town of Strabane towards its confluence with the River Foyle, immediately upstream of the existing Foyle Bridge which is located on the north west side of Strabane.

The Mourne River is a large, 20-30m wide watercourse with low gradient and slow flow within a large floodplain. Upstream of the proposed crossing point, the northern bank of the river has been protected with a flood wall, which terminates immediately after the existing bridge. At this point, the flood wall merges into an old masonry wall, which merges into an earth bank at the point of the proposed crossing. The earth bank is 2m high, and is set back 5m from the channel edge. There is a similarly sized levee on the south side of the river. The 2m high natural channel banks on the north side are steep and grass covered with small areas of erosion evident. The banks on the south side are less steep, grass covered and gradually slope up to the levee, with a point bar composed of sand developing on the inside of the bend. It was not possible to see the bed material on the day of the site visit because of the depth of the water and the high turbidity level. To the north of the river, the area is dominated by local infrastructure. The confluence with the Finn River is only 400 metres downstream. Erosion is evident and likely to continue on the northern banks where some toe protection is already in place.

Photograph 16C. 18. Looking West at the Crossing Point of the Mourne River from the North Bank

© Mouchel 2016

UD 15 (Mourne River Tributary)

This tributary (UD_15) drains a small network of field drains and flows east towards its confluence with the Mourne River, immediately downstream of the Seein Bridge.

UD_15 is a 1-1.5m wide, shallow watercourse confined within a narrow valley, with a dense cover of trees. The bed material comprises large cobbles and boulders, which have been transported and deposited recently, and there is evidence of flood deposits on the floodplain adjacent to the watercourse. Land use is dominated by agriculture. This watercourse is geomorphologically sensitive.

Photograph 16C. 19. UD_15 with Large Cobble Bar on Left Indicative of Active Erosion and Deposition.

Derg River

The Derg River flows north east to its confluence with the Mourne River, approximately 300m downstream of New Bridge.

The Derg River is a large 20-40m wide, shallow, natural, boulder bed watercourse. The watercourse is confined between steep, high terraces that are predominantly 10-50m from the watercourse on both sides. However, upstream of the proposed crossing point on the outside of a meander bend the watercourse is actively eroding into the southern terrace, creating a 20m high, steep slope. On the opposite side of the channel there is a flat, wide and open floodplain. A cobble point bar is actively accumulating on the inside of the meander. Within the channel the boulders are moss covered, indicating that large bed material has not been transported recently, however there were deposits of recently deposited cobble sized material. The flow is characterised by pools and riffles interrupted by exposed boulders.

© Mouchel 2016

Photograph 16C. 20. Looking Upstream Along the Derg River with Evidence of Recent Deposition of Cobbles in the Foreground.

UD_20 (Coolaghy Burn, Derg River Tributary)

Coolaghy Burn (UD_20) flows generally north west to converge with the Derg River approximately 3km downstream of Coolaghy.

The watercourse is a 2-4m wide, 0.5-1m deep channel incised into a flat floodplain. The channel has low sinuosity and the banks are poached due to the channel marking the boundary of two fields used for grazing. Along the channel edge, trees have become established, which indicate long-term stability of the channel position. However, there is evidence of some bank erosion and remobilisation of large cobbles into the channel, which are deflecting the thalweg towards the channel banks, potentially result in their erosion.

© Mouchel 2016

Photograph 16C. 21. UD_20 Cutting Across a Flat Floodplain, With Some Evidence of Cobble Deposition on Left-Hand Bank of the Channel, Looking Downstream.

UD 22 (Mourne River Tributary)

This tributary of the Mourne River (UD 22) flows north through Liby towards its confluence with the Mourne River approximately 500m downstream of Abercom Bridge.

UD_22 is a very small watercourse, with little baseflow, on a steep slope (approximately 10 degree), that has been artificially straightened adjacent to the existing road. The bank material is a sandy till with a high gravel and cobble content. The bed material is predominantly comprised of cobbles and gravel. The watercourse has incised 3-4m into the slope, before turning 90 degrees to the north. Around the outside of this sharp bend there is evidence of bank erosion. The local landowner has attempted to protect the bend and his land from further erosion by placing concrete blocks around the outside of the bend as toe protection. Any increased discharge into this small channel may exacerbate the erosion problem. The land on either side of the channel is agricultural land with a road running parallel to the southern side of the channel. Runoff from the road flows directly into the watercourse via a hand-dug gully and down the channel banks, which has resulted in failure of the channel banks. Bank failure is also evident on the north side of the channel.

© Mouchel 2016

Photograph 16C. 22. UD_22 Deeply Incised Small Watercourse.

UD_25-26 (Strule River Tributaries)

These Strule River tributaries UD_25 and UD_26 converge downstream of Beltany Lodge before flowing east towards the confluence with the Strule River approximately 200m downstream from that point.

UD_26 is a small, steep, 0.5-2m wide watercourse that has incised 10-15m into the slope down to bedrock, with a top of bank width of 30-50m. The predominantly bedrock bed and banks have a veneer of gravel and cobbles. The channel is characterised by bedrock steps with a step-pool topography. There is a large 4m high waterfall downstream from the proposed crossing. The channel is well confined within its valley and little lateral movement would be anticipated. Therefore, it should accommodate increased flow, however, there may be an increase in transportation and deposition.

Photograph 16C. 23. UD_25-26 Showing Evidence of Recent Deposition of a Large Volume of Cobble-Sized Material.

© Mouchel 2016

UD_33-34 (Strule River Tributaries)

UD_33 and UD_34 flow adjacently east to converge with the Strule River.

Both UD_33 and UD_34 are 1m wide by 0.5-1.5m deep, straight, ephemeral watercourses that have incised into a steep slope. They have formed a step-pool topography within till and there are slugs of cobble to boulder sized material that have been transported during high flows. There is no evidence of lateral movement, so erosion and entrainment of material is from the channel bed during high flows.

Photograph 16C. 24 UD_33-34, Often Ephemeral, but Steep and Straight and Capable of Transporting Cobble-Sized Material.

© Mouchel 2016

© Mouchel 2016

Fairy Water

The Fairy Water flows generally east towards its confluence with Strule River immediately downstream of Poe Bridge.

The Fairy Water is a 10-15m wide and deep (could not see the bed on the day of the visit) watercourse. Channel banks are up to 2m high and steep on both banks. There are 1.5m high levees on both sides that are set back 5m from the edge of the channel. There is imperceptible flow due to the low gradient cutting across a wide, well vegetated alluvial floodplain. No evidence of erosion or deposition, but meandering suggests past channel change. The flow is smooth. The Fairy Water is geomorphologically insensitive.

Photograph 16C. 26 Fairy Water Channel Showing Evidence of Toe Protection on the Right-Hand Bank.

© Mouchel 2016

Routing Burn Extension

The Routing Burn Extension drains several smaller tributaries to the east and flows towards its confluence with Eskragh Water, approximately 1km downstream of Brown's Bridge.

The Routing Burn Extension is a 3-5m wide bedrock controlled channel. It has incised down to bedrock which has eddie scour holes, suggesting long-term stability of channel position. The watercourse has a step-pool topography, with step height of less than 0.5m and pools varying in size. There is deposition of cobble-sized material within the channel and erosion of material on channel banks and bed in a lower gradient upstream. Bedrock control prevents lateral movement of the watercourse and the low rate of incision. The channel meanders through hummocky terrain on a moderate gradient, with evidence of deposition of material on the inside of meanders. Both banks are well vegetated with trees, shrubs and grasses. Some of the younger trees have been streamlined in a downstream direction by high flows. There is a waterfall and large pool evident in a glacial meltwater channel, with a large mid-channel bar downstream of the pool, confined by bedrock, however, there are large deposits that could be transported downstream.

Photograph 16C. 28 Bedrock-Controlled Routing Burn, Evidence of Deposited Cobble-Sized Material can be seen in the Centre of the Image.

© Mouchel 2016

UD_69 (Routing Burn Tributary)

UD_69 is one of several watercourses drained by Routing Burn / Routing Burn Extension, flowing generally west.

This tributary is a very small 0.5-1m wide by 0.5-1m depth watercourse with steep, well vegetated channel banks and a bed comprising sand to cobble-sized material set within a narrow and boggy 30m wide floodplain. The channel is restricted within a narrow floodplain, with limited potential for channel migration between the valley sides. The channel is sinuous within the confines of the floodplain, but is low gradient with very little flow. There is pasture land on both sides, but a tree dominated riparian zone exists. There is little evidence of erosion, bank overtopping or deposition outside of channel, it is therefore considered geomorphologically insensitive.

Photograph 16C. 29 UD_69.

© Mouchel 2016

Roughan Burn

The Roughan Burn drains several smaller tributaries to the north of Ballynasaggart and continues to flow generally south, with several convergences with other watercourses, until its confluence with the River Blackwater.

The Roughan Burn is a 2-3m wide, 0.5-1m deep stream that flows through a flat, wide floodplain occupied by arable farming. The channel has migrated to the southern side of the floodplain where it lies against a steep slope. The material within the channel is predominantly gravel, with some cobbles. At the point of the proposed crossing, the channel is straight, but downstream there is evidence of deposition of material in the channel and large boulders have been placed at the toe of the bank to prevent bank erosion.

Photograph 16C. 30 Roughan Burn Looking Downstream Showing the Gravel/Cobble Bed.

© Mouchel 2016

Ballygawley Water

The Ballygawley Water flows south from Ballygawley, draining several smaller tributaries en route before converging with Tullyvar downstream of Lismore Bridge, approximately 6km downstream of Ballygawley.

The Ballygawley Water is a 4-7m wide watercourse that has incised into the floodplain. It is currently located on the far western side of its floodplain, where it is actively eroding into the terrace immediately upstream of where the proposed road is to cross. At this bend, ad-hoc bank protection and river training has been installed creating a step-pool feature, with large angular blocks placed at the toe of slope in an attempt to prevent bank erosion. The banks are 3m high on the west side and 2m on the east, which show evidence of instability. There is an old fence line lying on the steep west bank of the river, suggesting rapid erosion of this bank. A lateral bar has developed downstream of the step-pools on the east side, forcing flow to the west. Bed material comprises cobbles and boulders. There is evidence of flood detritus in the trees on the west bank. The land on either side of the river is used for grazing.

Photograph 16C. 31. The Geomorphologically Sensitive Ballygawley Water Showing Evidence of Ad-Hoc Channel Protection in the Form of Rip-Rap and Shallow Step-Pool Sequences.

© Mouchel 2016

UD_89 (Ravella Tributary)

This tributary (UD_89) flows southwest to converge with Ravella on the western side of Dernabane which is located approximately 1.5km north west of Aughnacloy.

UD_89 is a small, 1.5-2m wide and 0.5-1m deep watercourse with alluvium sand banks and a gravel/cobble bed. The channel is confined within hummocky terrain with a narrow floodplain (<30m wide). There are large bar deposits suggesting it can be very active and cause lateral movement of the channel.

Photograph 16C. 32. The Confined Floodplain of the Small Historically Active UD_89.

© Mouchel 2016

UD_90 (Aughnacloy Urban Extension Tributary)

UD_90 flows south to converge with the Aughnacloy Urban Extension on the northern side of Aughnacloy.

Due to access restrictions this watercourse could not be inspected at the proposed crossing point, however the burn was visited downstream near Aughnacloy Primary School. From the aerial photography it appears the channel is active, based on the frequency of meanders and sharp bends. The channel is < 2m wide and has reasonably steep banks that are well vegetated and a gravel and cobble bed. Increased discharge may cause increased transportation and deposition. A possible palaeochannel has also been identified from the aerial photography, located in the area of flat land immediately upstream of the Proposed Scheme.

Photograph 16C. 33. A Section of the UD_90, 5 km Downstream of Aughnacloy

© Mouchel 2016

Lissadavil

Lissadavil flows southwest draining several smaller tributaries and converges with the Aughnacloy River which flows south through the centre of Aughnacloy village.

This is a 1-1.5m wide and 1.5-2m deep channel with very steep banks that have been excavated to stop lateral migration of the channel across a 100m wide floodplain. The channel has incised through alluvial sand with occasional cobbles. Further lateral movement is unlikely due to the depth of channel, but the outside of meander bends could suffer some erosion in high flows. The tops of banks are well vegetated, but bare earth is exposed lower down the channel banks. There is rough grazing on either side with drainage of the floodplain evident on the surface.

Photograph 16C. 34 Artificially Deepened Lisadavil Watercourse

Surface Water Quality Monitoring

A summary of the average water quality measurements collected by NIEA in this general area are presented in Table 16C.2. These surface water monitoring locations are shown on Figure 16.19. Further water quality information, including data from other sources, is provided in Appendix 16G.

Surface Water Abstractions

Public and private surface water abstraction data was requested from NIEA for the River Foyle and River Blackwater catchments and all individual WFD surface waterbodies through which the Proposed Scheme passes. These locations are shown on Figures 16.2-16.18 and 16.19.

There are 3 public water abstraction locations, operated by NI Water for drinking water supplies within the catchments crossed by the Proposed Scheme, of which 2 are downstream. These are collecting water from the Mourne River and Camowen River, located 2.5km and 4km downstream, respectively, of Proposed Scheme components.

58 surface water abstraction locations were provided which comprise all licenced abstractions as well as completed applications for abstraction consent in this region, with 18 abstractions located within surface water catchments that the Proposed Scheme crosses. There are 8 private surface water abstractions downstream of the route corridor. These abstractions are associated with quarries, concrete production, power stations (hydro and gas fired), gold extraction, protein processing and fish farming. Of these, 5 are on main watercourse channels, where surface water flows and water quality would be expected to be more reliable and consistent in comparison with smaller channels where more seasonal variability would be anticipated. The remaining 3 are located on smaller, minor watercourses / field drains, with 2 of these abstractions located within 100 m downstream of the Proposed Scheme. These are the supplies associated with Supermix Concrete Ltd, Newtownstewart, and Dalradian Gold Ltd, Omagh.

Abstractions located downstream of the Proposed Scheme corridor are identified in Table 16C.3.

© Mouchel 2016

Discharges

In Northern Ireland consent is required to discharge any trade or sewage effluent or any other potentially polluting matter (including site drainage liable to contamination) from commercial, industrial or domestic premises to waterways or underground strata. Information on discharges and discharge consents within the vicinity of the proposed route has been provided by NIEA.

Within the route corridor there are discharges from a number of public wastewater treatment works (WwTW), septic tanks, combined sewer overflows (CSO) and wastewater pumping stations (WwPS) owned and operated by NIW. WwTW are generally associated with the larger towns and villages in the area and the treated sewage effluent is continuously discharged directly into the larger rivers, the CSO and WwPS would be anticipated to be more intermittent discharges than

© Mouchel 2016

WwTW. The septic tanks typically serve a small cluster of properties, with the partially treated effluent generally discharged to groundwater via a soakaway.

In rural areas where connection to the public sewerage system is not possible, individual properties have private septic tanks. In Northern Ireland as a whole it is estimated that there are approximately 120,000 septic tanks, less than 100,000 of which are consented. As a result there is not a complete register of private septic tanks available and the number within the vicinity of the proposed route is uncertain. However, it is assumed that the majority of rural properties within the vicinity of the Proposed Scheme are served by individual septic tanks. Many private septic tanks are known to function poorly and this, combined with the number of tanks, can lead to issues with diffuse and point source pollution.

A summary of the known discharges, provided by NIEA, within 1 km upstream or downstream of a proposed mainline highway outfall is provided in Table 16C.4. It should be noted that there is likely to be a significant number of additional unidentified private septic tank discharges in the vicinity of the proposed route.

Standing Water

There are no major standing water bodies in the vicinity of the Proposed Scheme, however, there are a number of small loughs, ponds and flooded quarries. Further details are provided in Table 16C.5. These waterbodies are shown on Figures 16.1 and 16.2-16.18.

Table 16C.5 *Standing Waterbodies in the Vicinity of the Proposed Scheme*

Local Management Area	Associated WFD Surface Waterbody	Standing Waterbody Name	Location	Description
Burn Dennet and Foyle	**Foyle and Faughan Estuaries**	Unnamed Pond	Derry Road, Strabane 234670E 398700N	Large artificial pond, likely fed by culverted stream flowing from the east, drains into field ditches to the west.
		Unnamed Pond	West of Strabane, adjacent to River Foyle 234164E 398684N	Small artificial pond, appears to be related to flood defence embankment
Derg and Mourne	**Finn River**	Strahans Quarry	Strahans Road, Strabane 233011E 395913N	Disused and flooded limestone quarry, likely fed by groundwater and direct rainfall
	Mourne River	Sion Mills Reservoir	Located between Sion Mills and Glebe 233370E 393080N	Small disused reservoir, original use unknown, some disused pipework and chambers apparent, fringes of reservoir overgrown
		Unnamed Pond	1.2km west of Victoria Bridge 233870E 390530N	Small pond identified from aerial photography, not visited. No apparent inflow or outflow, may be fed by field drains and provides drainage and flood storage for surrounding agricultural land.

© Mouchel 2016

Local Management Area	Associated WFD Surface Waterbody	Standing Waterbody Name	Location	Description
Derg and Mourne	**Derg River 1 (Lower)**	Urbalreagh Lough	500m north of Derg River 236020E 388190N	Small pond identified from aerial photography, not visited. Appears to have overgrown and is largely fen. Likely groundwater fed with water levels affected by nearby sand and gravel workings.
	River Derg Tributary (Coolaghy Burn)	Millbrook Pond	Located on Coolaghy Burn, 200m south of Derg River 236470E 387450N	Small online millpond. From aerial photography appears to be disused, fringes of pond heavily overgrown. Sluice structures may pose barrier to fish migration
		Unnamed Pond	Located in Upper Deer Park, 1km south west of Newtownstewart 238890E 385310N	Small pond identified from aerial photography, not visited. No apparent inflow or outflow, may be fed by field drains and provides drainage and flood storage for surrounding agricultural land. May be associated with surrounding archaeological features. Located close to other pond in Upper Deer Park
	Mourne River	Unnamed Pond	Located in Upper Deer Park, 1km south west of Newtownstewart 238900E 385380N	Small pond identified from aerial photography, not visited. No apparent inflow or outflow, may be fed by field drains and provides drainage and flood storage for surrounding agricultural land. May be associated with surrounding archaeological features. Located close to other pond in Upper Deer Park

© Mouchel 2016

Local Management Area	Associated WFD Surface Waterbody	Standing Waterbody Name	Location	Description
Strule	**Eskragh Water**	Unnamed Pond	Located 200m east of Beltany Bog Drain 254770E 358488N.	Small pond identified from aerial photography, not visited. Appears to be artificial.

Surface Flow Characteristics

A number of the major rivers in the study area are gauged and records were retrieved from the National River Flow Archive (NRFA) providing information on the flow regime of each. A summary of these statistics are provided in Table 16C.6. Note the Q95 flow is the flow exceeded 95% of the time and is a measure of annual low flows. Similarly the Q10 flow is the flow exceeded 10% of the time and is a measure of annual high flows.

Table 16C.6 River Gauging Station Data.

River	NRFA Station Name and ID	Station Location	Station Catchment Area (km^2)	Standard Average Annual Rainfall (mm)	Mean Flow (m^3/s)	Low Flow Q_{95} (m^3/s)	Q_{95} as % of Mean Flow	Q_{10} (m^3/s)
Burn Dennet	Burn Dennet 201007	237249E 404792N	148.3	1186	3.95	0.82	21%	8.46
Mourne	Drumnabuoy House 201010	234779E 395969N	1843.8	1288	57.87	6.61	11%	141.7
Derg	Castlederg 201008	226513E 384217N	335.4	1558	14.365	0.92	6%	35.74
Fairy Water	Dudgeon Bridge 201002	240583E 375813N	158.4	1285	5.26	0.42	8%	13.4

© Mouchel 2016

River	NRFA Station Name and ID	Station Location	Station Catchment Area (km^2)	Standard Average Annual Rainfall (mm)	Mean Flow (m^3/s)	Low Flow Q_{95} (m^3/s)	Q_{95} as % of Mean Flow	Q_{10} (m^3/s)
Blackwater	Derrymeen Bridge 203022	262509E 353031N	182.9	1142	4.82	0.65	13%	10.76

The rivers' Q95 flows in the vicinity of the route can indicate the dilution potential available in the rivers for point drainage outfall discharges. Insufficient flow within the rivers during low flow conditions may result in pollution. With this in mind, Q95 flow estimates have been calculated for all watercourses in the vicinity of the route using LowFlows2 software. A selection of these are provided for information on Table 16C.7, exhibiting the variety of surface water flow characteristics through the Proposed Scheme corridor.

Flood Risk

There are a number of floodplain areas throughout the Proposed Scheme; particularly notable flood extents are associated with the River Foyle, Fairy Water and Ballygawley Water. An overview of flood risk locations in the Proposed Scheme corridor are provided in Table 16C.8, following an October 2014 review of the online Rivers Agency Flood Maps.

Table 16C.8 Baseline Flood Risk Conditions

Local Management Area	WFD Surface Waterbody	Watercourse	General Flooding Commentary
Burn Dennet and Foyle	Foyle and Faughan Estuaries	River Foyle	Extensive area of river flooding, widening where major tributaries the Burn Dennet, Glenmornan River and River Deele converge.
	Burn Dennet	Burn Dennet	Flooding confined to the area immediately adjacent to the main channel across much of its course. Areas of widened floodplain are visible at Burn Dennet Bridge, Barley Hill and at confluence with the River Foyle.
	Glenmornan River	Glenmornan River	Extensive floodplain between the western bank of the Glenmornan River and River Foyle.
Derg and Mourne	Finn River	Finn River	Moderately wide floodplain adjacent to main channel to the village of Claudy. Wider floodplain areas at confluences with Flushtown and the Mourne River.
	Mourne River	Mourne River	Moderately wide floodplain in upper course notably between Sion Mills to south of Strabane. Widened flooding zone confined where confluences with numerous tributaries, notably at Victoria Bridge and Sion Mills. Floodplain narrows at Strabane before widening at the Finn River confluence.

© Mouchel 2016

Local Management Area	WFD Surface Waterbody	Watercourse	General Flooding Commentary
	Derg River (across both WFD stretches, including Coolaghy Burn)	Derg River	Extensive floodplain at Castlederg where several smaller tributaries converge with the main channel. Floodplain narrows in its lower course, widening around Spamount and Ardshaw and again at its confluence with the River Strule.
Strule Strule	Strule (across both WFD stretches)	River Strule	Floodplain within urban settlements of Omagh and Newtownstewart. Widening at confluence with the Owenkillew River.
	Fairy Water	Fairy Water	Extensive floodplain in much of its lower course and at confluence with the River Strule.
	Drumragh River	Drumragh River	Substantial floodplain in the lower sections, notably at confluence with the Camowen within Omagh. Floodplain is narrower upstream, widening surrounding the Doogary/Dublin Road.
	Camowen River	Camowen River	Floodplain noted across central and south eastern areas of Omagh. Floodwaters from the Drumragh River also interact with the Camowen floodplain. Floodplain is narrower in the rural area south of Omagh.
	Routing Burn	Routing Burn	Floodplain is predominantly narrow with wider area across the Newtownsaville Rd and at confluence with the Eskragh

© Mouchel 2016

Local Management Area	WFD Surface Waterbody	Watercourse	General Flooding Commentary
			Water.
	Eskragh Water (across both WFD stretches)	Eskragh Water	Wide floodplain on western bank, confined to rural area between the Corkill and Newtownsaville roads
Blackwater	Blackwater Tributary (Roughan Burn)	Roughan Burn	The majority of this floodplain is confined immediate to its main channel, with some wider areas south of Glenhoy Road.
	Ballygawley Water	Ballygawley Water	Mapping shows 'strategic floodplain' with wide floodplain areas north of Ballygawley. Narrower floodplain within Ballygawley, with floodplain generally limited to the area immediately adjacent to the main channel for the majority of its course before confluence with the River Blackwater.
	Blackwater Aughnacloy (Aughnacloy River)	Lisadavil	Mapping shows substantial areas of 'strategic floodplain' inundating the northern areas of Aughnacloy. Downstream of Aughnacloy, floodplain widens substantially with flood waters potentially interacting with those of the larger River Blackwater.
	River Blackwater 5	River Blackwater	Mapping shows significant areas of 'strategic floodplain' inundating much of the surrounding floodplain south of Aughnacloy. Significant flooding shown downstream of its confluence with tributaries, west of Aughnacloy).

More specifically, preliminary flood risk assessments identified a number of floodplains within the study area of the Proposed Scheme and along the alignment of the Preferred Route of the A5 WTC. These were identified using historical flood maps, alluvium mapping, Rivers Agency Flood Maps and other sources; which included data in relation to desktop studies and survey information.

Table 16C.9 details the potential floodplains along the route, following a general north to south sequence.

© Mouchel 2016

Table 16C.9 Preliminary Floodplain Identification

These locations were then developed into hydraulic models; information pertaining to the development of the hydraulic models mitigation is provided in Flood Risk Assessment Report 2 – Hydraulic Model Build Report.

The predicted existing floodplain extents for the 'design' events (1% annual exceedance probability (AEP) for river floodplains and 0.5% AEP for tidal floodplains) associated with the flood models referenced in Table 16C.9 can be seen in Figures 16.1 and 16.2-16.18.

Subsequent assessment of impacts is provided in Flood Risk Assessment Report 3 – Impact and Mitigation Assessment Report and has been summarised in Chapter 16 and Appendix 16E of this report.

Groundwater

The road alignment passes over six WFD groundwater bodies, from north to south:

- Claudy WFD Groundwater Body (Chainage 0-17700m);
- Balleybofey WFD Groundwater Body (Chainage 17700-21600m);
- Gortin WFD Groundwater Body (Chainage 21600-33080m);
- Castlederg WFD Groundwater Body (Chainage 33080-38900m);
- Omagh WFD Groundwater Body (Chainage 38900-77080m);
- Aughnacloy WFD Groundwater Body (Chainage 77080-93150m).

© Mouchel 2016

Aquifer Classification

There are various local aquifers within each of the WFD groundwater bodies crossed by the Proposed Scheme, which exhibit large variations in individual characteristics.

The Precambrian strata underlying the northern part of the route corridor is classified as having 'fracture flow, of limited productivity, Bl(f)'. These aquifers are capable of producing high to moderate yields in places, although their dependence on fracture flow also makes poorer yields possible. There is some potential for regional flow, although local flow is more significant. These strata are capable of providing small domestic or farm supplies and may provide baseflow to local streams and ponds.

The Carboniferous rocks, around Victoria Bridge and Omagh, are dominated by sandstones and have been classified as 'fracture flow, of moderate productivity, Bm(f)'. This indicates that these strata have the possibility of higher yields than the Precambrian bedrock, although the predominance of fracture flow also indicates that low yields are possible.

South of the Omagh Thrust Fault, the bedrock is composed principally of Carboniferous and Devonian sandstones and mudstones. These have been assigned an aquifer classification of 'fracture flow, of moderate productivity, Bm(f)'. These strata are dominated by fracture flow, but also have some possibility of porous flow although yields are still likely to be variable.

The southernmost part of the route is underlain by limestones, sandstones and mudstones which have a classification of 'fracture flow, of moderate productivity, Bm(f)'. Fracture flow is dominant and water yields are dependent on the presence and connectivity of fractures.

A number of superficial aquifer deposits are recognised within the route corridor. These are typically glacial sands and gravels and granular alluvial deposits, and are generally associated with the major watercourses along the route, such as the Foyle and Strule. These alluvial deposits are classified as superficial aquifers supporting intergranular flow.

Additional superficial deposits, classified as non-aquifers, are present along the route corridor. These include cohesive and granular glacial till, moraine and peat deposits. Some areas of alluvium are composed of organic clay or more cohesive deposits, giving them a much lower permeability than the granular alluvium and meaning they are considered to be non-aquifers. Some areas have been identified where superficial deposits are thin or absent.

Groundwater Vulnerability

Groundwater vulnerability for Northern Ireland is classified on a five-point scale from 1 (Low) to 5 (Very High). Groundwater vulnerability along the A5WTC has been classified as varying between Class 5 (Very High) and Class 2 (Low).

© Mouchel 2016

Generally, the northern part of the route, from New Buildings to Mountjoy, is dominantly classified as 4 (High). There are small areas of Class 5 (Very High), associated with areas of exposed crystalline bedrock. Areas of Class 2 (Low) are associated with 3-10m thick low permeability lake alluvium and glacial till near Strabane and Sion Mills.

Between New Buildings and Sion Mills the Proposed Scheme corridor is almost exclusively underlain by Class 4 (High) vulnerability aquifers. This reflects the high water table within areas of high permeability alluvium within the Foyle floodplain and the sand and gravel deposits of the Burn Dennet and Glenmornan Valleys. There are small pockets of Class 2 (Low) vulnerability associated with low permeability peat deposits and lacustrine deposits with high clay content.

Vulnerability remains generally Class 4 (High) between Sion Mills and Omagh, by virtue of the combination of alluvium and glaciofluvial sands and gravels with a high water table within the Mourne and Strule Valleys and the sandy nature of the glacial till elsewhere within the area. Localised areas of Class 2 (Low) vulnerability are found in the vicinity of Victoria Bridge and between Mountjoy and Omagh, where there are glacial tills of low permeability and areas of peat.

Generally, the southern half of the route is dominated by groundwater vulnerability class 2 (Low) but classes 4 and 5 (High and Very High) are found locally where superficial aquifers are present. The sections between Mountjoy and Gortaclare, and from Ballygawley to Aughnacloy, are dominated by vulnerability class 2 (Low). This is largely a result of the extensive low permeability superficial deposits, mostly glacial tills, moraine deposits or peat. Areas with high permeability superficial deposits have been assigned class 4 (High) to reflect this and consist largely of river alluvium and glaciofluvial sands and gravels.

Between Gortaclare and Ballygawley, the route crosses a region of relatively low permeability deposits, mainly glacial till material, giving a vulnerability class of 2 (Low). This is dissected by areas of high permeability deposits and exposed bedrock, leading to increased vulnerability classifications of 4 (High) or 5 (Very High) for these sections. This corresponds to areas with only thin soil cover or exposed bedrock with dominantly fracture flow.

Within the Clogher Valley, vulnerability varies within the drumlin fields from Class 2 (Low) where there is low permeability glacial till up to 10m thick, to Class 4 (High) in inter-drumlin areas, where soils are thin and alluvial deposits occur, to Class 5 (Very High) in areas of exposed bedrock.

Groundwater Quality

The groundwater bodies throughout the study area have been assessed under the WFD as ‘Good’ for both chemical status and quantitative status. This was partly based on water quality monitoring at a small number of sites within the region. Due to the highly localised nature of the groundwater aquifer systems in the corridor the groundwater quality is expected to vary for specific areas.

Groundwater quality monitoring for a wide range of potential groundwater pollutants has been undertaken by the NIEA for several years. Water test results for 8 monitoring locations in proximity

© Mouchel 2016

to the Proposed Scheme have been screened against drinking water standards. The groundwater monitoring locations are shown on Figure 16.20. Where samples failed to meet standard values, these are shown on Table 16C.10, note that pH failures were all due to pH results less than 6.5. The grid reference of each NIEA groundwater sampling location is listed below:

- G277 and N277 at 237888, 408942 (Claudy WFD Groundwater Body);
- G278 at 237871, 406024 (Claudy WFD Groundwater Body);
- G149 at 242997, 374868 (Omagh WFD Groundwater Body);
- G401 at 242630,376016 (Omagh WFD Groundwater Body);
- G72 and GBNIGWNB23-C at 263009, 355551 (Aughnacloy WFD Groundwater Body);
- GBNIGWNB51-C at 262986, 355535 (Aughnacloy WFD Groundwater Body).

© Mouchel 2016

Table 16C.10 NIEA Groundwater Monitoring Data – Failures of Drinking Water Standards

Determinant	Number of Failures								Total Number of Failures	Maximum Exceedance (Sample ID)
	Claudy NIEA Sample ID			Omagh NIEA Sample ID		Aughnacloy NIEA Sample ID				
	G277	G278	N277	G149	G401	G72	GBNIGWNB 23-C	GBNIGWNB 51-C		
pH	6	15	1			1			23 (out of 139 samples)	pH 6.1 (G278)
Total Organic Carbon		1				1			2 (out of 66 samples)	3.15mg/l (G72)
Iron				13					13 (out of 66 samples)	484µg/l (G149)
Manganese				16					16 (out of 66 samples)	262µg/l (G149)
Nitrate		11							11 (out of 66 samples)	382mg/l (G278)
Total Coliforms		2		2	1	1			6 (out of 38 samples)	300cfu (G72)

© Mouchel 2016

The screening results show only a small number or localised exceedances mainly for iron, manganese, nitrate or total coliforms (bacteria).

Baseline data for well and springs was collected during four monitoring rounds of the Private Abstractions Survey undertaken in 2012. The survey covered wells and springs to be decommissioned, replaced or within a 150 m buffer zone of the vesting line in the northern and southern sections of the Proposed Scheme.

The wells and spring monitoring undertaken in 2012 indicated the existence of contamination related to farming activities. One quarter of the tested wells or springs had bacteria counts exceeding the drinking water standards. Ammonium concentrations above drinking water standard were recorded in 6 out of 44 tested locations and nitrate in 2 out of 44 locations. Other than the aforementioned results, the quality of the other tested locations was found to be generally good.

Groundwater Abstractions

Based on information from the NIEA, there are no public groundwater abstractions in the vicinity of the route, the closest being 1.2km away. This intervening distance is considered unlikely to lead to any Proposed Scheme interaction and public groundwater supplies are not considered further.

Private groundwater abstractions in the vicinity of the route are shown on Figures 16.2-16.18 and are based on the results of the abstractions survey combined with updated historical information from the desk study. The original number of supplies identified was 219, with 47 locations removed from further consideration due to intervening distance relative to the Proposed Scheme and specific local characteristics. The remaining 172 supplies are shown on Table 16C.11, of which 103 are considered actively in use from information provided.

Table 16C.11 Local Groundwater Private Water Supplies, from Private Water Supply Abstractions Survey

WFD Groundwater Body	Number of Wells or Springs Within Proposed Scheme Corridor at Risk of Impact
Claudy	21 (13 in use)
Ballybofey	6 (2 in use)
Gortin	26 (17 in use)
Castlederg	7 (6 in use)
Omagh	73 (40 in use)

© Mouchel 2016

WFD Groundwater Body	Number of Wells or Springs Within Proposed Scheme Corridor at Risk of Impact
Aughnacloy	39 (25 in use)
Total	**172 (103 in use)**

Peatland

Peat is a soft to very soft, highly compressible organic material that can consist of up to 90% water. It forms in waterlogged conditions where dead organic material, mainly plants undergoes slow anaerobic decomposition, resulting in accumulation of peat over thousands of years. Peat is generally acidic and nutrient poor and as a consequence supports a range of rare and unique plants and wildlife. For this reason peatlands are recognised as areas of significant ecological importance. The peatlands within the route corridor can generally be divided into two categories: raised bog or blanket bog.

Raised bogs are found in lowland areas such as river valleys, lake basins and between drumlins. The peat that forms in these hollows is initially fed by surface water runoff and groundwater, however over time the peat accumulates to form a raised dome and is cut off from both groundwater and surface runoff. The only source of nutrients for the plants on a raised bog is from direct rainfall and the atmosphere. Although the surface of the bog is raised the peat remains waterlogged due to the impermeability of the peat, which results in water being 'locked' into the peat body. Raised bogs can have peat up to 12m deep.

Blanket bog generally forms in upland areas with heavy rainfall, low temperatures and underlain by impermeable geology and/or mineral soils that form an iron pan which impedes drainage. These wet conditions allow peat to form and cover extensive areas like a blanket. Due to the undulating nature of the ground the thickness of peat can vary between 1m and 6m.

Both types of peatland habitat are dependent on the waterlogged conditions they form in and are highly sensitive to changes in water level, be this from natural climatic fluctuation or from disturbance of the peat body.

The areas of peatland within the route corridor have been identified from superficial geological mapping and from ground investigation logs; these are summarised in Chapter 12 of the Environmental Statement. Table 16C.12 provides a summary of the main peatland sites and other locations where the proposed alignment intersects or passes within close proximity.

© Mouchel 2016

There are two designated peatland sites within the vicinity of the proposed alignment. McKeans Moss (ASSI), 1km south-west of Cloghcor is the most north-western example of lowland raised bog in Northern Ireland. Tully Bog (SAC and ASSI), 2.5km south of Mountjoy is an isolated lowland raised bog lying in a shallow hollow within the former floodplain of the Fairy Water River. These designated peatland locations are shown on Figure 16.1, Figure 16.4 (McKeans Moss ASSI) and Figures 16.10-16.11 (Tully Bog SAC and ASSI).

© Mouchel 2016

Table 16C.12 Locations Where the Proposed Scheme Potentially Interacts with Peatland

Grid Ref	Highways Chainage	Chainage Length (m)	Peat Depth from GI (m)	Importance	Comment
236470E 403150N	11200 - 12500	n/a	n/a	Very High	Alignment passes adjacent to McKeans Moss ASSI boundary. Minimum distance between ASSI boundary and alignment is 80m. ASSI is a raised peat bog, therefore runoff radiates away from the bog. ASSI also surrounded by deep ditches, which separate the site and the alignment hydrologically. Ground investigation in the area found no peat underlying the alignment.
233980E 390610N	30450 - 30600	140	unknown	Low	Small isolated pocket of peat formed in localised hollow. Identified from geological mapping, no ground investigation carried out within the mapped peat deposit, however no peat was found at the in GI locations immediately outside this area.
234629E 389861N	31480 - 31560	80	1.8	Low	Small peat deposit up to 1.8m deep within stream valley crossed by alignment, peat immediately adjacent to stream, marshy ground upstream.
241702E 379062N	45600 - 45700	90	up to 3m	Low	Alignment crosses very edge of mapped peat deposit in inter drumlin hollow/dry channel. The peat is crossed at watershed saddle, therefore minimal impact on peat flows and likely minimised peat depths.
241534E 378310N	46400 - 46500	45	8	Low	Alignment crosses inter drumlin hollow/ stream valley on embankment, peat deposit likely to extend 100m west of alignment, drained by minor field drains.
241766E 377463N	47300	10	0.7	Low	Very localised peat deposit within stream valley
241814E 377358N	47450	30	0.5	Low	Very localised peat deposit within stream valley
242141E 376563N	48050 - 48500	440	2.7	Medium	Alignment cuts across the edge of extensive inter drumlin peat deposit. Alignment follows lower slope of drumlin where peat thins out. Therefore the depth of peat crossed is minimised and minimal runoff into peat area intercepted.
242685E 375472N	49400 - 49650	230	3.5	Low	Alignment passes through inter drumlin area, peat depth highly variable, GI results show peat deposit not as extensive as geological mapping suggests.

© Mouchel 2016

Grid Ref	Highways Chainage	Chainage Length (m)	Peat Depth from GI (m)	Importance	Comment
242011E 375635N	49600 - 49900	n/a	n/a	Very High	Alignment passes adjacent to Tully Bog SAC. Minimum distance between SAC boundary and Proposed Scheme is 60m, where an existing road is proposed to be upgraded to link onto the new carriageway, with minimum separation from the new A5 carriageway of 200m. Tully Bog SAC is a raised bog, therefore runoff radiates away from SAC site, which is also surrounded by perimeter ditches. There is an existing natural clay ridge located east of Tully Bog SAC which is likely to act a groundwater barrier. GI in the area shows no continuity between SAC site and peat deposits underlying alignment in this area.
242650E 374508N	50400 - 50600	180	up to 1.2	Low	Isolated deposit of peat on the upper edge of the Fairy Water floodplain, GI and aerial photo interpretation suggests peat deposit is limited in extent, alignment cuts edge of deposit.
242556E 374020N	50900 - 51000	170	1	Low	Peat deposit within stream valley, peat depth variable, likely connected to peat deposit mapped on geological map to NW, this area is drained by multiple field drains.
242714E 373426N	51350 - 51900	585	up to 1	Low	Peat deposit located in low lying inter drumlin area. GI logs indicate peat deposit is more extensive than shown on geological mapping. Alignment skirts around edge of low lying area, avoiding the main peat body and minimising fragmentation of peat deposit.
242769E 372796N	52270	10	1	Low	Isolated pocket of peat located on small plateau area, GI indicates not extensive deposit.
242939E 372161N	52600 - 53300	720	2.4	Low	Based on geological mapping a ribbon of peat winds through inter drumlin area, alignment broadly follows same route, most GI in the area is outwith the mapped peat deposit, therefore true extent of peat difficult to discern
243733E 371067N	54300	10	2.5	Low	Localised peat deposit within stream valley
244297E 370623N	55000	47	0.9	Low	Localised peat deposit in inter drumlin area, alignment crosses at saddle therefore minimising depth of peat crossed
244434E 370516N	55200	60	0.5	Low	Peat deposit in inter drumlin area, nearby GI results suggest peat is localised, alignment runs parallel to likely water flow in peat, therefore limited disruption to GW flow within peat
244538E 370372N	55370	30	1.1	Low	Alignment intercepts edge of peat deposit on lower slopes of drumlin, very localised

© Mouchel 2016

Grid Ref	Highways Chainage	Chainage Length (m)	Peat Depth from GI (m)	Importance	Comment
244662E 370284N	55380	13	3.1	Low	Inter drumlin peat, alignment cuts across peat disrupting drainage from east to west. Eastern side of alignment may become more boggy, PED may drain eastern peat area
244922E 369837N	55980 - 56080	103	unknown	Low	Peat deposit in stream valley mapped on geological map, no GI carried out in this area, aerial photos suggest boggy ground
247104E 369152N	62100 - 62800	700	up to 8	Low	Alignment cuts through large area of inter drumlin peat, variable in depth but up to 8m recorded in places. Western end of alignment crosses edge of raised bog,
247977E 368359N	63200 - 64100	910	up to 10.5	High	Alignment cuts edge of extensive inter drumlin raised peat bog, alignment minimises excavation of peat, minimal runoff intercepted, drainage of peat
254228E 359059N	74600 - 75570	980	7.2	Low	Alignment cuts edge of large inter drumlin peat deposit, alignment skirts lower slopes of drumlin minimising peat excavation and runoff interception
256841E 357175N	78400 - 78450	40	2.8	Low	Isolated pocket of peat in shallow gulley crossed by alignment
259390E 356649N	81000 - 81100	60	1.4	Low	Small pocket of peat where alignment crosses head of floodplain area

© Mouchel 2016

Assigning Importance to Water Environment Attributes

The various water environment attributes discussed in the baseline have been evaluated using the attribute importance criteria outlined in Appendix 16B, with the importance assigned to each surface water, flood risk and groundwater attribute provided in Table 16C.13 and Table 16C.14, respectively.

This is a key step in the impact assessment procedure as it establishes the baseline importance of various water environment attributes, to subsequently assess Proposed Scheme interactions.

In relation to surface water, a combination of WFD catchment data and local channel information has been applied, water quality and biodiversity are considered as catchment-wide attributes using the available regional data. Water resources, hydrology and channel geomorphology attributes apply more detailed characteristics available for locations with Proposed Scheme interactions within each catchment, taking account of typical typology of channels. Surface water attributes include the small number of standing water features within catchment areas.

Flood risk importance has been identified using the floodplain within the model extents associated with the A5WTC (see Flood Risk Assessment for further information), using the most conservative importance rating for those WFD surface waterbody catchments where various floodplains were assessed.

Note that where potential has been identified for surface water abstractions to provide public water supplies, such waterbodies have been assigned an escalated importance value reflecting current and potential future requirements.

In relation to groundwater, groundwater WFD information has been applied and baseline private water supply, river base flow and groundwater dependent location data has been applied.

The River Foyle and Tributaries SAC and River Finn SAC surface water quality are considered as very high importance attributes.

© Mouchel 2016

Table 16C.13 Importance of Surface Water Environment Attributes

Feature	Attribute	Comment	Importance
Foyle and Faughan Estuaries Burn Dennet and Foyle LMA Surface Water	Water Quality & Biodiversity	WFD Overall Status – Moderate Ecological Potential Species - Atlantic salmon, river/brook lamprey River Foyle and Tributaries SAC and ASSI is upstream	Very High
	Surface Water Resources	2 private water supplies (12km and 13.5km downstream), numerous NIW and private domestic wastewater discharges within 1km.	Medium
	Flood Risk	The River Foyle is a major channel with numerous tributaries of varying scale, draining a combined 2,905km^2 cross-border catchment. The Foyle has a tidal influence downstream from Strabane, where it is formed from the confluence of Mourne River and Finn River. Flood risk identified through project-specific flood model and the importance has been identified using the overall Foyle River System floodplain within the model extents associated with the A5WTC (see Flood Risk Assessment for further information).	High
	Fluvial Geomorphology	Classified as a heavily modified waterbody due to flood defences. Proposed Scheme interactions are predominantly with minor tributaries, rather than directly with the River Foyle, these are small channels, often artificially modified or field drains.	Low
Burn Dennet Burn Dennet and Foyle LMA Surface Water	Water Quality & Biodiversity	WFD Overall Status - Moderate Species – Atlantic salmon, river/brook lamprey, otter	High
	Surface Water Resources	Large watercourse with potential for public supply abstraction, two NIW domestic wastewater discharges within 1km	High
	Flood Risk	One of the main tributaries of River Foyle, draining 150km^2 subcatchment to the east of the Foyle. Flood risk identified through project-specific flood model and the importance has been identified using the overall Foyle River System floodplain within the model extents associated with the A5WTC (see Flood Risk Assessment for further information).	High
	Fluvial Geomorphology	Proposed Scheme interactions are directly with the Burn Dennet channel, with evidence of erosion and historic channel movement, artificial erosion protection evident.	High
Glenmornan River Burn Dennet and Foyle LMA Surface Water	Water Quality & Biodiversity	WFD Overall Status – Good Species – Atlantic salmon, otter	High
	Surface Water Resources	One NIW and one private domestic wastewater discharge within 1km. McKeans Moss ASSI is located within the Glenmornan catchment, with minimum separation of 80m from the Proposed Scheme. This is a raised bog with runoff radiating off to surrounding land and is surrounded by deep ditches, resulting in negligible hydrological linkage with Proposed Scheme.	Medium
	Flood Risk	Tributary of River Foyle, draining 36km^2 subcatchment to the east of the Foyle. Flood risk identified through project-specific flood model and the importance has been identified using the overall Foyle River System floodplain within the model extents associated with the A5WTC (see Flood Risk Assessment for further information).	High
	Fluvial Geomorphology	The Proposed Scheme interacts directly with the Glenmornan River, with good quality pool and riffle sequences, mobilised sediment, evidence of historic channel movement, artificial erosion protection evident. There are also a number of interactions with field drain tributaries.	High

© Mouchel 2016

Feature	Attribute	Comment	Importance
Finn River Derg and Mourne LMA Surface Water	Water Quality & Biodiversity	River Foyle and Tributaries SAC and ASSI WFD Overall Status - Poor Species – Atlantic salmon	Very High
	Surface Water Resources	Large watercourse with potential for public supply abstraction, three NIW domestic wastewater discharges within 1km.	High
	Flood Risk	One of the main tributaries of River Foyle, draining 495km^2 subcatchment to the west of the Foyle (cross-border). Lower reaches of the Finn River are tidal. Flood risk identified through project-specific flood model and the importance has been identified using the overall Foyle River System floodplain within the model extents associated with the A5WTC (see Flood Risk Assessment for further information).	High
	Fluvial Geomorphology	The Proposed Scheme interacts directly with the Finn River, which has little evidence of current geomorphological processes. Also interactions with field drain tributaries.	Low
Mourne River Derg and Mourne LMA Surface Water	Water Quality & Biodiversity	River Foyle and Tributaries SAC and ASSI WFD Overall Status – Moderate Ecological Potential Species – Atlantic salmon, otter	Very High
	Surface Water Resources	Public water supply abstraction (2.5 km downstream of Proposed Scheme), four private abstractions (100m, 2.5km, 3km and 4km downstream of Proposed Scheme), one private domestic wastewater discharge within 1km.	Very High
	Flood Risk	One of the main tributaries of River Foyle, draining 1,852km^2 subcatchment to the south of the Foyle. Tributaries include the River Strule and Derg River. Flood risk identified through project-specific flood model and the importance has been identified using the overall Foyle River System floodplain within the model extents associated with the A5WTC (see Flood Risk Assessment for further information).	High
	Fluvial Geomorphology	Classified as a heavily modified waterbody due to flood defences. Predominantly the Proposed Scheme interactions are with minor tributaries including field drains, also some direct interaction with the Mourne River, with small areas of erosion evident and artificial erosion protection in place.	Medium
Derg River Derg and Mourne LMA Surface Water	Water Quality & Biodiversity	River Foyle and Tributaries SAC and ASSI WFD Overall Status – Moderate Species – Atlantic salmon, otter	Very High
	Surface Water Resources	Public water supply abstraction (4 km upstream of Proposed Scheme), one NIW domestic wastewater discharge within 1km.	Very High
	Flood Risk	One of the main tributaries of Mourne River, draining 436km^2 subcatchment to the south west of the Mourne. Flood risk identified through project-specific flood model and the importance has been identified using the floodplain within the model extents associated with the A5WTC (see Flood Risk Assessment for further information).	Low
	Fluvial Geomorphology	Direct Proposed Scheme interaction with the Derg River, with erosion evident, bed material transport and pool and riffle features. Also Proposed Scheme interaction with a main tributary.	High
River Strule (across both	Water Quality & Biodiversity	WFD Overall Status – Moderate / Moderate Ecological Potential	Medium

Feature	Attribute	Comment	Importance
stretches) Strule LMA Surface Water	Surface Water Resources	Large watercourse with potential for public supply abstraction, one private surface water abstraction (100m downstream of Proposed Scheme), two unspecified discharges within 1km.	High
	Flood Risk	One of the main tributaries of Mourne River, draining 1,334km^2 subcatchment to the south east of the Mourne. Flood risk identified through project-specific flood model and the importance has been identified using the overall Omagh floodplain within the model extents associated with the A5WTC (see Flood Risk Assessment for further information).	High
	Fluvial Geomorphology	Proposed Scheme interactions are entirely with a large number of minor tributary channels to the west of the River Strule, no direct interaction with the River Strule. Tributaries are typically very small artificially modified channels or field drains. One of the WFD stretches is classified as heavily modified due to flood defences.	Low
Fairy Water Strule LMA Surface Water	Water Quality & Biodiversity	WFD Overall Status – Moderate Tully Bog SAC ASSI is located with a minimum separation of 60m from the Proposed Scheme.	High
	Surface Water Resources	No abstractions, potential for public abstraction, one NIW domestic wastewater discharge, one food processor discharge within 1km. Tully Bog SAC ASSI is drained by an upstream tributary of the Fairy Water. This is a raised bog with runoff radiating off to surrounding land and is surrounded by ditches, resulting in negligible hydrological linkage with Proposed Scheme.	High
	Flood Risk	One of the main tributaries of River Strule, draining 178km^2 subcatchment to the south west of the Strule. Flood risk identified through project-specific flood model and the importance has been identified using the overall Omagh floodplain within the model extents associated with the A5WTC (see Flood Risk Assessment for further information).	High
	Fluvial Geomorphology	Main Proposed Scheme interaction will be on minor tributary. Direct Proposed Scheme interaction with the Fairy Water channel, little current erosion or deposition processes, meandering channel suggests historic channel movement.	Medium
Drumragh River Strule LMA Surface Water	Water Quality & Biodiversity	WFD Overall Status – Moderate Species - Otter	High
	Surface Water Resources	No abstractions, no discharges within 1km	Low
	Flood Risk	One of the main tributaries of River Strule, draining 323km^2 subcatchment to the south of the Strule. Main tributaries of the Drumragh are the Owenreagh and Quiggery Water. River Strule is formed at the confluence of the Drumragh River and Camowen River. Flood risk identified through project-specific flood model and the importance has been identified using the floodplain within the model extents associated with the A5WTC (see Flood Risk Assessment for further information).	Low
	Fluvial Geomorphology	Predominant Proposed Scheme interaction will be on minor tributaries, these are artificially modified channels and field drains. Direct interaction with the Drumragh River but not geomorphologically sensitive.	Low
Camowen River	Water Quality & Biodiversity	WFD Overall Status – Moderate Ecological Potential Species – Atlantic salmon	High

Table 16C.14 Importance of Groundwater Environment Attributes

Feature	Attribute	Comment	Importance
Claudy Groundwater	Water Quality	WFD Groundwater Status - Good Generally high groundwater vulnerability McKeans Moss ASSI is located in this area, minimum 80m separation from the Proposed Scheme.	High
	Groundwater Resources	21 wells or springs close to the Proposed Scheme, 13 of which are in use. McKeans Moss is a raised bog, this is a rainwater-fed (ombrotrophic) and hydrologically isolated site, hence negligible groundwater linkage with Proposed Scheme. Relatively large base flow to rivers from groundwater (Burn Dennet and Glenmornan River).	High
Ballybofey Groundwater	Water Quality	WFD Groundwater Status - Good Generally high groundwater vulnerability	High
	Groundwater Resources	6 wells or springs close to the Proposed Scheme, 2 of which are in use.	Medium
Gortin Groundwater	Water Quality	WFD Groundwater Status - Good Generally high groundwater vulnerability	High
	Groundwater Resources	26 wells or springs close to the Proposed Scheme, 17 of which are in use.	High
Castlederg Groundwater	Water Quality	WFD Groundwater Status - Good Generally high groundwater vulnerability	High
	Groundwater Resources	7 wells or springs close to the Proposed Scheme, 6 of which are in use.	Medium
Omagh Groundwater	Water Quality	WFD Groundwater Status – Good Low groundwater vulnerability generally, high vulnerability at locations with shallow soil coverage and river alluvium. Tully Bog SAC ASSI is located in this area, with a minimum 60m separation from the Proposed Scheme, where there is a proposed alteration to an existing side road, existing natural clay ridge acting as a barrier for groundwater movement between the Proposed Scheme and Tully Bog SAC.	High
	Groundwater Resources	73 wells or springs close to the Proposed Scheme, 40 of which are in use. Tully Bog SAC ASSI is a raised bog, this is a rainwater-fed (ombrotrophic) and hydrologically isolated site, hence negligible groundwater linkage with Proposed Scheme. Relatively large base flow to rivers from groundwater (Routing Burn).	High
Aughnacloy Groundwater	Water Quality	WFD Groundwater Status - Good Low groundwater vulnerability generally, high vulnerability at locations with shallow soil coverage and river alluvium.	High
	Groundwater Resources	39 wells or springs close to the Proposed Scheme, 25 of which are in use.	High

APPENDIX 16D – WATER FRAMEWORK DIRECTIVE ASSESSMENT

The Water Framework Directive (WFD) is an EU legislative instrument which has been transposed into national legislation in Northern Ireland to ensure surface water and groundwater are protected and monitored. The Proposed Scheme has the potential to cause adverse effect upon surface water and NIEA request such proposals to undertake a WFD Assessment process in order to establish potential effects and measures anticipated to mitigate any such effects.

Further details on the background of WFD and the WFD Assessment process applied are provided in Appendix 16B.

Summary of WFD Locations

Watercourse locations with potential interactions with Proposed Scheme components have been identified and are summarised in Table 16D.1 as Water Framework Directive Assessment (WFDA) locations. This table details the local watercourse, WFD hydrological catchment and wider NIEA Local Management Area, to facilitate an understanding of Proposed Scheme interaction upon both the local watercourse and also across the wider catchment area. The location of the Proposed Scheme in relation to WFD surface waterbodies, as defined by NIEA, is shown on Figure 16.19.

The locations in Table 16D.1 are listed by hydrological catchment.

WFD Assessment Screening Process

Data sources and justification methodology for screening out of specific watercourses are identified in Appendix 16B - Methods of Assessment. Locations which have been screened out are identified on Table 16D.1, with photographs of screened out locations provided in Annex 16D.1 (at the rear of this document). These locations are shown on Figures 16D.1-16D.3.

Datasheets have been provided for 3 screened out locations, considered as representative of typical characteristics and components. These provide information on Fireagh Lough Drain, UD_71 and UD_83.3 watercourses, as datasheets S2-WFDA-38, S3-WFDA-22 and S3-WFDA-38, respectively.

Note that a small number (3) of the screened out locations do not have photographs, due to restricted land access or poor image quality. The images provide representative photographs for the missing images. Occasionally a nearby watercourse image has been provided (and noted), again this is considered a representative image.

© Mouchel 2016

WFD Assessment Datasheets

Datasheets have been prepared for all watercourses which have not met the screening criteria, providing site-specific assessments identifying Proposed Scheme components and receiving watercourse characteristics at these locations. The data sources for datasheets are detailed in Appendix 16B.

The components identified for the Proposed Scheme are as follows:

- Bridge structures;
- Culvert structures;
- Watercourse diversions; and
- Mainline (highway carriageway) drainage outfalls.

There are a total of 48 WFD Assessment Datasheets which assess a range of watercourse types with various combinations of Proposed Scheme component interactions. The coverage includes at least one datasheet within every WFD catchment with any surface water interaction, which may occur on the main channel (i.e. the named WFD waterbody) or an upstream tributary.

Most of the watercourses listed are designated by the Rivers Agency for ongoing drainage and flood management. Note that pre-earthworks drainage outfalls and side road drainage are listed for information purposes only, these structures are not considered as scheme components which would influence WFD status and are not displayed on the datasheet aerial imagery to improve clarity of image.

It was also important to assess the cumulative nature of multiple components on local water bodies and there is a cross-reference provided to Table 16D.1 which identifies all interactions within each Local Management Area and WFD Surface Water Catchment.

WFD Assessment Datasheet locations are shown and identified on Figures 16D.1-16D.3, with datasheet locations identified on Table 16D.1 and specific datasheets provided in Annex 16D.2 at the rear of this document. Details of components at various locations along the Proposed Scheme are provided on the series of detailed hydrology Figures 16.2-16.18.

© Mouchel 2016

Standard Good Practice Design Measures

The Proposed Scheme's direct interactions with larger watercourses are primarily outfall discharges, with associated watercourse crossings as clear span bridges, without in-channel supports. The smaller tributary watercourses, upstream of the main channels, often have diversion channels proposed in order to direct the watercourse away from planned A5 infrastructure and to reduce the number and length of culverted crossings.

Standard good practice design measures would be applied during the design, construction and operation of each component with potential watercourse interactions, including screened out locations. Comprehensive mitigation information is provided in Chapter 16 - Road Drainage and Water Environment. A summary of standard good practice design measures and principles, in relation to protecting WFD status is listed in Table 16D.2 and in Chapter 18 – Schedule of Environmental Commitments.

Mitigation

Mitigation for WFD Assessment has been identified as additional practices that have been identified as requirements at site-specific locations, beyond standard good practice measures.

Such mitigation measures are related to fluvial geomorphology and ecology, with location-specific details recorded on the applicable datasheets, further information on these measures are provided in the Fluvial Geomorphology Appendix (16F) and Chapter 11 – Ecology and Nature Conservation.

© Mouchel 2016

Proposed Scheme Impact Upon WFD Objectives

The assessment against WFD criteria is undertaken based on medium to long term status, rather than any temporary, short term effects or deterioration in status. With the standard good practice and applicable mitigation measures installed, the assessment of this Proposed Scheme is summarised, with respect to the 4 aforementioned WFD objectives, below:

1. *To prevent deterioration in the ecological status of the water body*

   There are a number of locations where specific additional ecology mitigation has been identified, with these taken into account, it is considered that the Proposed Scheme (and inherent local components including watercourse crossings, watercourse diversions and drainage outfalls) shall not lead to any adverse effect on current WFD status with regard to ecology.

2. *To prevent the introduction of impediments to the attainment of Good WFD status for the water body*

   The Proposed Scheme shall not prevent watercourses which are currently not meeting WFD objectives from reaching these in future. A number of surface waterbodies are currently failing to meet overall Good status, often due to benthic invertebrate and morphological condition status. Should such baseline characteristics improve, the Proposed Scheme components would not impede the attainment of overall Good status.

3. *To ensure that the attainment of the WFD objectives for the water body are not compromised*

   It is considered that the Proposed Scheme (and inherent local components including watercourse crossings, watercourse diversions and drainage outfalls) shall not compromise the attainment of good status, as discussed above.

4. *To ensure the achievement of the WFD objectives in other water bodies within the same catchment are not permanently excluded or compromised*

   It is recognised that particular waterbodies have a large number of surface water interactions, with the potential for cumulative effects on watercourse status. Examples of these being the multiple culverted sections on small tributary channels for the Foyle and Faughan Estuaries and Camowen River waterbodies, generally directly interacting with previously modified channels or artificial field drains. Taking account of good practice, cumulative interactions upon these minor tributaries are not anticipated to lead to potential downgrading of current status or prevention of the attainment of target WFD status. Therefore, the proposed components (individually and cumulatively) will not cause adverse influence to WFD status of water bodies within the same catchment.

© Mouchel 2016

Conclusion

As discussed on the 51 individual WFD Assessment Datasheets (including 3 screened out representative locations; S2-WFDA-38, S3-WFDA-22 and S3-WFDA-38), provided in Annex 16D.2 at the rear of this document, the application of the standard design and construction good practice measures in tandem with the identified watercourse-specific mitigation, shall minimise the likelihood and/or scale of any adverse environmental interaction on local watercourses or associated waterbodies and shall not adversely impact WFD status, nor impede attainment of target status.

Given the above, no locations on the proposed A5WTC require the provision of a WFD Article 4.7 exemption application.

Table 16D.2 Summary of Standard Design Good Practice Techniques for Protecting WFD Status

Potential WFD Element Impact	Standard Construction Design and Good Practice	Standard Operation Design and Good Practice
Biological	Construction work involving high levels of vibration at key crossing points for salmon would be timed to avoid the most sensitive periods. No night working will generally not be allowed, to reduce the impact of artificial lighting on fish species. In the event of emergency works, lighting will be positioned to minimise light spill onto watercourses. Culverts shall be designed to be of minimum length to serve function of transferring watercourse below the Proposed Scheme. In the vicinity of watercourses where otter is considered present, excavations in excess of 2m depth shall be fenced off or covered overnight to prevent trapping.	Diversions shall be designed to be of minimal length to transfer flows whilst encouraging natural bed, bank and flow characteristics within replacement channel. Culverts shall be of minimal length to transfer water below the Proposed Scheme, buried below natural channel bed depth, with natural bed material encouraged and natural channel gradient applied, where feasible. Where flow rates are too low to allow fish passage during normal flows, lowered sections would be cast into culverts to allow a continuous flow of water. Where substrate makes it likely that fish would be trapped in dewatered sections, prior translocation would take place (requiring a licence from NIEA or Loughs Agency). Watercourses with salmonid interest shall have a culvert embedment depth of 350mm and be designed as box culverts. On watercourses where otters are considered to be present, culverted channel sections shall contain mammal passage mitigation measures, such as ledges. Operational lighting will be designed to will contain the extent of spill within the dual carriageway footprint.

© Mouchel 2016

Potential WFD Element Impact	Standard Construction Design and Good Practice	Standard Operation Design and Good Practice
Hydromorphology	Appropriate design of culverts, crossing structures and diversions taking account of specific flow characteristics in local watercourses. Culvert sizing shall be determined with recognition of flood events, taking account of climate change. Environmental Manager to provide awareness training to construction personnel and monitoring ongoing activities. Appropriate placement and design of structures to avoid longer-term erosion or deposition issues. Following guidance provided in the Department of Environment (Northern Ireland) Surface Waters Alterations Handbook and with appropriate permissions from Planning NI, Rivers Agency, Loughs Agency, DCAL and NIEA.	Maintenance and monitoring of culverts, crossing structures and diversions to ensure appropriate hydrological/hydraulic performance. Scour protection shall be installed to reduce erosive forces at both inlet and outlet of culverts, with diversion channels designed to avoid channel migration or bed/bank erosion. Maintenance and monitoring of culverts, diversions and outfalls to ensure geomorphological issues such as scour, bank erosion and excessive deposition are identified and appropriately managed. Following guidance provided in the Department of Environment (Northern Ireland) Surface Waters Alterations Handbook and with appropriate permissions from Planning NI, Rivers Agency, Loughs Agency, DCAL and NIEA.
Physico-Chemical	Not anticipated to be influenced by Proposed Scheme	Not anticipated to be influenced by Proposed Scheme

© Mouchel 2016

Potential WFD Element Impact	Standard Construction Design and Good Practice	Standard Operation Design and Good Practice
Chemical	Environmental Manager to provide awareness training and monitor activities to minimise potential water quality impacts, particularly regarding sedimentation, hydrocarbon and chemical pollution. Machinery to operate within demarcated zones to avoid entering near-channel areas, with further restrictions on machinery entering watercourses. Where in-channel works are required, measures shall be taken to provide dry working conditions, using techniques such as coffer dams or temporary water diversions. Vegetation clearance to be carefully managed and soil storage areas carefully controlled and located away from watercourses. Construction-phase drainage to be installed as a priority before substantial earthworks commence. Surface runoff shall be intercepted before entering construction site and separately transferred to local surface waters to avoid site contamination. Construction site runoff shall be treated appropriately before discharge to local watercourses. Use of pre-cast concrete structural materials where feasible to minimise application of wet concrete during near-channel or in-channels works. Culverts and diversions to be installed 'offline', with flow to the new channel enabled when completed. Follow guidance provided in appropriate NetRegs Pollution Prevention Guidelines (PPGs). Adherence to discharge consent licence.	Appropriately designed highway drainage techniques, taking account of accidental spillage calculations, Highways Agency Water Risk Assessment (HAWRAT) and 'in river' sediment standards, for individual drainage networks discharges to local receiving watercourses. Maintenance and monitoring of drainage network, installed SUDS treatment and associated pipework to ensure appropriate hydraulic/water quality performance throughout operational period. Highways maintenance personnel aware of contamination issues, clearly identified and maintained shut-off valves in each network to reduce potential for network contamination to reach receiving surface watercourse. Maintenance issues incorporated into structural designs to reduce potential for water quality damage,

Annex 16D.2 – Water Framework Directive (WFD) Assessment Datasheets

© Mouchel 2016

ID	WFD Assessment ID	Datasheet S1-WFDA-01
WATERCOURSE BASELINE	Watercourse Name	River Foyle
	Grid Ref / Chainage	240235E 412220N / 0-1500 m
	Watercourse Description and Geomorphology	The River Foyle has a massive catchment area of approximately 2890 km^2, including a number of tributaries which are major watercourses in their own right, including the Burn Dennet, Mourne, Finn, Glenmornan and Fairy Water. The River Foyle reaches a width of approximately 750 m as it flows north to Londonderry and Lough Foyle. The lough is tidal and exerts a tidal influence up the River Foyle as far as Strabane, with a tidal range of approximately 3 m. No geomorphological sensitivity has been identified. The associated downstream WFD classified water body is named as the Foyle and Faughan Estuaries, defined by NIEA as a heavily modified water body and a transitional watercourse (given tidal influence).
	Watercourse Data	Upstream catchment: 2890 km^2, Bed width: 750 m Channel Gradient: Not Surveyed, Annual Mean Flow*: 58.1 m^3/s, Q95 Low Flow*: 6.4 m^3/s ** Flow values calculated for River Mourne (as major tributary of R. Foyle, above tidal influence), thus actual values for River Foyle, taking account of other tributaries, is likely to be considerably higher than the conservative values quoted.*
	Ecology Features	Atlantic salmon, river/brook lamprey
	Protected Areas (<1km)	None – planned components are downstream of the River Foyle and Tributaries SAC and ASSI / River Finn SAC boundaries and hence will not influence designated sites.
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Outfalls: Mainline Drainage S1-OF-01.1, S1-OF-02.1.A, S1-OF-02.1.B, S1-OF-25 Side Road Drainage S1 OFS Victoria Road 2A Pre-Earthworks Drainage (5)
	Component Description	Outfalls: S1-OF-01.1, S1-OF-02.1.A, S1-OF-02.1.B and S1-OF-25 will discharge mainline highway drainage to outfalls located on intertidal mudflats on the River Foyle. Road runoff will be treated sufficiently to pass the equivalent of Highways Agency Water Risk Assessment, Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l although substitute upstream freshwater locations have been used to assess these, given that these tests are designed for the assessment of freshwater discharge locations. Treatment planned for these outfall locations are wet/retention ponds. The combined annual flows from the mainline outfalls represent less than 0.01% of the receiving watercourse flow. There is also a side road drainage outfall and 5 pre-earthworks drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.
	Potential Impacts on WFD Status	Integral good practice design measures applied for the outfalls during construction and operational phases shall avoid significant impact upon WFD classifications on this modified watercourse for biological, physico-chemical, hydromorphology and chemical elements.
	Further Mitigation (beyond Standard Good Practice Design Measures)	None

WFD BASELINE

WFD Waterbody Name / ID	Foyle and Faughan Estuaries / UKGBNI5NW250010
Current Overall Status - 2013 (Objectives 2015 / 2021 / 2027)	Moderate Ecological Potential Moderate Ecol. Potential / Good Ecol. Potential / Good Ecol. Potential

Local Management Area (LMA) Action Plan Summary

Burn Dennet and Foyle LMA – LMA-wide measures to improve agricultural and land management practices to improve chemical and biodiversity status. Local measures required to improve water quality, particularly reducing levels of pesticides, ammonia, chromium and inorganic nitrogen. NIEA to maintain input into A5 road scheme during development and construction phases. The sources of adverse pressure causing current status are yet to be determined by NIEA. Classified as Heavily Modified Water Body due to flood defences.

WFD ASSESSMENT

	WFD Element (Heavily Modified Criteria)	Current Status	Assessed Post Works Status	Proposed Scheme Influence on WFD Status
Biological	Fish	High	High	Applying good practice design will not cause deterioration of status
	Alien Species	Absent	Absent	Not influenced by Proposed Scheme
	Phytoplankton	High	High	Not influenced by Proposed Scheme
Physico-Chem	General Conditions	Moderate	Moderate	Applying good practice design will not cause deterioration of status, nor prevent improvement
	Dissolved Inorganic Nitrogen	Poor	Poor	Not influenced by Proposed Scheme
	Dissolved Oxygen	High	High	Applying good practice design will not cause deterioration of status
	Specific Pollutants	Pass	Pass	Applying good practice design will not cause deterioration of status
Hydro-morph	Hydromorphology	Good	Good	Applying good practice design will not cause deterioration of status, nor prevent improvement
Chem	Priority Hazardous Substances	Fail	Fail	Applying good practice design will not cause deterioration of status, nor prevent improvement

WFD COMPLIANCE

Does the Proposed Scheme comply with WFD Objectives 1, 2, 3 and 4?

No - No, do not proceed or complete Article 4.7 Assessment
Yes (J) – Yes, with justification provided within integral environmental management good practice
Yes (M) – Yes, with specific mitigation details provided on this datasheet

0WATERCOURSE BASELINE	Watercourse Name	UD_02
	Grid Ref / Chainage	239494E 410920N / 3050 m
	Watercourse Description and Geomorphology	UD_02 is a field drain of approximately 500 m total length, which flows north west to discharge to the River Foyle at 239320E 410970N. This is a straightened field drain channel running along a field boundary.
	Watercourse Data	Upstream catchment: 0.3 km^2, Bed width: 0.6 m Channel Gradient: Not Surveyed, Annual Mean Flow: 0.005 m^3/s, Q95 Low Flow: 0.001 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	River Foyle and Tributaries SAC and ASSI / River Finn SAC (approx 50m downstream)
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S1-WD-02 Culverts: S1-PC-04, S1-PC-32 Outfalls: Pre-Earthworks Drainage (6)
	Component Description	
	Diversion: S1-WD-02 is a 130 m long diversion taking the existing watercourse north to pass under the new A5 carriageway in culvert, before re-entering a diversion channel and finally returning to its existing course. The diversion channel will reduce the length of necessary culverted sections and shall lengthen the watercourse by 20 m, slightly reducing the watercourse gradient. Culverts: S1-PC-04 is a 60 m long pipe culvert of 1.5 m diameter which passes underneath the new A5 carriageway, downstream of which S1-PC-32 is a 22 m long pipe culvert of 1.5 m diameter which passes under a new side road, these have an aggregated culvert length of 82 m. These culverted sections represent approximately 16% of the total channel length. The separation between the culverts is 68 m. Outfalls: There are 6 pre-earthworks drainage outfalls in this area, however, the installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.	
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the diversion, culverts and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications on this modified watercourse for biological, physico-chemical, hydromorphology and chemical elements. Morphological conditions will be influenced on this specific tributary due to the installation of these culverted sections, culverts may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the overall catchment.	
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	None

WATERCOURSE BASELINE	Watercourse Name	Blackstone Burn
	Grid Ref / Chainage	239228E 410727N / 3350 m
	Watercourse Description and Geomorphology	The Blackstone Burn is a minor watercourse that drains several smaller tributaries and flows north west through Magheramason to discharge to the River Foyle at 239190E 410950N. The upstream tributaries have been identified as artificially modified field drains from aerial photography. This is a 1-1.5 m wide channel with 1 m high, steep, grassy banks. The channel has large cobbles and boulders protruding above the surface of low flow. Deposition of material within the channel has led to lateral and point bar development. There is evidence of small-scale bank undercutting and poaching, both of which have exposed the sandy alluvial soil. The channel has incised into the floodplain and sits within an area of hummocky ground. Small sections of the channel have eroded down to the underlying bedrock.
	Watercourse Data	Upstream catchment: 3.3 km^2, Bed width: 1.7 m Channel Gradient: 1 in 85, Annual Mean Flow: 0.067 m^3/s, Q95 Low Flow: 0.005 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	River Foyle and Tributaries SAC and ASSI / River Finn SAC (approx 10 m)
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S1-WD-03 Culvert: S1-PC-05 Outfalls: S1-OF-26 Pre-Earthworks Drainage (3)
	Component Description	
	Diversion: S1-WD-03 is a 182 m diversion which relocates the channel to flow north, thus minimising culvert length below the new carriageway and embankments. The diversion reduces the channel length by approximately 8 m and may slightly increase channel gradient. Culvert: S1-PC-05 is a 105 m long box culvert, 2.1 m high and 3.9 m wide. The culverted section represents approximately 11% of the total channel length from the upstream confluence of field drains to the confluence with the River Foyle. Outfall: S1-OF-26 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment, Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual flow from the mainline outfall represents 1.6% of the receiving watercourse flow. Carriageway runoff is recognised as contributing to copper and zinc levels, currently being monitored by NIEA, outfalls at this location shall be designed to minimise the introduction of such materials as per HAWRAT guidance. There are also three pre-earthworks drainage outfalls in this area, however, the installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.	
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the culvert, diversion and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications on this modified watercourse for biological, physico-chemical and chemical elements. Morphological conditions will be influenced on this specific tributary due to the installation of the long culverted section, this culvert may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the overall catchment. Hydromorphological sensitivity has been noted and specific mitigation has been described for this watercourse.	
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	The entrance and exit to the culvert and the banks 5 m up and downstream of the culvert require erosion protection to prevent localised erosion and scour around the entrance to the culvert, and geotextiles may be the most appropriate and cost-effective option. Deposition of cobbles within the channel indicates that the culvert should be monitored regularly to ensure it does not become blocked. Construction management plans shall include details of hydromorphological monitoring methodologies and responsibilities, with pre-agreement from NIEA and monitoring terminated as and when NIEA are satisfied. Should monitoring evidence demonstrate a requirement for further measures, specific techniques and locations shall be evaluated and again agreed with NIEA.

WATERCOURSE BASELINE	Watercourse Name	UD_04
	Grid Ref / Chainage	238859E 410252N / 3950 m
	Watercourse Description and Geomorphology	UD_04 is a field drain of approximately 1100 m in length, flowing north west to discharge to the River Foyle at 238660E 410630N. This is a straightened field drain channel running along a field boundary. The existing road crosses this watercourse adjacent to this location.
	Watercourse Data	Upstream catchment: 0.8 km^2, Bed width: 2 m Channel Gradient: Not Surveyed, Annual Mean Flow: 0.013 m^3/s, Q95 Low Flow: 0.001 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	River Foyle and Tributaries SAC and ASSI / River Finn SAC (approx 200 m downstream)
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S1-WD-05 Culverts: S1-PC-06, S1-PC-29, S1-PC-37 Outfalls: Mainline Drainage S1-OF-05.1 Side Road Drainage S1 OFS Dunnalong Road 1, S1 OFS Meenagh Road 2, S1 OFS Dunnalong Road 2 Pre-Earthworks Drainage (6)
	Component Description	
	Diversion: S1-WD-05 is a 367 m diversion channel, relocating the current field drain west of its current location, to take the channel below the new A5 carriageway, existing road and new side roads through three culverts, before returning to its existing course. The diversion channel will shorten the watercourse by approximately 100 m and may slightly increase channel gradient. Culverts: S1-PC-06 is a 43 m long box culvert, 1.8 m high and 1.8 m wide, passing below the new A5 carriageway, via the newly diverted channel. S1-PC-29 is a 29 m long box culvert, 1.8 m high and 1.8 m wide, passing under an altered section of existing side road and S1-PC-37 is a 13 m long box culvert, 1.8 m high and 1.8 m wide, passing under a new side road. The aggregated culvert length is 85 m, representing approximately 9% of the total channel length. The separation between the culverts is 31 m and 8 m, respectively, travelling downstream to the north west. Outfall: S1-OF-05.1 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment, Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is swales / grassed surface water channels and a wet / retention pond. The annual flow from the mainline outfall represents approximately 12% of the receiving watercourse flow. Carriageway runoff is recognised as contributing to copper and zinc levels, currently being monitored by NIEA, outfalls at this location shall be designed to minimise the introduction of such materials as per HAWRAT guidance. There are also 3 side road drainage outfalls and 6 pre-earthworks drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the diversion, culverts and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications on this modified watercourse for biological, physico-chemical, hydromorphology and chemical elements. Morphological conditions will be influenced on this specific tributary due to the installation of the long combined culverted sections, these culverts may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the overall catchment.
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	None

ID		
WATERCOURSE BASELINE	**WFD Assessment ID**	**Datasheet S1-WFDA-10**
	Watercourse Name	Burn Dennet
	Grid Ref / Chainage	236988E 404318N / 10100 – 10500 m
	Watercourse Description and Geomorphology	The Burn Dennet flows west to discharge to the River Foyle at 235880E 404180N. This is a low gradient, meandering, mature channel. Bed material comprises gravel and cobble, with banks similarly composed with sand becoming increasingly dominant higher on banks. The channel exhibits point bars and steep banks, with evidence of small scale bank erosion. The current sinuous channel suggests historic channel migration and potential for future movement, particularly around tight meander sections. Artificial modification includes substantial constructed levees on south bank, set back from bank edge and in-channel boulder placement acting as toe protection and to deflect flow from banks.
	Watercourse Data	Upstream catchment: 146 km^2, Bed width: 11.4 m Channel Gradient: 1 in 1000, Annual Mean Flow: 3.82 m^3/s, Q95 Low Flow: 0.77 m^3/s
	Ecology Features	Atlantic salmon and river/brook lamprey, otter
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Bridge: S1-B06 Outfalls: Mainline Drainage S1-OF-11, S1-OF-12, S1-OF-13 Side Road Drainage S1 OFS Drumenny Road Pre-Earthworks Drainage (6)
	Component Description	
	Bridge: S1-B06 is a proposed 75 m concrete beam and slab, triple span bridge, without in-channel support. Outfalls: S1-OF-11, S1-OF-12 & S1-OF-13 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment, Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for these three outfall locations are wet/retention ponds. The combined annual discharge volume from these three outfalls represents less than 0.1% of the flow in the receiving watercourse. There are also 6 pre-earthworks drainage outfalls and a side-road drainage outfall in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.	
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the bridge and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for physico-chemical, hydrological regime and chemical elements at this location. Hydromorphology is currently classified as of moderate status. Specific hydromorphological and biological sensitivities have been identified during the assessment of this section of the watercourse.	
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	With evidence of current and historic erosive and channel migration processes, it is recommended that erosion protection is installed at bridge abutments and for channel banks immediately upstream of the bridge, especially on the northern side. Construction management plans shall include details of hydromorphological monitoring methodologies and responsibilities, with pre-agreement from NIEA and monitoring terminated as and when NIEA are satisfied. Should monitoring evidence demonstrate a requirement for further measures, specific techniques and locations shall be evaluated and again agreed with NIEA. Temporary bridges during construction will be designed as clear span structures and to enable mammal passage. Translocation of lamprey ammocoetes to a nearby suitable habitat is required.

WATERCOURSE BASELINE	Watercourse Name	Glenmornan River
	Grid Ref / Chainage	236448E 402340N / 12750 m
	Watercourse Description and Geomorphology	The Glenmornan River (also known as the Ballymagorry Burn) drains several smaller tributaries and field drains and flows north west to discharge to the River Foyle at 235930E 404070N. The channel is 2.5-3 m wide, with a gravel/cobble bed and a sandy alluvial bank that is well vegetated with grass. The channel has incised through a flat, low gradient floodplain, with pool-riffle sequences. There are lateral bars, indicating that sediment is mobilised, resulting in a concentration of flow, which could lead to bank erosion and meander development. The channel is sinuous, with palaeochannels visible on aerial photographs showing evidence of historic channel movement. The channel is heavily modified with inconsistent stone toe protection along its length and with large levees (1.5-2 m) on either side, generally set back 3-4 m from the channel edge. This relatively recent control of channel lateral movement has resulted in incision of the bed.
	Watercourse Data	Upstream catchment: 32 km^2, Bed width: 2.8 m Channel Gradient: 1 in 311, Annual Mean Flow: 0.809 m^3/s, Q95 Low Flow: 0.138 m^3/s
	Ecology Features	Atlantic salmon, otter
	Protected Areas (<1km)	McKeans Moss ASSI is located within this catchment, with minimum separation of 90 m from the Proposed Scheme. Raised bog with runoff radiating off to surrounding land and McKeans Moss is surrounded by deep ditches, resulting in very limited hydrological linkage with the Proposed Scheme.
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Bridge: S1-B08 Outfalls: Mainline Drainage S1-OF-15, S1-OF-16
	Component Description	Bridge: S1-B08 is a proposed 64 m concrete beam and slab, triple span bridge, without in-channel support. Outfalls: S1-OF-15 and S1-OF-16 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment, Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for these outfall locations are wet/retention ponds. The combined annual discharge volume from these outfalls represents less than 0.5% of the flow in the receiving watercourse. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.
	Potential Impacts on WFD Status	Integral good practice design measures applied for the bridge and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location. Hydromorphology is currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to this status in future.
	Further Mitigation (beyond Standard Good Practice Design Measures)	Temporary bridges during construction will be designed as clear span structures and to enable mammal passage.

ID	WFD Assessment ID	Datasheet S1-WFDA-21
WATERCOURSE BASELINE	Watercourse Name	Nancy Burn
	Grid Ref / Chainage	234381E 398643N / 17100 m
	Watercourse Description and Geomorphology	The Nancy Burn is a short, minor tributary of the River Foyle, draining several field drains and also the north east extent of Strabane. The Nancy Burn meets the River Foyle at 234100E 398700N. The associated downstream WFD classified water body is named as the Foyle and Faughan Estuaries, defined by NIEA as a heavily modified water body. At the location of Proposed Scheme interaction, the Nancy Burn has the characteristics of a field drain, with straightened and deepened channel modification evident. The Nancy Burn is likely to already be substantially culverted upstream of the Proposed Scheme, due to existing road and urban development in the local area.
	Watercourse Data	Upstream catchment: 0.4 km^2, Bed width: 2.4 m Channel Gradient: 1 in 2150, Annual Mean Flow: 0.008 m^3/s, Q95 Low Flow: 0.001 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	River Foyle and Tributaries SAC and ASSI / River Finn SAC (100 m downstream)
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Culverts: S1-PC-20, S1-PC-33, S1-PC-42 Outfalls: Mainline Drainage S1-OF-33, S1-OF-34 Pre-Earthworks Drainage (3)
	Component Description	Culverts: There are 3 culverts planned for this field drain; box culverts S1-PC-33 (34 m length, 2.4 m height by 3.9 m width) and S1-PC-42 (16 m length, 2.4 m height by 3.9 m width). S1-PC-20 is a triple pipe culvert which are between 0.6 m and 1.2 m diameter and all 45 m in length. The combined culverts have an aggregated culvert length of 95 m in order to take this watercourse below the carriageway and slip road. There is a separation distance between culverts S1-PC-20 and S1-PC-33 of 22 m, with separation between S1-PC-33 and S1-PC-42 of 49 m. The channel length of the Nancy Burn is approximately 1500 m. The aggregated Proposed Scheme culvert length totals 95 m representing 6% of the total channel length. Outfalls: S1-OF-33 and S1-OF-34 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment, Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for these two outfall locations are a combination of grassed surface water channels adjacent to the carriageway, wet/retention ponds, and a dry/detention pond. The combined annual flows from the mainline outfalls represent approximately 19% of the small receiving watercourse flow. There are also 3 pre-earthworks drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.
	Potential Impacts on WFD Status	Integral good practice design measures applied for the culverts and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications on this modified watercourse for biological, physico-chemical, hydromorphology and chemical elements. Morphological conditions will be influenced on this specific tributary due to the installation of the long combined culverted sections, these culverts may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the overall catchment.
	Further Mitigation (beyond Standard Good Practice Design Measures)	None

WATERCOURSE BASELINE	Watercourse Name	Park Road Drain
	Grid Ref / Chainage	234147E 398396N / 17400 m
	Watercourse Description and Geomorphology	The Park Road Drain is a field drain which flows north to converge with Nancy Burn, then discharges to the River Foyle at 234100E 398700N. It is likely to often exhibit virtually no flow conditions. This is an artificially modified field drain which is crossed by the existing A5 adjacent to this location and aerial photography suggests may be culverted for much of its length, upstream of the Proposed Scheme.
	Watercourse Data	Upstream catchment: 0.03 km^2, Bed width: 1.2 m Channel Gradient: Not Surveyed, Annual Mean Flow: <0.001 m^3/s, Q95 Low Flow: <0.001 m^3/s
	Ecology Features	Otter
	Protected Areas (<1km)	River Foyle and Tributaries SAC and ASSI / River Finn SAC (approx 200 m downstream)
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Culverts: S1-PC-22 Outfalls: Side Road Drainage S1 OFS Park Road, S1 OFS Park Road 3 Pre-Earthworks Drainage (3)
	Component Description	
	Culverts: S1-PC-22 is a 176 m long pipe culvert, 1.5 m diameter, passing under the main carriageway and a new side road. Upstream of the Proposed Scheme, this watercourse looks to generally be heavily modified and/or culverted and with the additional Proposed Scheme components will effectively become culverted for approximately 70% of its 500 m channel length. Outfalls: There are 2 side road drainage outfalls and 3 pre-earthworks drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.	
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the culvert and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications on this modified watercourse for physico-chemical, hydromorphology and chemical elements. Biological mitigation has been identified for this location. Morphological conditions will be influenced on this specific tributary due to the installation of the long culverted section, which may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the overall catchment.	
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	A specific pre-construction otter survey would be carried out at Strabane Nature Reserve. If evidence of breeding activity, or the care of young, is found, no construction works would be carried out at these locations until the cubs have left the den.

WATERCOURSE BASELINE	Watercourse Name	Mourne River
	Grid Ref / Chainage	233830E 398037N / 17900 m
	Watercourse Description and Geomorphology	The Mourne River is a large, wide watercourse with low gradient and slow flow set within a large floodplain, the confluence with the River Finn is approximately 400 m downstream of the crossing location. The natural channel banks on the north side are approximately 2 m high, steep and grass covered, with small areas of erosion evident and likely to continue, some toe protection is already in place. The banks on the south side are also grass-covered but less steep, with a point bar composed of sand developing on the inside of the bend. Upstream of the proposed crossing point, the northern bank of the river has been protected with a flood wall, which terminates immediately after the existing bridge. At this point, the flood wall merges into an old masonry wall, which merges into an earth bank at the point of the proposed crossing. The earth bank is 2 m high, set back 5 m from the channel edge. There is a similarly sized levee on south side.
	Watercourse Data	Upstream catchment: 1860 km^2, Bed width: 20 m Channel Gradient: Not Surveyed, Annual Mean Flow: 58.1 m^3/s, Q95 Low Flow: 6.41 m^3/s
	Ecology Features	Atlantic salmon, otter
	Protected Areas (<1km)	River Foyle and Tributaries SAC and ASSI / River Finn SAC (Bridge, Side Road and Pre-Earthwork Drainage only)
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Bridge: S1-B14 Outfalls: Side Road Drainage S1 OFS Lifford Road, S1 OFS Great Northern Link Pre-Earthworks Drainage (2)
	Component Description	Bridge: S1-B14 is a proposed 271 m steel, quadruple span bridge, without in-channel support. Outfalls: There are 2 pre-earthworks drainage outfalls and 2 side-road drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.
	Potential Impacts on WFD Status	Integral good practice design measures applied for the bridge and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location. Hydromorphology and biological sensitivities have been noted at the crossing location and specific mitigation has been proposed.
	Further Mitigation (beyond Standard Good Practice Design Measures)	Proposed erosion protection (rip-rap) on the north bank and west side should tie into softer erosion protection, such as geotextiles, as erosion often occurs at rip-rap joints due to eddy effects created by the rip-rap. Any rip-rap would be placed into the existing bank and not built out into the river, to maintain channel dimensions. Construction management plans shall include details of hydromorphological monitoring methodologies and responsibilities, with pre-agreement from NIEA and monitoring terminated as and when NIEA are satisfied. Should monitoring evidence demonstrate a requirement for further measures, specific techniques and locations shall be evaluated and again agreed with NIEA. Low vibration piling techniques would be used in the vicinity of the Mourne River crossing to reduce disturbance to salmon, temporary bridges during construction will be designed as clear span structures and to enable mammal passage. Operational lighting will be designed to minimise inadvertent 'lighting spill' onto the river.

	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S1-WD-18 Culvert: S1-PC-23 Pre-Earthworks Drainage (2)
	Component Description	
	Diversion: S1-WD-18 is a 243 m diversion, relocating the existing channel north west, passing under the new A5 main carriageway and side roads through a culvert and finally returning to its existing course. The diversion channel will slightly reduce the length of this watercourse and may slightly increase the channel gradient. Culvert: S1-PC-23 is a 1.8 m diameter pipe culvert, 118 m in length, and passes under the main carriageway along the watercourse diversion. This culvert is approximately 32% of the total watercourse length. Outfalls: There are 2 pre-earthworks drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.	
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the diversion, culvert and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime, morphological conditions and chemical elements at this location. Hydromorphology and fish are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements for the River Finn in future. Morphological conditions will be influenced on this specific tributary due to the installation of the long culverted section, this culvert may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the overall catchment.

WATERCOURSE BASELINE	Watercourse Name	Urney Road Drain
	Grid Ref / Chainage	233302E 397439N / 18700 m
	Watercourse Description and Geomorphology	Urney Road drain is a minor watercourse of approximately 730 m in length, and flows north west to discharge to the River Finn at 233520E 397470N. A heavily modified and incised field drain channel about 0.5-1 m wide, which has been straightened and deepened in alluvium. Well vegetated with little evidence of erosion. Upstream and south of the Proposed Scheme this watercourse is likely to be already modified where passing through an urban area of Strabane.
	Watercourse Data	Upstream catchment: 0.4 km^2, Bed width: 2.8 m Channel Gradient: Not surveyed, Annual Mean Flow: 0.006 m^3/s, Q95 Low Flow: <0.001 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	River Foyle and Tributaries SAC and ASSI / River Finn SAC (30m downstream)
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S1-WD-14 Culvert: S1-PC-24 Outfalls: Pre-Earthworks Drainage (2)

Component Description

Diversion: S1-WD-14 is a 107 m long diversion, relocating the existing watercourse west to pass under the new A5 carriageway through a culvert and finally returning to its existing course. The diversion channel will neither alter the overall length of the watercourse nor should it affect the channel gradient.

Culvert: S1-PC-24 is a 60 m long box culvert, 2.4 m high and 2.4 m wide, passing below the new A5 carriageway. The new culverted section represents approximately 8% of the length of this modified watercourse.

Outfalls: There are 2 pre-earthworks drainage outfalls in this area, however, the installation and operation of these components are not expected to alter existing watercourse conditions.

Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.

Potential Impacts on WFD Status

Integral good practice design measures applied for the diversion, culvert and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydromorphology and chemical elements at this location.

Hydromorphology and fish are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements for the River Finn in future.

Morphological conditions will be influenced on this specific tributary due to the installation of the long culverted section, this culvert may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the overall catchment.

Further Mitigation (beyond Standard Good Practice Design Measures)

None

WATERCOURSE BASELINE	Watercourse Name	Finn River
	Grid Ref / Chainage	233042E 397307N / 18150-19300 m
	Watercourse Description and Geomorphology	The Finn River is a large watercourse that drains several smaller tributaries and flows along the international border north east to Strabane, converging with the Mourne River to form the River Foyle at 233400E 398000N. The River Finn is a large 20-30 m wide, 5 m deep, low gradient, slow flowing, tidal watercourse. On the day of the site visit, the water level was 1 m below the top of the banks, which displayed no evidence of erosion. There was no evidence of deposition within the watercourse. There is a large levee on the east bank and a wide floodplain on the west side of the channel. The land on either side of the river is used for grazing with some poaching of the channel banks from grazing animals.
	Watercourse Data	Upstream catchment: 497 km^2, Bed width: 20 m Channel Gradient: Not Surveyed, Annual Mean Flow: 17.6 m^3/s, Q95 Low Flow: 1.81 m^3/s
	Ecology Features	Atlantic salmon
	Protected Areas (<1km)	River Foyle and Tributaries SAC and ASSI / River Finn SAC
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Outfalls: Mainline Drainage S1-OF-22.2, S1-OF-36, S1-OF-37, S1-OF-41 Side Road Drainage S1 OFS Strahans Road 1.1 Pre-Earthworks Drainage (4)
	Component Description	Outfalls: S1-OF-36, S1-OF-37, S1-OF-41 and S1-OF-22.2 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment, Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for these outfall locations are swales/grassed channels and wet/retention ponds. The combined annual discharge volume from these outfalls represents less than 0.03% of the flow in the receiving watercourse. There are also 4 pre-earthworks drainage outfalls and a side-road drainage outfall in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.
	Potential Impacts on WFD Status	Integral good practice design measures applied for the outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydromorphology and chemical elements at this location. Hydromorphology and fish are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements in future.
	Further Mitigation (beyond Standard Good Practice Design Measures)	None

Local Management Area (LMA) Action Plan Summary	
Derg and Mourne LMA – LMA-wide measures to improve agricultural and land management practices to improve chemical and biodiversity status, evaluating abstractions and physical structures, taking account of drinking water safety plans. Local measures required to improve water quality, particularly targeting unconsented discharges, cross-border pressures, and morphological mitigation measures. Consensus is required with ROI agencies in order to target feasible improvement measures.	

WFD ASSESSMENT

	WFD Element	Current Status	Assessed Post Works Status	Proposed Scheme Influence on WFD Status
Biological	Fish	Moderate	Moderate	Applying good practice design will not cause deterioration of status, nor prevent improvement
	Benthic Invertebrates	Good	Good	Applying good practice design will not cause deterioration of status, nor prevent improvement
	Macrophytes	High	High	Applying good practice design will not cause deterioration of status
	Phytobenthos	High	High	Applying good practice design will not cause deterioration of status
Physico-Chem	Ammonia	High	High	Not influenced by Proposed Scheme

WATERCOURSE BASELINE	Watercourse Name	UD_10
	Grid Ref / Chainage	232906E 397104N / 19250 m
	Watercourse Description and Geomorphology	UD_10 is a small watercourse with a channel length of approximately 1 km. This channel flows north west to discharge to the Finn River at 232860E 397140N. This is a heavily modified channel, crossed by the existing A5 and draining the urban fringe of Strabane to the south.
	Watercourse Data	Upstream catchment: 0.35 km^2, Bed width: 0.7m Channel Gradient: Not surveyed, Annual Mean Flow: 0.006 m^3/s, Q95 Low Flow: 0.000 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	River Foyle and Tributaries SAC and ASSI / River Finn SAC (15 m downstream)
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Culvert: S1-PC-25 Outfalls: Side Road Drainage S1 OFS Urney Road 2 Pre-Earthworks Drainage (4)

Component Description

Culvert: S1-PC-25 is a 54 m long pipe culvert, 1.8 m in diameter, passing below the new A5 carriageway. The UD_10 discharges to the Finn River approximately 20 m downstream of the exit from the new culvert. This culvert section represents approximately 5% of the total channel length from source to Finn River.

There is a side road outfall and also 4 pre-earthworks drainage outfalls in this area, however, the installation and operation of these components are not expected to alter existing watercourse conditions.

Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.

Potential Impacts on WFD Status

Integral good practice design measures applied for the culvert and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydromorphology and chemical elements at this location.

Hydromorphology and fish are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements in future.

Morphological conditions will be influenced on this specific tributary due to the installation of the long culverted section, this culvert may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the overall catchment.

Further Mitigation (beyond Standard Good Practice Design Measures)

None

WATERCOURSE BASELINE	Watercourse Name	UD_12
	Grid Ref / Chainage	233468E 394555N / 22000 m
	Watercourse Description and Geomorphology	UD_12 is a small watercourse which drains several smaller tributaries / field drains, and flows north east to discharge to the Mourne River at 234290E 394980N. This is a small, 0.5-1 m wide, 1 m deep, watercourse with shallow flow that has been artificially straightened and incised. The bed material comprises gravels and cobbles with a thin veneer of sand, and the bed has formed an armoured layer, therefore, more resistant to erosion through entrainment and transportation. The banks show no evidence of erosion or lateral movement.
	Watercourse Data	Upstream catchment: 1.9 km^2, Bed width: 1.6 m Channel Gradient: 1 in 56, Annual Mean Flow: 0.044 m^3/s, Q95 Low Flow: 0.003 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	River Foyle and Tributaries SAC and ASSI (650 m downstream)
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S1-WD-19 Culvert: S1-PC-28 Outfalls: S1-OF-24.1 Side Road Outfalls: S1 OFS Melmount Road 3, S1 OFS Melmount Road 4, S1 OFS Melmount Road 2.1, S2 OFS Primrose Park 1, S2 OFS Bellspark Road 3 Pre-Earthworks Drainage (6)
	Component Description	
		Diversion: S1-WD-19 is a 252 m diversion relocating the existing channel north before returning to the original channel to the east, this avoids the requirement for a much lengthier culvert to pass below the combined carriageway, embankments and side road junctions. The diversion channel is of similar length and channel gradient to the original channel. Culvert: S1-PC-28 is a 55 m long box culvert, 2.1 m high and 2.1 m wide. This culverted section represents less than 1% of the total channel length from source to the River Mourne. Outfalls: S1-OF-24.1 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual discharge volume from this outfall represents approximately 6% of the flow in the receiving watercourse. There are also 5 side road outfalls and 6 pre-earthworks drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.
	Potential Impacts on WFD Status	
		Integral good practice design measures applied for the diversion, culvert and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydromorphology and chemical elements at this location. Fish and phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements or overall status in future. Morphological conditions will be influenced on this specific tributary due to the installation of the long culverted section, this culvert may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the overall catchment.
	Further Mitigation (beyond Standard Good Practice Design Measures)	
		None

WATERCOURSE BASELINE	Watercourse Name	UD_13
	Grid Ref / Chainage	233360E 392679N / 28050 m
	Watercourse Description and Geomorphology	UD_13 is an unnamed field drain which flows north east, north and then north east, converging with other field drains before discharging to the Mourne River at 233913E 393279N. This is a heavily modified field drain of approximately 2.2 km channel length from source to its convergence with the Mourne River.
	Watercourse Data	Upstream catchment: 0.5 km^2, Bed width: 1.3 m Channel Gradient: 1 in 26, Annual Mean Flow: 0.011 m^3/s, Q95 Low Flow: 0.001 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	River Foyle and Tributaries SAC and ASSI (approx 900 m) (Side Road Outfall)
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Culvert: S2-PC-54 Outfalls: Mainline Outfall S2-OF-1 Side Road Drainage: S2 OFS BELLSPARK ROAD 1.1 Pre-Earthworks Drainage (4)

Component Description

Culvert: S2-PC-54 is a 28 m long pipe culvert, 0.6 m in diameter, on this field drain, connecting to an existing road culvert. The proposed culvert represents less than 2% of the length of the watercourse, from it's source to the confluence with downstream field drain, Sion Drain.

Outfall: S2-OF-1 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual discharge volume from this outfall represents less than 10% of the flow in the receiving watercourse. There is also 1 side road outfall and 4 pre-earthworks drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions.

Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.

Potential Impacts on WFD Status

Integral good practice design measures applied for the culvert extension and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydromorphology and chemical elements at this location.

Fish and phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements or overall status in future.

Morphological conditions will be influenced on this specific tributary due to the extension of the existing culverted section, this culvert may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the overall catchment.

Further Mitigation (beyond Standard Good Practice Design Measures)

None

WATERCOURSE BASELINE	Watercourse Name	UD_15
	Grid Ref / Chainage	233546E 391079N / 29900 m
	Watercourse Description and Geomorphology	UD_15 is a small watercourse that drains several field drains and flows east to Seein Bridge to discharge to the Mourne River at 234300E 391150N. UD_15 is 1-1.5 m wide, shallow watercourse confined within a narrow valley. The bed material comprises large cobbles and boulders, which have been transported and deposited recently, there is evidence of flood deposits on the floodplain adjacent to the watercourse. This watercourse is geomorphologically sensitive.
	Watercourse Data	Upstream catchment: 6.0 km^2, Bed width: 2.4 m Channel Gradient: 1 in 67, Annual Mean Flow: 0.150 m^3/s, Q95 Low Flow: 0.013 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	River Foyle and Tributaries SAC and ASSI (approx 700 m downstream)
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversions: S2-WD-01, S2-WD-43 Culvert: S2-PC-01 Outfall: Mainline Outfall S2-OF-2 Side Road Drainage: S2 OFS SEEIN ROAD 2 Pre-Earthworks Drainage (3)
	Component Description	Diversion: S2-WD-43 is an 85 m watercourse diversion which straightens the course of the channel and enables placement of a wet/retention pond. S2-WD-01 is a 198 m watercourse diversion which shortens the length of culvert and may slightly increase the channel gradient. Culvert: S2-PC-01 is a 87 m long box culvert 2.4 m high by 5.4 m wide passing under the main carriageway. The new culvert is approximately 7% of the total watercourse length. Outfall: S2-OF-2 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual discharge volume from this outfall represents less than 2% of the flow in the receiving watercourse. There is also 1 side road outfall and 3 pre-earthworks drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.
	Potential Impacts on WFD Status	Integral good practice design measures applied for the diversions, culvert and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location. Fish and phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements or overall status in future. Morphological conditions will be influenced on this specific tributary due to the installation of the long culverted section, this culvert may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the overall catchment.
	Further Mitigation (beyond Standard Good Practice Design Measures)	Bed and bank erosion protection to be installed 5 m upstream and downstream of the culvert so that the structure is not undermined. The culvert should also be monitored annually or after large storm events to ensure it does not become blocked with cobbles and boulders. Construction management plans shall include details of hydromorphological monitoring methodologies and responsibilities, with pre-agreement from NIEA and monitoring terminated as and when NIEA are satisfied. Should monitoring evidence demonstrate a requirement for further measures, specific techniques and locations shall be evaluated and again agreed with NIEA.

	Grid Ref / Chainage	234147E 390387N / 30800 m
	Watercourse Description and Geomorphology	UD_17 is a small field drainage channel which flows east then north to discharge to the Mourne River at 234380E 391020N.
	Watercourse Data	Upstream catchment: 0.8 km^2, Bed width: 1.2 m Channel Gradient: 1 in 59, Annual Mean Flow: 0.018 m^3/s, Q95 Low Flow: 0.001 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	River Foyle and Tributaries SAC and ASSI / (approx 1 km)
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Culvert: S2-PC-02 Outfalls: S2-OF-3 Pre-Earthworks Drainage (4)

Component Description

Culvert: S2-PC-02 is a 96 m long box culvert, 1.8 m high and 2.7 wide, passing under the proposed main carriageway. This culverted section represents approximately 5% of the total watercourse length.

Outfall: S2-OF-3 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location are a combination of swales / grassed channels and a wet/retention pond. The annual discharge volume from this outfall represents less than 6% of the flow in the receiving watercourse. There are also 4 pre-earthworks drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions.

Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.

Potential Impacts on WFD Status

Integral good practice design measures applied for the culvert and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydromorphology and chemical elements at this location.

Fish and phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements or overall status in future.

Morphological conditions will be influenced on this specific tributary due to the installation of the long culverted section, this culvert may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the overall catchment.

Further Mitigation (beyond Standard Good Practice Design Measures)

None

WATERCOURSE BASELINE	Watercourse Name	UD_19
	Grid Ref / Chainage	234603E 389858N / 31500 m
	Watercourse Description and Geomorphology	UD_19 is a small watercourse which drains several smaller tributaries and field drains and flows north east to discharge to the Mourne River at 235230E 390700N.
	Watercourse Data	Upstream catchment: 1.9 km^2, Bed width: 1.9 m Channel Gradient: 1 in 123, Annual Mean Flow: 0.043 m^3/s, Q95 Low Flow: 0.005 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	River Foyle and Tributaries SAC and ASSI / (approx 900 m downstream)
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S2-WD-33 Culverts: S2-PC-03, S2-PC-49 Outfall: Mainline Drainage S2-OF-4 Side Road Drainage: S2 OFS STONE ROAD 1, S2 OFS STONE ROAD 2, S2 OFS URBALREAGH ROAD 1 Pre-Earthworks Drainage (7)

Component Description

Diversion: S2-WD-33 is 262 m in length and diverts the existing watercourse north of its current route, under the new carriageway and side road, rejoining the watercourse west of the Proposed Scheme. The length and gradient of the watercourse is not altered.

Culverts: S2-PC-03 is a 109 m long box culvert, 2.1 m high by 3.3 m wide, passing under the proposed main carriageway and shortening the existing watercourse. S2-PC-49 is a 48 m long box culvert, 2.4 m high and 3.6 m wide, and passes under a proposed side road. The culverted sections total 157 m and represents approximately 5% of the total watercourse length. The separation distance between the culverts is 44 m.

Outfall: S2-OF-4 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual discharge volume from this outfall represents less than 4% of the flow in the receiving watercourse. There are also 3 side road outfalls and 7 pre-earthworks drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions.

Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.

Potential Impacts on WFD Status

Integral good practice design measures applied for the diversion, culverts and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydromorphology and chemical elements at this location. Fish and phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements or overall status in future. Morphological conditions will be influenced on this specific tributary due to the installation of the multiple lengthy culverted sections. However, this would not be considered to alter the categorisation, or overall status, for the overall catchment.

Further Mitigation (beyond Standard Good Practice Design Measures)

None

WATERCOURSE BASELINE	Watercourse Name	Derg River
	Grid Ref / Chainage	236211E 387556N / 34300 m
	Watercourse Description and Geomorphology	The Derg River is a large watercourse with several smaller tributaries in the north west region of Tyrone, it flows north east to converge with the Mourne River at 236760E 387920N. The Derg River is a classified WFD surface waterbody, at this location identified as Derg River 1 (Lower). The River Derg is a large 20-40 m wide, shallow, natural, boulder bed watercourse. The watercourse is confined between steep, high terraces generally set back 10-50 m from the watercourse on both sides. There is evidence of current erosion, with the watercourse eroding into the southern terrace, creating a steep slope into the terrace of up to 20 m height. On the opposite side of the channel there is a flat, wide and open floodplain. A cobble point bar is actively accumulating on the inside of the meander. Within the channel, boulders are moss-covered, indicating that large bed material has not been transported recently, however there were deposits of recently deposited cobble sized material. The flow is characterised by pools and riffles interrupted by exposed boulders.
	Watercourse Data	Upstream catchment: 442 km^2, Bed width: 28.5 m Channel Gradient: 1 in 388, Annual Mean Flow: 15.9 m^3/s, Q95 Low Flow: 1.93 m^3/s
	Ecology Features	Atlantic salmon, otter
	Protected Areas (<1km)	River Foyle and Tributaries SAC and ASSI
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Bridge: S2-B07 Outfalls: Mainline Drainage S2-OF-5, S2-OF-6 Side Road Drainage S2 OFS Derg Road 1, S2 OFS Deerpark Road 1 Pre-Earthworks Drainage (6)
	Component Description	Bridge: S2-B07 is a proposed 92 m steel, double span bridge, without in-channel support. Outfalls: S2-OF-5 and S2-OF-6 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for these outfall locations are wet/retention ponds. The combined annual discharge volume from these outfalls represents less than 0.03% of the flow in the receiving watercourse. There are also 6 pre-earthworks drainage outfalls and 2 side-road drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.1.
	Potential Impacts on WFD Status	Integral good practice design measures applied for the bridges and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for physico-chemical, hydrological regime and chemical elements at this location. This waterbody registered a failure on dissolved copper in 2013, carriageway runoff is recognised as contributing to copper levels and outfalls at this location shall be designed to minimise the level of copper introduced to pass HAWRAT standard. Hydromorphology and biological features have been identified as sensitive at this location, with mitigation suggested.
	Further Mitigation (beyond Standard Good Practice Design Measures)	It is recommended that the bank protection around the pier and southern abutment is created from hard engineering options. Sheet piling could be considered immediately around the piers and abutments and stone revetment façade in front of the sheet piling on banks parallel to river and around piers or abutments. Erosion protection along the upstream side of the bridge structure to the point where the natural ground steepens on the north side of the river would utilise rip-rap, which will tie into the sheet piling and stone revetment. Construction management plans shall include details of hydromorphological monitoring methodologies and responsibilities, with pre-agreement from NIEA and monitoring terminated as and when NIEA are satisfied. Construction period shall avoid salmon migration period, with a working window of May to September agreed with the Loughs Agency for the Derg River crossing, temporary bridges during construction will be designed as clear span structures and to enable mammal passage. An artificial otter holt would be created and mammal fencing installed along the road boundary. Further mitigation measures would be determined at the detailed design stage to protect otters during construction.

WATERCOURSE BASELINE	Watercourse Name	UD_20
	Grid Ref / Chainage	237354E 385883N / 36500 m
	Watercourse Description and Geomorphology	The Coolaghy Burn (also known as UD_20) is a tributary of the River Derg which drains a large network of field drains, flowing north to converge with the River Derg at 236300E 387630N. NIEA recognise this watercourse in their WFD classification as the River Derg Tributary. This is a 2-4 m wide, 0.5-1 m deep channel incised into a flat floodplain. The channel has low sinuosity and the banks are poached due to the channel marking the boundary of two fields used for grazing. Along the channel edge, trees have become established, which indicate long-term stability of the channel position. However, there is evidence of some bank erosion and remobilisation of large cobbles into the channel, which are deflecting the flow towards the channel banks and potentially result in their erosion.
	Watercourse Data	Upstream catchment: 28 km^2, Bed width: 3.7 m Channel Gradient: 1 in 273, Annual Mean Flow: 0.69 m^3/s, Q95 Low Flow: 0.10 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Bridge: S2-B09.1 Outfalls: Mainline Drainage S2-OF-8 Side Road Drainage S2 OFS Drumlegagh Road 2, S2 OFS Maghercolton Road Pre-Earthworks Drainage (4)
	Component Description	
	Bridge: S2-B09.1 is a proposed 15 m concrete beam and slab, single span bridge, without in-channel support. Outfalls: S2-OF-8 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual discharge volume from this outfall represents approximately 0.3% of the flow in the receiving watercourse. There are also 4 pre-earthworks drainage outfalls and 2 side-road drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.2.
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the bridges and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location. Hydromorphology has been identified as potentially sensitive at this location and mitigation measures have been determined.
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	A 12 m span bridge is currently proposed at this location. As the banks show evidence of erosion, the bridge abutments should be protected with hard engineering, either sheet piling or rock armour for example. The use of soft engineering erosion protection should be used upstream to a point where the possibility of erosion is minimal, and at least 5 m downstream to minimise the possibility of the structure being scoured. Construction management plans shall include details of hydromorphological monitoring methodologies and responsibilities, with pre-agreement from NIEA and monitoring terminated as and when NIEA are satisfied. Should monitoring evidence demonstrate a requirement for further measures, specific techniques and locations shall be evaluated and again agreed with NIEA.

WATERCOURSE BASELINE	Watercourse Name	UD_22
	Grid Ref / Chainage	239883E 3384709N / 39050 m
	Watercourse Description and Geomorphology	UD_22 is a small watercourse that flows north as part of a network of field drains which collectively discharge to the Mourne River at 239770E 386190N. UD_22 is a very small watercourse, with little baseflow, on a steep 10 degree slope, that has been artificially straightened adjacent to the existing road. The bank material is a sandy till with a high gravel and cobble content. The bed material is comprised predominantly of cobbles and gravels. The watercourse has incised 3-4 m into the slope before turning 90 degrees to the north. Around the outside of this sharp bend there is evidence of erosion. This watercourse is deemed to be geomorphologically sensitive.
	Watercourse Data	Upstream catchment: 0.9 km^2, Bed width: 1.2 m Channel Gradient: 1 in 13, Annual Mean Flow: 0.028 m^3/s, Q95 Low Flow: 0.005 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	River Foyle and Tributaries SAC and ASSI (approx 900 m downstream)
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Culverts: S2-PC-09, S2-PC-60 Outfalls: Mainline Drainage S2-OF-10 Side Road Drainage: S2 OFS GLEN ROAD 1, S2 OFS CASTLETOWN ROAD 1, S2 OFS GLEN ROAD 2, S2 OFS GLEN ROAD 3 Pre-Earthworks Drainage (3)
	Component Description	
	Culverts: S2-PC-09 is a 64 m long box culvert, 1.8 m high and 1.8 m wide, and passes under the proposed main carriageway. S2-PC-60 is an 8 m long box culvert, 1.8 m high and 1.8 m wide, and passes under a proposed side road. The culverted sections total 72 m in length and represents approximately 2% of the total watercourse length. The separation distance between the culverts is 24 m. Outfalls: S2-OF-10 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual discharge volume from this outfall represents less than 6% of the flow in the receiving watercourse. There are also 4 side road outfalls and 3 pre-earthworks drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.2.	
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the culverts and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location. Fish and phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements or overall status in future. Morphological conditions will be influenced on this specific tributary due to the installation of the multiple culverted sections, these culverts may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the overall catchment. Hydromorphology mitigation has been identified for this location.	
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	To minimise bank failure, the slopes would be stabilised with geotextiles along with growth of densely rooted vegetation. Installation of appropriate side road drainage on the side road would reduce flow down the slopes towards the channel. Erosion control measures would be laid at the entrance and exit of the culvert to reduce potential erosion. Erosion on the outside of the 90 degree bend would be controlled with soft erosion control measures to minimise erosion risk, due to increased flow rate through the culvert. Construction management plans shall include details of hydromorphological monitoring methodologies and responsibilities, with pre-agreement from NIEA and monitoring terminated as and when NIEA are satisfied.

WATERCOURSE BASELINE	Watercourse Name	UD_25
	Grid Ref / Chainage	241320 E 382997 N / 41550 m
	Watercourse Description and Geomorphology	This is a field drain which flows south east, north east and then south east to converge with Main watercourse, UD_26 at 241620E 382922N before then discharging to the River Strule at 241812E 382920N. A small, steep, 0.5-2 m wide watercourse that has incised 10-15 m into the slope down to bedrock, with a top width of 30-50 m. The predominantly bedrock bed and banks have a veneer of gravel and cobbles. The channel is characterised by bedrock steps with a step-pool topography. There is a large 4 m high waterfall downstream from the proposed crossing. The channel is well confined within its valley and there will be no lateral movement. Therefore, it should accommodate increased flow without increased erosion, however, there may be an increase in transportation and deposition.
	Watercourse Data	Upstream catchment: <0.1 km^2, Bed width: 1.0 m Channel Gradient: Not surveyed, Annual Mean Flow: 0.002 m^3/s, Q95 Low Flow: 0 m^3/s
	Ecology Features	Otter
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S2-WD-35 Pre-Earthworks Drainage (1)
	Component Description	Diversion: S2-WD-35 is a 275 m watercourse diversion which effectively brings the confluence with UD_26 upstream of the Proposed Scheme and removes the requirement for an additional culvert. The existing channel is relocated to flow south east to converge with UD_26 at 241450E 387770N. The length and gradient of the watercourse is similar to the existing channel. There is one pre-earthwork drainage outfall in this area, however, installation and operation of this component is not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.2.
	Potential Impacts on WFD Status	Integral good practice design measures applied for the diversion and outfall during construction shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location. Hydromorphological and biological sensitivities have been identified at this location, aligned with those for the adjacent channel, detailed on S2-WFDA-14.
	Further Mitigation (beyond Standard Good Practice Design Measures)	The drainage proposals in this area divert UD_25 into the nearby UD_26, leading to increased flows at the confluence of the channels and through the new downstream culvert. Mitigation could involve the creation of an upstream online pool in order to reduce flow velocity or other measures may be required to prevent sediment transport which could cause culvert blockage downstream. The specific method of mitigation will be determined following discussion with NIEA and other stakeholders. A specific pre-construction otter survey would be carried out at Beltany Lodge. If evidence of breeding activity, or the care of young, is found, no construction works would be carried out at these locations until the cubs have left the den.

WATERCOURSE BASELINE	Watercourse Name	UD_26
	Grid Ref / Chainage	241486 E 382793 N / 41850 m
	Watercourse Description and Geomorphology	UD_26 is a small watercourse which drains a network of field drains, flows north east to converge with UD_25 and then flows east to discharge to the River Strule at 241810E 382930N. A small, steep, 0.5-2 m wide watercourse that has incised 10-15 m into the slope down to bedrock, with a top width of 30-50 m. The predominantly bedrock bed and banks have a veneer of gravel and cobbles. The channel is characterised by bedrock steps with a step-pool topography. There is a large 4 m high waterfall downstream from the proposed crossing. The channel is well confined within its valley and there will be no lateral movement.
	Watercourse Data	Upstream catchment: 3.7 km^2, Bed width: 3 m Channel Gradient: Not surveyed, Annual Mean Flow: 0.112 m^3/s, Q95 Low Flow: 0.014 m^3/s
	Ecology Features	Otter
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S2-WD-09 Culvert: S2-PC-12 Outfalls: S2-OF-11 Pre-Earthworks Drainage (3)
	Component Description	
	Diversion: S2-WD-09 is a 99 m watercourse diversion which passes underneath the main carriageway towards the east, straightening the watercourse. It is joined to diversion S2-WD-35, which diverts the tributary channel UD_25. The length and gradient of the watercourse will remain similar to the existing channel. Culvert: S2-PC-12 is a 74 m long box culvert, 1.8 m high and 3.3 m wide, passing underneath the main carriageway. This represents 3% of the total watercourse length. Outfalls: S2-OF-11 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual discharge volume from the outfall represents less than 2% of the flow in the receiving watercourse. There are also three pre-earthworks drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.2.
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the diversion, culvert and outfalls during construction shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location. Hydromorphological sensitivities have been identified at this location, aligned with those for the adjacent S2-WFDA-13. Morphological conditions may be influenced in this area due to the installation of the culverted section, this culvert may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the River Strule downstream.
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	The drainage proposals in this area divert tributary UD_25 into UD_26 upstream of the existing confluence, leading to increased flows at the confluence of the channels and through the new downstream culvert. Mitigation could involve the creation of an upstream online pool in order to reduce flow velocity or other measures may be required to prevent sediment transport which could cause culvert blockage downstream. The specific method of mitigation will be determined following discussion with NIEA and other stakeholders. A specific pre-construction otter survey would be carried out at Beltany Lodge. If evidence of breeding activity, or the care of young, is found, no construction works would be carried out at these locations until the cubs have left the den.

WATERCOURSE BASELINE	Watercourse Name	UD_33
	Grid Ref / Chainage	241723 E 380869 N / 43750 m
	Watercourse Description and Geomorphology	UD_33 is a small watercourse which flows east to discharge to the River Strule at 241990E 380940N. UD_33 has similar characteristics to the nearby UD_34, this is a 1 m wide by 0.5-1.5 m deep, straight, ephemeral watercourse that has incised into a steep slope. It has formed a step-pool topography within till and there are deposits of cobble to boulder sized material that have been transported during high flows. There is no evidence of lateral movement, so erosion and entrainment of material is from the channel bed during high flows. This watercourse is deemed to be geomorphologically sensitive.
	Watercourse Data	Upstream catchment: 0.4 km^2, Bed width: 0.7 m Channel Gradient: Not surveyed, Annual Mean Flow: 0.011 m^3/s, Q95 Low Flow: 0.001 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S2-WD-37 Culvert: S2-PC-18 Outfalls: S2-OF-13 Pre-Earthworks Drainage (3)
	Component Description	
	Diversion: S2-WD-37 is approximately 200 m in length, passing under the main carriageway from west to east. The length of the watercourse will remain unchanged. Culvert: S2-PC-18 is a 55 m long box culvert, 1.5 m high and 1.5 wide, passing underneath the main carriageway. The culvert is approximately 3% of the total watercourse length. Outfalls: S2-OF-13 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual discharge volume from this outfall represents less than 8% of the flow in the receiving watercourse. There are also three pre-earthworks drainage outfalls in this area, however, installation and operation of this component is not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.2.	
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the diversion, culvert and outfalls during construction shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location. Morphological conditions may be influenced in this area due to the installation of the culverted section, this culvert may also impact locally upon benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the River Strule downstream.	
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	The diversion channel needs sufficient gradient to prevent deposition of material within the channel, avoiding blocking of the channel and enabling deposited material to become easily entrained in future floods. The diversion channel would be lined with erosion protection measures, to prevent erosion and lateral movement of the channel. Construction management plans shall include details of hydromorphological monitoring methodologies and responsibilities, with pre-agreement from NIEA and monitoring terminated as and when NIEA are satisfied. Should monitoring evidence demonstrate a requirement for further measures, specific techniques and locations shall be evaluated and again agreed with NIEA.

WATERCOURSE BASELINE	Watercourse Name	UD_34
	Grid Ref / Chainage	241770 E 380680 N / 43950 m
	Watercourse Description and Geomorphology	UD_34 is a small watercourse which flows east to discharge to the Strule River at 241980E 380800N. UD_34 has similar characteristics to the nearby UD_33, this is a 1 m wide by 0.5-1.5 m deep, straight, ephemeral watercourse that has incised into a steep slope. It has formed a step-pool topography within till and there are deposits of cobble to boulder sized material that have been transported during high flows. There is no evidence of lateral movement, so erosion and entrainment of material is from the channel bed during high flows. This watercourse is deemed to be geomorphologically sensitive.
	Watercourse Data	Upstream catchment: 0.1 km^2, Bed width: 0.5 m Channel Gradient: 1 in 9, Annual Mean Flow: 0.003 m^3/s, Q95 Low Flow: 0.000 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S2-WD-38 Culvert: S2-PC-19 Outfalls: S2-OF-35 Pre-Earthworks Drainage (3)
	Component Description	
	Diversion: S2-WD-38 is approximately 132 m in length, passing under the main carriageway from west to east. There will be no change to watercourse length. Culvert: S2-PC-19 is a 66 m long pipe culvert, 1.2 m in diameter, also passing underneath the main carriageway. The culvert is approximately 15% of the total watercourse length. Outfalls: S2-OF-35 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual discharge volume from this outfall represents approximately 24% of the flow in the receiving watercourse. There are also three pre-earthworks drainage outfalls in this area, however, installation and operation of this component is not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.2.	
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the diversion, culvert and outfalls during construction shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location. Morphological conditions may be influenced in this area due to the installation of the lengthy culverted section, this culvert may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the River Strule downstream. Hydromorphological sensitivity has been identified in this area, with mitigation measures detailed below.	
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	The diversion channel requires to be steep enough to prevent deposition of material within the channel, with any deposited material easily entrained and relocated downstream in future floods. The diversion channel should be wide enough that any deposited sediment does not block the channel and reduce channel capacity for conveying high flows. The diversion channel should be lined with erosion protection measures to prevent erosion and lateral movement of the channel. Construction management plans shall include details of hydromorphological monitoring methodologies and responsibilities, with pre-agreement from NIEA and monitoring terminated as and when NIEA are satisfied. Should monitoring evidence demonstrate a requirement for further measures, specific techniques and locations shall be evaluated and agreed with NIEA.

WATERCOURSE BASELINE	Watercourse Name	UD_36
	Grid Ref / Chainage	241889 E 380199 N / 44350 m
	Watercourse Description and Geomorphology	UD_36 is a minor watercourse which flows north east to converge with UD_35 at 241910E 380415N before discharging to the River Strule at 242036E 380611N.
	Watercourse Data	Upstream catchment: 0.2 km^2, Bed width: 0.9 m Channel Gradient: Not surveyed, Annual Mean Flow: 0.005 m^3/s, Q95 Low Flow: <0.01 m^3/s
	Ecology Features	Otter
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S2-WD-13 Culvert: S2-PC-20 Outfalls: S2-OF-39 Side Road Outfalls: S2 OFS KILLINURE ROAD 1, S2 OFS KILLINURE ROAD 2 Pre-Earthworks Drainage (2)

Component Description

Diversion: S2-WD-13 is a 262 m watercourse diversion which passes underneath the main carriageway and straightens the course of the channel, minimising the length of culvert required at this location. This may slightly increase the channel gradient.

Culvert: S2-PC-20 is an 89 m long box culvert, 1.5 m high and 1.8 m wide. This culvert is approximately 8% of the total watercourse length.

Outfalls: S2-OF-39 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual discharge volume from this outfall represents approximately 24% of the flow in the receiving watercourse. There are two side road outfalls and two pre-earthworks drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions.

Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.2.

Potential Impacts on WFD Status

Integral good practice design measures applied for the diversion, culvert and outfalls during construction shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location.

Phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of this element.

Morphological conditions may be influenced in this area due to the installation of the lengthy culverted section. However, this would not be considered to alter the categorisation, or overall status, for the River Strule downstream.

Further Mitigation (beyond Standard Good Practice Design Measures)

None

ID	WFD Assessment ID	Datasheet S2-WFDA-32
WATERCOURSE BASELINE	Watercourse Name	Fairy Water
	Grid Ref / Chainage	242775E 374962N / 50000 m
	Watercourse Description and Geomorphology	The Fairy Water (also known as Fairywater) drains several smaller tributaries and field drains, flowing approximately 10 km south east from its origin, to converge with the River Strule at 243200E 374920N. The Fairy Water is a classified WFD surface waterbody. The Fairy Water is a 10-15 m wide watercourse, with steep channel banks on both banks which are up to 2 m high. There is imperceptible flow due to the low gradient cutting across a wide, well vegetated alluvial floodplain. No evidence of erosion or deposition, but meandering suggests historic channel change. There are also 1.5 m high levees on both sides that are set back 5 m from the edge of the channel. Rip-rap erosion protection is present along the toe of the banks.
	Watercourse Data	Upstream catchment: 174 km^2, Bed width: 5 m Channel Gradient: Not Surveyed, Annual Mean Flow: 5.6 m^3/s, Q95 Low Flow: 0.48 m^3/s
	Ecology Features	Atlantic salmon
	Protected Areas (<1km)	Tully Bog SAC ASSI is drained by a tributary to the Fairy Water, with which it converges approximately 150 m upstream of S2-OF-41 and hence the Proposed Scheme does not impact upon the SAC ASSI site.
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Bridge: S2-B19 Outfalls: Mainline Drainage S2-OF-23, S2-OF-41 Pre-Earthworks Drainage (3)
	Component Description	
	Bridge: S2-B19 is a proposed 46 m steel, single span bridge, without in-channel support. Outfalls: S2-OF-23 and S2-OF-41 will both discharge mainline highway drainage to the Fairy Water on opposite banks but in close proximity to one another, runoff will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for these outfall locations are wet/retention ponds, note that the pond associated with S2-OF-41 is located approximately 650 m south of the Fairy Water. The combined annual discharge volume from these outfalls represents less than 0.04% of the flow in the receiving watercourse. There are also 3 pre-earthworks drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.2.	
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the bridge and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location. Phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of this element in future. Mitigation has been suggested to avoid morphological impacts occurring, although the watercourse at this location is considered of limited geomorphological sensitivity.	
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	The southern bank upstream of the bridge structure would be reinforced with geotextiles as far upstream as the water treatment works, to prevent erosion of the outside bend of the meander. This protection may take the form of sheet piling or rip-rap. Construction management plans shall include details of hydro-morphological monitoring methodologies and responsibilities, with pre-agreement from NIEA and monitoring terminated as and when NIEA are satisfied. Should monitoring evidence demonstrate a requirement for further measures, specific techniques and locations shall be evaluated and again agreed with NIEA. Temporary bridges during construction will be designed as clear span structures and to enable mammal passage.

WATERCOURSE BASELINE	Watercourse Name	UD_54
	Grid Ref / Chainage	243343 E 371508 N / 53700 m
	Watercourse description and geomorphology	UD_54 is a small watercourse which flows north east to discharge to Fireagh Lough Drain at 243480E 371550N. This is a tributary to the heavily modified section of the River Strule.
	Watercourse Data	Upstream catchment: 0.4 km^2, Bed width: 0.6 m Channel Gradient: Not surveyed, Annual Mean Flow: 0.007 m^3/s, Q95 Low Flow: 0.001 m^3/s
	Ecology Features	Otter
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S2-WD-26 Culverts: S2-PC-34, S2-PC-51 Pre-Earthworks Drainage (3)

Component Description

Diversion: S2-WD-26 comprises two pipe culverts passing underneath the main carriageway. Note the diverted channel is entirely within the culverted section of the watercourse. The length of the channel would be increased by approximately 20 m and therefore the gradient may be slightly reduced.

Culverts: S2-PC-34 is a 97 m long box culvert, 1.5 m high and 1.5 m wide, passing underneath the main carriageway from south to north. This immediately joins S2-PC-51, which is a 32 m long box culvert, 1.5 m high and 1.5 m wide, and flows south east below two side roads. The culvert lengths combined total 129 m and represent approximately 14% of the total watercourse length.

There are three pre-earthworks drainage outfalls in this area, however, installation and operation of these component are not expected to alter existing watercourse conditions.

Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.2.

Potential Impacts on WFD Status

Integral good practice design measures applied for the diversion, culverts and outfalls during construction shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location.

Morphological conditions, macrophytes and phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these in future.

Morphological conditions may be influenced in this area due to the installation of the multiple lengthy culverted sections, these culverts may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the River Strule downstream.

Further Mitigation (beyond Standard Good Practice Design Measures)

None

WATERCOURSE BASELINE	Watercourse Name	Fireagh Lough Drain
	Grid Ref / Chainage	243507E 371306N / 53850 m
	Watercourse Description and Geomorphology	This is a minor watercourse which flows north from Fireagh Lough to converge with an unnamed tributary of the Culmore Drain at 243510E 372530N, which then flows north east to converge with Culmore Drain at 243690E 372510N. It then flows north and then east, becoming Hunter's Crescent Stream and then drains into the River Strule, in the north west of Omagh. These are tributaries to the heavily modified classified section of the River Strule.
	Watercourse Data	Upstream catchment: 2.4 km^2, Bed width: 1.6 m Channel Gradient: 1 in 171, Annual Mean Flow: 0.05 m^3/s, Q95 Low Flow: 0.005 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S2-WD-27 Culverts: S2-PC-36, S2-PC-57 Outfalls: Mainline Drainage S2-OF-27, S2-OF-29 Side Road Drainage S2 OFS Brookmount Road, S2 OFS Clanabogan Road 1, S2 OFS Clanabogan Road 2 Pre-Earthworks Drainage (5)
	Component Description	
	Diversion: S2-WD-27 is a 271 m watercourse diversion, relocating the existing channel north from current location, adjacent to the A32. The channel then flows north east, perpendicular to the proposed carriageway, minimising the length of culvert required. This increases the watercourse length by approximately 26 m and may slightly reduce the channel gradient. Culverts: S2-PC-36 is a 102 m long box culvert, 2.1 m high and 3.0 m wide, and S2-PC-57 is an 18 m long box culvert, 2.1 m high and 3.0 m wide. They have an aggregated culvert length of 120 m and the separation between these culvert sections is 40 m. The aggregated culvert length represents approximately 3% of the Fireagh Lough Drain channel length, when measured from Fireagh Lough to the urban boundary of Omagh. Outfalls: S2-OF-27 and S2-OF-29 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for these outfall locations are wet/retention ponds. The combined annual discharge volume from these outfalls represents approximately 4% of the flow in the receiving watercourse. There are also 5 pre-earthworks drainage outfalls and 3 side-road drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.2.	
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the diversion, culverts and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location. Macrophytes and phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements in future. Morphological conditions may be influenced on this tributary due to the installation of the multiple lengthy culverted sections, these culverts may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the River Strule downstream.	
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	None

WATERCOURSE BASELINE	Watercourse Name	Drumragh River
	Grid Ref / Chainage	245297E 369435N / 56600 m
	Watercourse Description and Geomorphology	The Drumragh River drains several smaller tributaries / field drains, flowing approximately 10 km south east from its origin, to converge with the River Strule at 243200E 374920N. The Drumragh River is a classified WFD surface waterbody. The Drumragh River is a 10-15 m wide and 1-1.5 m deep natural watercourse with steep, sandy alluvial channel banks that are well vegetated with grass. The watercourse has a small floodplain between drumlins. The bed material comprises cobbles with a thin veneer of sand. There are no levees on either side of the channel.
	Watercourse Data	Upstream catchment: 308 km^2, Bed width: 16 m Channel Gradient: 1 in 359, Annual Mean Flow: 8.0 m^3/s, Q95 Low Flow: 0.65 m^3/s
	Ecology Features	Otter
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Bridge: S2-B28 Outfalls: Mainline Drainage S2-OF-30, S2-OF-31 Side Road Drainage S2 OFS Ballynahatty Road 1 Pre-Earthworks Drainage (3)
	Component Description	
	Bridge: S2-B28 is a proposed 34 m concrete beam and slab, single span bridge, without in-channel support. Outfalls: S2-OF-30 and S2-OF-31 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for these outfall locations are wet/retention ponds. The combined annual discharge volume from these outfalls represents less than 0.02% of the flow in the receiving watercourse. There are also 3 pre-earthworks drainage outfalls and a single side road drainage outfall in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.2.	
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the bridge and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydromorphology and chemical elements at this location. Hydromorphology and phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements in future. The failing chemical parameters would not be influenced by the Proposed Scheme.	
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	None

WATERCOURSE BASELINE	Watercourse Name	UD_42
	Grid Ref / Chainage	241809 E 377335 N / 47500 m
	Watercourse Description and Geomorphology	UD_40 and UD_41 meet to form UD_42. UD_42 is a minor watercourse which flows south before discharging to the Tully Drain at 242590E 375710N, which meets the River Strule at 243750E 375040N.
	Watercourse Data	Upstream catchment: 2 km^2, Bed width: 2.3 m Channel Gradient: 1 in 113, Annual Mean Flow: 0.005 m^3/s, Q95 Low Flow: <0.001 m^3/s
	Ecology Features	Otter
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversions: S2-WD-16, S2-WD-18 Culvert: S2-PC-47 Outfalls: Mainline Drainage S2-OF-19 Side Road Drainage S2 OFS Dunteige Road 1, S2 OFS Dunteige road 2 Pre-Earthworks Drainage (5)
	Component Description	
	Proposed Scheme interactions with UD_42 have been considered alongside tributary watercourses UD_40 and UD_41. Diversions: S2-WD-16 is a 156 m long diversion which relocates UD_40 east of the Proposed Scheme, to flow south east. S2-WD-18 is a 210 m long diversion that relocates UD_41 west of the Proposed Scheme, to flow south east and includes a new confluence with UD_40 at the downstream end of S2-WD-16. These diversions minimise the culvert length required below the new carriageway and embankments. The combined diversions lengthens the local channels by 13 m and will reduce the gradient. Culvert: S2-PC-47 is a 57 m long box culvert, 2.1 m high and 2.1 m wide. The culverted section represents approximately 1% of the total length of UD_41 / UD_42 from source to its confluence with the River Strule at 243749E 375047N. Outfalls: S2-OF-19 will discharge mainline highway drainage to UD_41 and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual discharge volume from this outfall represents approximately 4% of the flow in the receiving watercourse. There are also 5 pre-earthworks drainage outfalls and 2 side road drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.2. This location has been selected to provide a representative datasheet of a 'screened out' watercourse channel.	
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the diversions, culvert and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydromorphology and chemical elements at this location. Phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of this element. Morphological conditions may be influenced in this area due to the installation of the lengthy culverted section. However, this would not be considered to alter the categorisation, or overall status, for the River Strule downstream.	
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	None

ID	WFD Assessment ID	Datasheet S3-WFDA-05
WATERCOURSE BASELINE	Watercourse Name	Ranelly Drain (downstream)
	Grid Ref / Chainage	248752E 366278N / 65000 m
	Watercourse Description and Geomorphology	The Ranelly Drain is a minor watercourse collecting runoff from a network of drains, it flows north to discharge into the Camowen River at 248450E 369180N. These channels are heavily modified watercourses, acting as a network of field drains along field boundaries, with evidence of straightening and deepening to maximise drainage capacity.
	Watercourse Data	Upstream catchment: 5.8 km^2, Bed width: 2 m Channel Gradient: Not Surveyed, Annual Mean Flow: 0.12 m^3/s, Q95 Low Flow: 0.013 m^3/s
	Ecology Features	Atlantic salmon
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversions: S3-WD-05, S3-WD-46 Culverts: S3-PC-06, S3-PC-53, S3-PC-74, S3-PC-82 Outfalls: Mainline Drainage S3-OF-2, S3-OF-22 Side Road Drainage S3 OFS Drumconnelly Road 1, S3 OFS Drumconnelly Road 2, Pre-Earthworks Drainage (13)
	Component Description	
	The Proposed Scheme follows the general route and orientation of the Ranelly Drain for approximately 2.5 km. This network of meandering minor channels has a large number of Proposed Scheme component interactions and two WFD Assessment datasheets have been prepared to adequately evaluate this stretch. Diversions: S3-WD-05 is 158 m and S3-WD-46 is 310 m, with the aggregated diversion length in this area being 468 m. The combined diversion channels are approximately 50 m longer than the existing channels and hence channel gradient may slightly reduce. Culverts: 4 box culverts are proposed; S3-PC-06 is 80 m long, 2.7 m high and 3.0 m wide; S3-PC-53 is 57 m long, 2.7 m high and 3.3 m wide; S3-PC-74 is 41 m long, 2.7 m high and 3.3 m wide; and S3-PC-82 is 18 m long, 2.7 m high and 4.2 m wide. Their aggregated length is 196 m and the separation between S3-PC-06 and S3-PC-82 is over 500 m, with the aggregated culvert length representing approximately 6% of this stretch of the Ranelly Drain's channel length. Outfalls: S3-OF-2 and S3-OF-22 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the required standards via dry detention pond (S3-OF-2) and wet/retention pond (S3-OF-22). The combined annual discharge volume from these outfalls represents approximately 2% of the flow in the receiving watercourse. In this extensive area, there are also a total of 13 pre-earthworks drainage outfalls and 2 side-road drainage outfalls, these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.2.	
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the diversions, culverts and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for physico-chemical, hydrological regime and chemical elements at this location. Hydromorphology and phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements. Morphological conditions will be influenced on this tributary due to the installation of the multiple culverted sections, effecting fish and other biota. However, this would not be considered to alter the categorisation of individual elements or overall status.	
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	None

WATERCOURSE BASELINE	Watercourse Name	Ranelly Drain (upstream)
	Grid Ref / Chainage	248752E 366278N / 65900 m
	Watercourse Description and Geomorphology	The Ranelly Drain is a minor watercourse collecting runoff from a network of drains, which flows north to discharge into the Camowen River at 248450E 369180N. These channels are heavily modified watercourses, acting as a network of field drains along field boundaries, with evidence of straightening and deepening to maximise drainage capacity.
	Watercourse Data	Upstream catchment: 3.5 km^2, Bed width: 2.4 m Channel Gradient: Not Surveyed, Annual Mean Flow: 0.08 m^3/s, Q95 Low Flow: 0.007 m^3/s
	Ecology Features	Atlantic salmon
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversions: S3-WD-06, S3-WD-07, S3-WD-08, S3-WD-09, S3-WD-10 Culverts: S3-PC-07, S3-PC-08, S3-PC-10 Outfalls: Mainline Drainage S3-OF-3 Side Road Drainage S3 OFS TULLYRUSH ROAD LANE 1, S3 OFS TULLYRUSH ROAD LANE 2, Pre-Earthworks Drainage (7)

Component Description

The Proposed Scheme follows the general route and orientation of the Ranelly Drain for approximately 2.5 km. This network of meandering minor channels has a large number of Proposed Scheme components interactions and two WFD Assessment datasheets have been prepared to adequately evaluate this stretch.

Diversions: S3-WD-06 is 173 m, S3-WD-07 is 125 m, S3-WD-08 is 125 m, S3-WD-09 is 220 m and S3-WD-10 is 52 m in length. The aggregated diversion length in the area is 695 m. The diversion channels are approximately 30 m longer than the existing channels and hence channel gradient may slightly reduce.

Culverts: 3 box culverts are proposed; S3-PC-07 is 55 m in length, 2.7 m high and 5.1 m wide; S3-PC-08 is 69 m in length, 2.4 m high and 6.0 m wide; and S3-PC-10 is 70 m in length, 2.1 m high and 2.7 m wide, with an aggregated culvert length of 194 m. The separation between the culverts is 345 m and 170 m, respectively, with the aggregated culvert length representing approximately 8% of this stretch of the Ranelly Drain's channel length.

Outfalls: S3-OF-3 will discharge mainline highway drainage to a very small watercourse and will be treated sufficiently to pass the required standards via wet/retention pond. The annual discharge volume from this outfall represents approximately 32% of the flow into the very small receiving watercourse, upstream of the main Ranelly Drain. There are a total of 7 pre-earthworks drainage and 2 side-road drainage outfalls in this area, none expected to alter conditions.

Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.2.

Potential Impacts on WFD Status

Integral good practice design measures applied for the diversions, culverts and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for physico-chemical, hydrological regime and chemical elements at this location. Hydromorphology and phytobenthos are currently classified as of moderate status, the installation of components, following good practice, shall not impede improvements to the status of these elements in future.

Morphological conditions will be influenced on this tributary due to the installation of the multiple culverted sections, effecting fish and other biota. However, this would not be considered to alter the categorisation of individual elements or overall status.

Further Mitigation (beyond Standard Good Practice Design Measures)

None

ID	WFD Assessment ID	Datasheet S3-WFDA-11
WATERCOURSE BASELINE	Watercourse Name	Letfern
	Grid Ref / Chainage	250499E 364060N / 68570 m
	Watercourse Description and Geomorphology	Letfern is a minor watercourse that drains several tributaries / field drains and flows south west to converge with Seskinore (known upstream as Routing Burn) at 249500E 362490N. The watercourse is modified, with sections having artificial and straightened banks.
	Watercourse Data	Upstream catchment: 7.8 km^2, Bed width: 2.8 m Channel Gradient: Not Surveyed, Annual Mean Flow: 0.175 m^3/s, Q95 Low Flow: 0.018 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversions: S3-WD-12, S3-WD-48 Culverts: S3-PC-14, S3-PC-58 Outfalls: Mainline Drainage S3-OF-5 Side Road Drainage S3 OFS MOYLAGH ROAD 1 Pre-Earthworks Drainage (4)
	Component Description	
	Diversion: S3-WD-12 is 51 m in length and diverts the watercourse south of its existing route, south west of the main carriageway. This connects to diversion S3-WD-48, which is also 51 m in length and passes south west underneath a new side road before rejoining the watercourse. The diversion lengthens the watercourse by approximately 14 m and may therefore slightly reduce the gradient. Culvert: S3-PC-14 is a 96 m long box culvert, 2.1 m high and 3.6 m wide, passing below a side road and main carriageway. S3-PC-58 is a 25 m long box culvert, 2.1 m high and 3.6 m wide, and passes below a side road south of the proposed A5 carriageway, east of the existing watercourse. The culverted sections total 121 m and represents approximately 2% of the total channel length. Outfall: S3-OF-5 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment, Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual flows from the mainline outfall represents approximately 1% of the receiving watercourse flow. There is also 1 side road outfall and 4 pre-earthworks drainage outfalls in this area, however, the installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.3.
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the diversions, culverts and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location. Phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements in future. Morphological conditions will be influenced on this tributary due to the installation of the lengthy culverted sections. However, this would not be considered to alter the categorisation of individual elements, or overall status, for the Eskragh Water.
	Mitigation	
	None

ID	WFD Assessment ID	Datasheet S3-WFDA-18
WATERCOURSE BASELINE	Watercourse Name	Routing Burn
	Grid Ref / Chainage	252385E 361830N / 71650 m
	Watercourse Description and Geomorphology	The Routing Burn drains several smaller tributaries / field drains, flowing generally west until its convergence with Eskragh and Seskinore at 247330E 363420N. The Routing Burn is a classified WFD surface waterbody. The Routing Burn Extension is a 3-5 m wide channel that meanders through hummocky terrain on a moderate gradient. Both banks are well vegetated with trees, shrubs and grasses. The watercourse has a step-pool topography with steps <0.5 m high and pools varying in size. It has incised down to bedrock, with evidence of eddy scour holes, suggesting long-term stability of current channel position. Bedrock control prevents lateral movement of the watercourse and low rates of incision. There is evidence of deposition of material on the inside of meanders. Upstream, there is deposition of cobble-sized material within the channel and erosion of material on channel banks and bed in a lower gradient area, with a large pool and waterfall also upstream in a glacial meltwater channel. There is a large mid-channel bar downstream of this pool, which is bedrock confined, however, this contains large deposits that could be transported downstream.
	Watercourse Data	Upstream catchment: 19.6 km^2, Bed width: 5.0 m Channel Gradient: 1 in 50, Annual Mean Flow: 0.5 m^3/s, Q95 Low Flow: 0.07 m^3/s
	Ecology Features	Atlantic salmon, river/brook lamprey.
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Bridge: S3-B08.1 Outfalls: Mainline Drainage S3-OF-7 Side Road Drainage S3 OFS Routingburn Road Lane 1, S3 OFS Routingburn Road Lane 2 Pre-Earthworks Drainage (2)

Component Description

Bridge: S3-B08.1 is a proposed 31 m concrete beam and slab, single span bridge, without in-channel support.

Outfalls: S3-OF-7 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual discharge volume from this outfall represents less than 0.2% of the flow in the receiving watercourse. There are also 2 pre-earthworks drainage outfalls and 2 side road drainage outfalls in this area, however, installation and operation of these components are not expected to alter existing watercourse conditions.

Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.3.

Potential Impacts on WFD Status

Integral good practice design measures applied for the bridge and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location.

Phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements in future. Morphological conditions have been classified as of moderate status, however, this is because a full survey has not been completed.

Further Mitigation (beyond Standard Good Practice Design Measures)

A clear span bridge is currently proposed for this location. The northern bank upstream of the proposed bridging point would be protected with geotextiles to reduce the risk of erosion of the bridge.

Construction management plans shall include details of hydromorphological monitoring methodologies and responsibilities, with pre-agreement from NIEA and monitoring terminated as and when NIEA are satisfied. Should monitoring evidence demonstrate a requirement for further measures, specific techniques and locations shall be evaluated and again agreed with NIEA.

A specific pre-construction otter survey would be carried out. If evidence of breeding activity, or the care of young, is found, no construction works would be carried out at these locations until the cubs have left the den.

Translocation of lamprey ammocoetes to a nearby suitable habitat is required.

WATERCOURSE BASELINE	**WFD Assessment ID**	**Datasheet S3-WFDA-20**
	Watercourse Name	UD_69
	Grid Ref / Chainage	252791E 361258N / 72300 – 72350 m
	Watercourse Description and Geomorphology	UD_69 forms part of a network of drains that converge and flow generally north west to discharge to Routing Burn at 252030E 361350N. This is a very small, 0.5-1 m wide by 0.5-1 m deep, watercourse with steep well vegetated channel banks and a bed comprising sand to cobble-sized material, set within a narrow and boggy 30 m wide floodplain. Restricted within a narrow floodplain, there is limited potential for channel migration between the valley sides. The channel is sinuous within the confines of the floodplain, but is low gradient with very little flow. No major erosion evident and no evidence of bank overtopping and deposition outside of channel.
	Watercourse Data	Upstream catchment: 1.7 km^2, Bed width: 1.1 m Channel Gradient: 1 in 88, Annual Mean Flow: 0.038 m^3/s, Q95 Low Flow: 0.004 m^3/s
	Ecology Features	Otter
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S3-WD-21 Culvert: S3-PC-22 Outfalls: Mainline Drainage S3-OF-24 Pre-Earthworks Drainage (4)
	Component Description	
	Diversion: S3-WD-21 is a 223 m channel diversion which relocates the existing channel north and then west and enables a shorter perpendicular culverted section. The diversion will require a deep channel to be excavated to maintain level because the existing channel has incised up to 1 m into the floodplain. The diversion extends the channel length by approximately 40 m, slightly reducing the channel gradient. Culvert: S3-PC-22 is a 50 m long box culvert, 1.8 m high and 1.8 m wide, taking the watercourse below the A5 carriageway. This culverted section represents approximately 2% of the total watercourse length. Outfalls: S2-OF-24 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment (HAWRAT), Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual discharge volume from this outfall represents approximately 4% of the flow in this small receiving watercourse. There are also 4 pre-earthworks drainage outfalls, however, installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.3.
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the diversion, culvert and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location. Phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements in future. Morphological conditions have been classified as of moderate status, however, this is because a full survey has not been completed. Morphological conditions will be influenced on this tributary due to the installation of the lengthy culverted section. However, this would not be considered to alter the categorisation of this individual element, or overall status, for the Routing Burn.
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	The diversion would be carefully designed to maintain gradient and minimise deposition and erosion within the diverted channel. Consideration should be given to slight realignment of the diversion entrance to locate this upstream of the natural kink in the channel, as this is an area where natural deposition of material will occur that could instigate channel movement. Construction management plans shall include details of hydromorphological monitoring methodologies and responsibilities, with pre-agreement from NIEA and monitoring terminated as and when NIEA are satisfied. Should monitoring evidence demonstrate a requirement for further measures, specific techniques and locations shall be evaluated and agreed with NIEA.

Current Overall Status - 2013 Objectives 2015 / 2021 / 2027	Moderate (Confidence of Overall Status; Medium) Moderate / Good / Good
Local Management Area (LMA) Action Plan Summary	
Strule LMA – LMA-wide measures to improve agricultural and land management practices to improve chemical and biodiversity status, taking account of hydropower developments and to assess morphological structures and abstractions. Local measures required regarding organic pollution, elevated ammonia levels and assessment of forestry operations.	

WFD ASSESSMENT

	WFD Element	Current Status	Assessed Post Works Status	Proposed Scheme Influence on WFD Status
Biological	Fish			Not assessed, applying good practice design will not cause deterioration of status, nor prevent improvement
	Benthic Invertebrates	Good	Good	Applying good practice design will not cause deterioration of status, nor prevent improvement
	Macrophytes	Good	Good	Applying good practice design will not cause deterioration of status, nor prevent improvement
	Phytobenthos	Moderate	Moderate	Applying good practice design will not cause deterioration of status, nor prevent improvement
Physico-Chem	Ammonia	High	High	Not influenced by Proposed Scheme
	Biochemical Oxygen Demand	Good	Good	Not influenced by Proposed Scheme
	Dissolved Oxygen	High	High	Applying good practice design will not cause deterioration of status
	Soluble Reactive Phosphate	High	High	Not influenced by Proposed Scheme
	pH	High	High	Applying good practice design will not cause status deterioration
	Temperature	High	High	Not influenced by Proposed Scheme
Hydro-morph	Hydrological Regime	Moderate	Moderate	Applying good practice design will not cause deterioration of status, nor prevent improvement
	Morphological Conditions	Moderate	Moderate	Applying good practice design and mitigation as described will not cause deterioration of status, nor prevent improvement
Chem	Priority/Dangerous Substances	Pass	Pass	Applying good practice design will not cause deterioration of status, nor prevent improvement

WFD COMPLIANCE

WATERCOURSE BASELINE	Watercourse Name	UD_71
	Grid Ref / Chainage	253320E 359968N / 73800 m
	Watercourse Description and Geomorphology	UD_71 is a minor tributary of the Eskragh Water, it is a natural watercourse forming part of a network of drains that converge and discharge at two points along the Eskragh Water at 251950E 359070N and 252870E 358560N.
	Watercourse Data	Upstream catchment: 0.2 km^2, Bed width: 2.1 m Channel Gradient: Not Surveyed, Annual Mean Flow: 0.004 m^3/s, Q95 Low Flow: 0.001 m^3/s
	Ecology Features	None
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S3-WD-49 Culvert: S3-PC-23 Outfalls: Mainline Drainage S3-OF-8 Side Road Drainage S3 OFS Springhill Road Pre-Earthworks Drainage (2)

Component Description

Diversion: S3-WD-49 is a 184 m length watercourse diversion taking this minor channel in a north west direction, to relocate west of the planned carriageway and embankment. This avoids constructing the A5 Proposed Scheme on the existing watercourse channel, which would have necessitated a longer culverted section. This shortens the watercourse length by approximately 30 m and may slightly increase the gradient.

Culvert: S3-PC-23 is a 29 m long box culvert, 2.1 m high and 2.7 m wide, passing below an existing road, via the newly diverted channel. This culverted section represents less than 1% of the total channel length.

Outfall: S3-OF-8 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment, Environmental Quality Standards and a downstream 'in river' sediment standard of 25mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual flows from the mainline outfall represents approximately 17% of the receiving watercourse flow. There is also a side road outfall and 2 pre-earthworks drainage outfalls in this area, however, the installation and operation of these components are not expected to alter existing watercourse conditions.

Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.3.

Potential Impacts on WFD Status

Integral good practice design measures applied for the diversion, culvert and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location.

Phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements in future.

Further Mitigation (beyond Standard Good Practice Design Measures)

None

WATERCOURSE BASELINE	Watercourse Name	UD_110
	Grid Ref / Chainage	254849E 358628N / 75500 m
	Watercourse Description and Geomorphology	UD_110 is a small tributary that forms part of a network of drains in the upper reaches of the Eskragh Water catchment, flowing downstream via the Beltany Bog Drain and then flows west and north west to discharge to the Cormore River at 253040E 358490N. The Cormore River is a tributary of the Eskragh Water. This is a minor, 1-1.5 m wide 0.5 m deep, watercourse with channel banks composed of sandy alluvium overlying a sandy, gravely, cobbly glacial material that forms the bed. A low gradient stream confined by topography to the east of the existing road, and likely to have been anthropogenically positioned. The southern banks are poached by cattle and have exposed banks that could erode easily in high flows. Pasture on either side with wooded riparian zone. Higher banks on north side will prevent lateral erosion in that direction. No evidence of current erosion and deposition processes were observed.
	Watercourse Data	Upstream catchment: 2.8 km^2, Bed width: 1.5 m Channel Gradient: Not Surveyed, Annual Mean Flow: 0.067 m^3/s, Q95 Low Flow: 0.007 m^3/s
	Ecology Features	Otter
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversions: S3-WD-50, S3-WD-51 Culverts: S3-PC-54, S3-PC-60, S3-PC-72 Outfalls: Mainline Drainage S3-OF-9, S3-OF-10 Side Road Drainage S3 OFS TULLANFOILE ROAD, S3 OFS TULLANFOILE ROAD 2 Pre-Earthworks Drainage (7)
	Component Description	
	Diversion: S3-WD-50 is a 388 m length watercourse diversion taking this minor channel south and then west. Approximately 350 m downstream (to the north west) S3-WD-51 is a 478 m long diversion relocating the existing channel away from the base of the planned embankment. Diversion S3-WD-50 will lengthen the watercourse by approximately 110 m, reducing the channel gradient locally, diversion S3-WD-51 does not alter channel length or gradient. Culvert: S3-PC-54 is an 84 m long box culvert, 2.1 m high and 2.4 m wide, passing below the new A5 carriageway. Downstream, S3-PC-60 is a 13 m long box culvert, 2.1 m high and 2.4 m wide, passing under an adjacent new side road. Further downstream, beyond diversion S3-WD-51, culvert S3-PC-72 is 10 m in length, and 3.3 m high by 3.3 m wide, taking the watercourse below a new access road. The separation between the three culverts is 25 m and 1 km, respectively. The aggregated culvert length is 107 m, with this representing approximately 3% of the total channel length between source and becoming known as the Beltany Bog Drain. Outfalls: S3-OF-9 and S3-OF-10 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment, Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for these outfall locations are wet/retention ponds. The combined annual flows from the mainline outfalls represents approximately 4% of the receiving watercourse flow. There are also two side road outfalls and 7 pre-earthworks drainage outfalls in this area, these are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.3.	
	Potential Impacts on WFD Status	
	Integral good practice design measures applied for the diversions, culverts and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location. Phytobenthos are currently classified as of moderate status, the installation of Proposed Scheme components, following good practice, shall not impede improvements to the status of these elements in future. Morphological conditions will be influenced on this tributary due to the installation of the multiple culverted sections. However, this would not be considered to alter the categorisation of individual elements, or overall status, for the Eskragh Water.	
	Further Mitigation (beyond Standard Good Practice Design Measures)	
	None

WATERCOURSE BASELINE	Watercourse Name	UD_111
	Grid Ref / Chainage	255531E 357946N / 76800 m
	Watercourse Description and Geomorphology	UD_111 is a minor field drain which flows south east and joins the UD_78.3 at 256585E 357259N, before joining the Roughan Burn further downstream at 258680E 356301N. The Roughan Burn is named the Blackwater Tributary in the WFD classification.
	Watercourse Data	Upstream catchment: 0.28 km^2, Bed width: 1.0 m Channel Gradient: Not Surveyed, Annual Mean Flow: 0.007 m^3/s, Q95 Low Flow: 0.001 m^3/s
	Ecology Features	Otter
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S3-WD-53 Outfalls: Side Road Drainage S3 OFS TYCANNY ROAD 2 Pre-Earthworks Drainage (2)

Component Description

Diversion: S3-WD-53 diverts the watercourse south of its original course, running adjacent to the main carriageway and then joins UD_75. The diversion reduces the length of the watercourse by 22 m and may increase the gradient.

Outfalls: There is a side road outfall and 2 pre-earthworks drainage outfalls in this area, however, the installation and operation of these components are not expected to alter existing watercourse conditions.

Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.3.

Potential Impacts on WFD Status

Integral good practice design measures applied for the diversion and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location.

Morphological conditions are categorised by NIEA as of moderate status as a full survey has not yet been completed. The current status of benthic invertebrates are preventing reaching target level of overall good status.

Further Mitigation (beyond Standard Good Practice Design Measures)

None

	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversions: S3-WD-64, S3-WD-65 Culverts: S3-PC-33, S3-PC-59 Outfalls: Side Road Drainage S3 OFS GLENHOY ROAD 2, S3 OFS GLENHOY ROAD 3 Pre-Earthworks Drainage (8)

Component Description

Diversion: S3-WD-64 is 83 m long and diverts the watercourse west of the existing watercourse, below a new side road, where it rejoins the existing watercourse south of the Proposed Scheme, lengthening the watercourse approximately 11 m and may slightly reduce the gradient. S3-WD-65 flows south west underneath the main carriageway where it joins the existing channel south of the Proposed Scheme, shortening the watercourse by 8 m and may slightly increase the gradient.

Culverts: S3-PC-59 is a 42 m long pipe culvert, 1.8 m in diameter, and passes south below a new side road. S3-PC-33 is a 73 m long pipe culvert, 1.8 m in diameter, and passes south west under the main carriageway. The combined culvert length is 115 m and represents approximately 6% of the total length of the watercourse.

Outfalls: There are two side road outfalls and 8 pre-earthworks drainage outfalls in this area, however, the installation and operation of these components are not expected to alter existing watercourse conditions.

Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.3.

Potential Impacts on WFD Status

Integral good practice design measures applied for the diversions, culverts and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location.

Morphological conditions are categorised by NIEA as of moderate status as a full survey has not yet been completed. The current status of benthic invertebrates are preventing reaching target level of overall good status.

Morphological conditions will be influenced on this specific tributary due to the installation of the long culverted sections, these culverts may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the overall catchment, for the Blackwater Tributary.

Further Mitigation (beyond Standard Good Practice Design Measures)

None

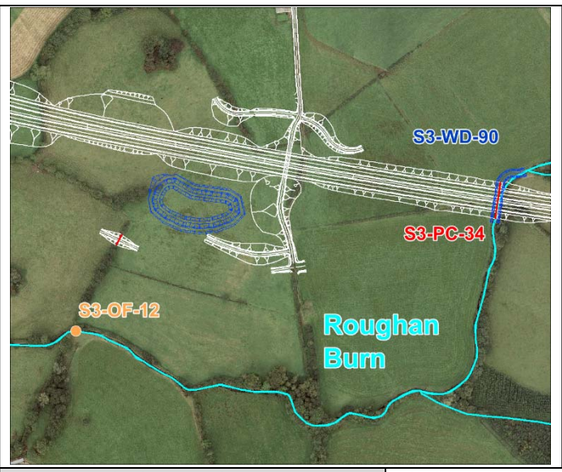
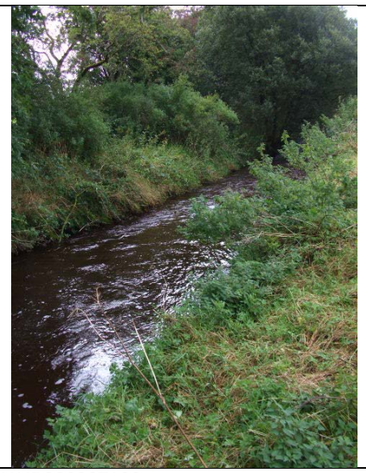
WATERCOURSE BASELINE	Watercourse Name	Roughan Burn
	Grid Ref / Chainage	259699E 356598N / 81350 m
	Watercourse Description and Geomorphology	The Roughan Burn (also known as the Roughan River) is a main tributary of the River Blackwater. This watercourse drains several smaller tributaries and field drains and flows south west and then south east to converge with the River Blackwater at 259800E 353920N. The Roughan Burn is named the Blackwater Tributary in the WFD classification. The watercourse is a 2-3 m wide, 0.5-1 m deep stream that flows through a flat, wide floodplain occupied by arable farming. The channel has migrated to the southern side of the floodplain where it lies against a steep slope. The material within the channel is predominantly gravel with some cobbles. At the point of the proposed crossing, the channel is straight, but downstream there is evidence of deposition of material in the channel and large boulders have been placed at the toe of the bank to prevent bank erosion.
	Watercourse Data	Upstream catchment: 11.6 km^2, Bed width: 3.4 m Channel Gradient: 1 in 215, Annual Mean Flow: 0.26 m^3/s, Q95 Low Flow: 0.03 m^3/s
	Ecology Features	Atlantic salmon, otter, river/brook lamprey.
	Protected Areas (<1km)	None
	Abstractions (<1km)	None
PROPOSED SCHEME INFORMATION	Component Type & ID	Diversion: S3-WD-90 Culvert: S3-PC-34 Outfalls: Mainline Outfall S3-OF-12 Side Road Drainage S3 OFS SESS ROAD LANE 1, S3 OFS SESS ROAD LANE 2 Pre-Earthworks Drainage (5)
	Component Description	Diversion: S3-WD-90 is 78 m in length and diverts the watercourse west of its existing route, passing south underneath the main carriageway. The diversion extends the length of the watercourse by 10 m and may slightly reduce the gradient. Culvert: S3-PC-34 is a 41 m long box culvert 2.7 m high and 5.7 m wide, transferring the watercourse below the proposed route. This culverted section represents approximately 0.5% of the Roughan Burn watercourse length, from source to confluence with the River Blackwater. Outfalls: S3-OF-12 will discharge mainline highway drainage to the watercourse and will be treated sufficiently to pass the Highways Agency Water Risk Assessment, Environmental Quality Standards and a downstream 'in river' sediment standard of 25 mg/l. Treatment planned for this outfall location is a wet/retention pond. The annual flow from the mainline outfall represents approximately 1% of the receiving watercourse flow. There are 2 side road outfalls and 5 pre-earthworks drainage outfalls in this area, however, the installation and operation of these components are not expected to alter existing watercourse conditions. Other watercourses within this Local Management Area and WFD Catchment which have interactions with the Proposed Scheme components are detailed on WFD Assessment Summary Table 16D.1 and displayed on Figure 16D.3.
	Potential Impacts on WFD Status	Integral good practice design measures applied for the culvert and outfalls during construction and operational phases shall avoid significant impact upon WFD classifications for biological, physico-chemical, hydrological regime and chemical elements at this location. Morphological conditions are categorised by NIEA as of moderate status as a full survey has not yet been completed. The current status of benthic invertebrates are preventing reaching target level of overall good status. Morphological conditions will be influenced on this specific tributary due to the installation of the long culverted section, this culvert may also impact locally upon fish, benthic invertebrates and phytobenthos. However, this would not be considered to alter the categorisation of these elements, or overall status, for the overall catchment, for the Blackwater Tributary.
	Further Mitigation (beyond Standard Good Practice Design Measures)	The channel has demonstrated historic instability, so erosion control measures would be required upstream and downstream of the crossing. Construction management plans shall include details of hydromorphological monitoring methodologies and responsibilities, with pre-agreement from NIEA and monitoring terminated as and when NIEA are satisfied. Should monitoring evidence demonstrate a requirement for further measures, specific techniques and locations shall be evaluated and again agreed with NIEA. Translocation of lamprey ammocoetes to a nearby suitable habitat is required.

SITE PHOTOGRAPHY





WFD BASELINE

WFD Waterbody Name / ID	Blackwater Tributary / UKGBNI1NB030307180
Current Overall Status - 2013 Objectives 2015 / 2021 / 2027	Poor (Confidence of Overall Status; Low) Moderate / Good / Good
Local Management Area (LMA) Action Plan Summary	
River Blackwater LMA – LMA-wide measures to improve land management practices to improve status and take account of River's Agency maintenance programme, hydropower developments, abstractions and assessment of morphological structures. Local measures to improve water quality by assessing forestry operations, investigating aquatic invertebrate suppression and liaising with angling club.	

WFD ASSESSMENT

WFD Element		Current Status	Assessed Post Works Status	Proposed Scheme Influence on WFD Status
Biological	Benthic Invertebrates	Poor	Poor	Applying good practice design will not cause deterioration of status, nor prevent improvement
	Macrophytes	Good	Good	Applying good practice design will not cause deterioration of status, nor prevent improvement
	Phytobenthos			Not assessed, applying good practice design will not cause deterioration of status, nor prevent improvement
Physico-Chem	Ammonia	High	High	Not influenced by Proposed Scheme
	Biochemical Oxygen Demand	High	High	Not influenced by Proposed Scheme
	Dissolved Oxygen	High	High	Applying good practice design will not cause deterioration of status
	Soluble Reactive Phosphate	Good	Good	Not influenced by Proposed Scheme
	pH	High	High	Applying good practice design will not cause deterioration of status
	Temperature	High	High	Not influenced by Proposed Scheme
Hydro-morph	Hydrological Regime	High	High	Applying good practice design will not cause deterioration of status
	Morphological Conditions	Moderate	Moderate	Applying good practice design and mitigation, as described, will not cause deterioration of status, nor prevent improvement
Chem	Copper and Zinc	Pass	Pass	Applying good practice design will not cause deterioration of status

WFD COMPLIANCE

Does the Proposed Scheme comply with WFD Objectives 1, 2, 3 and 4? No - No, do not proceed or complete Article 4.7 Assessment Yes (J) – Yes, with justification provided within integral environmental management good practice Yes (M) – Yes, with specific mitigation details provided on this datasheet	WFD Obj 1?	Yes (M)
	WFD Obj 2?	Yes (M)
	WFD Obj 3?	Yes (M)
	WFD Obj 4?	Yes (M)

APPENDIX 16E RESULTS AND CALCULATIONS

Surface Water

Outfalls - HAWRAT & EQS Assessment Results

The A5WTC Proposed Scheme involves a total of 91 road drainage network outfalls. Each outfall has been individually assessed using the methodology detailed in Appendix 16B. A summary datasheet has been produced for each outfall, which includes details on the baseline conditions of the receiving watercourse, proposed mitigation and summary results of each water quality assessment carried out. The datasheets also include the final assessment of impact significance. These output datasheets are presented in Annex 16E at the rear of this document, identified by outfall identifier.

The result of each outfall's water quality assessment are summarised in the following sections.

Assessment of Pollution Impacts from Routine Runoff to Surface Waters

The results of the HAWRAT and EQS assessments, after mitigation, are summarised in Table 16E.1.

Outfall discharges directly to SAC designated watercourse

© Mouchel 2016

A.16E-8

Outfall discharges upstream of SAC designated watercourse(s)

After mitigation, all 91 individual outfalls pass the HAWRAT assessment, pass EQS assessment and meet downstream 25mg/l 'in river' sediment requirements.

Cumulative HAWRAT and EQS Assessments

Cumulative HAWRAT and EQS assessments have been carried out for 21 outfalls located on the same reach of a watercourse. The full results sheets for the assessments are shown on Table 16E.2.

Outfall discharges directly to SAC designated watercourse

Outfall discharges upstream of SAC designated watercourse(s)

© Mouchel 2016

A.16E-12

After mitigation, all 21 cumulative outfall networks pass the HAWRAT assessment, pass EQS assessment and meet downstream 25mg/l ‘in river’ sediment requirements.

© Mouchel 2016

A.16E-13

Sediment Load to Transitional Waterbodies

Using the calculations provided in Appendix 16B, the annual sediment volume for each of the tidal outfalls can be estimated as shown on Table 16E.3.

Table 16E.3 Annual Sediment Volume for Each of the Tidal Outfalls

Outfall ID	SAAR (mm)	Road Catchment (m^2)	Annual Runoff (m^3)	Annual Sediment Volume (m^3)
S1 OF 01.1	1303	3,362	4,381	0.304
S1 OF 02.1a	1303	8,423	10,975	0.763
S1 OF 02.1b	1303	3,408	4,441	0.309
S1 OF 25	1303	23,195	30,223	2.1
Cumulative OF 01.1 to OF 25	1303	38,388	50,020	3.476
S1 OF 36	1346	21,496	28,934	2.011
S1 OF 37	1346	6,587	8,866	0.616
S1 OF 41	1346	10,988	14,790	1.028
S1 OF 22.2	1346	27,981	37,662	2.618
Cumulative OF 36 to OF 22.2	1346	67,052	90,252	6.273

The volume of sediment released from each of these outfalls each year is very small, approximately equivalent to a small bank collapse due to natural erosion. It should also be noted that these calculations are conservative as they do not account for the effect of mitigation measures incorporated into the road drainage system to remove sediment pre-outfall. The mitigation method employed will capture a proportion of the sediment generated within the road catchment, often via wet/retention pond systems, which are anticipated to remove approximately 60% of sediment load and would hence reduce the sediment volume value by the equivalent proportion.

To provide context, comparison can be made with the annual sediment input from the road drainage outfalls and the annual average sediment input to the rivers from natural processes. NIEA have carried out water quality monitoring on the Mourne River, Finn River, Glenmornan and Burn Dennet for a number of years. Based on this data the Finn River has an average natural suspended solids load of 7.0 mg/l. Although the River Foyle has not been monitored for suspended solids an estimate of the likely suspended solids load can be made by taking a weighted average of the suspended solids load in its main tributaries. In this way the average suspended solids load of the River Foyle has been estimated as 6.5 mg/l. Using the equations in Appendix 16B the annual average natural sediment volume in the rivers can therefore be calculated as per Table 16E.4.

© Mouchel 2016

Table 16E.4 Annual Average Natural Sediment Volume in Rivers

River	SAAR (mm)	River Catchment (km^2)	Annual River Runoff (m^3)	Annual Sediment Volume (m^3)
Foyle	1303	1,852	1,500,120,000	7,634
Finn	1346	497	423,770,400	1,483

Table 16E.4 shows that there are substantial natural volumes of suspended solids passing down the River Foyle and the Finn River every year. Comparison of the sediment loads with those derived for the relevant road drainage outfalls are indicated in Table 16E.5.

Table 16E.5 Comparison of Road Drainage Outfalls Sediment Volume with River Sediment Volume.

Outfall ID	Annual Road Drainage Sediment Volume (m3)	Annual Natural River Sediment Volume (m3)	% Road Sediment Contribution
S1 OF 01.1 (Foyle)	0.304	7,634	0.004
S1 OF 02.1a (Foyle)	0.763	7,634	0.010
S1 OF 2.1b (Foyle)	0.309	7,634	0.004
S1 OF 25 (Foyle)	2.1	7,634	0.028
Cumulative OF 01.1 to OF 25 (Foyle)	3.476	7,634	0.046
S1 OF 36 (Finn)	2.011	1,483	0.136
S1 OF 37 (Finn)	0.616	1,483	0.042
S1 OF 41 (Finn)	1.028	1,483	0.069
S1 OF 22.2 (Finn)	2.618	1,483	0.177
Cumulative OF 36 to OF 22.2 (Finn)	6.273	1,483	0.423

As can be seen the contribution of the road runoff sediments is a very small percentage of sediments naturally present in the river. Taking the above calculations and the planned sediment treatment measures into account (representing approximately 60% sediment removal from the calculated values), it is not considered necessary to carry out further assessment of the impact from sediment-bound pollutants from outfalls discharging to transitional waters.

Assessment of Pollution Impacts from Accidental Spillages

The accidental spillage assessment has been carried out alongside HAWRAT, the output datasheets presented in Annex 16E show accidental spillage inputs and outcomes for each drainage network, identified by discharge outfall identifier.

© Mouchel 2016

The assessment of pollution impacts from accidental spillages found that for the most probable individual outfall (i.e. worst case), the annual probability of a serious pollution incident, before mitigation, was a 1 in 1,100 year return period (i.e. 0.1%) at drainage network S3-OF-13. This value is well within the threshold recommended within the DMRB guidance of 1% for standard receiving watercourses and 0.5% for sensitive watercourses.

Impacts on Surface Water Abstractions

Following assessment of public and private surface water abstraction locations provided by NIEA, a small number of abstraction locations were identified located downstream of the Proposed Scheme corridor, these locations are identified in Appendix 16C and shown on Figures 16.2-16.18 and 16.19.

Impacts associated with changes in surface water flow characteristics

Details on Proposed Scheme interactions with surface flow characteristics and fluvial geomorphology are specifically discussed in Appendices 16D and 16F.

Flood Risk

Table 16E.6 summarises the potential impacts upon the various floodplains throughout the Proposed Scheme. This assessment was undertaken using the approach described in Appendix 16B (Tables 16B.12 and 16B.14) and is based on Tables A4.4 and A4.6 taken from the DMRB Volume 11, Section 3, Part 10 Annex IV.

Detail on the flood risk assessment rationale/scoring and further information can be seen in Flood Risk Assessment Report 3 – Impact and Mitigation Assessment Report.

A.16E-19

Groundwater

Pollution from Routine Runoff to Groundwater

All outfalls for the Proposed Scheme have been designed to discharge to surface waters, in the vast majority of networks via wet/detention pond systems. The surface water treatment is designed to remove soluble pollutants such as metals via sediment settling and uptake in plant material. However, as surface water and groundwater are hydrologically connected there is the potential for small volumes of runoff to infiltrate to groundwater and a Method C Assessment has been undertaken in accordance with DMRB.

The results of this assessment are presented in Table 16E.7, using the methodology described in Appendix 16B. It should be noted that in scoring the individual groundwater risk parameters the following notation is used: a score of 1 represents a low risk parameter, 2 is a medium risk and 3 a high risk parameter. Each parameter score is then multiplied by the weighting factor at the top of the column and then summed to give an overall risk classification for the outfall.

Assuming that the ponds and wetlands are designed and constructed to best practice standards and are appropriately maintained throughout their operational lifetime, these have been conservatively allocated a low risk category for soakaway geometry, recognising that some groundwater interaction may inadvertently occur but the infiltrating water is expected to be adequately treated prior to entering the groundwater such that there is low risk of pollution. There are a small minority of drainage networks treated via grassed surface water channels, these are also designed as surface water features and also accorded a low risk category for soakaway geometry.

Pond locations have been used as the assessment location position where these are planned. Where linear drainage systems are planned, a representative location within the network was chosen. Risk level for all drainage networks is medium, thus these locations require pre-construction ground investigation to ensure groundwater interaction is limited, such as by investigating local soil conditions and, as appropriate, applying lining materials to minimise infiltration pathways.

© Mouchel 2016

Accidental spillage was assessed for surface water, this established that there was a low risk (1 in 1100 at most likely location), consequently the risk of accidental spillage impacting upon groundwater would be considered as lower still.

© Mouchel 2016

Impacts to Groundwater Levels and Flows

The increased impermeable surface area associated with the construction from a new dual carriageway will permanently reduce infiltration to groundwater. To establish the potential impact of this issue on each groundwater body a calculation has been undertaken using the approximate surface area of each groundwater body against the planned new impermeable area. The results are provided in Table 16E.8. The outcomes are very small values, which are likely to be imperceptible across the scale of the respective groundwater bodies.

Table 16E.8 Impermeable Area of Scheme Overlying Groundwater Bodies

WFD Groundwater Body Name (ID)	Approximate surface area of Groundwater Body (m^2)	Increased Impermeable Surface Area (m^2)	% Increase in Impermeable Surface Area in Groundwater Body

Road Cuttings

Where road cuttings penetrate into or close to the water table this can lead to permanent change to local groundwater levels and flow patterns, effecting local receptors. Note that groundwater levels may change seasonally and hence the depth to the water table will alter, typically being shallower in wetter periods.

The impact of the proposed road cuttings on groundwater has been assessed using the methodology and criteria detailed in Appendix 16B. The results of the assessment are summarised by approximate chainage (including side road cuttings running perpendicular to the Proposed Scheme route) and presented in Table 16E.9.

Cutting locations for which there was not sufficient information to assess the pre-mitigation significance of the impact, have been shown as 'Unknown', such cuttings have been evaluated as either reasonably likely or unlikely to have an impact on the local groundwater conditions.

The creation of cuttings may have an adverse impact on local water resources and the estimated significance of that impact is presented in Table 16E.10, where 12 moderate impact and 46 slight impact locations have been identified, prior to the application of standard good practice and location-specific groundwater mitigation measures.

Total	**18**	**3**	**9**	**9**	**64**	**31**	**134**

In addition to intercepting the groundwater and effects on local aquifers, cuttings were assessed for impacts on nearby receptors that may be interacting with groundwater; surface water, contaminated land and/or quarries. As shown on Table 16E.11, this assessment identified 59 locations as having potential effects, with 8 cuttings potentially effecting multiple receptors. The risk to such features was qualitatively rated on the basis of the estimated radius of influence (groundwater drawdown radius) compared to the distance of the receptor from the cutting. The breakdown of risk by groundwater body is shown in Table 16E.11. Of these, 7 cuttings were identified with a moderate risk of causing an effect and 1 with a high risk of causing an effect:

- Claudy WFD Groundwater Body:
  - Cutting at approximate chainage 6500-7320 – moderate risk of causing effect to a small stretch of a minor watercourse / spring and to a backfilled quarry;
- Balleybofey WFD Groundwater Body:
  - Cutting at approximate chainage 19550-20880 – high risk of causing effect to Finn River / minor tributary watercourse and to Strabane Quarry (flooded former quarry);
- Gortin WFD Groundwater Body:
  - Cutting at approximate chainage 32900 – moderate risk of causing effect to an operational sand and gravel pit;
- Castlederg WFD Groundwater Body:
  - Cutting at approximate chainage 33025-33725 – moderate risk of causing effect to an operational sand and gravel pit;
  - Cutting at approximate chainage 33725-33850 – moderate risk of causing effect to a small wetland area and an operational sand and gravel pit;
- Omagh WFD Groundwater Body:
  - Cutting at approximate chainage 46500-47250 – moderate risk of causing effect to a minor tributary / small wetland / area of open water;
  - Cutting at approximate chainage 73350-73765 – moderate risk of causing effect to a storage pond;
  - Cutting at approximate chainage 73770 – moderate risk of causing effect to a storage pond.

Impacts to Groundwater Abstractions

Abstraction survey data was used to establish the number of groundwater abstractions (wells and springs) which lie within vesting area of the Proposed Scheme and will require to be decommissioned. It also identified the abstractions which lie outside the vesting area but which installation of cuttings or other engineering activities may adversely effect.

The total number of wells or spring abstractions which were initially identified in the route corridor (from NIEA data search) was 219, of which 47 were considered not at risk of impact due to relative distance and local characteristics and not considered further.

The resultant number of groundwater supplies potentially affected by the Proposed Scheme is 172, of which 103 were confirmed as in use. Details are presented in Table 16E.12.

Table 16E.12 Summary of Impacts on Groundwater Abstractions

WFD Groundwater Body	Within Vested Area		Outside vested area but potentially affected by road cuttings		Outside vested area (within 50 m) but potentially affected during construction phase.	
	Wells	Springs	Wells	Springs	Wells	Springs
Claudy	2 (2 in use)	2 (0 in use)	12 (9 in use)	5 (2 in use)	0	0
Ballybofey	2 (1 in use)	0 (0 in use)	2 (1 in use)	2 (0 in use)	0	0
Gortin	3 (3 in use)	2 (2 in use)	19 (11 in use)	2 (1 in use)	0	0
Castlederg	0 (0 in use)	0 (0 in use)	4 (3 in use)	3 (3 in use)	0	0
Omagh	17 (8 in use)	11 (5 in use)	32 (20 in use)	11 (5 in use)	2 (2 in use)	0
Aughnacloy	3 (1 in use)	5 (2 in use)	21 (17 in use)	7 (2 in use)	3 (3 in use)	0
Combined Scheme	**27 (15 in use)**	**20 (9 in use)**	**90 (61 in use)**	**30 (13 in use)**	**5 (5 in use)**	**0**

24 active wells or springs within the proposed construction site area are assessed as being decommissioned at the construction stage, although some of these may be retained with agreement from TransportNI. A further 79 active well or spring abstractions are potentially affected, predominantly by road cuttings and their impacts on groundwater levels. Groundwater abstractions are shown on Figures 16.2-16.18, with the 24 supplies within the vested area and in use shown on Figure 16.20.

Date of assessment	23/09/2014	Version of assessment		V7.3	
Notes	River width taken from available GIS aerial photography. River width greater than 500m. Flow conditions data taken from River Mourne at Strabane. Sediment not assessed.				

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 6.411 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 1.5193 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.406 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1 — Estimated river width (m): 499

Tier 2 — Bed width (m): 3 | Manning's n: 0.07 | Side slope (m/m): 0.5 | Long slope (m/m): 0.0001

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)		Attenuation for solubles - restricted discharge rate (l/s)		Settlement of sediments (%)	
Existing measures		0	0	Unlimited	0	0	0
Proposed measures	3 x Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40		Unlimited	0	0

Date of assessment	23/09/2014	Version of assessment		V7.3	
Notes	River width taken from available GIS aerial photography. River width greater than 500m. Flow conditions data taken from River Mourne at Strabane. Sediment not assessed.				

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 6.411 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 1.5193 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.406 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1 — Estimated river width (m): 499

Tier 2 — Bed width (m): 3 | Manning's n: 0.07 | Side slope (m/m): 0.5 | Long slope (m/m): 0.0001

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)		Attenuation for solubles - restricted discharge rate (l/s)		Settlement of sediments (%)	
Existing measures		0	0	Unlimited	0	0	0
Proposed measures	3 x Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40		Unlimited	0	0

Notes	Combination treatment (S1-OF-38) Swales/ Grassed Channels & Wet/Retention Pond. (S1-OF-23.1) Single Wet/ Retention Pond.				

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.001 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 3.6325 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.411 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

- ○ Tier 1 — Estimated river width (m): 5.42
- ◉ Tier 2 — Bed width (m): 3 | Manning's n: 0.08 | Side slope (m/m): 0.91 | Long slope (m/m): 0.001

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	2 x Wet/Retention Pond & Swales/Grassed Channels (Cu 50%, Zn 42%, Sed 71%)	50	Unlimited	71

Step 3	0.16	0.48	ug/l

Copper: Pass

Zinc: Pass

Sediment - Chronic Impact

Sediment deposition for this site is judged as:

Accumulating? Low flow Vel m/s

Extensive? Deposition Index

Location Details

Road number	A5WTC		HA Area / DBFO number		
Assessment type	Cumulative assessment excluding sediments (outfalls between 100m and 1km apart)				
OS grid reference of assessment point (m)	Easting	267366		Northing	351874
OS grid reference of outfall structure (m)	Easting	267366		Northing	351874
Outfall number	Lisadavil Outfalls (S3-OF-19 Lowest)		List of outfalls in cumulative assessment	S3-OF-18	S3-OF-19
Receiving watercourse	Lisadavil				
EA receiving water Detailed River Network ID	WFD ID: UKGBNI1NB030307041		Assessor and affiliation		LN Mouchel
Date of assessment	29/09/2014		Version of assessment		V7.3
Notes	Sediment Not Assessed				

Step 1 Runoff Quality

AADT: >10,000 and <50,000

Climatic region: Colder Wet

Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.014 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 3.4568

Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.389

Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: High = >200mg CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge?

Tier 1 Estimated river width (m)

Tier 2 Bed width (m) — Manning's n — Side slope (m/m) — Long slope (m/m)

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)		Attenuation for solubles - restricted discharge rate (l/s)		Settlement of sediments (%)	
Existing measures		0		Unlimited			
Proposed measures	Wet/Retention Ponds (Cu 40%, Zn 30%, Sed 60%)	30		Unlimited

Highways Agency Water Risk Assessment Tool version 1.0 November 2009

Soluble - Acute Impact: Annual Average Concentration	Copper	Zinc	
Step 2	0.00	0.00	ug/l
Step 3	0.00	0.00	ug/l

Soluble - Acute Impact: Copper: Pass; Zinc: Pass

Sediment - Chronic Impact: Pass

Sediment deposition for this site is judged as:

Accumulating?	Yes	0.00	Low flow Vel m/s
Extensive?	No	0	Deposition Index

Location Details

Road number	A5WTC		HA Area / DBFO number		
Assessment type	Non-cumulative assessment (single outfall)				
OS grid reference of assessment point (m)	Easting	240659		Northing	412552
OS grid reference of outfall structure (m)	Easting	240659		Northing	412552
Outfall number	S1-OF-2.1b		List of outfalls in cumulative assessment		
Receiving watercourse	River Foyle				
EA receiving water Detailed River Network ID	WFD ID: UKGBNI5NW250010		Assessor and affiliation		LN Mouchel
Date of assessment	23/09/2014		Version of assessment		V7.3
Notes	River width taken from available GIS aerial photography. River width greater than 500m. Flow conditions data taken from River Mourne at Strabane.				

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 6.411 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 0.3408 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.406 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1 — Estimated river width (m): 499

Tier 2 — Bed width (m): 3 | Manning's n: 0.045 | Side slope (m/m): 1.33 | Long slope (m/m): 0.0114

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.005 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 2.7928 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.415 | Is the discharge in or within 1 km upstream of a protected site for conservation?: Yes

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge?: No

- Tier 1 — Estimated river width (m): 2.87
- Tier 2 — Bed width (m): 1.7 | Manning's n: 0.045 | Side slope (m/m): 2.36 | Long slope (m/m): 0.0118

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.009 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 2.3423 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.542 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only

Water hardness: High = >200mg CaCO3/l

For sediment impact only

Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1 / Tier 2

Estimated river width (m): 6

Bed width (m): 3 | Manning's n: 0.045 | Side slope (m/m): 0.67 | Long slope (m/m): 0.0033

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s)	0.765	(Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)	
Impermeable road area drained (ha)	0.7499	Permeable area draining to outfall (ha)	0
Base Flow Index (BFI)	0.485	Is the discharge in or within 1 km upstream of a protected site for conservation?	No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

(•) Tier 1	Estimated river width (m)	14.81					
( ) Tier 2	Bed width (m)	11.4	Manning's n	0.035	Side slope (m/m)	1.13	Long slope (m/m)	0.001

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.001 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 2.4526 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.591 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

- Tier 1 — Estimated river width (m): 1.8
- Tier 2 — Bed width (m): 1 | Manning's n: 0.08 | Side slope (m/m): 2.7 | Long slope (m/m): 0.001

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Swales/ Grassed Channels & Wet/Retention Pond (Cu 70%, Zn 65%, Sed 92%)	70	Unlimited	92

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.005 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 1.417 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.613 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only

Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only

Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1 Estimated river width (m): 4.16

Tier 2 Bed width (m): 2.8 | Manning's n: 0.07 | Side slope (m/m): 1.6 | Long slope (m/m): 0.0004

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Justification for choice of existing measures factors:

Additional road types result in actual value of 1 in 3857 return period.

Justification for choice of proposed measures factors:

Note – HAWRAT enables data entry of 6 assessment elements (columns A-F), at this network there are over 6 elements and the actual risk is shown in Justification note.

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.005 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 1.5533 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.613 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

- Tier 1 — Estimated river width (m): 6.39
- Tier 2 — Bed width (m): 2.5 | Manning's n: 0.07 | Side slope (m/m): 0.93 | Long slope (m/m): 0.007

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s)	0.001	(Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)	
Impermeable road area drained (ha)	0.471	Permeable area draining to outfall (ha)	0
Base Flow Index (BFI)	0.609	Is the discharge in or within 1 km upstream of a protected site for conservation?	No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

○ Tier 1	Estimated river width (m)	4					
◉ Tier 2	Bed width (m)	1.9	Manning's n	0.027	Side slope (m/m)	1.52	Long slope (m/m)	0.0018

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.001 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 2.4428

Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.586

Is the discharge in or within 1 km upstream of a protected site for conservation? Yes

For dissolved zinc only

Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only

Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1 Estimated river width (m): 5.71

Tier 2 Bed width (m): 2.44 Manning's n: 0.03 Side slope (m/m): 1.2 Long slope (m/m): 0.0005

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Dry Detention Pond & Wet/Retention Pond (Cu 40%, Zn 30%, Sed 80%)	40	Unlimited	80

Step 1 Runoff Quality

AADT: >10,000 and <50,000

Climatic region: Colder Wet

Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 1.81 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 1.0988

Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.352

Is the discharge in or within 1 km upstream of a protected site for conservation? Yes

For dissolved zinc only

Water hardness: Low = <50mg CaCO3/l

For sediment impact only

Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1 Estimated river width (m): 40

Tier 2 Bed width (m): 3 Manning's n: 0.03 Side slope (m/m): 0.5 Long slope (m/m): 0.0001

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Swales/ Grassed Channels (Cu 50%, Zn 50%, Sed 80%)	50	Unlimited	80

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.001 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 1.2315 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.411 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only

Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only

Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1 Estimated river width (m): 5.42

Tier 2 Bed width (m): 3 | Manning's n: 0.08 | Side slope (m/m): 0.91 | Long slope (m/m): 0.001

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Swales/ Grassed Channels & Wet/ retention Pond (Cu 70%, Zn 65%, Sed 92%)	70	Unlimited	92

Receiving watercourse	UD_13				
EA receiving water Detailed River Network ID	WFD ID: UKGBNI1NW010102074		Assessor and affiliation		LN Mouchel
Date of assessment	23/09/2014		Version of assessment		V7.3
Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s)	0.001	(Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)	
Impermeable road area drained (ha)	2.4243	Permeable area draining to outfall (ha)	0
Base Flow Index (BFI)	0.371	Is the discharge in or within 1 km upstream of a protected site for conservation?	No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1	Estimated river width (m)	4.26						
Tier 2	Bed width (m)	1.3	Manning's n	0.08	Side slope (m/m)	0.89	Long slope (m/m)	0.0385

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sediment 60%)	40	Unlimited	60

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.005 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 3.5906 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.461 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

- Tier 1 — Estimated river width (m): 5.17
- Tier 2 — Bed width (m): 1.89 | Manning's n: 0.027 | Side slope (m/m): 0.68 | Long slope (m/m): 0.0081

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.103 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 3.9458 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.425 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1 — Estimated river width (m): 4.95

Tier 2 — Bed width (m): 3.7 | Manning's n: 0.035 | Side slope (m/m): 1.33 | Long slope (m/m): 0.0037

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.005 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 2.9739 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.569 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Low = <50mg CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

- Tier 1 — Estimated river width (m): 3.39
- Tier 2 — Bed width (m): 1.23 | Manning's n: 0.04 | Side slope (m/m): 0.82 | Long slope (m/m): 0.0769

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.014 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 4.1341 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.379 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Low = <50mg CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

- Tier 1 — Estimated river width (m): 4.69
- Tier 2 — Bed width (m): 3 | Manning's n: 0.04 | Side slope (m/m): 1.3 | Long slope (m/m): 0.0667

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.009 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 4.6564 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.343 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1 — Estimated river width (m): 5

Tier 2 — Bed width (m): 1 | Manning's n: 0.027 | Side slope (m/m): 0.5 | Long slope (m/m): 0.0016

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.007 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 5.6944 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.388 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only

Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only

Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1 Estimated river width (m): 2.59

Tier 2 Bed width (m): 1.27 | Manning's n: 0.027 | Side slope (m/m): 0.5 | Long slope (m/m): 0.0016

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Date of assessment	23/09/2014		Version of assessment		V7.3
Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 — Climatic region: Colder Wet — Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.648 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 1.3265 — Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.398 — Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

- Tier 1 — Estimated river width (m): 18.67
- Tier 2 — Bed width (m): 1.5 — Manning's n: 0.03 — Side slope (m/m): 1 — Long slope (m/m): 0.0042

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.002 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 4.119 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.356 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

- ○ Tier 1 — Estimated river width (m): 3.18
- ◉ Tier 2 — Bed width (m): 1.5 | Manning's n: 0.027 | Side slope (m/m): 1.31 | Long slope (m/m): 0.0025

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.001 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 2.2713 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.333 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1 — Estimated river width (m): 4.5

Tier 2 — Bed width (m): 1 | Manning's n: 0.048 | Side slope (m/m): 0.67 | Long slope (m/m): 0.0192

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.018 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 4.1498 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.436 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

- Tier 1 — Estimated river width (m): 5.5
- Tier 2 — Bed width (m): 2.5 | Manning's n: 0.04 | Side slope (m/m): 0.67 | Long slope (m/m): 0.0053

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.069 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 2.0447 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.507 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

- Tier 1 — Estimated river width (m): 7.25
- Tier 2 — Bed width (m): 4.95 | Manning's n: 0.04 | Side slope (m/m): 0.91 | Long slope (m/m): 0.02

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.007 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 5.008

Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.5

Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only

Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only

Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1 Estimated river width (m): 3.22

Tier 2 Bed width (m): 1.5 | Manning's n: 0.04 | Side slope (m/m): 1.62 | Long slope (m/m): 0.0038

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.027 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 6.818 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.41 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

- Tier 1 — Estimated river width (m): 6
- Tier 2 — Bed width (m): 3.4 | Manning's n: 0.035 | Side slope (m/m): 0.95 | Long slope (m/m): 0.0047

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Pond (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.128 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 0.4335 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.435 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1 — Estimated river width (m): 9.86

Tier 2 — Bed width (m): 6.7 | Manning's n: 0.035 | Side slope (m/m): 1.32 | Long slope (m/m): 0.0024

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Swales/ Grassed Channels (Cu 50%, Zn 50%, Sed 80%)	50	Unlimited	80

Notes				

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.131 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 1.4959 | Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.435 | Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only — Water hardness: Medium = 50-200 CaCO3/l

For sediment impact only — Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

- Tier 1 — Estimated river width (m): 8.74
- Tier 2 — Bed width (m): 6.78 | Manning's n: 0.035 | Side slope (m/m): 1.42 | Long slope (m/m): 0.0006

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Ponds (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000 | Climatic region: Colder Wet | Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.001 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 9.9141

Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.403

Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only

Water hardness: High = >200mg CaCO3/l

For sediment impact only

Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1 Estimated river width (m): 3.87

Tier 2 Bed width (m): 0.6 | Manning's n: 0.035 | Side slope (m/m): 0.53 | Long slope (m/m): 0.0263

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Ponds & Swales/ Grassed Channels (Cu 70%, Zn 65%, Sed 92%)	70	Unlimited	92

Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000

Climatic region: Colder Wet

Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.014 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 1.9774

Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.389

Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only

Water hardness: High = >200mg CaCO3/l

For sediment impact only

Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

- Tier 1 Estimated river width (m): 2.5
- Tier 2 Bed width (m): 1.02 Manning's n: 0.027 Side slope (m/m): 0.6757 Long slope (m/m): 0.0061

Date of assessment	29/09/2014		Version of assessment		V7.3
Notes					

Step 1 Runoff Quality

AADT: >10,000 and <50,000

Climatic region: Colder Wet

Rainfall site: Carmoney (SAAR 993mm)

Step 2 River Impacts

Annual 95%ile river flow (m^3/s): 0.014 (Enter zero in Annual 95%ile river flow box to assess Step 1 runoff quality only)

Impermeable road area drained (ha): 1.9206

Permeable area draining to outfall (ha): 0

Base Flow Index (BFI): 0.389

Is the discharge in or within 1 km upstream of a protected site for conservation? No

For dissolved zinc only

Water hardness: High = >200mg CaCO3/l

For sediment impact only

Is there a downstream structure, lake, pond or canal that reduces the velocity within 100m of the point of discharge? No

Tier 1 Estimated river width (m): 5.34

Tier 2 Bed width (m): 2.1 Manning's n: 0.027 Side slope (m/m): 0.77 Long slope (m/m): 0.0032

Step 3 Mitigation

	Brief description	Estimated effectiveness: Treatment for solubles (%)	Attenuation for solubles - restricted discharge rate (l/s)	Settlement of sediments (%)
Existing measures		0	Unlimited	0
Proposed measures	Wet/Retention Ponds (Cu 40%, Zn 30%, Sed 60%)	40	Unlimited	60

APPENDIX 16F FLUVIAL GEOMORPHOLOGY

Introduction

The Proposed Scheme is located within the River Foyle and the River Blackwater catchments and will cross a number of major tributaries including the Burn Dennet, Glenmornan River, Mourne River, Finn River, Derg River, Fairy Water, Drumragh River and Ballygawley Water.

An overview of surface watercourses and WFD status are provided on Figures 16.1 and 16.19. Figures 16.2-16.18 provides additional watercourse detail along the length of the route as a series of drawings.

Between New Buildings and Strabane the route lies within the wide valley of the River Foyle and runs close to and parallel to the river itself. South of Strabane, the route follows the narrower valleys of the Mourne River and River Strule. The Strule valley is particularly steep to the south of Newtownstewart. To the north west of Omagh the landscape is dominated by the low lying Fairy Water floodplain. South of Omagh the route passes through extensive drumlin fields, which comprise of an intricate network of the headwater streams of the Foyle catchment. The watershed between the Foyle and Blackwater catchments lies on the Garvaghy Ridge, approximately halfway between Omagh and Aughnacloy. South of the watershed the route passes through the extensive drumlin fields of the wide Blackwater valley.

The River Foyle and its tributaries are designated as a Special Area of Conservation (SAC) (with the same watercourse stretch known as the River Finn SAC on the ROI side of the border) and all the major rivers are important salmon fishing rivers.

Along the length of the route there are a number of large towns, beyond which residential development is sporadic and generally consists of isolated single or small clustered dwellings and farmsteads. The majority of land draining the watercourses along the route corridor is used for pastoral agriculture.

Scope of the Report

Fluvial geomorphology is the investigation of river morphology and the magnitude and frequency of processes operating to alter that morphology. It incorporates an understanding of hydrology, hydraulics and ecology and is concerned with improving the relationship between morphology and habitat. When applied to civil engineering projects, it ensures that the works will not affect the morphology and process regimes operating in adjacent watercourses and that the processes operating within the watercourses will not impact the civils project in the future.

There are 150 watercourse crossings (13 bridges and 137 culverts for smaller watercourses), 104 diversions and 91 mainline carriageway outfalls planned for the Proposed Scheme, potentially such components can affect the fluvial morphology of watercourses. Scheme watercourses vary in size from small artificial field drains to major rivers.

The scope of this report is to:

© Mouchel 2016

- Determine the baseline fluvial geomorphology of the affected watercourses;
- Identify the civil engineering works affecting each watercourse;
- Identify and assess the potential impacts of those works;
- Identify appropriate mitigation measures to ameliorate any impacts.

A key driver for the fluvial geomorphology assessment is consideration of the Water Framework Directive (WFD) and its objectives, which include the protection, enhancement and restoration of surface water bodies. The overall emphasis of the WFD is the ecological status of the hydrological system which reflects:

- Biological quality elements (invertebrates, plants and fish)
- General chemical quality elements (toxic substances, nutrients, dissolved oxygen, temperature, conductivity and pH)
- Hydromorphological quality elements (water flow and physical modifications)

Poorly designed and constructed engineering works within the watercourses could directly impact on the hydromorphological quality element and indirectly impact on the other quality elements mentioned above in the following ways:

- Discharge from the road can increase the volume and velocity of water in the watercourses, which can influence the entrainment, transportation and deposition of sediment within the channel, influencing its morphology.
- Bridging or culverting the watercourses has both construction and operational impacts. The construction impacts involve direct disturbance to the material within the channel, the channel morphology and flow of the water through the channel. The operational impacts are the loss of material from the banks, the hardening of the channel banks and bed, straightening of the channel, changes in channel slope and the fixing of the channel position.
- Diversions of watercourses create a completely new section of channel, resulting in a change in river length, slope, position, width and depth.

In addition to looking at the potential fluvial geomorphological impacts to the watercourses from the activities listed above this assessment also considers how the watercourses could impact the road through erosion.

Impacts to watercourses that cause morphological and process regime changes can have significant downstream impacts if poorly implemented, therefore, a geomorphological assessment is required to determine the magnitude and nature of the impact. Hard engineering hardens channel banks and beds and thus prevents material from being mobilised, which can impact channel morphology downstream. Hard engineering solutions often result in channels becoming rigid which means they are often unable to respond to external pressures, such as climate change

© Mouchel 2016

or land use changes and are not in equilibrium with the environment. They tend to have a uniform morphology without natural pools, which would slow the flow and reduce its potential energy. The hard surfaces have low Manning values and are often free of objects to impede and slow the flow, therefore the flow can accelerate through these sections. Consequently, the increased flow rate may exceed the entrainment threshold for material in the channel when it exits these sections resulting in erosion and transportation of material down channel.

Straightening the channel and increasing the volume of water in the channel can increase the speed of flow, which may cause localised and downstream erosion. It can lead to increased transportation of material downstream to an area where it could be deposited, forcing the channel to change course and resulting in bank and bed erosion.

Diverting watercourses can result in the above, but also lead to localised erosion as the river tries to establish its natural equilibrium in relation to the natural driving forces operating in that area. The natural driving forces are weather, climate, slope and land use, for example. If these do not alter, but the channel is moved and straightened, then it will attempt to find its pre-diversion morphology, which is in equilibrium with the natural conditions.

Understanding the nature of the watercourses and how they have responded in the past to environmental stimulus can help understand how they will respond to any impacts associated with a scheme, but also how the watercourse may adversely affect the scheme when it is operational. During a flood event, a watercourse may change its course which could threaten a section of the scheme hitherto unprotected.

© Mouchel 2016

Method of Assessment

An initial desk-based fluvial geomorphological assessment of all watercourse crossings, discharge points and diversions affected by the proposed A5 route was undertaken by looking at aerial and ground-based photographs, and maps to assess the potential impact to the morphology of the watercourses and the geomorphological processes operating within them. This exercise was undertaken to reduce the number of sites to be visited in the field. Sites where it was assessed that there would be no significant impact to the fluvial geomorphology of the watercourses and no impact to the Proposed Scheme from the watercourses were ruled out from further investigation. These tended to be small field drains with minimal flow and no evidence of instability.

Following the desktop assessment 46 sites were identified to be visited in the field, locations considered to show evidence of instability or where it was not possible to make a definite conclusion from the desk-based assessment. The sites of highest initial concern were visited by an experienced geomorphologist to assess the geomorphological sensitivity of these watercourses. These tended to exhibit planimetric evidence of instability and/or evidence of erosion and deposition in the photographs, often larger watercourses or higher energy watercourses in steeper environments. Extensive and detailed photographs of the remaining sites were taken and the photographs reviewed by an experienced geomorphologist. These sites typically showed some instability, but tended to be small watercourses or on low gradient ground where conditions would not be as dynamic.

At each of the higher concern sites, the watercourses were walked upstream and downstream from the potential point of impact. The distance walked being dependent on the size of the watercourse, its geomorphological sensitivity and the nature of the potential impact. Typically, a distance of 100 metres up and downstream was walked for small watercourses with low geomorphological sensitivity, while, for larger watercourses with greater geomorphological sensitivity, a distance of 500 metres up and downstream was walked. Investigation up and downstream of the point of interest allowed it to be put in context in relation to the whole watercourse.

A detailed digital photographic library was taken at each site and the nature of the watercourse and surrounding land recorded including the channel morphology, bed and bank material, degree of vegetation, sinuosity, braiding, evidence of erosion and deposition, and land use. Any evidence of historic channel change was recorded including palaeochannels, terraces and raised bars. These features provide an indication of the sensitivity and dynamism of the watercourse.

In the case of diversions, the area in which the new diversion channel is to be created was investigated to determine if the slope is similar to the existing channel and how the local topography and material may respond to the presence of a watercourse. Any slight change to the nature of the watercourse could result in erosion or deposition, which could have significant impacts on how the watercourse may behave in proximity to the road and impact downstream.

The field assessment was undertaken from the 14th to 18th of June 2010 and the sites where only photographs were taken was conducted on the 28th and 29th of June. Both trips occurred during a prolonged warm dry spell when flow in all the watercourses investigated was very low. The

© Mouchel 2016

qualitative survey identified that no further information relevant to this geomorphological investigation would be gleaned from quantitative investigations.

This report was originally prepared in 2010, with a number of minor revisions made for the subsequent 2014 ES submission.

Many of the watercourses were only walked along one bank due to access restrictions and the high density of the vegetation. It was not possible to view the bed of a small number of the watercourses due to the depth of flow. The diversion areas were investigated closely to determine how rerouting the watercourses will affect these areas and how the characteristics of these areas will impact the watercourses.

© Mouchel 2016

Fluvial Geomorphology Assessment

Of the 46 watercourses assessed in the field, 19 were identified as being geomorphologically insensitive and were not considered further, this was based on individual channel characteristics and professional judgement. The remaining 27 locations are considered in detail below.

Blackstone Burn

This is a 1-1.5 m wide channel with steep 1 m high, predominantly well vegetated, grassy banks. The channel has large cobbles and boulders protruding above the surface of low flow. Deposition of material within the channel has led to lateral and point bar development. There is evidence of small-scale bank undercutting and poaching, both of which have exposed the sandy alluvial soil. The channel has incised into the floodplain and sits within an area of hummocky ground. Small sections of the channel have eroded down to the underlying bedrock. There is a mature riparian zone with a dense cover of trees before reaching open pasture.

Photograph 16F.1 A typical section of the Blackstone Burn.

The channel is to be culverted with a 2.1 m by 3.9 m box culvert. The entrance and exit to the culvert and the banks 5 m up- and downstream of the culvert require erosion protection to prevent localised erosion and scour around the entrance to the culvert, and geotextiles may be the most appropriate and cost-effective option. Deposition of cobbles within the channel indicates that the culvert should be monitored regularly to ensure it does not become blocked.

© Mouchel 2016

Burn Dennet

This is a mature, meandering, 10-15 m wide, 2-3 m deep watercourse. There are no obvious palaeochannels, but the channel is sinuous, which suggests historic channel planform instability. The bed material comprises gravel and cobble and the bank material is composed of cobbles and sand, with sand becoming more dominant higher up the bank. The banks are steep and well vegetated with trees, Japanese Knotweed and Giant Hogweed. There are point bars and evidence of small-scale erosion on some of the banks. There is a large levee on the south side, which is c. 2 m high and set back 5 m from the channel edge. There is toe protection in the form of large boulders along sections of the banks. The crossing will be immediately downstream of a tight meander bend that has obviously experienced erosion in the past on its 7-8 m high southern bank. The meandering nature of the channel suggests that erosion of this bend and lateral migration of the channel could continue. Boulders have been placed along the bank to prevent it from eroding and affecting the farm above. Within the channel, along the straight where the proposed crossing point is, two small ad-hoc boulder weirs have been created to keep the main thalweg, the fasting moving and most erosive part of the flow, away from the channel banks.

Photograph 16F.2 Looking upstream at the crossing point of Burn Dennet.

A bridge is proposed at this location, with a clear span across the river channel, but with piers within the floodplain. It is recommended that the bridge abutments are protected in addition to the protection of the channel banks immediately upstream of the bridge, especially on the northern side. However, any further protection should be based on a continued monitoring strategy so that protection can be identified and located more accurately and at a time when evidence shows it to be occurring. Monitoring should be conducted annually or after large storm events that are known to cause bankfull conditions.

© Mouchel 2016

Glenmornan River

Access to the main crossing point was not possible, so the channel was viewed at Ballymagorry. The channel has large levees (1.5-2 m) on either side set back 3-4 m from the channel edge. The channel has incised 1-1.5 m into the floodplain. The channel is 2.5-3 m wide with a gravel/cobble bed and a sandy alluvial bank that is well vegetated with grass. The channel is heavily modified with inconsistent stone toe protection along its length. There are lateral bars, indicating that sediment is mobilised, resulting in a concentration of flow, which could lead to bank erosion and meander development. The channel has incised through a flat, low gradient floodplain. The channel has a pool-riffle sequence. At the point of the crossing, the channel is sinuous. Palaeochannels are visible on aerial photographs. The control of lateral movement of the channel has resulted in incision of the bed becoming the dominant erosion process.

Photograph 16F.3 Glenmornan looking downstream at Ballymagorry. The actual crossing point is downstream.

A bridge is proposed at this location, with a clear span across the river channel, but with piers within the floodplain. Given the stability of the watercourse channel no specific geomorphological mitigation is required.

© Mouchel 2016

Mourne River

This is a large, 20-30 m wide watercourse with low gradient and slow flow set within a large floodplain. Upstream of the proposed crossing point, the northern bank of the river has been protected with a flood wall, which terminates immediately after the existing bridge. At this point, the flood wall merges into an old masonry wall, which merges into an earth bank at the point of the proposed crossing. The earth bank is 2 m high, and is set back 5 m from the channel edge. There is a similarly sized levee on the south side of the river. The 2 m high natural channel banks on the north side are steep and grass covered with small areas of erosion evident. The banks on the south side are less steep, grass covered and gradually slope up to the levee, with a point bar composed of sand developing on the inside of the bend. It was not possible to see the bed material on the day of the site visit because of the depth of the water and the high turbidity level. To the north of the river, the area is dominated by local infrastructure. The confluence with the Finn is only 400 metres downstream. Erosion is evident and likely to continue on the northern banks where some toe protection is already in place.

Photograph 16F.4 Looking west at the crossing point of the Mourne River from the north bank.

A bridge is proposed at this location, with a clear span across the river channel, but with a single pier tied into the existing flood levee on the southern side of the floodplain. It is currently proposed for the northern abutment to be located in line with, and to be tied into, the existing flood defences, with bank protection around the northern abutment and southern pier.

It is recommended that at the end of the proposed rip-rap on the north bank and west side, it should tie into softer erosion protection, such as geotextiles, as erosion often occurs after rip-rap due to eddie effects created by the rip-rap. To the east, the proposed rip-rap does not tie into the existing flood wall. Extending the floodwall would look more aesthetically pleasing. Any rip-rap should be placed into the existing bank and not built out into the river, to maintain its dimensions.

© Mouchel 2016

Finn River

The Finn River is a large 20-30 m wide, 5 m deep, low gradient, slow flowing, tidal watercourse. On the day of the site visit, the water level was 1 m below the top of the banks, which displayed no evidence of erosion. There was no evidence of deposition within the watercourse. There is a large levee on the east bank and a wide floodplain on the west side of the channel. The land on either side of the river is used for grazing with some poaching of the channel banks from grazing animals. There will be no geomorphological impact from the road or to the road as the watercourse is stable and will not migrate laterally towards the road due to the low velocity of the flow within the channel.

Photograph 16F.5 The 20-30 m wide Finn River taken from the east bank at the point adjacent to the road.

© Mouchel 2016

Urney Road Drain

This is a heavily modified and incised small channel about 0.5-1 m wide, which has been straightened and deepened in alluvium. Well vegetated with little evidence of erosion. This watercourse is geomorphologically insensitive, therefore there are no geomorphology specific recommendations.

Photograph 16F.6 The small and heavily anthropogenically altered Urney Road Drain.

© Mouchel 2016

UD_12

This is a small 0.5-1 m wide, 1 m deep watercourse with shallow flow that has been artificially straightened and incised. The bed material comprises gravels and cobbles with a thin veneer of sand, and the bed has formed an armoured layer, which means that the material has arranged itself with the largest material on the surface and is well compacted, therefore, more resistant to erosion through entrainment and transportation. The banks are well vegetated, with shrubs, grasses and small trees with the channel completely overgrown, and show no evidence of erosion and no evidence of lateral movement. Land use on either side is agricultural. This watercourse is not geomorphologically sensitive, therefore there are no geomorphology specific recommendations.

Photograph 16F.7 UD_12 artificially straightened at a field boundary, located within the dense shrubs to the left of the picture.

© Mouchel 2016

UD-15

This is a 1-1.5 m wide, shallow watercourse confined within a narrow valley, with a dense cover of trees. The bed material comprises large cobbles and boulders, which have been transported and deposited recently, and there is evidence of flood deposits on the floodplain adjacent to the watercourse. Land use is dominated by agriculture. This watercourse is geomorphologically sensitive.

A box culvert 2.4 m high by 5.4 m wide is currently proposed at this location, the base of which will be buried and backfilled with at least 250 mm of bed material. It is recommended that there is bed and bank protection 5 m up and downstream of the culvert so that the structure is not undermined. The culvert should also be monitored annually or after large storm events to ensure it does not become blocked with cobbles and boulders.

Photograph 16F.8 UD_15 with large cobble bar on left indicative of active erosion and deposition.

© Mouchel 2016

Derg River

The Derg River is a large 20-40 m wide, shallow, natural, boulder bed watercourse. The watercourse is confined between steep, high terraces that are predominantly 10-50 m from the watercourse on both sides. However, upstream of the proposed crossing point on the outside of a meander bend the watercourse is actively eroding into the southern terrace, creating a 20 m high, steep slope. On the opposite side of the channel there is a flat, wide and open floodplain. A cobble point bar is actively accumulating on the inside of the meander. Within the channel the boulders are moss covered, indicating that large bed material has not been transported recently, however there were deposits of recently deposited cobble sized material. The flow is characterised by pools and riffles interrupted by exposed boulders.

Photograph 16F.9 Looking upstream along the Derg River showing evidence of recent deposition of cobbles in the foreground.

A bridge is proposed at this location, with a clear span across the river channel, but with a single pier within the northern floodplain. Bank protection is proposed around the pier and southern abutment.

It is recommended that the bank protection around the pier and southern abutment is created from hard engineering options such as sheet piling immediately around the piers and abutments and stone revetment façade in front of the sheet piling on banks parallel to river and around piers or abutments to create a more aesthetically pleasing appearance. Erosion protection along the upstream side of the bridge structure to the point where the natural ground steepens on the north side of the river should utilise rip-rap, which will tie into the sheet piling and stone revetment. At the steep slope on the outside of the meander bend upstream of the bridge, no erosion protection is required, but the slope should be monitored to detect early signs of instability.

© Mouchel 2016

UD_20 (Coolaghy Burn)

This is a 2-4 m wide, 0.5-1 m deep channel incised into a flat floodplain. The channel has low sinuosity and the banks are poached due to the channel marking the boundary of two fields used for grazing. Along the channel edge, trees have become established, which indicate long-term stability of the channel position. However, there is evidence of some bank erosion and remobilisation of large cobbles into the channel, which are deflecting the thalweg towards the channel banks where and potentially result in their erosion.

Photograph 16F.10 UD_20 cutting across a flat floodplain. Some evidence of cobble deposition on left-hand bank of the channel, looking downstream.

A 15 m span bridge is currently proposed at this location. As the banks show evidence of erosion, the bridge abutments should be protected with hard engineering, either sheet piling or rock armour for example, with the use of soft engineering erosion protection used upstream to a point where the possibility of erosion is minimal and at least 5 m downstream to minimise the possibility of the structure being scoured.

© Mouchel 2016

UD_22

This is a very small watercourse, with little baseflow, on a steep 10 degree slope, that has been artificially straightened adjacent to the existing road. The bank material is a sandy till with a high gravel and cobble content. The bed material is comprised of predominantly cobbles and gravels. The watercourse has incised 3-4 m into the slope before turning 90 degrees to the north. Around the outside of this sharp bend there is evidence of erosion. The local landowner has attempted to protect the bend and his land from further erosion by placing concrete blocks around the outside of the bend. Any increased discharge into this small channel may exacerbate the erosion problem. The land on either side of the channel is agricultural land with a road running parallel to the southern side of the channel. Runoff from the road flows directly into the watercourse via a hand-dug gully and down the channel banks, which has resulted in failure of the channel banks. Bank failure is also evident on the north side of the channel.

Photograph 16F.11 UD_22 Deeply incised but small watercourse on steep slope.

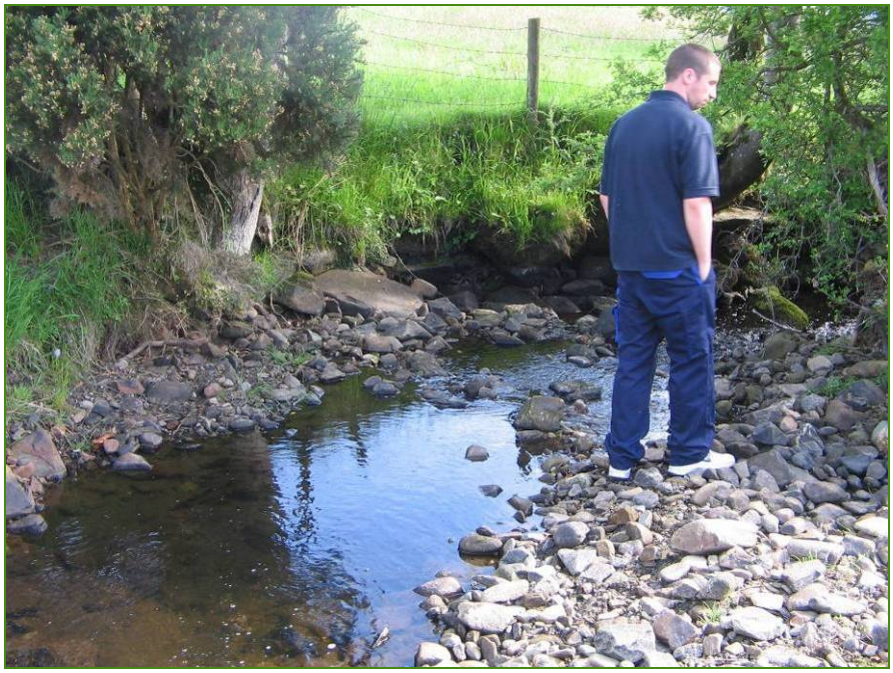
In order to minimise bank failure the slopes could be stabilised with geotextiles and growth of densely rooted vegetation encouraged and installation of proper road drainage on the side road so it does not flow down the slopes to the channel. Two 1.8 m by 1.8 m box culverts are proposed for which erosion control measures should be laid at the entrances and exits to reduce erosion. Erosion on the outside of the 90 degree bend should be controlled with soft erosion control measures to minimise erosion risk, which will be increased from increased flow rate through the culverts.

UD_25-26

© Mouchel 2016

This is a small, steep, 0.5-2 m wide watercourse that has incised 10-15 m into the slope down to bedrock, with a top width of 30-50 m. The predominantly bedrock bed and banks have a veneer of gravel and cobbles. The channel is characterised by bedrock steps with a step-pool topography. There is a large 4 m high waterfall downstream from the proposed crossing. The channel is well confined within its valley and there will be no lateral movement. Therefore, it should accommodate increased flow without increased erosion, however, there may be an increase in transportation and deposition.

The drainage proposals in this area include a 1.8 m high by 3.3 m wide culvert located on UD_26, with UD_25 diverted into UD_26 immediately upstream of the culvert. The steep, c. 4 degrees, culvert will have virtually no hydraulic impediments/ roughness and increased discharge from the combined channel flows, resulting in increased flow velocity exiting the culvert, compared to the existing stream, which is hydraulically rough and has a natural step-pool topography, where the natural pools slow the flow. Therefore, slowing the flow on the exit of the culvert will dissipate the energy and reduce the potential for erosion downstream, which has been a problem in the past. The flow could be slowed by creating a small pond on the exit of the culvert.



Photograph 16F.12 UD_25-26 showing evidence of recent deposition of a large volume of cobble-sized material.

As the bed and banks are predominantly bedrock there should be no need for erosion protection at the culvert inlet and outlet. However the sediment trapping properties of the natural step-pool channel will be lost with the introduction of the culvert resulting in increased sediment transport. This sediment is likely to be deposited in the pool of the downstream waterfall. To prevent large volumes of sediment collecting here either the pool could be cleaned regularly or another pool could be created above the waterfall to trap the excess sediment before it reaches the waterfall, or

© Mouchel 2016

a filter could be put on the entrance to the culvert which will trap sediment that could have, otherwise, filled the pool or blocked the culvert.

UD_33-34

These are a pair of 1 m wide by 0.5-1.5 m deep, straight, ephemeral watercourses that have incised into a steep slope. They have formed a step-pool topography within till and there are slugs of cobble to boulder sized material that have been transported during high flows. There is no evidence of lateral movement, so erosion and entrainment of material is from the channel bed during high flows.

Photograph 16F.13 UD_33-34, often ephemeral, but steep and straight and capable of transporting large slugs of cobble-sized material.

Each watercourse will flow through a diversion, which are aligned very closely to each original route, passing under the road via two culverts c. 200 m from each other. The diversion channels on the original plans are shallow and may clog with sediment, therefore, the diversion channels need to be steeper to prevent deposition of material within the channel, and so any deposited material is easily entrained in future floods. The diversion channels should be made wider so that any deposited sediment does not block the channel and result in the flow overtopping the channel and affecting the road. The diversion channels should be lined with erosion protection measures, to prevent erosion and lateral movement of the channels.

UD_37-39

A 2-3 m wide channel that has incised down to bedrock through a sandy alluvium. The bed and banks are poached on the east side where there is also a large boggy area. On the west side it is forested with pine trees and the banks are steep and composed of sandy alluvium. The stream has low gradient and meanders, but this is controlled by the hummocky topography and not natural

© Mouchel 2016

lateral migration. Any lateral movement will be slight across the boggy area of ground. There are no significant geomorphological concerns at this location.

Photograph 16F.14 UD_37-39 are small watercourses topographically confined between drumlins.

© Mouchel 2016

Fairy Water

The Fairy Water is a 10-15 m wide and deep (could not see the bed on the day of the visit) watercourse. Channel banks are up to 2 m high and steep on both banks. There are 1.5 m high levees on both sides that are set back 5 m from the edge of the channel. There is imperceptible flow due to the low gradient cutting across a wide, well vegetated alluvial floodplain. No evidence of erosion or deposition, but meandering suggests past channel change. The flow is smooth. The Fairy Water is geomorphologically insensitive.

A single span bridge is proposed for the Fairy Water crossing, with local bank protection around both abutments. This protection may take the form of sheet piling or rip-rap. Rip-rap is already present along the toe of the channel banks. The southern bank upstream of the bridge structure should be reinforced with geotextiles as far upstream as the water treatment works, to prevent erosion of the outside bend of the meander.

Photograph 16F.15 The 5-10 m wide Fairy Water channel showing evidence of toe protection on the right-hand bank.

© Mouchel 2016

Drumragh River

The Drumragh River is a 10-15 m wide and 1-1.5 m deep natural watercourse with steep, sandy alluvial channel banks that are well vegetated with grass. The flow on the day of the visit was slow and smooth. There are no levees on either side of the channel. Land use is agricultural on both sides of the channel, with some trees on the bank edge. The watercourse has a small floodplain between drumlins. The bed material comprises cobbles with a thin veneer of sand. This watercourse is geomorphologically insensitive, therefore there are no geomorphology specific recommendations.

Photograph 16F.16 The geomorphologically insensitive Drumragh River.

© Mouchel 2016

Routing Burn

The Routing Burn Extension is a 3-5 m wide bedrock controlled channel. It has incised down to bedrock which has eddie scour holes, suggesting long-term stability of channel position. The watercourse has a step-pool topography with steps <0.5 m high and pools varying in size. There is deposition of cobble-sized material within the channel and erosion of material on channel banks and bed in a flatter area upstream. Bedrock control prevents lateral movement of the watercourse and low rates of incision. The channel meanders through hummocky terrain on a moderate gradient. There is evidence of deposition of material on the inside of meanders. Both banks are well vegetated with trees, shrubs and grasses. Some of the younger trees have been streamlined in a downstream direction by high flows. There is a large pool and waterfall upstream in a glacial meltwater channel. There is a large mid-channel bar downstream of the pool. It is bedrock confined, however, there are large deposits that could be transported downstream.

A clear span bridge is currently proposed for this location. It is recommended that the northern bank upstream of the proposed bridging point should be protected with geotextiles to eliminate the risk of erosion and secure the integrity of the bridge.

Photograph 16F.17 Bedrock-controlled Routing Burn, evidence of deposited cobble-sized material can be seen in the centre of the image.

© Mouchel 2016

UD_69

This is a very small 0.5-1 m wide by 0.5-1 m deep watercourse with steep well vegetated channel banks and a bed comprising sand to cobble-sized material set within a narrow and boggy 30 m wide floodplain. The channel is restricted within a narrow floodplain, with only limited potential for channel migration between the valley sides. The channel is sinuous within the confines of the floodplain, but is low gradient with very little flow. Pasture land on both sides, but a tree dominated riparian zone exists. No major erosion evident and no evidence of bank overtopping and deposition outside of channel.

Photograph 16F.18 The very small and geomorphologically insensitive UD_69.

Current proposals for this watercourse include a box culvert 1.8 m high by 1.8 m wide, with a diversion approximately 223 m long to allow the culvert to be positioned perpendicular to the road alignment which will minimise the length of the culvert.

The diversion will require a deep channel to be excavated to maintain level because the existing channel has incised up to 1 m into the floodplain. The diversion entrance should be moved upstream of the natural kink in the channel as the kink is an area where natural deposition of material will occur that could instigate channel movement. The diversion needs to be carefully designed to maintain gradient and minimise deposition and erosion within the diverted channel.

© Mouchel 2016

UD_110

This is a small 1-1.5 m wide, 0.5 m deep watercourse with channel banks composed of sandy alluvium overlying a sandy, gravely, cobbly glacial material that forms the bed. Low gradient confined by topography to east of the existing road, and anthropogenically positioned to the north of the field as the floodplain opens out to the west of the road. The southern banks are poached by cattle and have exposed banks that could erode easily in high flows. Pasture on either side with wooded riparian zone. Higher banks on north side will prevent lateral erosion in that direction. No evidence of current erosion and deposition was observed. This watercourse is geomorphologically insensitive, therefore there are no specific geomorphology recommendations.

Photograph 16F.19 UD_110 taken from the road as access to the crossing point was restricted.

© Mouchel 2016

Roughan Burn

The Roughan Burn is a 2-3 m wide, 0.5-1 m deep stream that flows through a flat, wide floodplain occupied by arable farming. The channel has migrated to the southern side of the floodplain where it lies against a steep slope. The material within the channel is predominantly gravel with some cobbles. At the point of the proposed crossing, the channel is straight, but downstream there is evidence of deposition of material in the channel and large boulders have been placed at the toe of the bank to prevent bank erosion.

The channel has demonstrated historic instability, so erosion control measures will be required up and downstream of the crossing.

Photograph 16F. 20 Roughan Burn looking downstream showing the gravel/cobble bed.

© Mouchel 2016

Ballygawley Water

The Ballygawley Water is a 4-7 m wide watercourse that has incised into the floodplain. It is currently located on the far western side of its floodplain, where it is actively eroding into the terrace immediately upstream of where the proposed road is to cross. At this bend, ad-hoc bank protection and river training has been installed creating a step-pool feature, with large angular blocks placed at toe of slope to try and prevent erosion of the bank. The banks are 3 m high on the west side and 2 m on the east, which also shows evidence of instability. There is an old fence line lying on the steep west bank of the river, suggesting rapid erosion in this area. A lateral bar has developed downstream of the step-pools on the east side, forcing flow to the west. Bed material comprises cobbles and boulders. There is evidence of flood detritus in the trees on the west bank. The land on either side of the river is used for grazing.

Photograph 16F.21 The geomorphologically sensitive Ballygawley Water showing evidence of ad-hoc channel protection in the form of rip-rap and shallow step-pool sequences.

Current proposals for this watercourse crossing are for a clear span bridge across the channel. The bridge piers or abutments should be protected with erosion protection measures such as sheet piling and rip-rap, but the channel should be allowed to migrate naturally between the piers or abutments. Protection should be taken along the embankment on the northwest side of the river, until the 1:200, plus climate change, year return interval point is reached.

© Mouchel 2016

UD_89

A small, 1.5-2 m wide and 0.5-1 m deep watercourse with alluvium sand banks and a gravel/cobble bed. The channel is confined within hummocky terrain with a narrow <30 m wide floodplain. There are large bar deposits suggesting it can be very active and cause lateral movement of the channel.

The existing watercourse is to be diverted under a side road through a 1.5 m diameter pipe culvert, and then under the new A5 via a 1.5 m culvert before entering a diversion channel and finally returning to its existing course. The diversion channel will lengthen the watercourse, but should not influence the geomorphology of the channel. The diversion channel should be protected on the outside of the bends with erosion control measures such as geotextiles.

Photograph 16F.22 The confined floodplain of the small, but historically active, UD_89.

© Mouchel 2016

UD_90

Due to access restrictions this watercourse could not be inspected at the proposed crossing point, however the burn was visited downstream near Aughnacloy Primary School. From the aerial photography it appears the channel is active, based on the frequency of meanders and sharp bends. The channel is <2 m wide and probably has steep banks that are well vegetated and a gravel and cobble bed. If this is the case, increased discharge may cause increased transportation and deposition. A possible palaeochannel has also been identified from the aerial photography, located in the area of flat land immediately upstream of the proposed road alignment.

Photograph 16F.23 Section of the UD_90, approximately 5 km downstream of Aughnacloy.

A box culvert 2.1 m high by 3.9m wide is currently proposed at this location, with minor realignment of the watercourse upstream and downstream of the culvert. It is worth giving consideration to the possibility of the culvert being moved to the east, in order to take out a corner where there is potential for erosion and supply of material that could block the culvert. If the channel has not eroded down to bedrock, then erosion protection, such as geotextiles, should be used at the inlet and outlet of the culvert to protect the bed and banks of the channel.

© Mouchel 2016

Lisadavil

This is a 1-1.5 m wide and 1.5-2 m deep channel with very steep banks that have been excavated to stop lateral migration of the channel across a 100 m wide floodplain. The channel has incised through alluvial sand with occasional cobbles. Further lateral movement is unlikely due to the depth of channel, but the outside of the meander bends could suffer some erosion in high flows. The tops of banks are well vegetated, but bare earth is exposed lower down the channel banks. There is rough grazing on either side with drainage of the floodplain evident on the surface.

Photograph 16F.24 The narrow and artificially deepened Lisadavil watercourse.

The current course of the Lisadavil meanders along the length of the proposed road alignment, therefore a 2.7 m by 3.9 m culvert perpendicular to the road and an associated diversion are proposed. The proposed diversion is shortening and straightening the channel, therefore the velocity of flow may increase causing more localised erosion. It is recommended that the channel dimensions are maintained and lined with geotextiles to prevent erosion and future migration of the channel.

Conclusions

After detailed desk and field-based assessment, of the 27 watercourses identified as being potentially geomorphologically sensitive, there are 18 locations where geomorphological mitigation measures and monitoring to minimise geomorphological impact have been recommended and are summarised in Table 16F.1. Outline mitigation recommendations are provided for the majority of these locations with more detailed mitigation recommendations provided for the Mourne River, Derg River, UD_22, UD_25-26, UD_33-34, Ballygawley Water and UD_90.

As aforementioned, this report was originally prepared in 2010, with a number of minor revisions made for the subsequent 2014 ES submission. Geomorphological issues are considered unlikely to have altered since the original report, however, subject to planning consent, prior to construction, the content of this report shall be assessed against current channel conditions and may lead to amended mitigation requirements including dialogue with statutory stakeholders including NIEA, Loughs Agency, Rivers Agency and DCAL.

The most common potential impact identified is channel planform change associated with dynamic, mobile watercourses, requiring bank protection and river training to ensure the watercourses pass under the road where intended. Such active watercourses need to be monitored to ensure that ‘slugs’ of sediment do not block culverts and that banks do not rapidly eroded, changing the alignment of the watercourse and ultimately adversely affecting the Proposed Scheme.

APPENDIX 16G SURFACE WATER QUALITY MONITORING

Scope of the Report

Within the general area of the Proposed Scheme, the Northern Ireland Environment Agency (NIEA) carry out long-term surface water quality monitoring on all of the major rivers. This data has been provided by the NIEA and provides useful information on their baseline condition. Having reviewed the NIEA monitoring locations in relation to the Proposed Scheme it was judged that additional water quality monitoring should be carried out. The project monitoring was undertaken at 28 locations throughout the Proposed Scheme corridor.

This version of the Water Quality Appendix updates the 2010 version previously submitted to include longer term data from NIEA.

The scope of this report is to:

- To provide information on the project surface water quality monitoring programme, including details of the monitoring locations, parameters and procedures;
- Present the results of the monitoring programme; and
- Provide analysis and interpretation of the results, including comparison with the long-term data provided by the NIEA and the water quality standards contained within the former Freshwater Fish Directive (FFD) (repealed since December 2013) and the Water Framework Directive (WFD). Given that this assessment was originally produced in line with the FFD, prior to it being revoked, such water quality standards have been retained for consistency against the original report.

Monitoring Programme Locations

Long term surface water monitoring data was requested from NIEA in the context of the Proposed Scheme, as provided in Table 16G.1 and with locations shown on Figure 16.19.

Following review of these monitoring locations, additional locations were identified and surface water quality monitoring undertaken at 28 locations, as listed in Table 16G.2. These locations are typically situated on the larger tributary streams of the major rivers within the Proposed Scheme corridor. These monitoring locations were chosen to complement the NIEA long-term monitoring stations, filling in the gaps in coverage within the corridor, these locations are also shown on Figure 16.19.

The monitoring locations were initially identified from desk study. During the initial site visit the precise monitoring sites were selected close to the initial locations, subject to suitable sampling locations and access to the channel. In some cases the monitoring site had to be moved further along the chosen watercourse as land access had not been agreed. Photographs and GPS readings were taken at each site to ensure the sampling occurred at the same location each time (as far as was reasonably practicable).

Sampling Frequency & Timescale

The program consisted of 5 rounds of bi-monthly (every 2 months) sampling at these sites, which was scheduled between October 2009 and May 2010. Due to difficulties in resolving land access restrictions to certain monitoring sites, the first round of the sampling was delayed until November 2009. Also the February 2010 sampling round had to be brought forward a week to the end of January 2010 due to staff and equipment restrictions.

© Mouchel 2016

Sample Parameters

The parameters were chosen as part of the monitoring program to provide measurements of general chemical and physico-chemical quality, appropriate indicator pollutants resulting from construction, some pollutants routinely found in road runoff and those characteristics that influence pollutant concentrations. These are listed in Table 16G.3.

Table 16G.3 Monitoring Parameters/Determinands

In-Situ (field) Measurements	Spot Sampling & Laboratory Analysis
• Dissolved Oxygen (DO) • pH • Conductivity • Temperature • Turbidity	• Suspended Solids • Biological Oxygen Demand (BOD) • Copper • Zinc • Total Petroleum Hydrocarbons (TPH) • Hardness as $CaCO_3$

The monitoring program utilised both spot (bottle) sampling, followed by extraction and instrumental analysis in a laboratory, and in-situ (field) measurements as several parameters (pH, temperature and dissolved oxygen) cannot be analysed adequately after transport to the laboratory.

Procedures

During the initial site visit all required sampling locations were scoped and any site specific access details and risks were noted. The sampling method at each site was determined (direct or indirect, see below for details) to ensure all water samples and in-situ measurements were collected in a consistent and reproducible way. A risk assessment was taken on each round to assess any changes on site.

In choosing the sampling location it was important to ensure that there was an adequate water depth so that the bed was not disturbed during the sampling and the sample point was away from the bank to prevent contamination from bank disturbance. The aim was to obtain a representative whole water sample (suspended solids and water), without any influx of basal sediments.

Prior to the sampling rounds all the equipment & bottles were checked to ensure they were free from contaminants and in working order. The in-situ measurement equipment was calibrated before the start of each sampling round according to the manufacturer instructions and stored correctly when not in use.

Before taking a sample/measurement all equipment was thoroughly rinsed with water from the body about to be tested. Set procedures were followed to prevent contamination of the samples.

© Mouchel 2016

All samples were labelled immediately after collection and in-situ measurements were recorded at the time of measurement.

Equipment

The equipment used in the collection and in-situ testing of the water samples included the following:

- Sample bottles – due to the specified parameters to be analysed, two sample bottles were required at each site (one glass 250 ml; and one plastic 500 ml). These were supplied by the laboratory;
- Labels - the sample bottles were not pre-labelled prior to the monitoring so labels had to be completed after each sample was taken;
- Water beaker/vessel – used when direct sampling was not possible & for filling of the turbidity meter cuvette;
- Extension handle/pole – used when direct sampling was not possible, the vessel could be extended into the water from the bank to obtain a water sample;
- Rope – used when direct sampling was not possible, the vessel could be lowered from a bridge to obtain a water sample;
- YSI 556 (handheld multi-parameter system) allows simultaneous measurements of dissolved oxygen, conductivity, temperature and pH;
- HI 93703 turbidity meter – designed according to the ISO 7027 International Standard, consequently the turbidity unit is the Formazine Turbidity Unit (FTU). FTU is equivalent to the other internationally recognised unit NTU (Nephelometric Turbidity Unit); and
- Health & Safety equipment (including PPE) – samplers were required to wear all PPE items identified in the risk assessment.

Direct sampling

Samples are taken by entering the channel and, while facing upstream into the flow of water, the bottle is submerged just under the surface to obtain the sample direct from the channel (if the water is static the bottle is moved away from the sampler in a forward motion). In the case of direct sampling the multi-parameter probe is deployed into the water column at the location of the spot sampling and the readings are recorded once they have stabilised. The vessel is used to collect a water sample which is poured into the turbidity meter cuvette. Due to the nature of this meter it is important to ensure the outside of the cuvette remains clear and clean.

Indirect sampling

When direct sampling is not possible (e.g. it is not safe to enter the channel) the water sample can be obtained through the use of a vessel attached to either: an extension handle/pole (when

© Mouchel 2016

sampling from a bank, extend the vessel into the mid-stream to obtain the sample); or a rope (when sampling from a bridge, lower the vessel into the mid-stream from the upstream face of the bridge).

The water is then transferred slowly & carefully into the sample bottle. When using the indirect method it is still important to ensure that the bank and bed are not disturbed. The in-situ measurements were also performed on water samples collected in this way.

In either method the bottles are filled to the top so that a meniscus forms, the bottle is then capped to ensure no airspace. Alternatively, with the plastic bottles it is possible to fill to the top of the rim and then apply a slight pressure to the sides as the top is screwed on, this helps ensure no air is entrained with the water sample. The samples are then stored, as instructed by the laboratory, with the completed appropriate paper work and collected by their courier service.

Laboratory Analysis

Severn Trent Laboratories (STL) was chosen to perform the analysis of the water samples. The required sample bottles were delivered and collected by STL couriers and results were provided within a 10 day turnaround.

STL hold UKAS accreditation for a number of the tests required, as shown in Table 16G.4. The analysis of each determinand is subject to reporting limits. STL utilise set protocols for determining reporting limits, they are not just based on limit of detection or the detection ability of the instrument. The whole test method is assessed and regulatory body recommendations are applied. This helps provide assurance that the method is producing a sound estimate of the analyte concentration especially at low levels (reliance solely upon instrument levels of detection would not provide the same level of assurance). If the reporting limit of a determinand is reached it is not a guarantee that the determinand is not present in the sample at a lower level.

Analysis of Results

Monitoring water quality of all water bodies is a requirement of European Commission (EC) directives, national policy and international agreements. The parameters sampled in this report are compared with standards set in the Freshwater Fish Directive (FFD) (repealed since December 2013) and the Water Framework Directive (WFD).

The Northern Ireland Environment Agency (NIEA) has been undertaking water quality monitoring programs for the rivers in Northern Ireland for a number of years. Under the WFD the major rivers and their tributaries have been classified in terms of their ecological status (based on three main quality elements: biological (i.e. invertebrates, plants, fish etc.), chemical (toxic substances, nutrients, dissolved oxygen, temperature and pH) and hydromorphological (water flow and physical modifications). As discussed in other technical reports different categorisation schemes have been developed depending on whether the river is freshwater, transitional or a heavily modified waterbody. The status of the rivers within the project area of the Proposed Scheme are summarised in Table 16G.6, which focusses upon overall status and chemical status as per the scope of this document. Figure 16.19 shows the location and overall WFD status for each of these surface waterbodies.

It should be noted that the NIEA have carried out the classification process based around waterbodies rather than on individual river reaches. Also, the classification data provided by NIEA covers only those waterbodies displayed on the 1:50,000 scale ordnance survey mapping. For the purposes of this assessment it has been assumed that those headwater streams and tributaries not mapped by NIEA have the same classification status as the first downstream waterbody to be classified.

The results of the project surface water quality monitoring program (Table 16G.2) is compared with the longer-term NIEA monitoring (Table 16G.1) for each parameter in the sections below.

Temperature

The water temperatures recorded at all the project monitoring sites were as would be expected for the time of year / seasonal / weather conditions during the time of sampling. They also correspond well with data collected by the NIEA and the trends displayed. None of the sites exceed the standards shown in Annex 16G.2.

Dissolved Oxygen

Generally the dissolved oxygen measurements recorded at the project monitoring sites were within acceptable levels with regards to both the FFD (repealed December 2013) & WFD standards and correspond well with data collected by the NIEA.

However low dissolved oxygen measurements were recorded at a monitoring site (WQ-06) on the Flushtown Burn (located SW of Strabane) during the January 2009 (35.20%), April 2010 (45.3%) and May 2010 (25.70%) visits. These readings are below the standards set in the FFD (repealed December 2013) & WFD. This site is downstream of a quarry/concrete works and during the January 2010 visit it was noted that there was an orange flocculation in the water so it is possible that local activities were impacting on the water quality.

Biochemical Oxygen Demand (BOD)

The majority of the BOD readings recorded during the monitoring program were 1 or <1, i.e. very good levels with regards to the FFD (repealed December 2013) & WFD standards and correspond well with the data collected by NIEA. Higher levels of BOD were noted at some sample sites during specific months in the monitoring program, however, none of the sites showed consistently high levels of BOD.

WQ-06 (Flushtown Burn) in January 2010 had BOD recorded as 20 mg/l which could correlate with the low dissolved oxygen recorded at the site and the possibility of a pollution incident at this site linking with the reported orange flocculation in the water.

WQ-12 monitoring site is on a tributary of the River Strule (on the southern edge of Newtownstewart). In November 2009 the BOD was recorded as 21 mg/l. As BOD is related to the presence of degradable organic compounds, it can be correlated with petroleum hydrocarbons. Also in November 2009 the TPH at this site was recorded at 81 ug/l, exceeding the standard of 10 ug/l[1]. Consequently an incident could have occurred resulting in elevated levels of TPH and an increased BOD.

Total Petroleum Hydrocarbons (TPH)

Under the FFD, petroleum hydrocarbons are assessed on a visual basis, and this has been the case for data collected by the NIEA. Consequently, it is not possible to directly compare the TPH results from this monitoring program with previous data. The drinking water standard (of 10 ug/l) is referred to instead (however, as this is used for potable supplies it should be considered as a conservative threshold value).

[1] There is no Environmental Quality Standard (EQS) set for TPH therefore the Drinking Water Standard is referred to, however as this standard is used for potable supplies it should be considered as a conservative threshold value

© Mouchel 2015

For the majority of the monitoring locations the TPH values remain <10 ug/l. A number of sites during specific months in the monitoring program exceed this threshold value. However, no site continuously exceeds the value suggesting the enhanced levels are tied to individual local events.

For example WQ-12 in November 2009 had a TPH value of 81 ug/l, this reading was all under the >C20-C40 fraction implying the presence of mineral range organics (such as lubricant oils) which may have been partly responsible for the elevated BOD level.

WQ-18 monitoring site is on Fireagh Lough Drain, which leads into the Fairy Water (located on the West edge of Omagh). In April the TPH reading for this site was 105 ug/l however this was split between the 3 fractions (>C6-C10 = 13 ug/l, >C10–C20 = 53 ug/l & >C20-C40 = 39 ug/l). The monitoring site is located close to a road and lay-by with nearby houses, which could all be the potential sources for such chemicals to enter the water course, however in the other sampling months the TPH for this site was <10 ug/l.

pH

The pH levels recorded at all monitoring locations are within acceptable levels set by the FFD (repealed December 2013) & WFD standards. They also compare well with the data previously collected by the NIEA, following similar trends in changes in pH values throughout the different months of the year.

Turbidity

At present there is no environmental standard for turbidity for rivers, however this will be addressed in future reports from the UK Technical Advisory Group on the Water Framework Directive[2]. The turbidity levels recorded during the monitoring program do vary from site to site and from month to month, however the turbidity levels (and changes) do generally correlate well with the suspended solid concentrations. Local site circumstances and weather/seasonal conditions do appear to have an impact on the turbidity and suspended solid concentrations of water bodies.

For example WQ-02 monitoring site on a tributary of the River Foyle (North of Beady) is a small stream in a field with only track access (the monitored section of the stream is upstream & away from any roads). During the November 2009 visit (which was during a period of a few days heavy rain) the turbidity level recorded was 152 FTU which correlated with a high suspended solid concentration of 309 mg/l. In the following months the turbidity dropped to below 2 FTU, again correlating with a reduction in suspended solid concentrations. In the May 2010 visit the suspended solid concentration was again elevated (252 mg/l) and the turbidity value did increase, however it was not as marked as it was in November 2009 (13.6 FTU). The conditions at this site meant that any soil erosion/field run off could easily enter the water course.

The turbidity and suspended solid concentration levels recorded at WQ-07 (monitoring site on a tributary of the Mourne River, just upstream of the existing A5 between Strabane & Sion Mills)

[2] UKTAG on WFD – UK Environmental Standards & Conditions (April 2008)

© Mouchel 2015

remained low throughout the monitoring program even during the period of heavy rain in November 2009.

Suspended Solids

As with the turbidity levels, the suspended solid concentrations recorded during the monitoring program varied temporally and between sites, again dependent on local site, weather and seasonal conditions. The FFD (repealed December 2013) set a guide standard of 25 mg/l for suspended solids in water, which at times is exceeded. The data collection by the NIEA also shows varying suspended solid concentrations.

For example, WQ-10 monitoring site is located on the Derg River upstream of Millbrook New Bridge. During the monitoring program the suspended solid concentrations recorded at this site was not recorded above pass 6 mg/l. Whereas at WQ-11, which is located on the Coolaghy Burn, a tributary of the Derg River which joins downstream of the WQ-10, the suspended solid concentrations range from 6 mg/l to 30 mg/l. The NIEA monitoring location was on the Derg River at Millbrook New Bridge which is downstream of both WQ-10 and downstream of where the tributary joins. The average suspended solid concentration recorded was 5.83 mg/l however the NIEA data ranges from 2 mg/l to 30 mg/l (2004-2013).

Conductivity

The conductivity levels recorded during the monitoring program are quite varied between sites; however, at individual monitoring locations the change in conductivity values is relatively small and thus would provide a good indication of a potential contaminant if the levels were to dramatically change. However the data collected by the NIEA at their monitoring locations indicate greater ranges in conductivity which could be the result of a longer monitoring period.

Hardness (Total as $CaCO_3$)

The majority of waters monitored would be classed as soft or moderately hard water which is consistent with the data collected by the NIEA. However, certain sites, particularly on sections and tributaries of the River Blackwater and Ballygawley Water, would be classed as hard or at certain times very hard, which again, is consistent with data collected by the NIEA.

Generally the calcium and magnesium ions that contribute to water hardness lower metals toxicity by competing with metals for binding sites on the organism. However the extent of this effect varies by metal and by metal speciation.

Copper

During this monitoring program, both dissolved and total copper (mg/l) were measured. Unfortunately the data recorded by the NIEA monitoring program and the standards referred to by the WFD and FFD (repealed December 2013) consider dissolved copper levels only and so the results of this monitoring program were not directly comparable.

© Mouchel 2015

Measured values of copper recorded during the monitoring program displayed slight variation temporally and between sites. It was noted that recorded copper levels were slightly higher at a number of sites during the November 2009 visit, which could be attributed to increased runoff during the heavy rain period. In general, the recorded levels of copper were within acceptable levels for the given water hardness under the FFD (repealed December 2013) & WFD including total copper levels.

At the following sites the FFD standard (for the given water hardness) was exceeded, however these were not continuous breaches:

- WQ-02 monitoring site on a tributary of the Foyle, Cu = 0.025 mg/l at 76 mg/l Ca CO_3 (Hardness band < = 100 & > 50 mg $CaCO_3$ / litre);
- WQ-19 monitoring site on the Drumragh River, Cu = 0.047 mg/l at 87 mg/l $CaCO_3$ (Hardness band < = 100 & > 50 mg $CaCO_3$ / litre);
- WQ-21 monitoring site on the Letfern Burn, Cu = 0.074 mg/l at 100 mg/l $CaCO_3$ (Hardness band < = 100 & > 50 mg $CaCO_3$ / litre); and
- WQ-23 monitoring site on a tributary of the Routing Burn, Cu = 0.150 mg/l at 68 mg/l $CaCO_3$ (Hardness band < = 100 & > 50 mg $CaCO_3$ / litre).

A number of sites also exceeded the long-term exposure standard for the given water hardness set by the WFD (there is no standard at present for short term exposure under the WFD)[3] when considering the average concentration for copper at the monitoring locations with the average water hardness. However this was usually the result of an exceptional month with an outlying (higher) copper level rather than continuously high levels. During this monitoring program, a total of ten sampling locations had average copper levels that exceeded the WFD standard for the given water hardness:

- WQ-10 monitoring site on the Derg River had an average Cu concentration of 0.003mg/l at an average hardness of 38 mg/l $CaCO_3$ (Hardness band < = 50 mg $CaCO_3$ / litre);
- WQ-12 monitoring site on a tributary of the River Strule had an average Cu concentration of 0.003 mg/l at an average hardness of 47.8 mg/l $CaCO_3$ (Hardness band < = 50 mg $CaCO_3$ / litre);

[3] Short-term standard, usually expressed as a Maximum Allowable Concentration (MAC) is based on the analysis of data on acute (short term) toxicity. The short-term standard aims to protect against intermittent or short-lived periods of exposure. The long-term standard, usually expressed as an annual average is derived by analysing data from chronic (long term) toxicity tests. This standard covers long-term or continuous exposure. UKTAG on WFD Proposals for environmental quality standards for annex VIII substances Jan 2008.

© Mouchel 2015

- WQ-19 monitoring site on the Drumragh River had an average Cu concentration of 0.011 mg/l at an average hardness of 68.8 mg/l $CaCO_3$ (Hardness band < = 100 & > 50 mg $CaCO_3$ / litre);

- WQ-21 monitoring site on the Moylagh River had an average Cu concentration of 0.018 mg/l at an average hardness of 92.4 mg/l $CaCO_3$ (Hardness band < = 100 & > 50 mg $CaCO_3$ / litre); and

- WQ-23 monitoring site on a tributary of the Routing Burn had an average Cu concentration of 0.031 mg/l at an average hardness of 63.6mg/l $CaCO_3$ (Hardness band < = 100 & > 50mg $CaCO_3$ / litre).

Note that copper is a soluble metal that is identified by the Highways Agency as being a contaminant within operational road runoff and is a key element assessed by the Highways Agency Water Risk Assessment Tool (HAWRAT) for mainline outfall discharges for road schemes.

Zinc

Measured values of total zinc recorded during the monitoring program displayed slight variation temporally and between sites. Zinc concentrations did not exceed the standards set under the FFD (repealed December 2013), for the given water hardness. Under the WFD, the average zinc concentrations at three sites exceeded the long-term exposure standard for the given water hardness (there is no standard at present for short term exposure under the WFD):

- WQ-10 monitoring site on the Derg River had an average Zn level of 0.009 mg/l at an average hardness of 38 mg/l $CaCO_3$ (Hardness band < = 50 mg $CaCO_3$ / litre);

- WQ-11 monitoring site on a tributary of the Derg River had an average Zn level of 0.012 mg/l at an average hardness of 45.4 mg/l $CaCO_3$ (Hardness band < = 50 mg $CaCO_3$ / litre); and

- WQ-12 monitoring site on a tributary of the River Strule had an average Zn level of 0.010 mg/l at an average hardness of 47.8 mg/l $CaCO_3$ (Hardness band < = 50 mg $CaCO_3$ / litre);

Note that zinc is a soluble metal that is identified by the Highways Agency as being a contaminant within operational road runoff and is a key element assessed by the Highways Agency Water Risk Assessment Tool (HAWRAT) for mainline outfall discharges for road schemes.

Summary

In general the results provided by this monitoring program demonstrate that on average the majority of the water bodies tested meet the formerly required standards of the FFD (repealed December 2013) and WFD. The results also correspond well with NIEA results, e.g. the classification for the Derg River has in the recent past taken account of elevated zinc levels, with results from the project monitoring program over the 2009-10 period showing that zinc levels within the Derg River were in excess of the standards set in the WFD. However, the results also demonstrate that local factors can play an important role in determining the water quality of a section of river/stream but these may only be intermittent effects.

© Mouchel 2015

The limitations of spot sampling must also be considered when analysing water quality data as a snap shot of the water quality is provided. Consideration has been given to identify the sampling locations within the chosen stretch of water to ensure a representative sample is obtained.

© Mouchel 2015

Conclusions & Recommendations

As demonstrated in the results and analysis sections, the water quality within the Proposed Scheme area fluctuate between river sections and from month to month. Local, seasonal and weather conditions all can have notable effects on the water quality.

As part of the Construction Environmental Management Plan, a water quality monitoring programme should be implemented throughout the construction phase. It is recommended that this is carried out as a rolling programme of monitoring in line with the phasing of the construction works.

Monitoring of selected stations positioned on the larger, more environmentally sensitive streams and rivers should be undertaken.

Monitoring stations should be deployed in pairs approximately one month before construction is due to begin in a particular area. The stations should be located on the watercourses in the area that may be affected by construction pollution, with one positioned upstream of the works and the other downstream of the works. The monitoring should be undertaken throughout the construction phase in the relevant area, and should continue for approximately one month after construction has ceased in that particular area. This should provide sufficient baseline information prior to construction to gauge the natural variation in water quality. Deployment in pairs ensures that, should there be deterioration in water quality, it can be identified, whether this is due to the Proposed Scheme construction works or another external pollution source. Extending the monitoring period beyond the completion of the construction works will facilitate measurement of the water quality as the area recovers to baseline conditions.

The parameters which should be monitored are largely related to potential impacts from construction sediment, but may include temperature, conductivity, pH, dissolved oxygen and turbidity, where practicable.

Appendix B – Water Quality Assessment

This appendix contains information on relevant water quality standards contained within the Freshwater Fish Directive (FFD) (repealed December 2013) and the Water Framework Directive (WFD). Only the standards relevant to the sampling program are displayed, each Directive lists other monitoring parameters & standards.

© Mouchel 2016

Table 16G.7 FFD (former), Water Quality Standards

Parameter	Standard			Notes
	Unit	Salmonid	Cyprinid	
Temperature [1]	°C	1.5	3.0	Increase due to thermal changes
	°C	21.5	28.0	Maximum at monitoring site
	°C	10.0	10.0	Maximum for breeding season
Dissolved Oxygen [1]	% (satn)	50.0	50.0	
pH [1]		6 to 9	6 to 9	
BOD [2]	mg/l	3.0	6.0	
Petroleum Hydrocarbons [1]		Non visible	Non visible	
Suspended Solids [2]	mg/l	25.0	25.0	
Total Zinc (Zn) [1] (Standard is dependent on the average yearly hardness)	mg/l	0.03	0.3	Hardness <= 10mg CaCO3 / litre
	mg/l	0.2	0.7	Hardness <= 50 & > 10mg CaCO3 / litre
	mg/l	0.3	1.0	Hardness <= 100 & > 50mg CaCO3 / litre
	mg/l	0.5	2.0	Hardness > 100mg CaCO3 / litre
Dissolved Copper (Cu) [2] (standard is dependent on the average yearly hardness)	mg/l	0.005	0.005	Hardness <= 10mg CaCO3 / litre
	mg/l	0.022	0.022	Hardness <= 50 & > 10mg CaCO3 / litre
	mg/l	0.040	0.040	Hardness <= 100 & > 50mg CaCO3 / litre
	mg/l	0.112	0.112	Hardness > 100mg CaCO3 / litre

[1] FFD Imperative Water Quality Standards

[2] FFD Guideline Water Quality Standards

The Water Framework Directive considers a number of factors when determining quality standards, including the typology of rivers (which has been shown to play an important role in determining the biota of UK rivers). The typology contains two factors – alkalinity and altitude. Alkalinity is expressed as five divisions of the concentration of calcium carbonate (which covers the range found in UK rivers). Altitude is split into two types – less than or greater than 80 metres. The basic typology for rivers is shown in Table 16G.8. Further analysis was performed on combined types (when the resulting standards for types turned out to be similar) which provided the simplified typology shown in Table 16G.9 (these are used for dissolved oxygen & ammonia).

© Mouchel 2016

Table 16G.8 WFD, Basic Typology for Rivers

Site Altitude	Alkalinity (as mg/l $CaCO_3$)				
	Less than 10	10 to 50	50 to 100	100 to 200	Over 200
Under 80 metres	Type 1	Type 2	Type 3	Type 5	Type 7
Over 80 metres			Type 4	Type 6	

Table 16G.9 WFD, Final Typology for Oxygen and Ammonia for Rivers

Upland and low alkalinity	Types: (1+2), 4 and 6
Lowland and high alkalinity	Types: 3, 5 and 7

For comparison with existing standard, the following matches with the Freshwater Fish Directive:

- Salmonid Waters (FFD) – Upland and Low Alkalinity Type (2, 4 & 6)
- Cyprinid Water (FFD) – Lowland and High Alkalinity Type (3, 5 &7)

Table 16G.10 WFD, Standards for Oxygen in Rivers

Dissolved Oxygen (% saturation) (10-percentile)				
Type	**High**	**Good**	**Moderate**	**Poor**
Upland & low alkalinity	80	75	64	50
Lowland & high alkalinity	70	60	54	45

Table 16C.11 WFD, Standards for Oxygen Conditions (BOD)

Biological Oxygen Demand (mg/l) (90-percentile)				
Type	**High**	**Good**	**Moderate**	**Poor**
Upland & low alkalinity	3	4	6	7.5
Lowland & high alkalinity	4	5	6.5	9

© Mouchel 2016

Table 16G.12 WFD, Standards for Acid Conditions in Rivers

pH – all river types in England, Wales & Northern Ireland			
High	**Good**	**Moderate**	**Poor**
(5 and 95 percentile)		(10 percentile)	(10 percentile)
> = 6 to < = 9		4.7	4.2

© Mouchel 2016

Table 16G.13 WFD, Standards for specific pollutants (Cu & Zn)

Parameter	Receiving medium & exposure	Hardness Bands	Existing EQS (µg/l)
Copper (dissolved)	Freshwater / long term	< = 50 mg $CaCO_3$/l	1
		< = 100 & > 50 mg $CaCO_3$/l	6
		< = 250 & > 100 mg $CaCO_3$/l	10
		>250 mg $CaCO_3$/l	28
	Freshwater / short term		No proposal
	Saltwater / long term		5
	Saltwater / short term		No proposal
Zinc (total)	Freshwater / long term	< = 50 mg $CaCO_3$/l	8
		< = 100 & > 50 mg $CaCO_3$/l	50
		< = 250 & > 100 mg $CaCO_3$/l	75
		>250 mg $CaCO_3$/l	125
	Freshwater / short term		No proposal
	Saltwater / long term		40 (dissolved Zn)

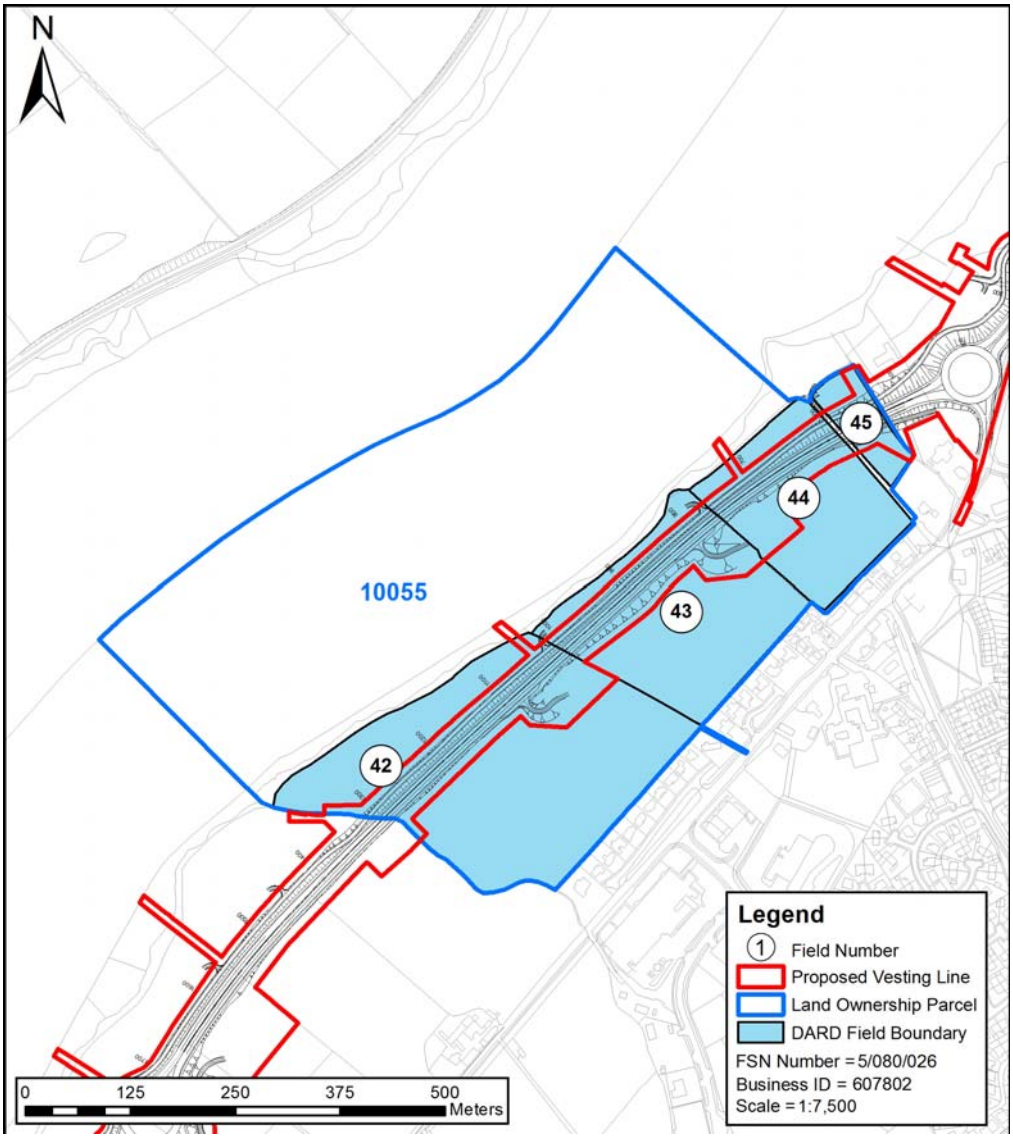
Land Parcel Ref	10055	**DARD Business Ref**	607802
		Data sources	April 2010 meeting held. 2013 AIA letters not returned. Declined landowner confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 200.49ha of owned land and is all in grass.	
Type of Enterprise and Husbandry The farm runs a large dairy herd of 220 cows and 3 bulls, with approximately 140 young stock being reared as herd replacements. All calves not required as replacements are reared and finished for beef. The land in parcel 10055 is several miles away from the home farm.	
Conacre Arrangement N/a	
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	A large proportion of the land is registered Disadvantaged Area / Severely Disadvantaged Area (DA/SDA), and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 5.4 hectares in fields 42, 43, 44 and 45 of the 200.49 hectare farm equating to 2.69% of the productive land.

This would include land from three fields adjacent to the Foyle River. The landtake impacts would be slight.

New severance would impact on the farm. Access would be provided to severed land via a shared farm lane running parallel to the proposed route. This would connect to the roundabout at the north of the Proposed Scheme. Severance impacts would be slight.

There would be temporary impacts during the construction phase of the Proposed Scheme.

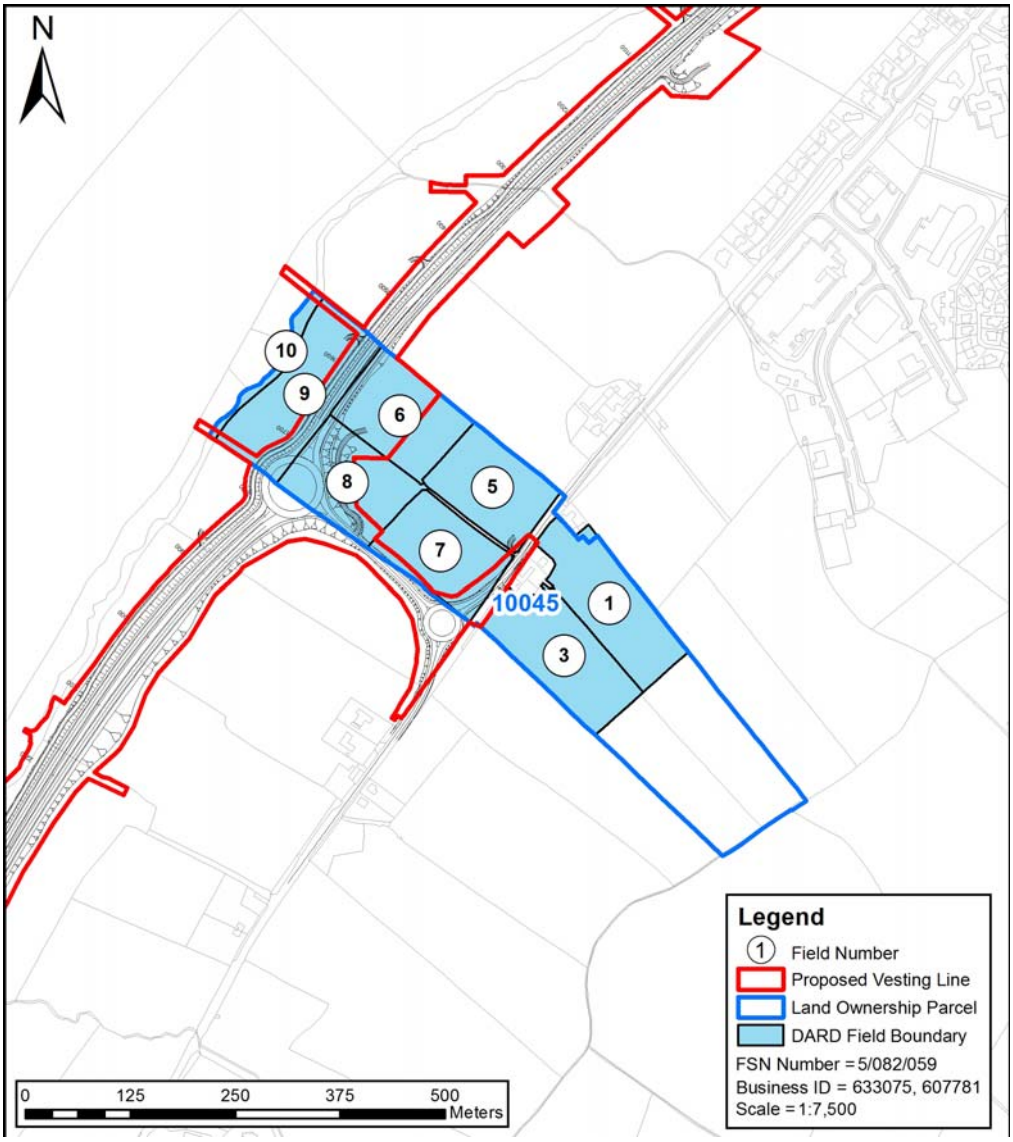
© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 2.69% of the available productive land would have a slight impact on the farm's potential output and constitute a slight adverse effect on the farm'

© Mouchel 2016

Land Parcel Ref	10045	**DARD Business Ref**	607781
		Data Sources	March 2010 meeting held. No response to 2013 AIA letters. No response to 2014 Landowner confirmation meeting. No response to 2014 AIA meeting invitation.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and the proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Information is based on 2010 information as no response to meeting request from landowner in 2014.

Size and Quality of Farm

The farm extends to 13.49ha and is all in grass.

Type of Enterprise and Husbandry

The farm is all rented out in conacre.

Conacre Arrangement	The farm is all rented out in conacre. No information of the conacre tenant.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Schemed.
Less Favoured Area Compensatory Allowances Scheme	The land is all in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 3.05 hectares from fields 1, 3, 5, 6, 7, 8, 9 and 10 of the 13.49 hectare farm equating to 22.6% of the productive land

The landtake required by the Proposed Scheme would total 3.05ha. This would include land for the proposed junction with the existing A5. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

New severance would impact on the farm. Access would be provided to severed land via a shared lane that connects to Victoria Road (existing A5). As the land is currently out in conacre and not farmed by the landowner directly, the severance impacts would be slight.

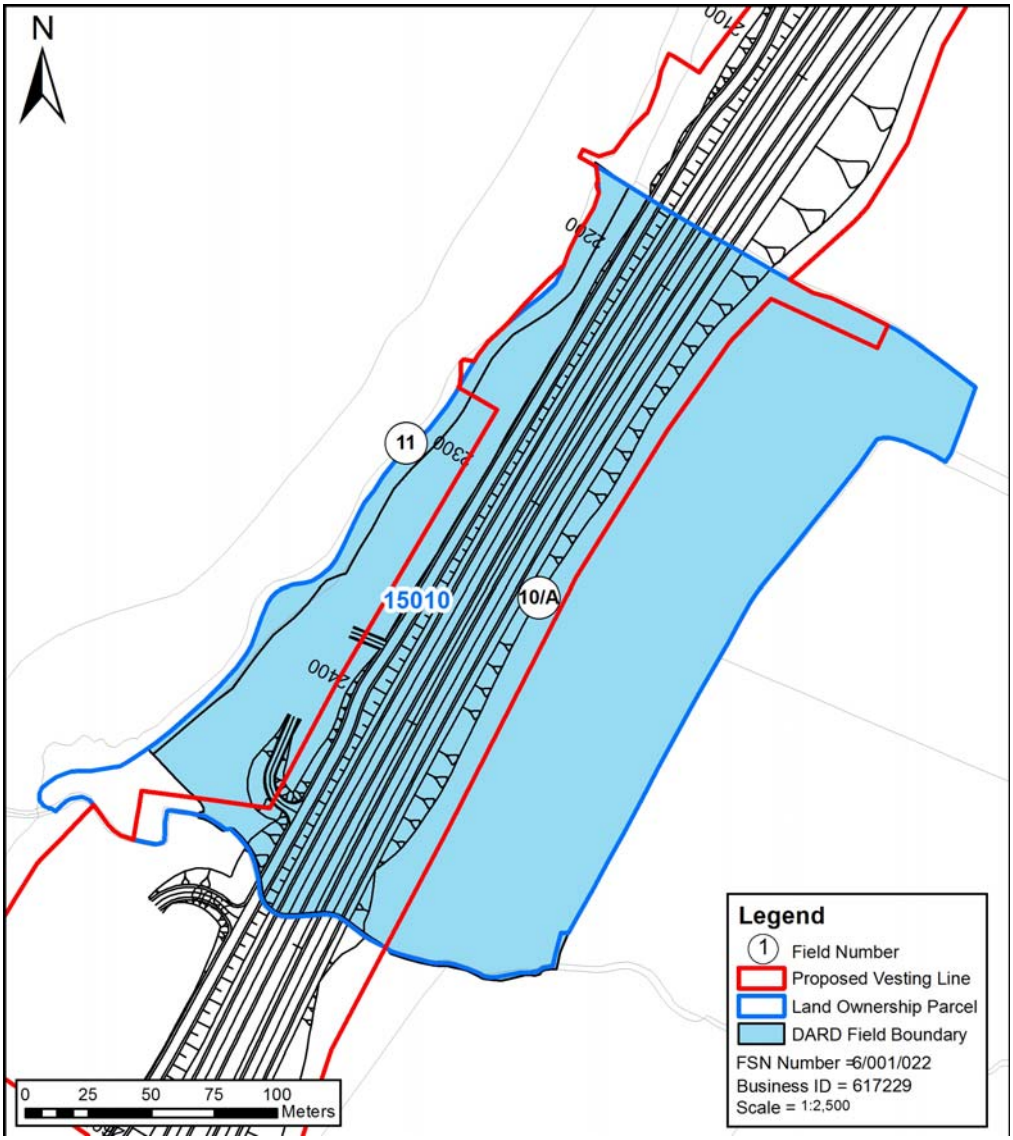
© Mouchel 2016

There would be temporary impacts during the construction phase of the Proposed Scheme. Given no information is held on the conacre tenant or their use of the conacre land, no conclusions can be made on how the proposed landtake would impact the conacre tenant's farm.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 22.6% of the available productive land would have a slight impact on the farms potential output and constitute a slight adverse effect on the farm. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

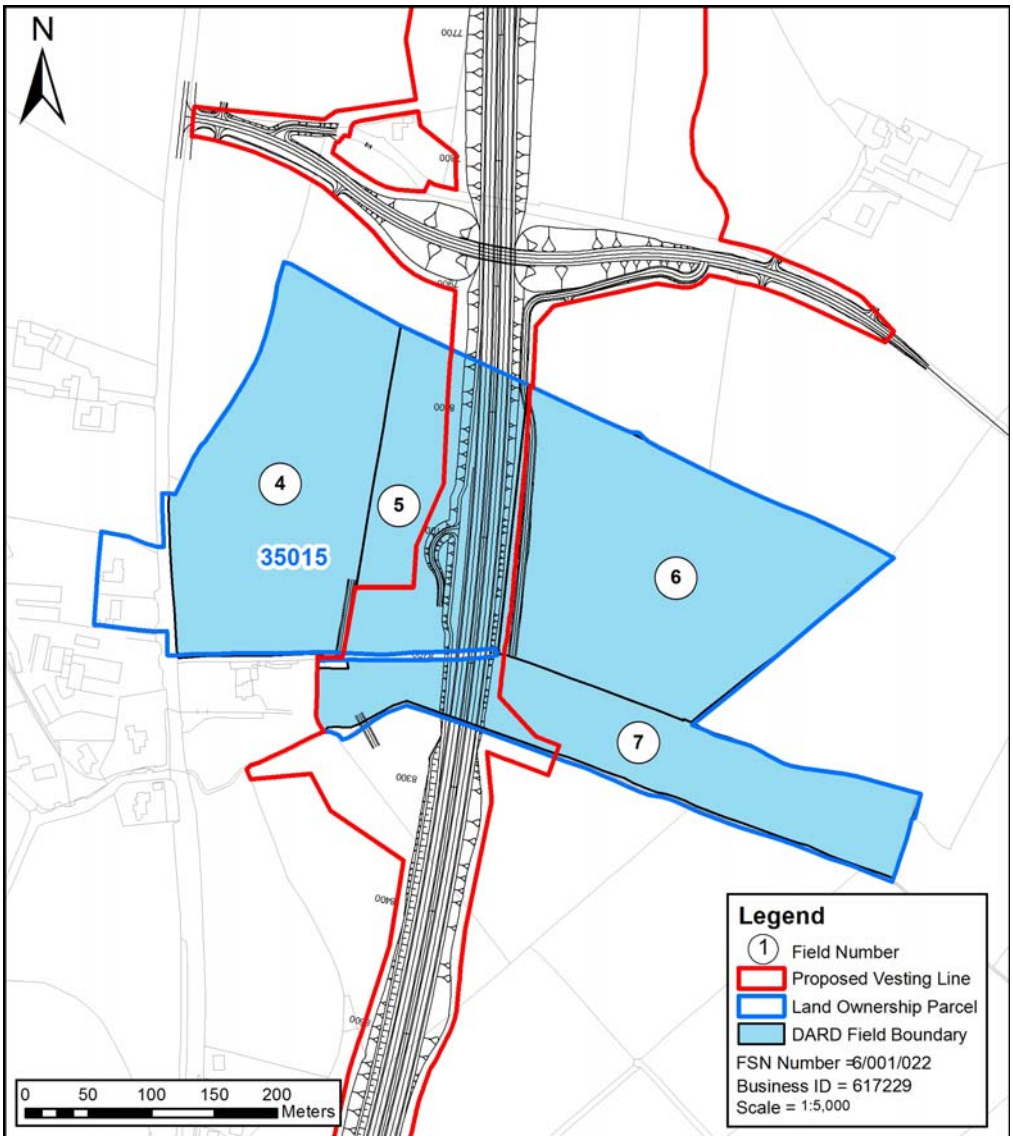
© Mouchel 2016

Land Parcel Ref	15010, 35015	**DARD Business Ref**	617229
		Data Sources	2010 AIA meeting held. Did not respond to AIA letters. Changes highlighted in landowner confirmation meeting. September 2014 AIA meeting held.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016



Size and Quality of Farm

The farm extends to 195.92ha, which includes 42.83ha of owned land with the remainder (153.09ha) being taken in conacre.

Type of Enterprise and Husbandry

This is a very large beef farm, with accommodation for approximately 900 cattle, which are bought in at approximately 450-500kg liveweight and carried through to finish. Approximately 500 cattle are grazed during the summer. The farm has a turnover of approximately 3000 cattle per year.

© Mouchel 2016

In addition, approximately 600-700 store lambs are purchased in for winter finishing.	
Conacre Arrangement	Approximately 153.09ha of land are rented in conacre from 8 different landowners. Two landowners are affected by the Proposed Scheme.
Single farm payment	The landowner collects the Single Farm Payment on owned land, on some conacre land.
Nitrates Directive	The landowner considers that there are implications under the Nitrates Directive, due to the very high stocking rate on the farm. The farm currently exports approximately 300k gallons of slurry.
Countryside Management Scheme	Owned land is all registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	Most of the land is classified Disadvantaged Area/Severely Disadvantaged Area (DA/SDA) and is eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

Predicted Impacts

Total loss of 5.71 hectares in fields 10/A, 11, 4, 5, 6 and 7 of the 42.83 hectare farm equating to 13% of the owned land. Additional areas taken in conacre are affected by the proposed scheme.

During the construction phase, access to severed land adjacent to the River Foyle, Parcel No 15010, and on Parcel No 35015 will need to be maintained.

The main impacts on this farm are severance and land take.

Proposed Mitigation

During the construction phase access to severed land would be maintained.

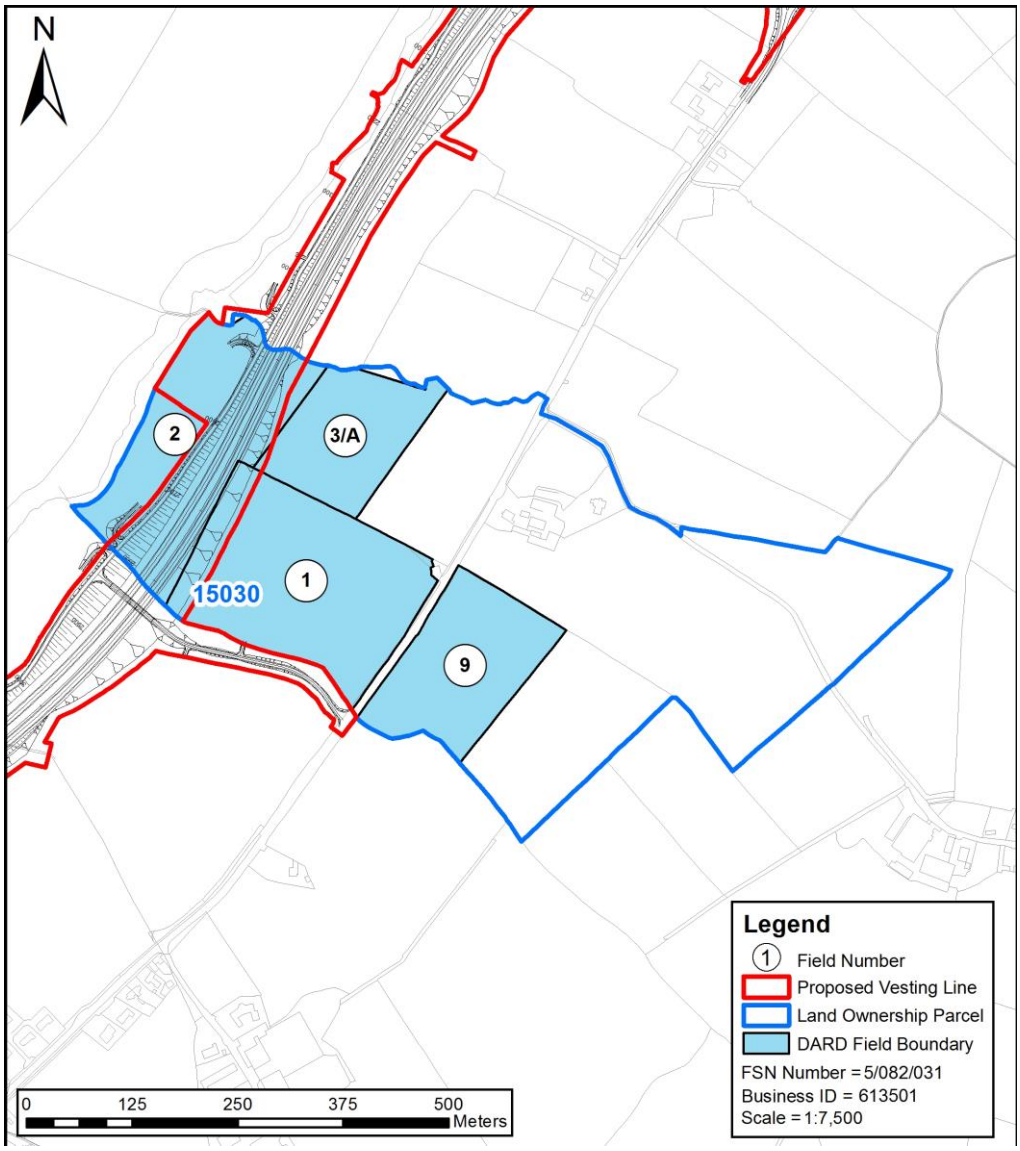
Predicted Effects	The loss of 2.9% of the available productive land would have a slight impact on the farms potential output and constitute a slight adverse effect on the farm.

© Mouchel 2016

© Mouchel 2016

Land Parcel Ref	15030	**DARD Business Ref**	613501
		Data Sources	2010 AIA meeting held. AIA letters returned and land confirmation meeting held. September 2014 AIA revisit held.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme only, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 28.69ha of owned land which is all in grass.	
Type of Enterprise and Husbandry The farm runs a flock of 240 ewes plus 4-5 rams, producing approximately 400 lambs which are all finished. In addition, the farm buys in approximately 30-40 store cattle, which are grazed during the summer.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts Total loss of 3.23 hectares from fields 1, 2 and 3/A of the 28.69 hectare farm equating to 11.3% of the productive land. This would include land between Victoria Road and the Foyle. The impact from the scheme would be landtake and severance. There would be temporary impacts during the construction phase of the Proposed Scheme. Access to severed land adjacent to the River Foyle, will be maintained by the provision of an overbridge.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	

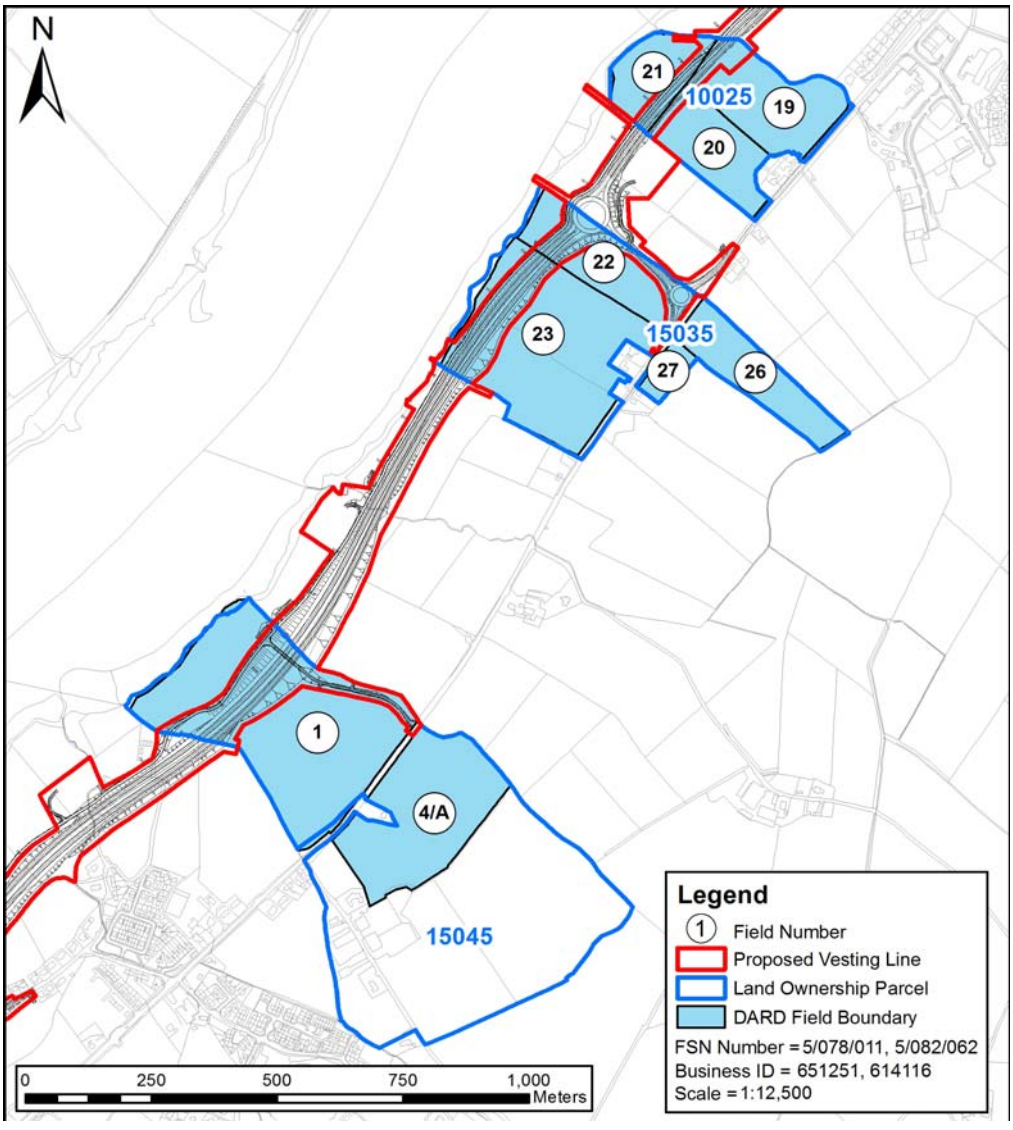
© Mouchel 2016

Predicted Effects	The loss of 11.3% of the available productive land would have a substantial impact on the farms potential output and constitute a **substantial adverse** effect

© Mouchel 2016

Land Parcel Ref	15045, 10025, 15035	**DARD Business Ref**	618305
		Data Sources	2010 AIA meeting held. Feedback received from 2013 AIA letters/2014 landowner confirmation meeting. September 2014 AIA meeting held.
Conacre Parcel Ref	includes Parcel 10155		

Land parcel reference, farm map field surveys and proposed vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm This is a very large farm, extending to over 263.93ha of owned (82.46ha) and conacre land. The home farm extends to 35.51ha of owned land, laid-out mainly in 4 large fields surrounding the farm-yard, and one very large field lying across the existing A5, running down to the Foyle.	
Type of Enterprise and Husbandry This is mixed farm running several major enterprises, including: A dairy herd of approximately 400 dairy cows with a herd average of 8,000 litres together with approximately 250 young stock as herd replacements. In addition the farm runs approximately 300 beef cattle, must of which are home-bred calves reared through to finish. There are approximately 1000 cattle on the herd list. The farm runs a flock of 500 ewes plus 20 rams, with approximately 750 lambs carries through to finish.	
Conacre Arrangement	Approximately 181.47 ha of land are rented in conacre. Includes Parcel 10155 (Fig 15.4).
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, and also on some, but not all, of the conacre land.
Nitrates Directive	The farm is currently over the 170kg organic Nitrogen per ha at 210.57kg/ha. In order to remain compliant, the farm currently exports 900,000 gallons of slurry (450 tanker loads). Consequently, any land take will directly impact on the farm, increasing the quantity required to be exported.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The home-farm is classified Low Land (LL) and is not eligible for payments under LFACAS, but some of the conacre land is eligible, being classified either Disadvantaged Area (DA) or Severely Disadvantaged Area (SDA).
Biosecurity	No biosecurity issues have been identified.

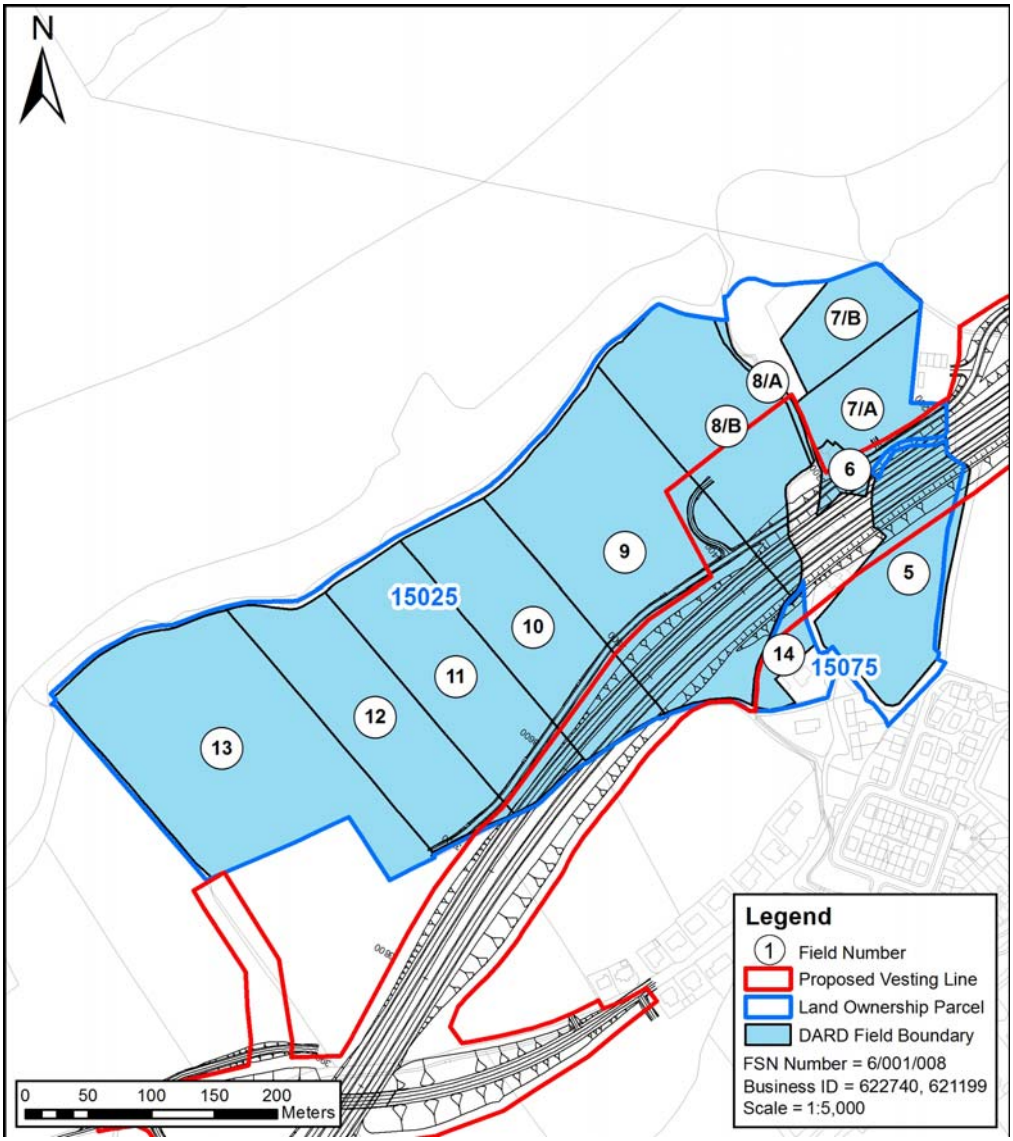
© Mouchel 2016

Predicted Impacts Total loss of 3.61 hectares from fields 1, 4/A, 19, 20, 21, 22, 23, 26 and 27 of the 263.93 hectare farm equating to 1.4% of the productive land. This would include land for the proposed highway and an overbridge connecting to Victoria Road (existing A5). The landtake impacts would be moderate. New severance would impact on the farm. Access would be provided to severed land via a shared farm lane that links into Victoria Road (the existing A5). The severance impacts would be slight. The main impacts on this farm is severance and land take.
Proposed Mitigation During the construction phase access to severed land would be maintained.
Predicted Effects The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	15025, 15075	**DARD Business Ref**	621199
		Data Sources	2010 AIA meeting held. Feedback from 2013 AIA letters/ Landowner confirmation meeting. November 2014 AIA meeting held.
Conacre Parcel Ref	Let in conacre (except fields 5 & 7A) to Datasheet 021-242		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 29ha and is all in grass, with most of it potentially arable in rotation. Field No. 14 is owned by the landowner's son.	
Type of Enterprise and Husbandry	
The land is all rented out in conacre with the exception of field Nos. 5 & 7A, which are retained by the landowner.	
Conacre Arrangement	The land is all rented out in conacre with the exception of field Nos. 5 & 7A, which are retained by the landowner. An assessment of impacts on conacre tenant are reflected in Datasheet 021-242.
Single Farm Payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive, as the land is all in conacre.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Lowland (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
Total loss of 3.81 hectares from fields 5, 6, 7/A, 7/B, 8/A, 8/B, 9, 10, 11, 12, 13 and 14 of the 29 hectare farm equating to 13.1% of the productive land. This would include the two fields not rented out in conacre. New severance would impact on the farm. Access would be provided to severed land via an overbridge off Dunnalong Road.

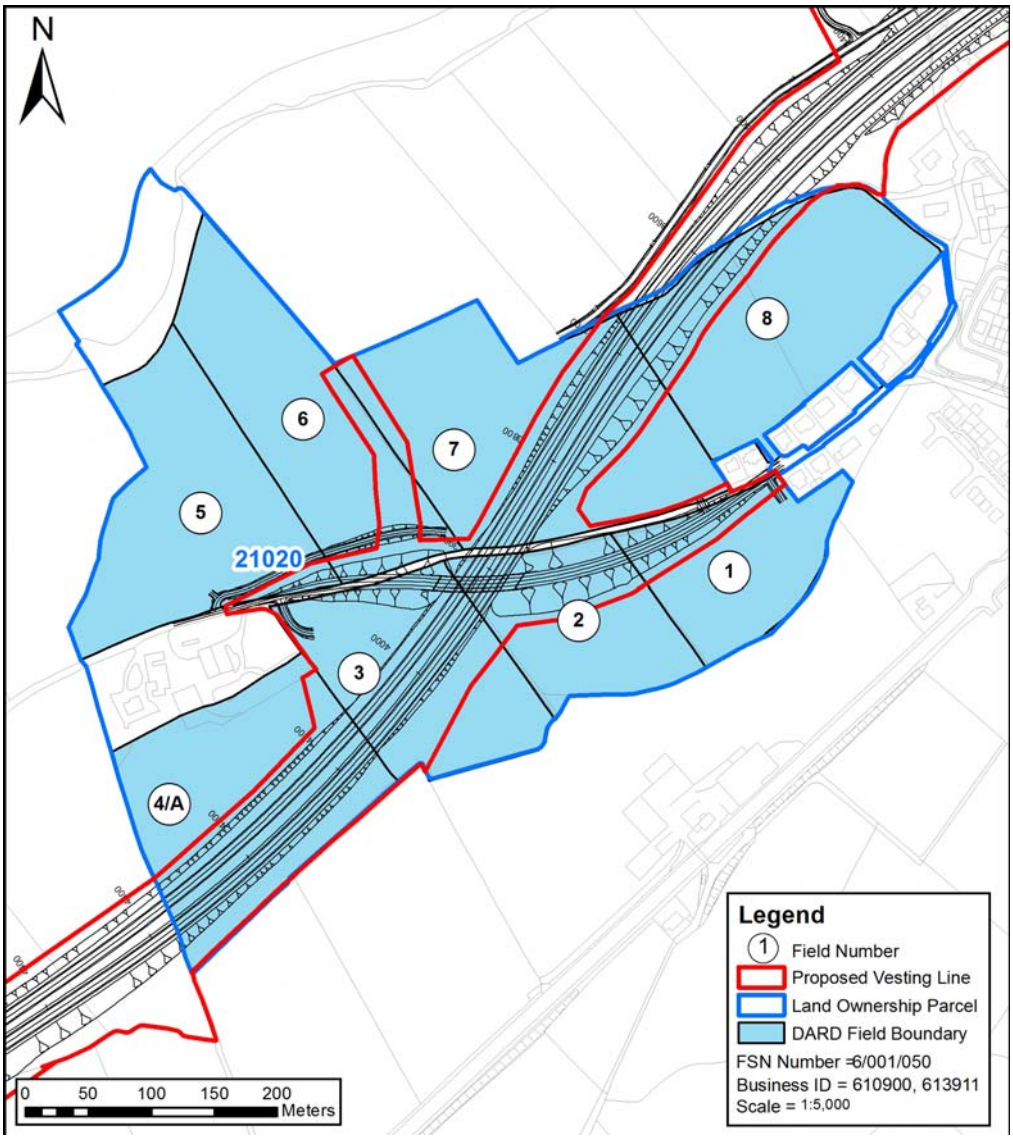
© Mouchel 2016

There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase, access to severed land adjacent to the River Foyle, will need to be maintained.	
Predicted Effects	The loss of 13.1% of the available productive land would have a substantial impact on the farms potential output and constitute a substantial adverse effect on the farm.

© Mouchel 2016

Land Parcel Ref	21020	**DARD Business Ref**	613911
		Data Sources	June 2010 meeting, Feedback received for 2013 AIA letters/ 2014 Land confirmation meeting. Declined 2014 AIA meeting request.
Conacre Parcel Ref	Fields 5, 7, 8 let in conacre		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm Landowner did not wish to meet in 2014. Information based on 2010 AIA. The farm extends to 21.29ha of owned land. The land is mainly arable, and is in a rotation of crops and grass.	
Type of Enterprise and Husbandry The farm provides a “bed and breakfast” facility for 60-70 cattle each winter, with the farm providing accommodation food and management. The farm also buys in approximately 100 ewes, lambing them down to produce 150 lambs which are carried through to finish. One field is currently in potatoes in a rotation.	
Conacre Arrangement	Fields 5, 7 and 8 are let in conacre in 2014 to a landowner who farm is not affected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

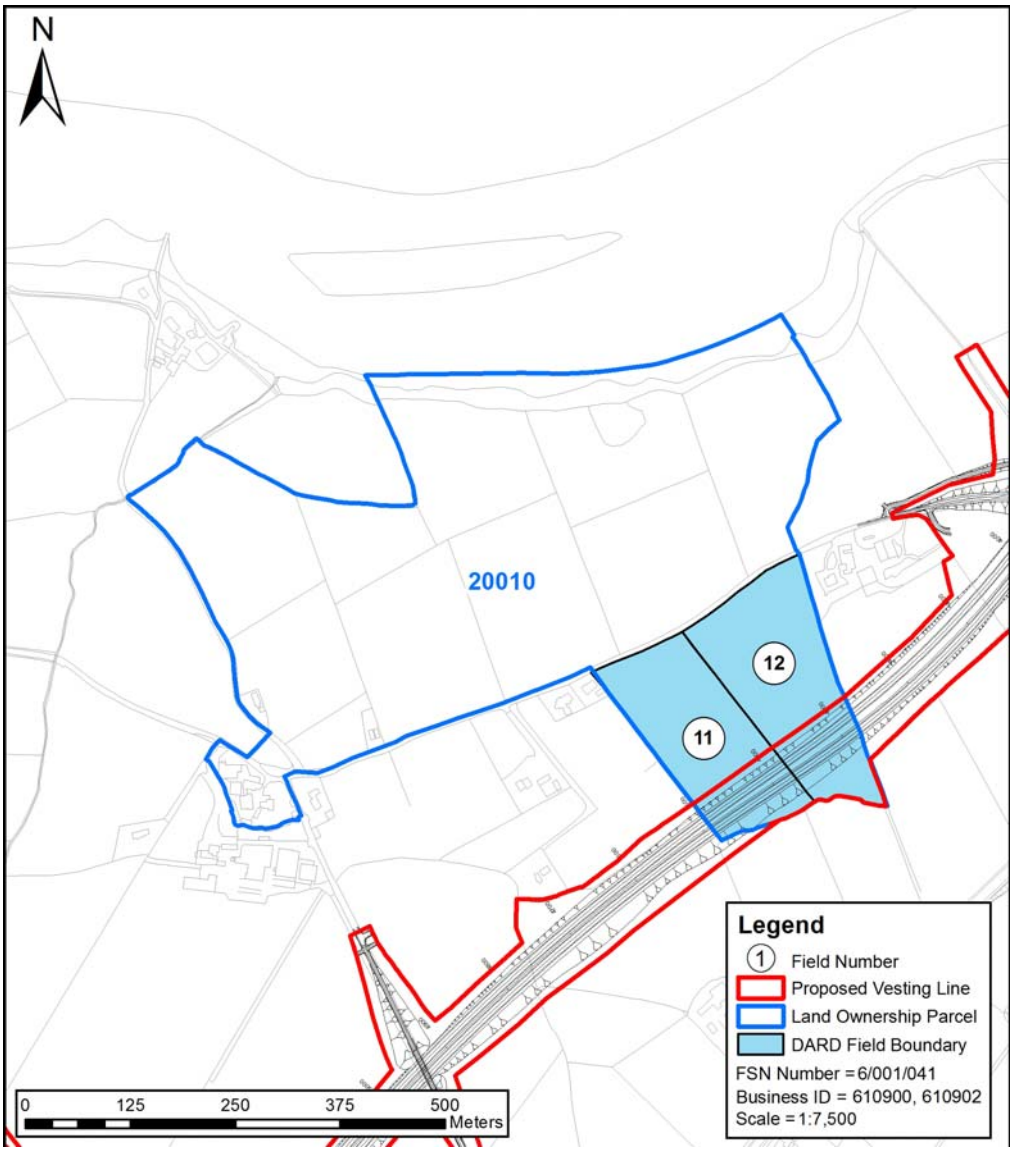
Predicted Impacts Total loss of 7.54 hectares from fields 1, 2, 3, 4/A, 5, 6, 7 and 8 of the 21.9 hectare farm equating to 34.4% of the productive land. Fields 5, 7 and 8 are let out in conacre. This would include land required for the realigned Dunnalong Road. New severance would impact on the farm from the alignment of the A5 WTC. Access would be provided to all severed land via the realigned Dunnalong Road which runs under the A5 WTC. There would be temporary impacts during the construction phase of the Proposed Scheme. No information is held on the conacre tenant's use of the conacre land, therefore, no conclusions can be made on how the proposed land take would impact the conacre tenant's farm.
Proposed Mitigation During the construction phase access to severed land would be maintained.

Predicted Effects	The loss of 34.4% of the available productive land would have a substantial impact on the farms potential output and constitute a **substantial adverse** effect on the farm.

© Mouchel 2016

Land Parcel Ref	20010	**DARD Business Ref**	Not available
		Data Sources	July 2010 meeting. No response to 2013 AIA letters/ 2014 Landowner confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Let in conacre to Parcel 20025 landowner, Datasheet 021-010.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to approximately 32ha of owned land.	
Type of Enterprise and Husbandry The land is all rented out in conacre to three landowners. Some of the land is arable, while the rest is in grass.	
Conacre Arrangement	Affected field 12 let in conacre to parcel landowner 20025. An impact on predicted impacts are outlined in Datasheet 021-010. No conclusions can be made about the impact on the conacre tenant of field 11 as there is not sufficient information on their farm.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is rented in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

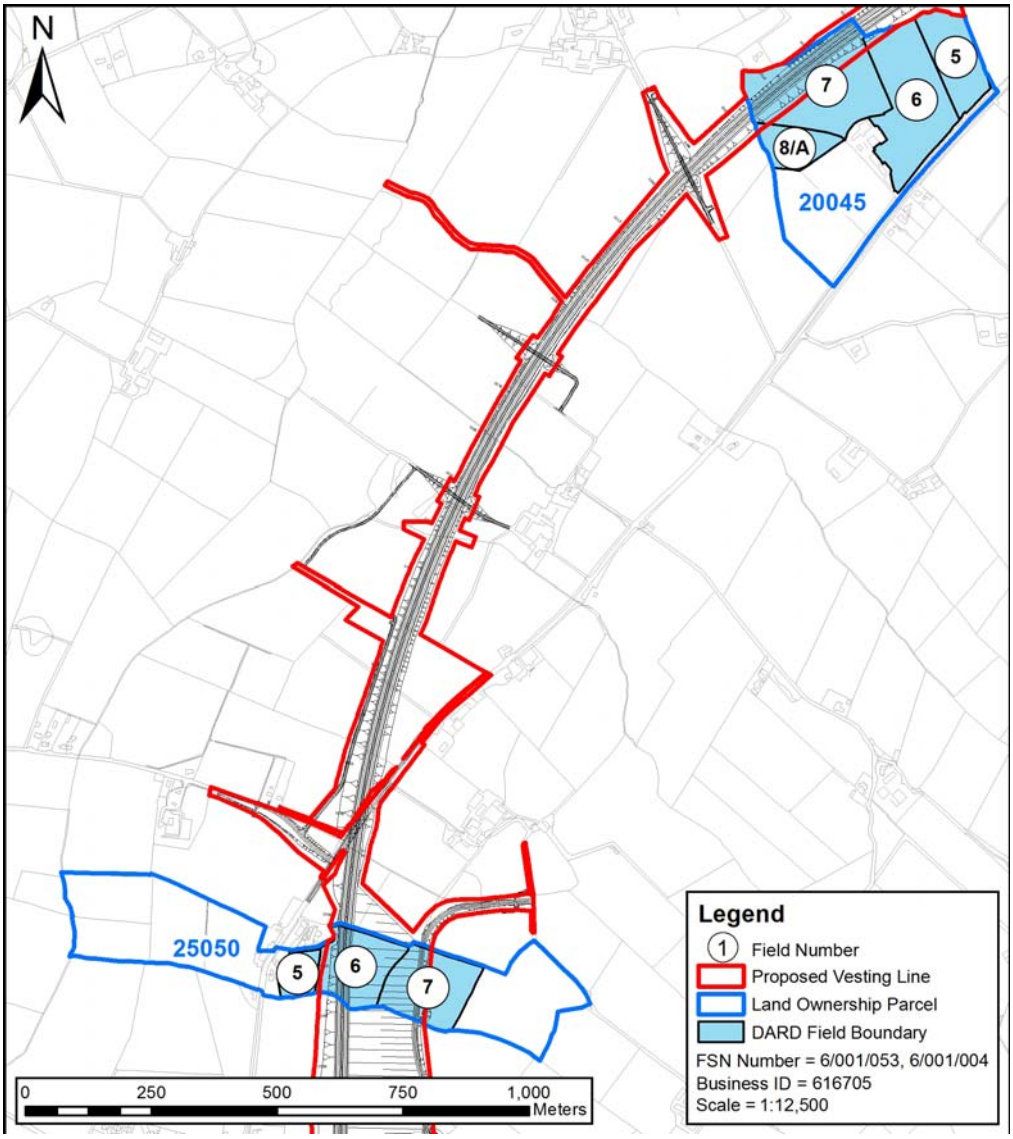
Predicted Impacts Total loss of 1.09 hectares of land from fields 11 and 12 of the 32 hectare farm equating to 3.4% of the productive land. This would include land to the south to the land parcel. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight. There would be no severance as a result of the Proposed Scheme.
Proposed Mitigation No mitigation is proposed.

Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	20045 & 25050	**DARD Business Ref**	616705
		Data Sources	2014 AIA meeting held. Feedback received for 2013 AIA letters/2014 Landowner confirmation meeting. September 2014 AIA meeting held.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends 73.39ha, of which 47.3ha is owned land and 26.09ha is taken in conacre. Conacre is taken from two landowners, both of which are not affected by the Proposed Scheme.	
Type of Enterprise and Husbandry The farm runs a herd of 45 suckler cows and 2 bulls, with all the progeny being finished as beef. In addition, the farm rears approximately 40-45 cross-bred beef calves for finishing. There are approximately 180 cattle on the herd list. In addition, the farm runs a flock of approximately 160 ewes and 8 rams, producing approximately 250 lambs, which are carried through to finish. Store lambs are also purchased in (20-30 per year) for finishing.	
Conacre Arrangement	26.09ha is taken in conacre, which is unaffected by the Proposed Scheme.
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	The landowner collects the Single Farm Payment on owned land.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	Some of the farm is classified Disadvantaged Area (DA) and Severely Disadvantaged Area (SDA), and is eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity

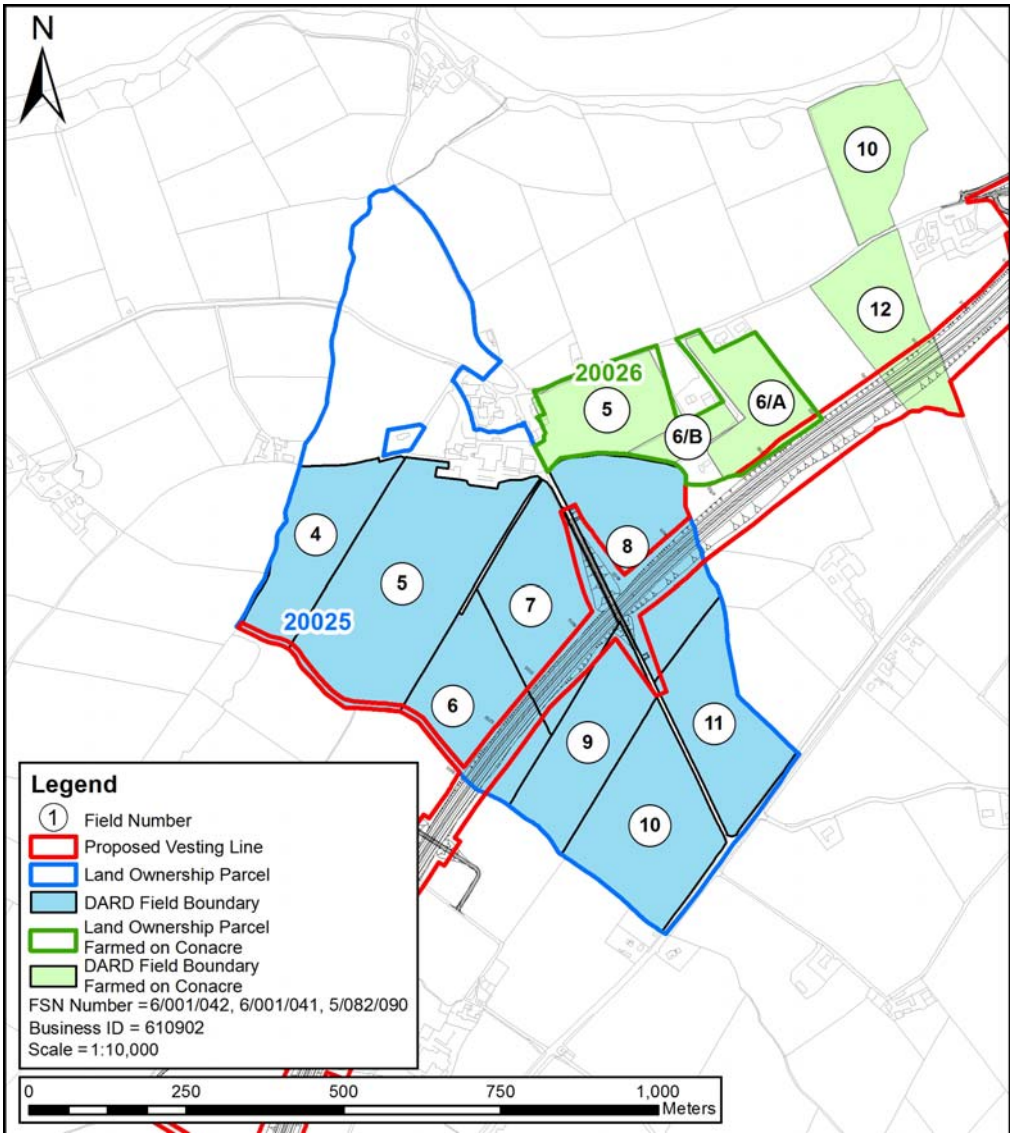
© Mouchel 2016

Predicted Impacts Total loss of 5.38 hectares of from fields 5, 6 and 7 in land parcel 25050 and fields 5, 6, 7 and 8/A of the 73.39 hectare farm equating to 7.3% of the productive land. During the construction phase, access to severed land will need to be maintained. The main impacts on this farm are severance and land take.	
Proposed Mitigation During the construction phase access to severed land will be required.	
Predicted Effects	The loss of 7.3% of the available productive land would have a slight impact on the farms potential output and constitute a slight adverse effect on the farm.

© Mouchel 2016

Land Parcel Ref	20025	**DARD Business Ref**	610902
		Data Sources	July 2010 meeting. 2013 AIA letter response & Landowner confirmation meeting identified minor changes to farm and scheme only, therefore no 2014 revisit
Conacre Parcel Ref	Conacre let from affected parcels 20010 & 20026		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 69.73ha, of which 45.9ha is owned land, with the remaining 24.34ha being taken in conacre, including 2 land parcels which are affected by the proposed scheme. Field no 6 is currently planted in forage maize, with the remainder of the farm being in grass.	
Type of Enterprise and Husbandry The farm runs a dairy herd of 140 cows, with a herd average of 7,500 litres. There are approximately 140 herd replacements and 3 bulls on the farm. There are a total of 280-290 cattle on the herd list. Bull calves are sold as dropped calves. The farm is grazed during the winter by sheep.	
Conacre Arrangement	24.34ha of land is let in conacre and based on 2010 information including land from affected parcels 20010 (718736-3000-R-013-008) & 20026. Landowner was not willing to confirm list of land interest in 2014 consultation.
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	The farm is currently over the limit of 170kg of organic nitrogen per ha and exports slurry to maintain compliance with the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	As this is a dairy farm the land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

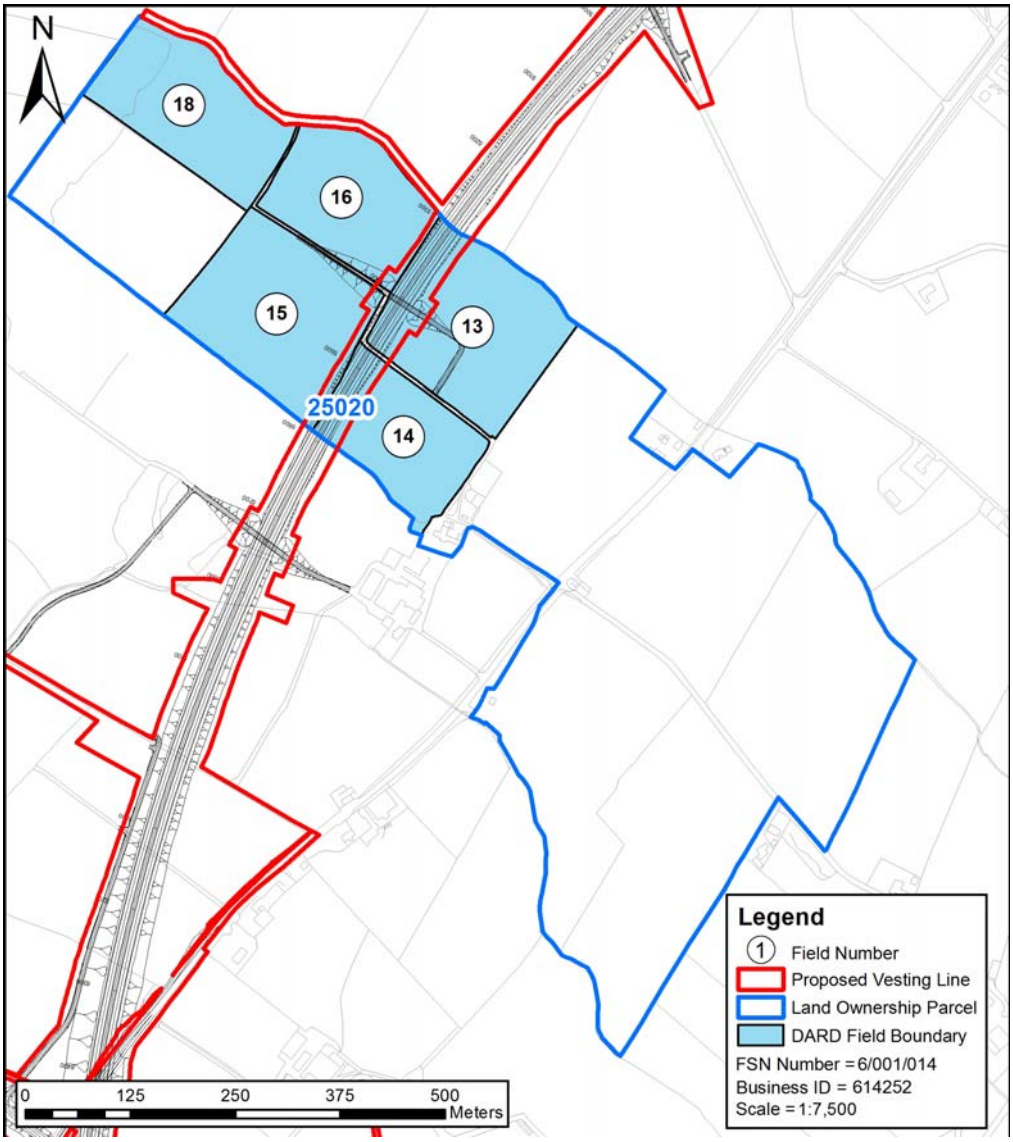
Predicted Impacts Total loss of 4.59 hectares from fields 4, 5, 6, 7, 8, 9, 10 and 11 of owned land in land parcel 20025. This equated to 10% of the owned land. Additional land taken in conacre is affected by the Proposed Scheme. The landtake is currently used as the grazing platform for the dairy herd. Under the Nitrates Directive, landtake may impact on future compliance. The landtake impacts would be moderate. New severance would impact on the farm. Access would be provided via the realigned Meenagh Road. The severance impacts would be a slight. There would be temporary impacts during the construction phase of the Proposed Scheme.
Proposed Mitigation During the construction phase access to severed land would be maintained.

Predicted Effects	The loss of 610% of the owned land would have a moderate impact on the farms potential output and constitute a moderate adverse effect on the farm.

© Mouchel 2016

Land Parcel Ref	25020	**DARD Business Ref**	614252
		Data Sources	2010 meeting held. Did not respond to 2012 AIA letters. 2014 Land confirmation meeting held. Declined 2014 AIA meeting request
Conacre Parcel Ref	Unknown		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 114.87ha of owned land, which is mainly is grass, with the occasional field being rented out in conacre for potatoes (field No. 12 in 2010). In addition, field Nos. 15 & 16 are normally arable and have been in maize silage.

Type of Enterprise and Husbandry

The farm runs a small suckler cow herd of 6 cows, with calves being sold either as stores or finished as beef.

In addition, the farm has accommodation for up to 350 beef cattle, which are bought in at approximately 350-400 kg and finished through to beef. As cattle are sold, cattle are bought in to replace them, resulting in a turn-over of approximately 700 – 750 beef cattle per year.

The farm runs a flock of 130 ewes and 3 rams, with approximately 200 lambs being finished each year. In addition, approximately 500 – 600 store lambs are bought in each autumn for finishing.

Conacre Arrangement	Unknown. Field no. 12 let in conacre in 2010.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land but not on conacre land.
Nitrates Directive	Given the high stocking rate of beef cattle, the farm is currently border-line, getting close to the upper limit of 170kg organic nitrogen per ha.
Countryside Management Scheme	The farm is all registered under the Countryside Management Scheme, including conacre land.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 1.71 hectares from fields 13, 14, 15, 16 and 18 of the 114.87 hectare farm equating to 1.5% of the productive land

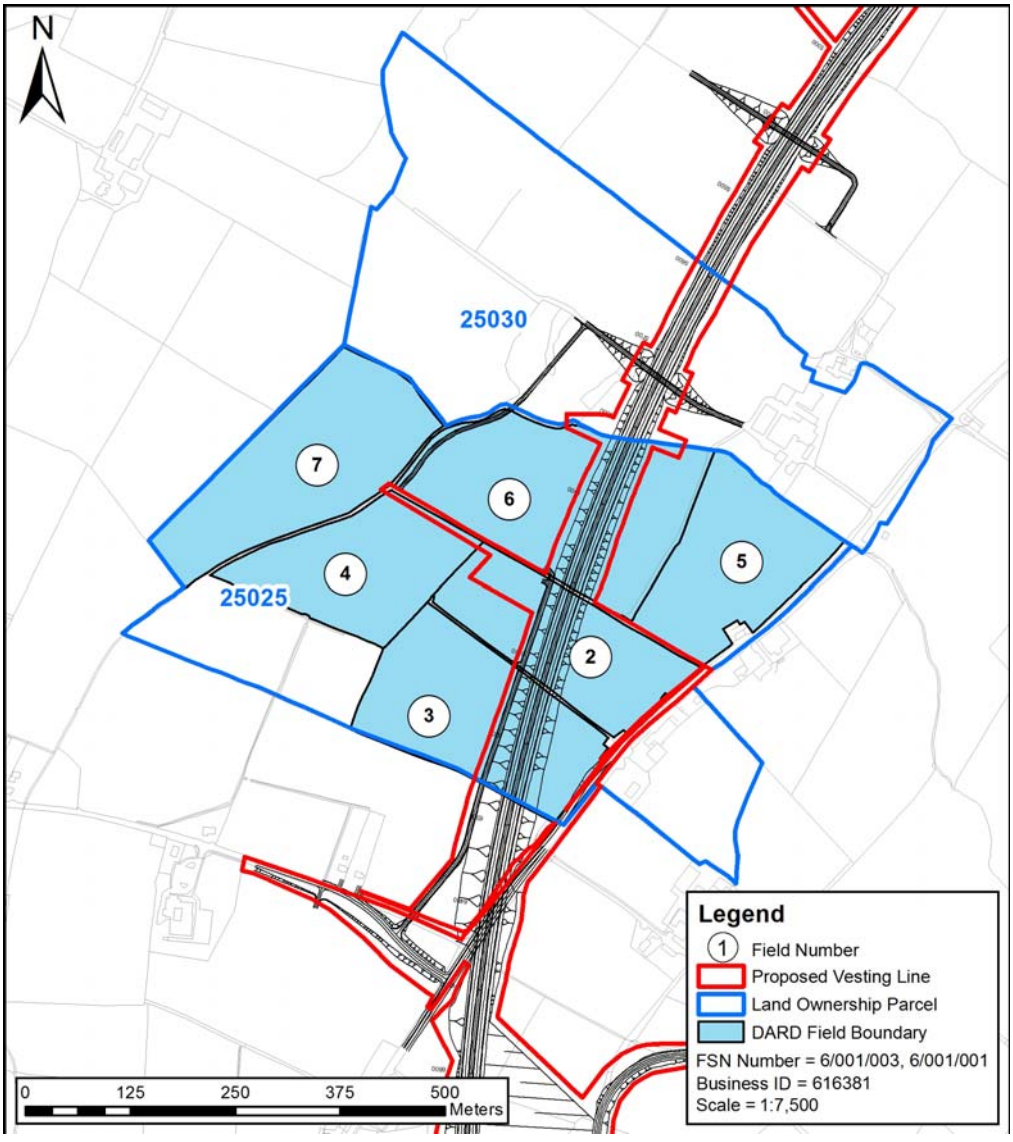
© Mouchel 2016

The landtake impacts would be slight. New severance would impact on the farm. Access would be provided to all severed land via a shared overbridge that connects fields 13 and 16. The severance impacts would be slight. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 1.5% of the available productive land would have a slight impact on the farms potential output and constitute a slight adverse effect on the farm.

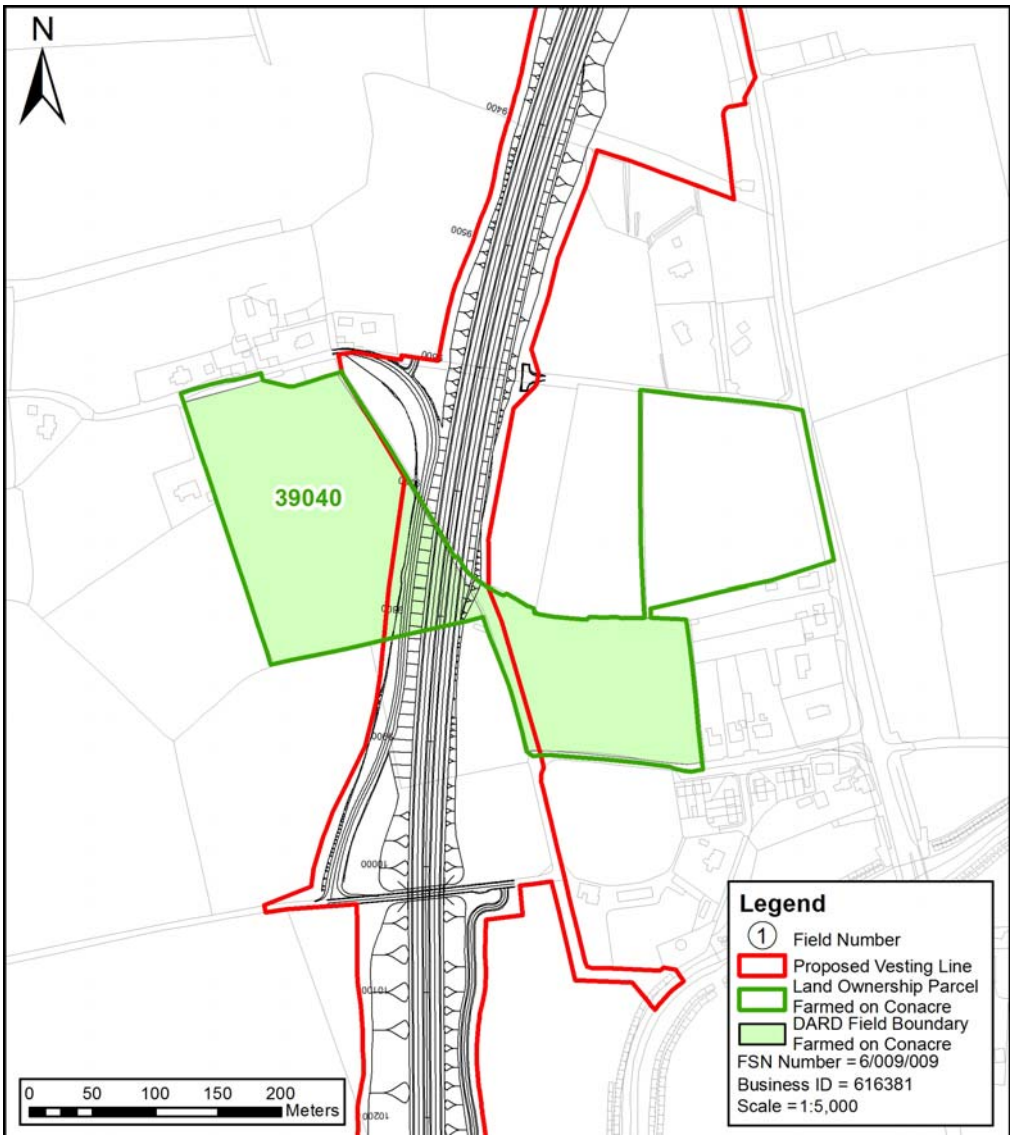
© Mouchel 2016

Land Parcel Ref	25025 & 25030	**DARD Business Ref**	616381
		Data Sources	2010 AIA meeting held. No response to 2013 AIA letters. Landowner meeting held. September 2014 AIA meeting held.
Conacre Parcel Ref	Affected conacre rented from parcel 39040.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016



Size and Quality of Farm

The farm extends to 128.72ha, of which 62.27ha is owned land, with the remaining 47.19ha being taken in conacre in 6 separate parcels. The farm is all in grass.

Type of Enterprise and Husbandry

The farm runs a dairy herd of 265 cows, with a herd average of 7,800 litres. In addition, there are approximately 100 young stock as herd replacements. There are approximately 420 cattle on the herd list.

During the day, cows are grazed on the grazing platform around the main farmyard. Cows are either housed at night or in full-time.

© Mouchel 2016

Conacre Arrangement	47.19ha of land is rented in conacre in 6 separate parcels. Including Parcel 39040 which is affected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land but not on conacre land.
Nitrates Directive	Given the high stocking rate there may be implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all registered Lowland (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 7.4 hectares from fields 2, 3, 4, 5, 6 and 7 in land parcel 25025 and 25030 as well as 0.71ha in land parcel number 39040 taken in conacre. This equates to 6.3% of the farms productive land.

Landtake from parcel 25025 would impact the availability of grass for the dairy herd. Grass on this area is currently zero grazed and transported to the farmyard, for cows, which are housed overnight. Under the Nitrates Directive, landtake may impact on the farm. The landtake impacts would be substantial.

New severance would impact on the farm. Access would be provided to parcel 25025 via a farm lane to the north of the parcel which links to Victoria Road (existing A5). Access to severed land in parcel 25030 would be provided via an overbridge connecting fields 22 and 23. The severance impacts would be slight.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

During the construction phase, access to severed land would be maintained, on both affected parcels.

Access would be provided to parcel 25025 via a farm lane to the north of the parcel which links to Victoria Road (existing A5). Access to severed land in parcel 25030 would be provided via an overbridge connecting fields 22 and 23.

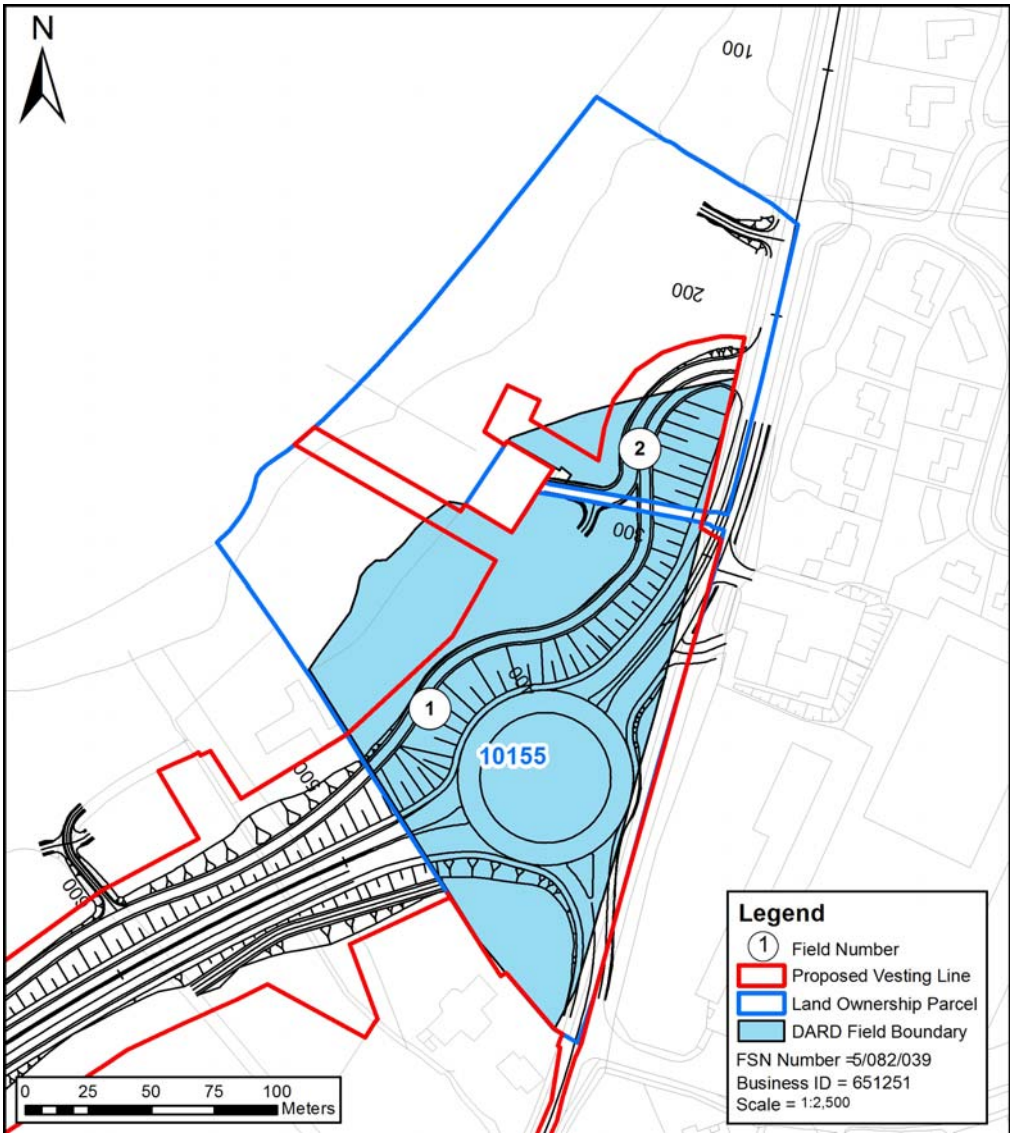
© Mouchel 2016

Predicted Effects	The overall impact of the scheme on the farm is considered to be significant but with an overbridge, the impact is considered to be **moderate adverse.**

© Mouchel 2016

Land Parcel Ref	10155	**DARD Business Ref**	651251
		Date of Visit	2010 meeting held. 2013 AIA letters not returned, no landowner confirmation meeting held. Minor change to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Let in conacre to parcel 10025 landowner, Datasheet 021-005		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

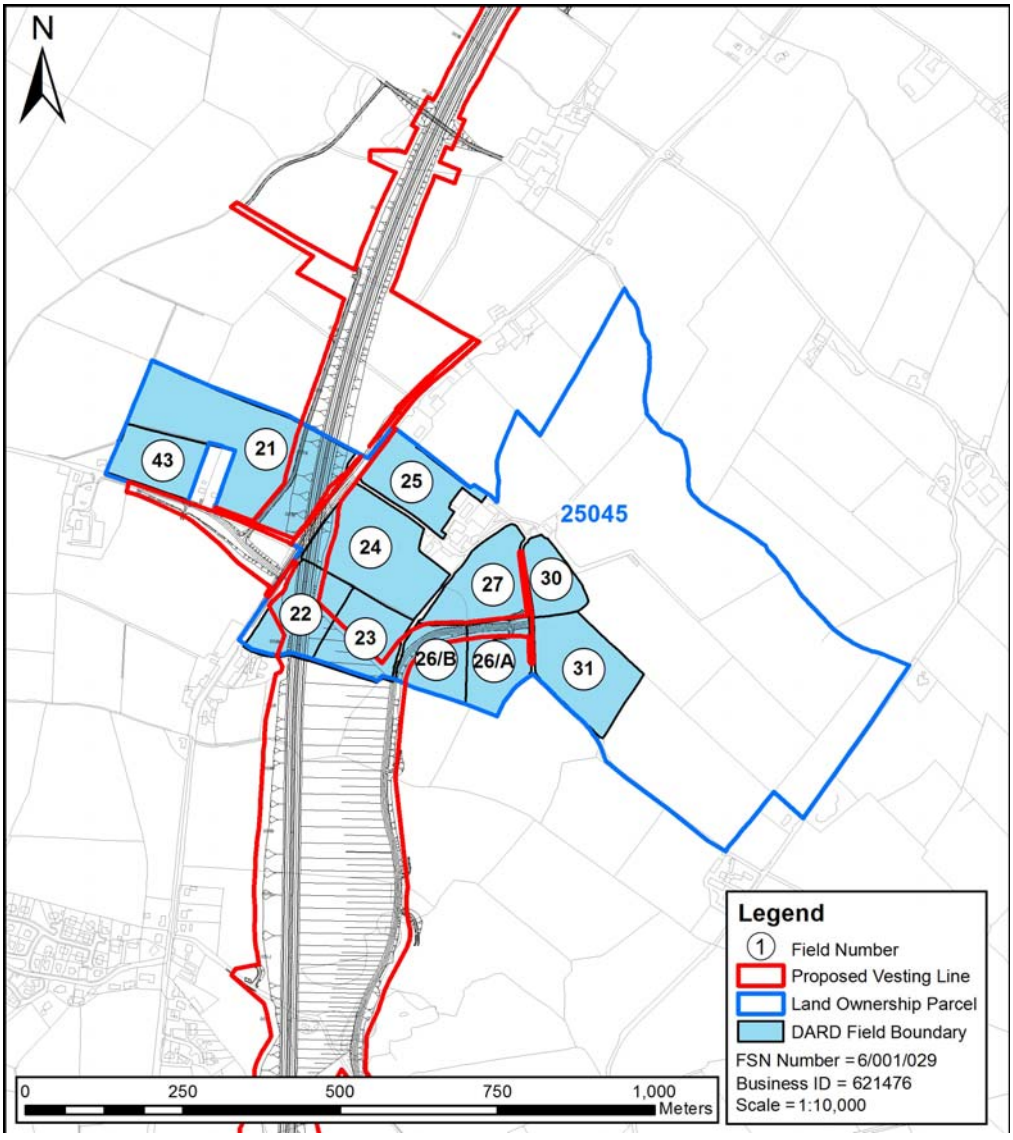
Size and Quality of Farm The farm extends to 4.4ha of which approx. 1.6ha is in grass.	
Type of Enterprise and Husbandry All the land is let in conacre	
Conacre Arrangement Let in conacre to parcel 10025 landowner. An assessment of the impacts on the conacre tenant are outlined in Datasheet 021-005.	
Single farm payment	Unknown
Nitrates Directive	No implication to the landowner.
Countryside Management Scheme	No information
Less Favoured area Compensatory Allowance Scheme	Since the land is in conacre, it is not eligible for payments under LFACAS.
Biosecurity	No Biosecurity issues have been highlighted.

Predicted Impacts Total loss of 2.2 hectares from fields 1 and 2 of the 4.4 hectare farm equating to 50% of the productive land. The main impacts of the Proposed Scheme would be land take. Landtake for the Proposed Scheme would be approximately 2.2ha. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner is considered slight adverse.	
Proposed Mitigation During the construction phase access to severed land will be required.	
Predicted Effects	The predicted effect of the proposed A5WTC on the farm is **slight adverse.**

© Mouchel 2016

Land Parcel Ref	25045	**DARD Business Ref**	621476
		Data Sources	March 2010 meeting held. Identified a change to the farm in the landowner confirmation meeting 2014. Did not respond to 2014 AIA meeting invitation.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 126.28ha of owned land, with a further 21.51ha in conacre which is not affected by the proposed scheme.

The farm is all in grass.

Type of Enterprise and Husbandry

This is an intensive beef and dairy farm.

The dairy herd contains approximately 110 cows and 1 bull, with a herd average of 7,500 litres. In addition, the farm runs approximately 70 young stock as herd replacements.

The farm has accommodation for 350 beef cattle, with 150 home reared calves all being finished, plus a further 200 bought-in store cattle (350-400kg) per year, which are carried through to finish.

The cow grazing platform includes field No's 21-25. The current limits of the cow grazing platform are 32, 34, 35, 36 & 29 (not all fields are marked on plan above). All of the other fields are either cut for silage or graze young stock or dry cows. Field No 21, on the opposite side of the A5, is cut for silage, with the after grass being grazed by young stock.

Conacre Arrangement	Land taken in conacre unaffected. Approximately 21.51ha rented in conacre.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land and also on conacre land.
Nitrates Directive	The farm is currently registering over 160kg organic nitrogen per ha, which is coming close to the 170kg per ha maximum limit. Consequently, there may be implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Some of the owned land is registered Disadvantaged Area (DA) and Severely Disadvantaged Area (SDA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts

Total loss of 4.49 hectares from fields 21, 22, 23, 24, 25, 26/A, 26/B, 27, 30, 31 and 43 of the 128.72 hectare farm equating to 5.7% of the productive land.

This would include some of grazing platform used by the dairy herd. Under the Nitrates Directive, the landtake may have implications for the farm. The landtake impacts would be moderate.

New severance would impact on the farm. Access would be provided to severed land via the realigned Cloghboy Road. The severance impacts would be slight.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

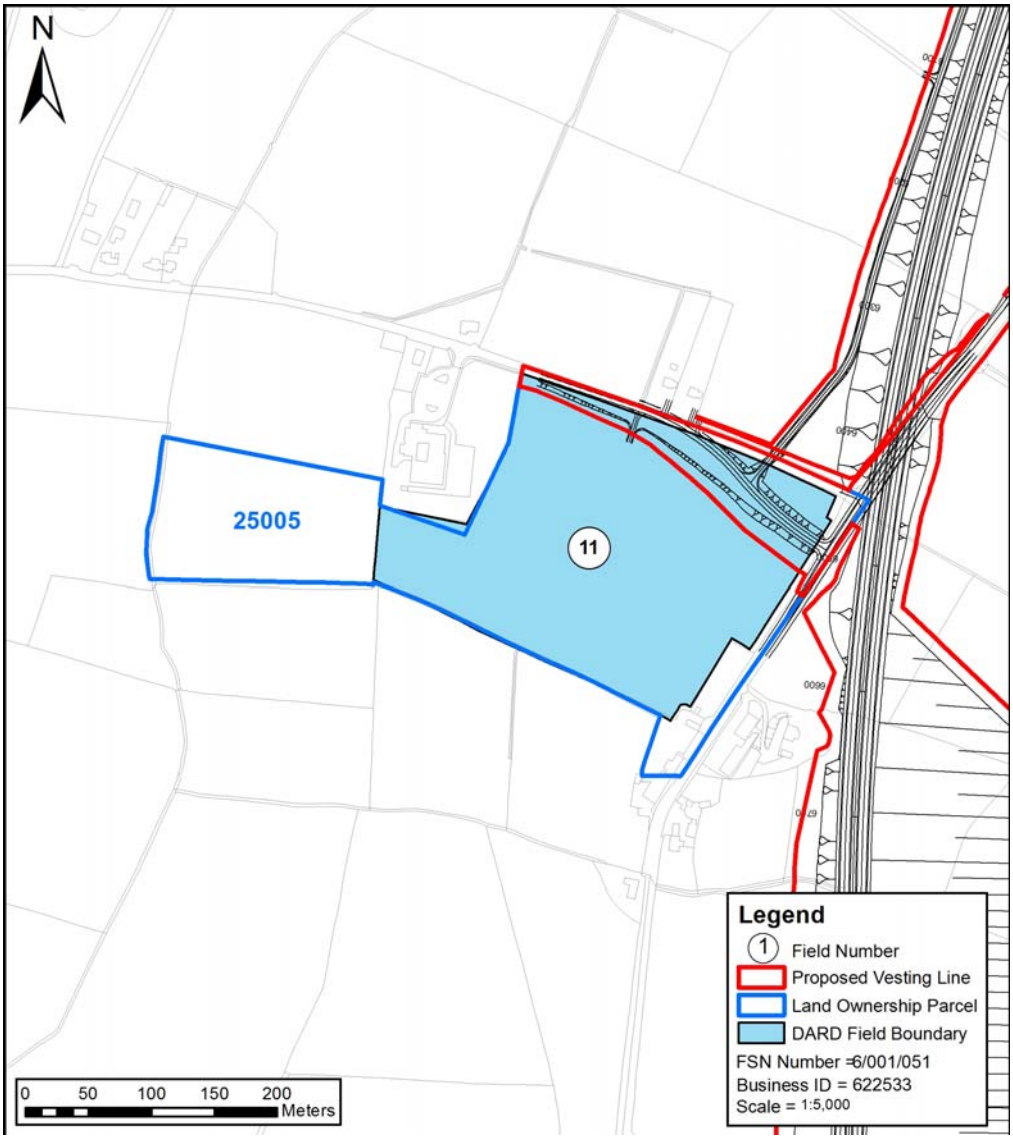
During the construction phase access to severed land would be maintained.

Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

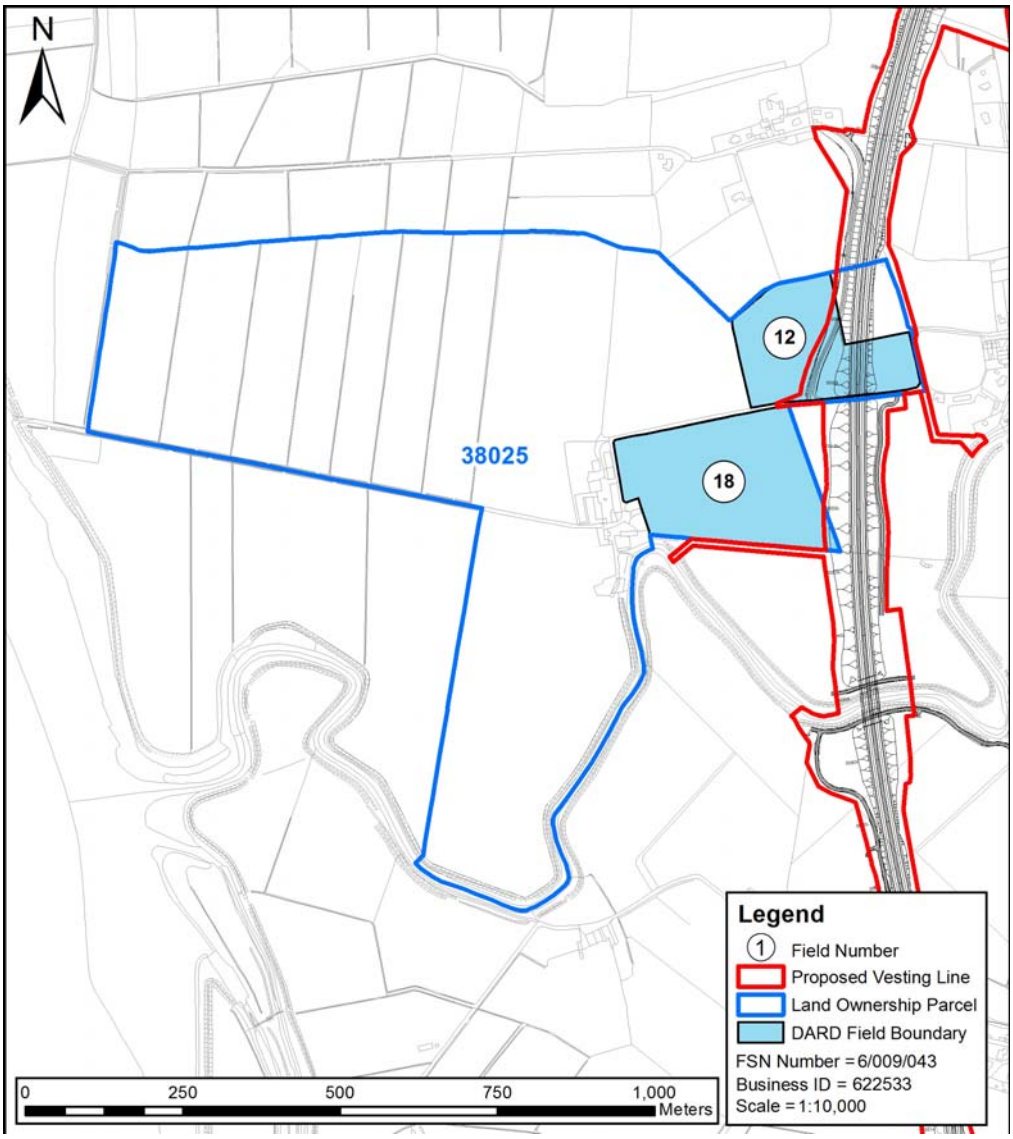
© Mouchel 2016

Land Parcel Ref	25005, 38025	**DARD Business Ref**	622533
		Data Sources	2010 AIA meeting held. Responded to AIA letters and landowner confirmation meeting. September 2014 meeting held.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016



Size and Quality of Farm

The farm extends to 152.16ha of owned land. Additional land is rented in conacre which is unaffected by the Proposed Scheme.

Type of Enterprise and Husbandry

The farm runs a suckler herd of 70 – 80 cows plus 2 bulls, with all the progeny being over-wintered, grazed the following summer and sold as stores or, alternatively, finished for beef.

In addition the farm runs a flock of 200 ewes, plus 7 - 8 rams, producing approximately 300 lambs, which are carried through to finish.

© Mouchel 2016

Conacre Arrangement Land rented in conacre is unaffected by the Proposed Scheme.	
Single farm payment	The landowner collects the Single Farm Payment on owned land, and on land rented off Stevenson.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land in FSN6/009/043 is all registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	Some of the land is registered Disadvantaged Area (DA) and Severely Disadvantaged Area (SDA), and is eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

Predicted Impacts

Total loss of 4.3 hectares in fields 11 in land parcel 25005 and fields 12 and 18 in land parcel 38025 of the 152.16 hectare farm, equating to 2.8% of the productive land.

During the construction phase access will need to be maintained to severed parcels.

The main impacts on this farm are severance and land take.

The overall impact of the scheme on the farm is considered to be **moderate adverse.**

Proposed Mitigation

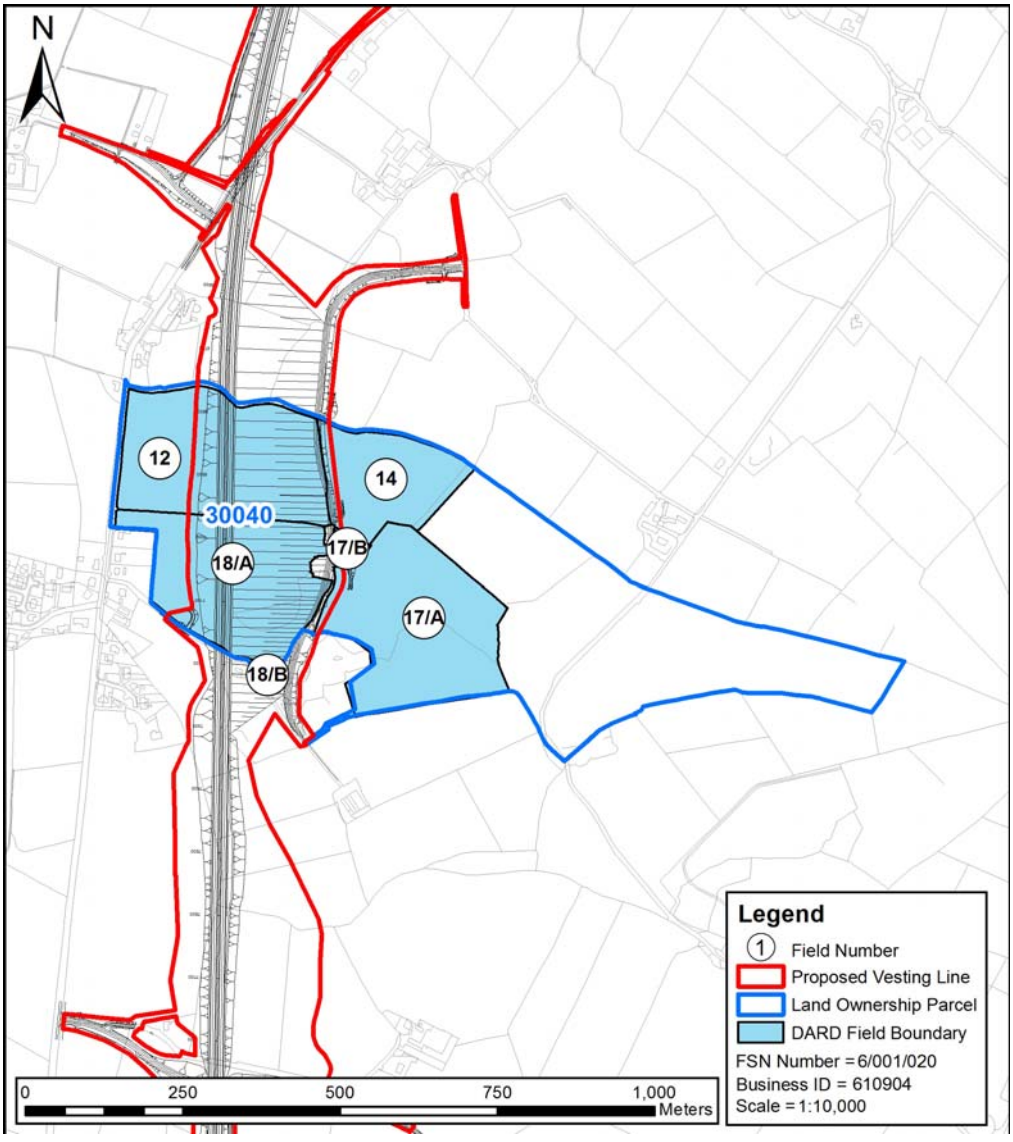
During the construction phase access to severed land will be required.

Predicted Effects	The residual effect of the Proposed Scheme on the farm is **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	30040	**DARD Business Ref**	610904
		Data Sources	2010 AIA meeting held. Responded to 2013 AIA letter and 2014 Land confirmation meeting. September 2014 meeting held.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 110.44ha, of which 72.84 ha is owned land, with the remainder being rented in conacre. The farm is all in grass, with the exception of approximately 9.4ha of arable for barley, which is grown in rotation around the farm.	
Type of Enterprise and Husbandry The farm runs a herd of 75 suckler cows and 2 bulls, with all the progeny being finished for beef. In addition, approximately 30 store cattle (350kg liveweight) are bought in for finishing. There is also a flock of 240 ewes and 10 rams, producing approximately 400 lambs, which are all carried through to finish. Stock are housed in two separate farmyards – namely on the home farm and also in a yard on conacre land at the end of the Tamnabrady Road.	
Conacre Arrangement	Approximately 37.6ha of land is rented in conacre from 2 different landowners. The conacre is not affected by the Proposed Scheme.
Single farm payment	The landowner collects the Single Farm Payment on owned land and also on conacre land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive as the organic nitrogen is approximately 130kg/ha (2013 data).
Countryside Management Scheme	Owned land is registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	Two fields and some of the conacre land is classified either Disadvantaged Area (DA) or Severely Disadvantaged Area (SDA), and is eligible for payments under LFACAS.

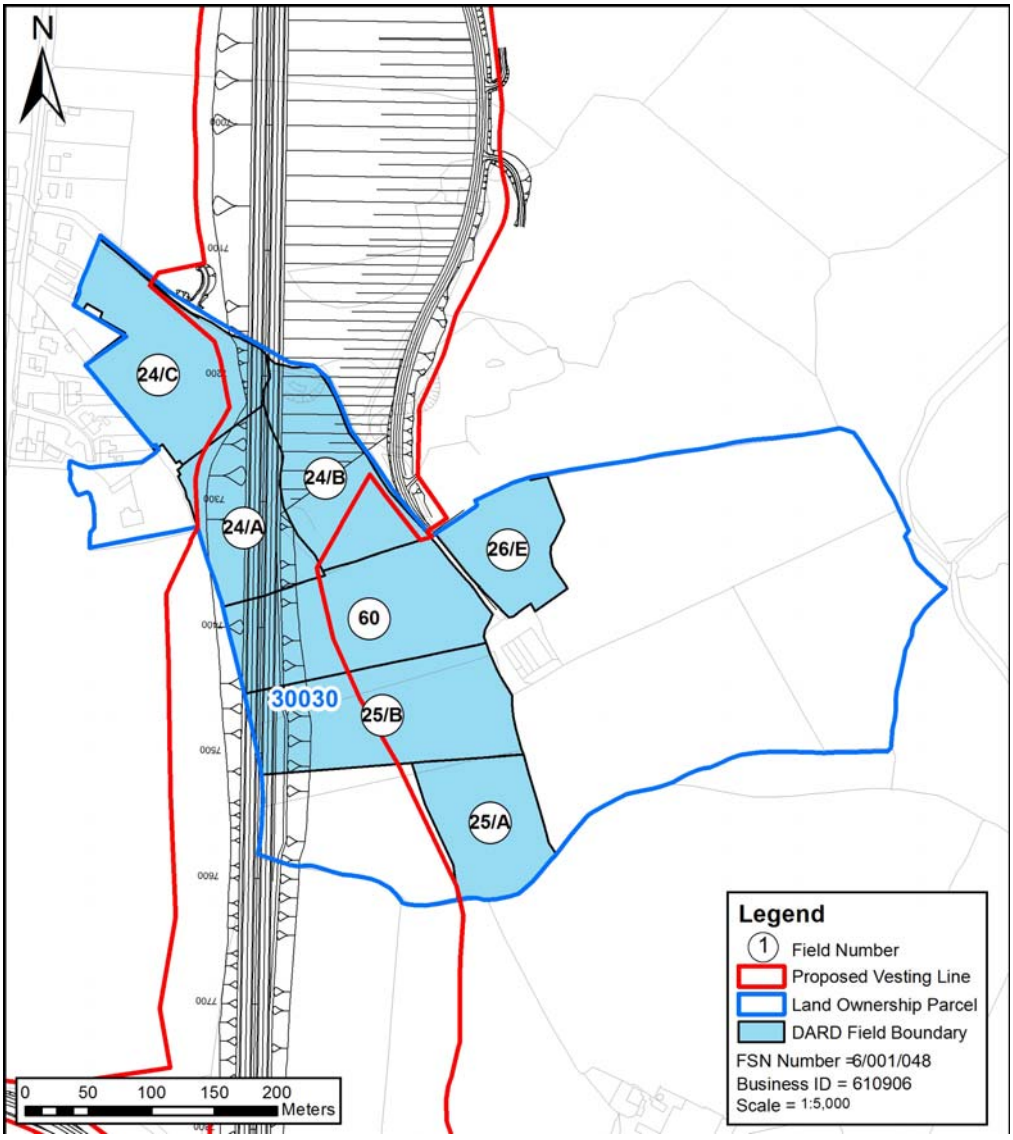
© Mouchel 2016

Biosecurity	There are no issues of biosecurity that are not already being addressed.
Predicted Impacts Total loss of 9.2hectares from fields 12, 14, 17/A, 17/B, 18/A and 18/B of the 110.44 hectare farm equating to 8.3& of the productive land. During the construction phase access will need to be maintained to Field Nos 14, 15 & 17A/B (FSN6/001/020). The main impacts on this farm business are severance and land take.	
Proposed Mitigation During the construction phase access will need to be maintained.	
Predicted Effects	The residual effect of the proposed A5WTC on the farm is a **moderate adverse** impact

© Mouchel 2016

Land Parcel Ref	30030	**DARD Business Ref**	631690
		Data Sources	May AIA 2010 meeting held. 2014 AIA letter, correspondence identified minor changes to farm and scheme only. Therefore no 2014 revisit.
Conacre Parcel Ref	Let in conacre to Datasheet 021-235		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 32.28ha of owned land, some of which is in grass and some arable.	
Type of Enterprise and Husbandry The farm is all rented out in conacre and not farmed by the landowner.	
Conacre Arrangement	All land is let in conacre to an otherwise unaffected farmer. An assessment of the impacts on the conacre tenant are outlined in Datasheet 021-235.
Single Farm Payment	The landowner collects the Single Farm Payment on Field Nos 50C-59 (not shown on the map), and also on 24A.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is not eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity.

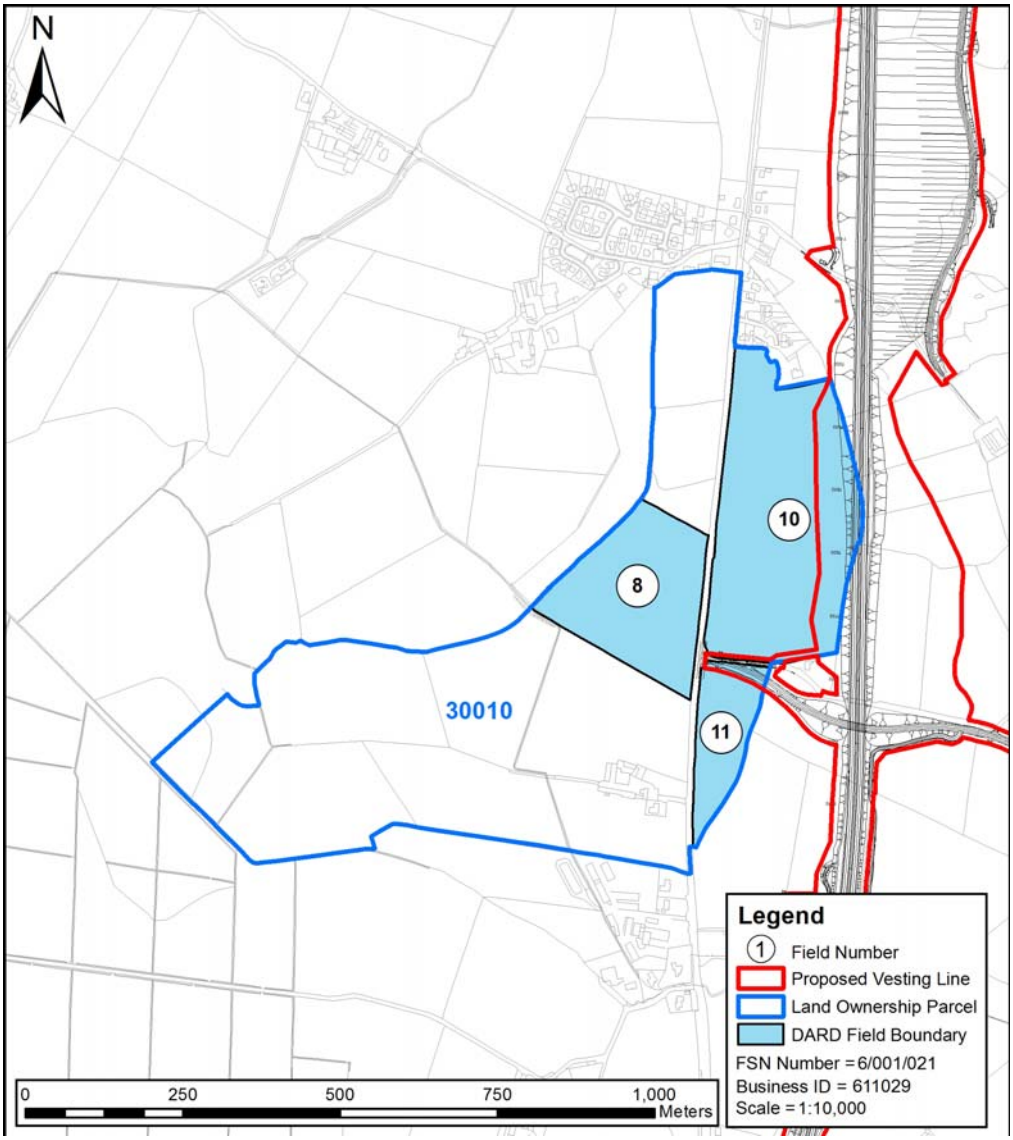
© Mouchel 2016

Predicted Impacts Total loss of 4.61 hectares of the 32.28 hectare farm equating to 14.3% of the productive land. This would include land for a deposition area. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight New severance would also impact on the farm. Access would be provided to severed land via a shared farm lane that links into Victoria Road (the existing A5). As the land is currently out in conacre and not farmed by the landowner directly, the severance impacts would be slight. There would be temporary impacts during the construction phase of the Proposed Scheme.
Proposed Mitigation During the construction phase access to severed land would be maintained.
Residual Effects The residual effect of the Proposed Scheme on the farm is **slight adverse**.

© Mouchel 2016

Land Parcel Ref	30010	**DARD Business Ref**	611029
		Data Sources	2010 AIA meeting held. No response to 2013 AIA letters. 2014 landowner confirmation meeting held. September 2014 AIA meeting held.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 44.35ha of owned land, which is all in grass, with the exception of Field No 10 and 11 which are in barley and kale respectively and 9A and B in potatoes. Not all fields are shown on the above plan.

Conacre is taken from a landowner that is not affected by the proposed scheme.

Type of Enterprise and Husbandry

The farm runs a suckler cow herd containing 25 cows, with all the progeny being finished for beef. In addition, approximately 50 cattle are bought in as stores (350kg) and carried through to finish. There are approximately 120 cattle on the herd list.

Conacre Arrangement	Land rented by the farmer in conacre is unaffected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned and conacre land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 2.63 hectares from fields 9, 10 and 11 of the 44.35 hectare farm equating to 5.9% of the productive land. This would include land taken for the realignment of Donaghedy Road.

There would be no severance as a result of the Proposed Scheme.

Proposed Mitigation

No mitigation is required.

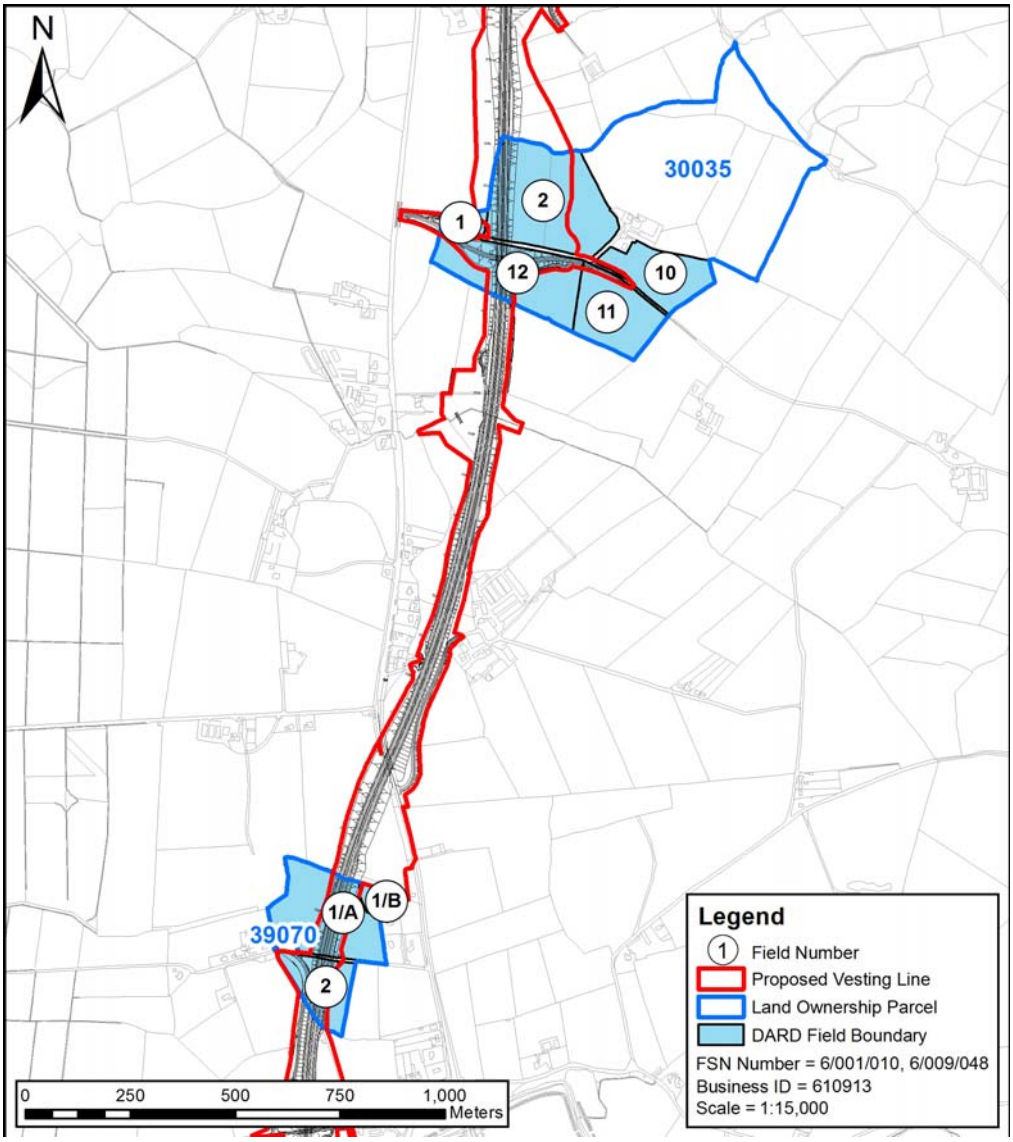
© Mouchel 2016

Predicted Effects	The loss of 5.9% of the available productive land would have a moderate impact on the farms potential output and constitute a moderate adverse effect on the farm.

© Mouchel 2016

Land Parcel Ref	30035, 39070	**DARD Business Ref**	610913
		Data Sources	2010 AIA meeting held. Did not respond to 2013 AIA letters. 2014 Landowner confirmation meeting held. September 2014 meeting
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm is run as a partnership. The farm extends to 143.98ha of owned land, most of which is in grass, with some fields being arable.	
Type of Enterprise and Husbandry The farm runs a dairy herd of 126 cows plus 2 bulls, with approximately 90 young stock retained as herd replacements. All bull calves are sold off the farm at birth. There are approximately 210 cattle on the herd list. The cow grazing platform includes field Nos 2 & 12, with field No 2 being long narrow paddocks. The Preferred Route will cut a section off the end of the paddocks, with the result that they will be too small for one-day paddocks for grazing herd. Paddock size will therefore have to be adjusted. Parcel 39070 is arable and are considered important to the farm as it is utilised for forage maize for the dairy herd. Access to additional land off Ash Avenue is also considered important, with stock grazed here having to be checked at least once and possibly twice, daily.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There may be implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified lowland (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts

Total loss of 10.24 hectares from fields 1, 2, 10, 11 and 12 from land parcel 30035 and from fields 1/A, 1/B and 2 in land parcel 39070 of the 143.98 hectare farm equating to 7.1% of the productive land.

The Proposed Scheme would take all of the paddocks in field number 2 (parcel 30035), with the result that they would be too small for one day paddocks for the grazing herd. The landtake impacts would be substantial.

New severance would impact on the farm. Access to field number 30035 would be provided across the realigned overbridge. Access to parcel number 39070 would be provided off Ash Avenue and via a shared farm lane off Drumenny Road. The severance impacts would be moderate.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

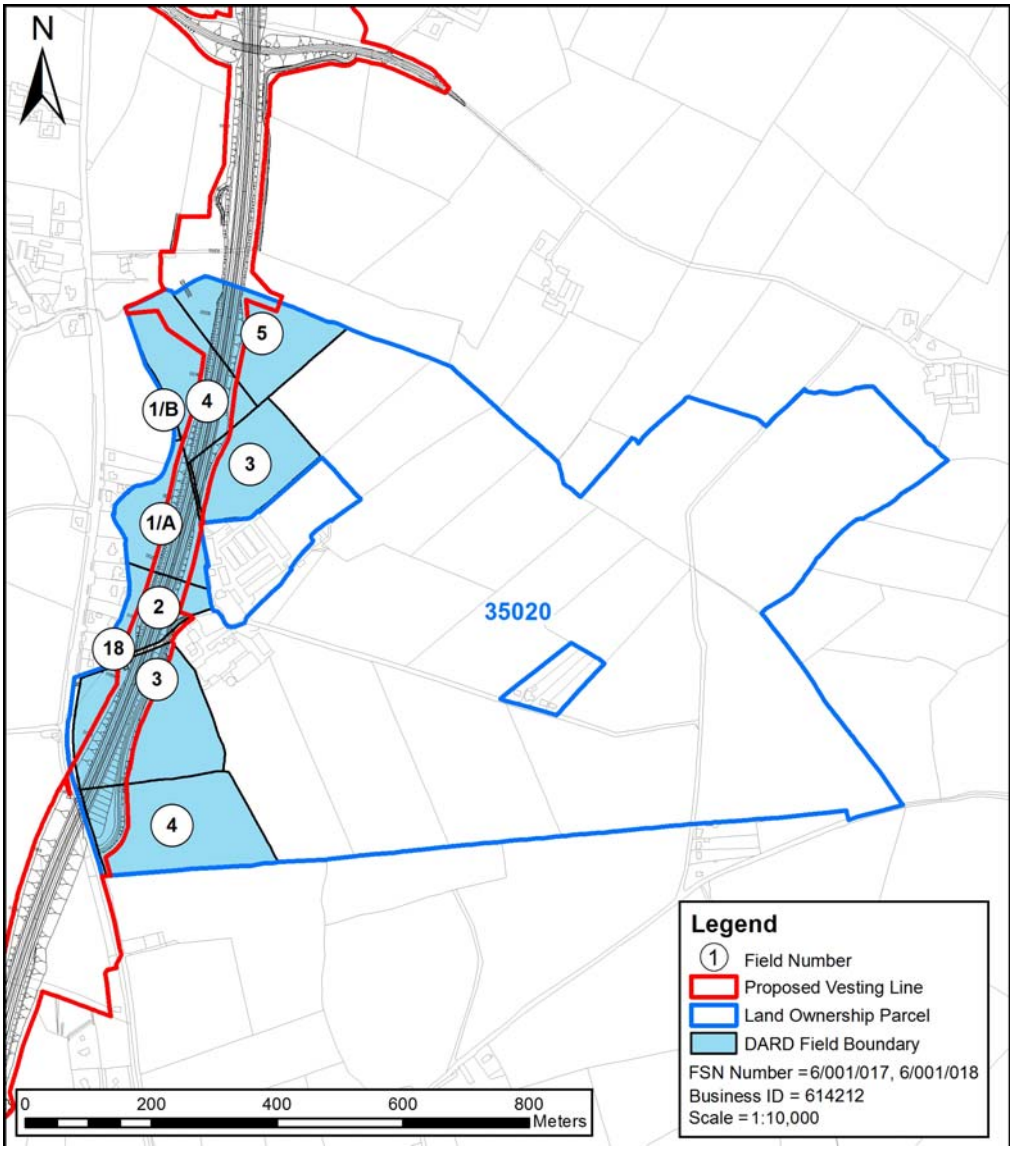
During the construction phase access to severed land would be maintained to facilitate access to the grazing platform for the dairy herd. Similarly, access to severed land in Parcel No 39070 would be maintained.

Predicted Effects	The loss of 7.1% of the available productive land, including the loss of paddock and resulting severance would constitute a **substantial adverse** effect in the farm.

© Mouchel 2016

Land Parcel Ref	35020	**DARD Business Ref**	614212
		Data Sources	March 2010 meeting held. 2013 AIA letters not returned and declined 2014 landowner confirmation meeting. Minor changes to the scheme only, therefore not revisited in 2014.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 80.35ha of owned land.

Most of the farm is in grass, with the exception of some fields, which are utilised for maize silage and whole crop wheat.

Type of Enterprise and Husbandry

The farm runs a herd of 120 dairy cows with a herd average of approximately 11,000 litres. The cows are milked 3 times a day when calving starts in September, through to August each year.

There are approximately 200 young stock retained on the farm, with heifers all being reared and surplus replacements sold off for breeding. In addition, approximately 20 bulls are selected and reared for sale as breeding bulls. Bull calves, which are not suitable for breeding, are sold off as dropped calves.

Approximately 200 ewes are brought in each winter for grazing.

Field Nos. 3 – 7 (FSN 6/001/018) are all utilised for silage (normally 2 cuts), with the after grass being grazed. These are also the fields which get slurry after silage cuts. In addition, field Nos. 6, 7 & 8 (FSN 6/001/017) also get cut for silage, with field No. 6 normally being cropped for maize silage. Not all fields are shown on the plan above.

The grazing platform for the dairy herd is normally, field Nos. 1, 2, 3, 4, 5 (FSN 6/001/017), with field Nos. 9, 10, 11 & 17 (FSN 6/001/017) generally being grazed by the young stock and or dry cows.

Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	Due to the high stocking rate, the farm is currently well over 160kg organic nitrogen per ha, which is close to the upper limit of 170kg per ha.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Low Land (LL) and is not eligible for payments under LFACAS.

© Mouchel 2016

Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 6.9 hectares from fields 1/A, 1/B, 2, 3, 4, 5 and 18 of the 80.35 hectare farm equating to 8.6% of the productive land.

This would include land from the grazing platform of the dairy herd. Under the Nitrates Directive, landtake may impact on future compliance. The landtake impacts would be substantial.

New severance would impact on the farm. Access would be provided off Victoria Road (the existing A5) to severed land to the west. The severance impacts would be substantial.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

During the construction phase access to severed land would be maintained.

Predicted Effects	The loss of 8.6% of the available productive land would have a substantial impact and risk compliance with the Nitrates Directive as current stocking levels. In combination with new severance the Proposed Scheme would constitute a substantial adverse effect on the farm.

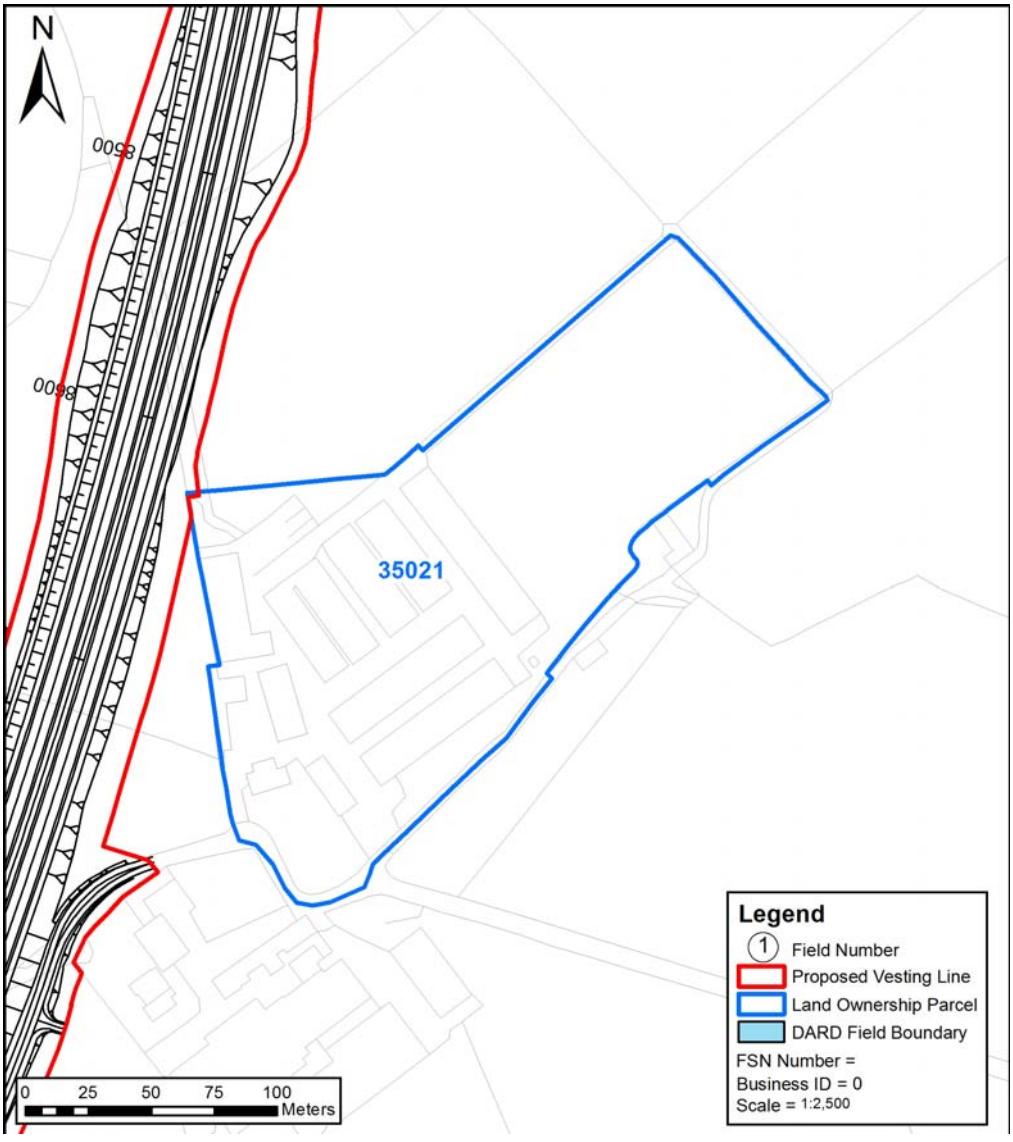
Land Parcel Ref	35021	**DARD Business Ref**	Not available
		Data Sources	April 2010 meeting – 2014 correspondence identified minor changes to farm and scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm business. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm This is a large broiler unit with capacity of 120,000 birds, housed in 3 houses, with 40,000 birds in each.	
Type of Enterprise and Husbandry The unit produces up to 7 crops per year, with birds being slaughtered at 35-40 days of age. In addition, the farm relies on a well (9m deep), which supplies potable drinking water to both the broiler houses and the dwelling house. The last crop of birds had water consumption from the well of over 600m^3.	
Conacre Arrangement	N/a
Single Farm Payment	Not applicable
Nitrates Directive	Not applicable
Countryside Management Scheme	Not applicable
Less Favoured Area Compensatory Allowances Scheme	Not applicable
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts There would be impact of light and noise from the Proposed Scheme on the broiler unitswhich would be slight adverse.. During the construction phase there may be implications with regard to the affect of light and noise on the chicken farm.
Proposed Mitigation During the construction phase access to land would be maintained.

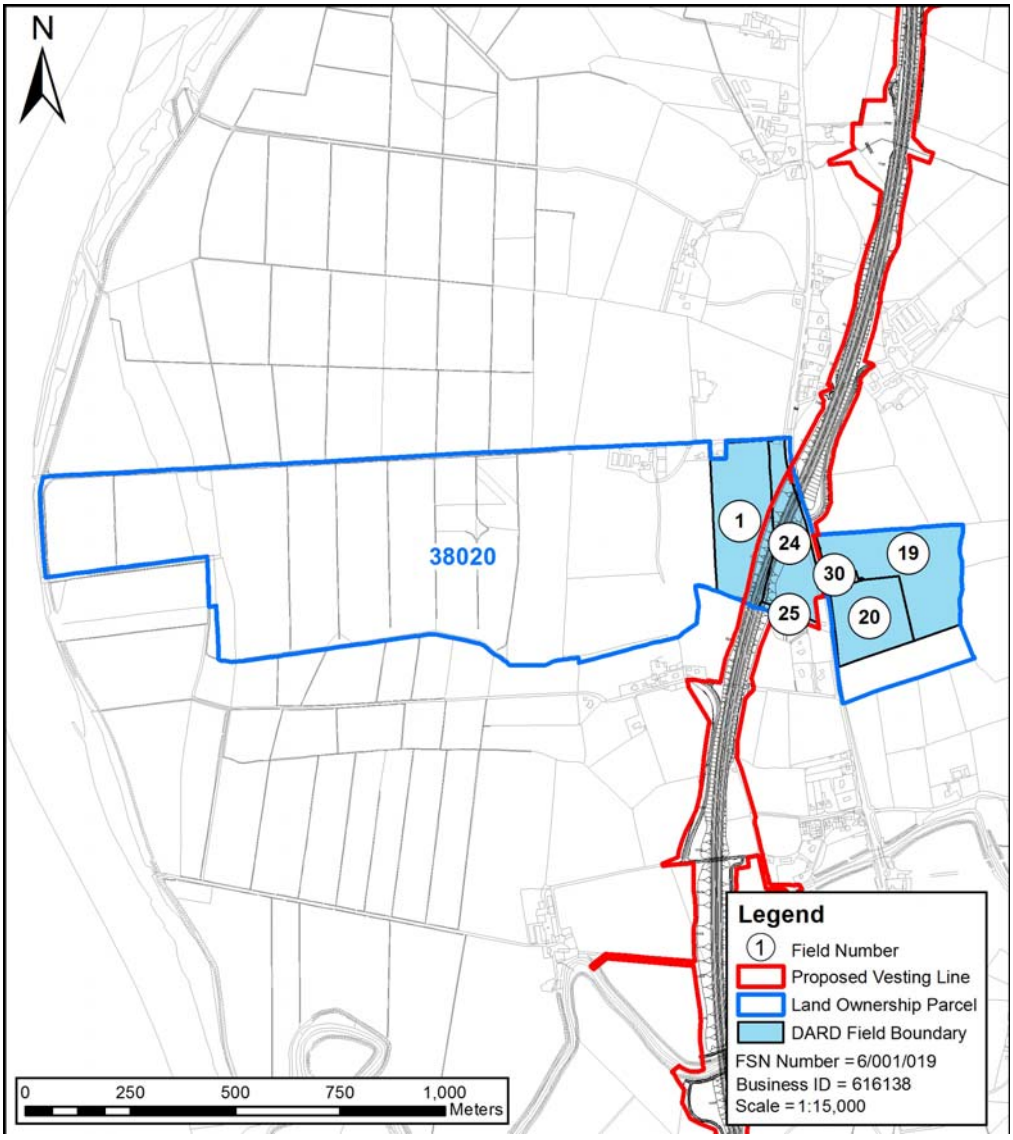
© Mouchel 2016

Residual Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	38020	**DARD Business Ref**	616138
		Data Sources	2010 AIA meeting held. Declined Landowner confirmation meeting but identified AIA changes. October 2014 meeting.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 81.97ha of owned land, some of which is in grass, with the remainder being arable (cereals and potatoes) with one or two fields planted up under the DARD Woodland Scheme.	
Type of Enterprise and Husbandry The farm runs buys approximately 350 - 400 black and white calves at 12 week old, and rears them for 'Rose' veal, which are finished inside. Not all field plan are identified on the above plan. Field Nos 7 & 8 are wooded, with field Nos 25, 26 & 29 being mature woodland. Field Nos 1, 4, 5, 19, 20 & 21 (not all fields are marked on plan above) are arable, growing forage maize, whole crop wheat, and barley, followed by grass in rotation.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme, including conacre land.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

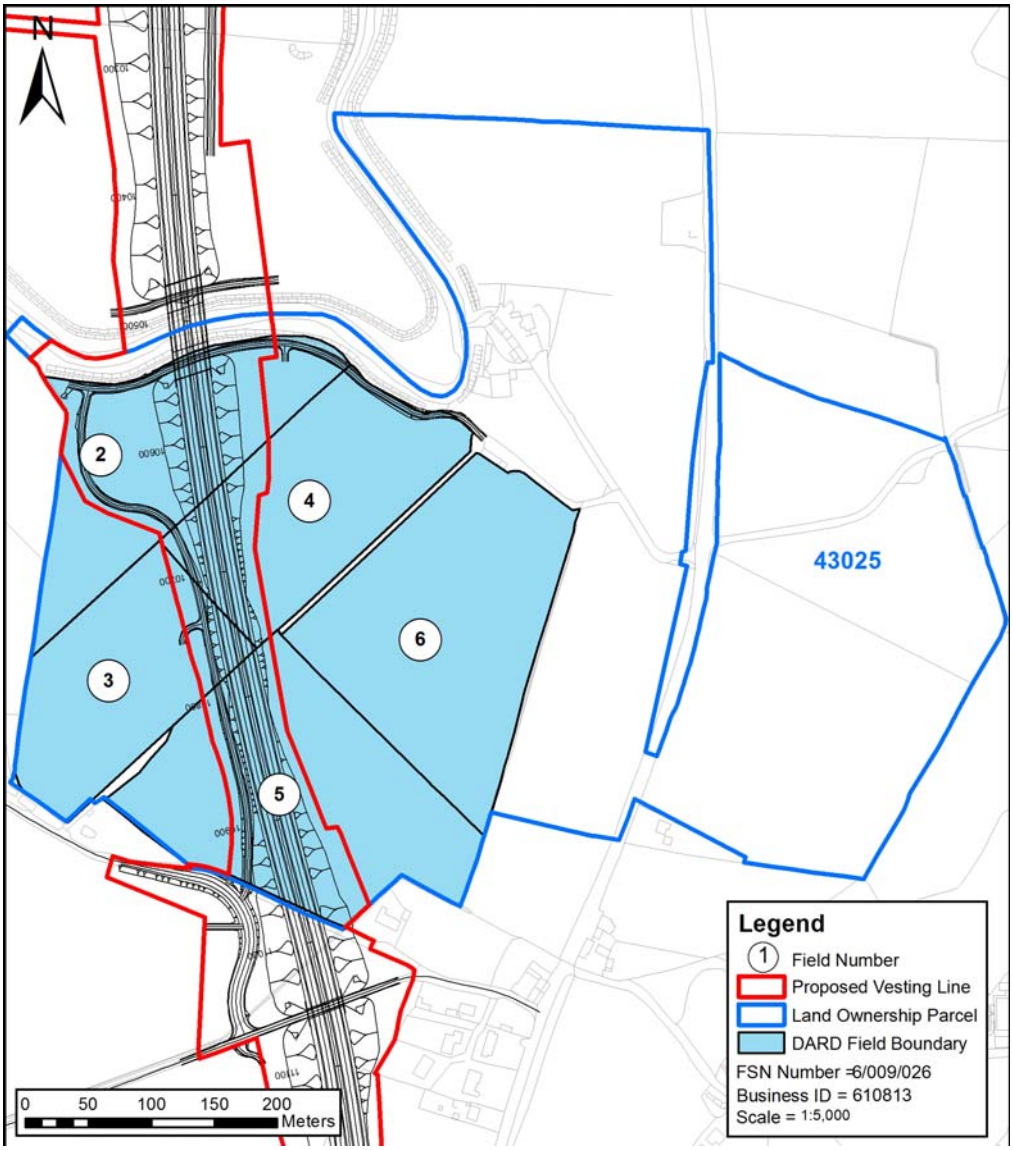
Predicted Impacts Total loss of 4.22 hectares from fields 1, 19, 20, 24, 25 and 30 of the 81.97 hectare farm equating to 5.1% of the productive land. New severance would impact on the farm. Access would be provided to severed land off Victoria Road (existing A5). There would be temporary impacts during the construction phase of the Proposed Scheme.
Proposed Mitigation During the construction phase access to severed land would be maintained.

Predicted Effects	The loss of 5.1% of the available productive land would have a slight impact on the farms potential output and constitute a slight adverse effect on the farm.

© Mouchel 2016

Land Parcel Ref	43025 & 46020	**DARD Business Ref**	610813
		Data Sources	March 2010 meeting. 2013 AIA letters not returned, decline landowner meeting. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	5 hectares let in conacre		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 124.33ha and is currently all in grass, with the exception of approximately 5ha, which is rented out in conacre for potatoes.	
Type of Enterprise and Husbandry	
This is a beef farm, with accommodation for approximately 250 head of beef cattle in a recently built (3 years) shed. The cattle are bought in at approximately 350 - 400 kg, with a turn-over of approximately 500 cattle per year. In addition, the farm runs a flock of 180 ewes and 4 rams, producing approximately 350 lambs, which are carried through to finish.	
Conacre Arrangement	5 hectares rented in conacre for potatoes to another farmer. No further details on the conacre tenant therefore no conclusion can be made on the impacts on the conacre tenant's farm.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 6.66 hectares from fields 2, 3, 4, 5 and 6 from parcel 43025 and from fields 10, 11 and 12 from parcel 46020 of the 124.33 hectare farm equating to 5.4% of the productive land. The landtake impacts would be slight.New severance would impact the farm. In land parcel 43025 access would be provided via a farm lane off Ballydonaghy Road and underbridge adjacent to the river. In land parcel 46020 access would be provided via an underbridge adjacent to the river. The severance impacts would be slight.

There would be temporary impacts during the construction phase of the Proposed Scheme.

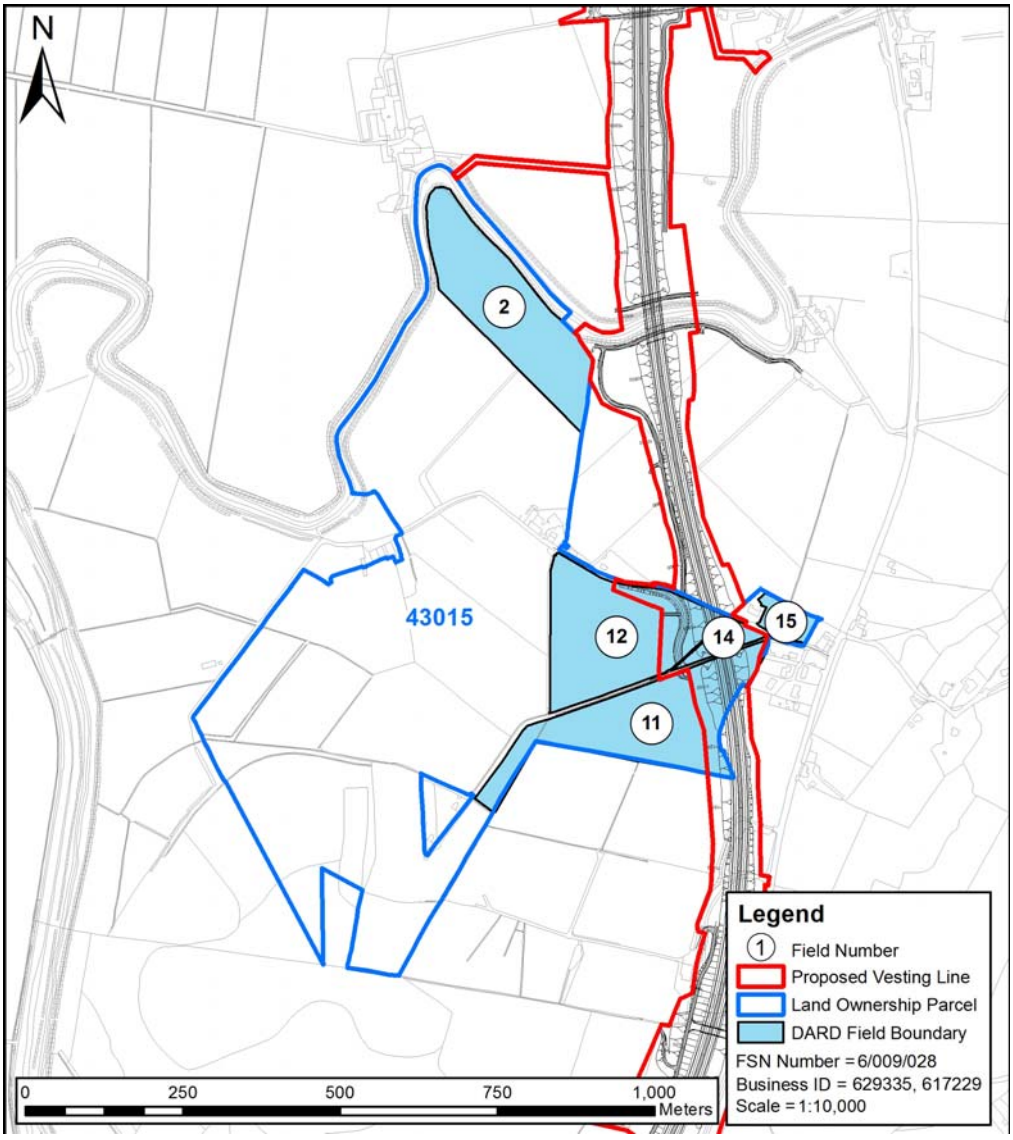
© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 5.4% of the available productive land would have a slight impact on the farms potential output and constitute a slight adverse effect on the farm.

© Mouchel 2016

Land Parcel Ref	43015	**DARD Business Ref**	629335
		Data Sources	2010 meeting held. Did not respond to 2013 AIA letter. Land confirmation meeting held. Declined 2014 meeting
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Landowner refused meeting request in 2014. Information based on 2010 data and 2013 consultation response.

Size and Quality of Farm

The land extends to 48.09ha of owned land which is all in grass.

Type of Enterprise and Husbandry

Since 2010, the farm is no longer let in conacre and the landowner farms the land himself. No information provided on type of husbandry.

Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	No information
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 2.66 hectares from fields 2, 11, 12, 14 and 15 of the 48.09 hectare farm equating to 5.5% of the productive land. This would include land from the east of the land parcel. The landtake impacts would be slight.

New severance would impact on the farm. Access would be provided to severed land via Moss Road.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

During the construction phase access to severed land would be maintained.

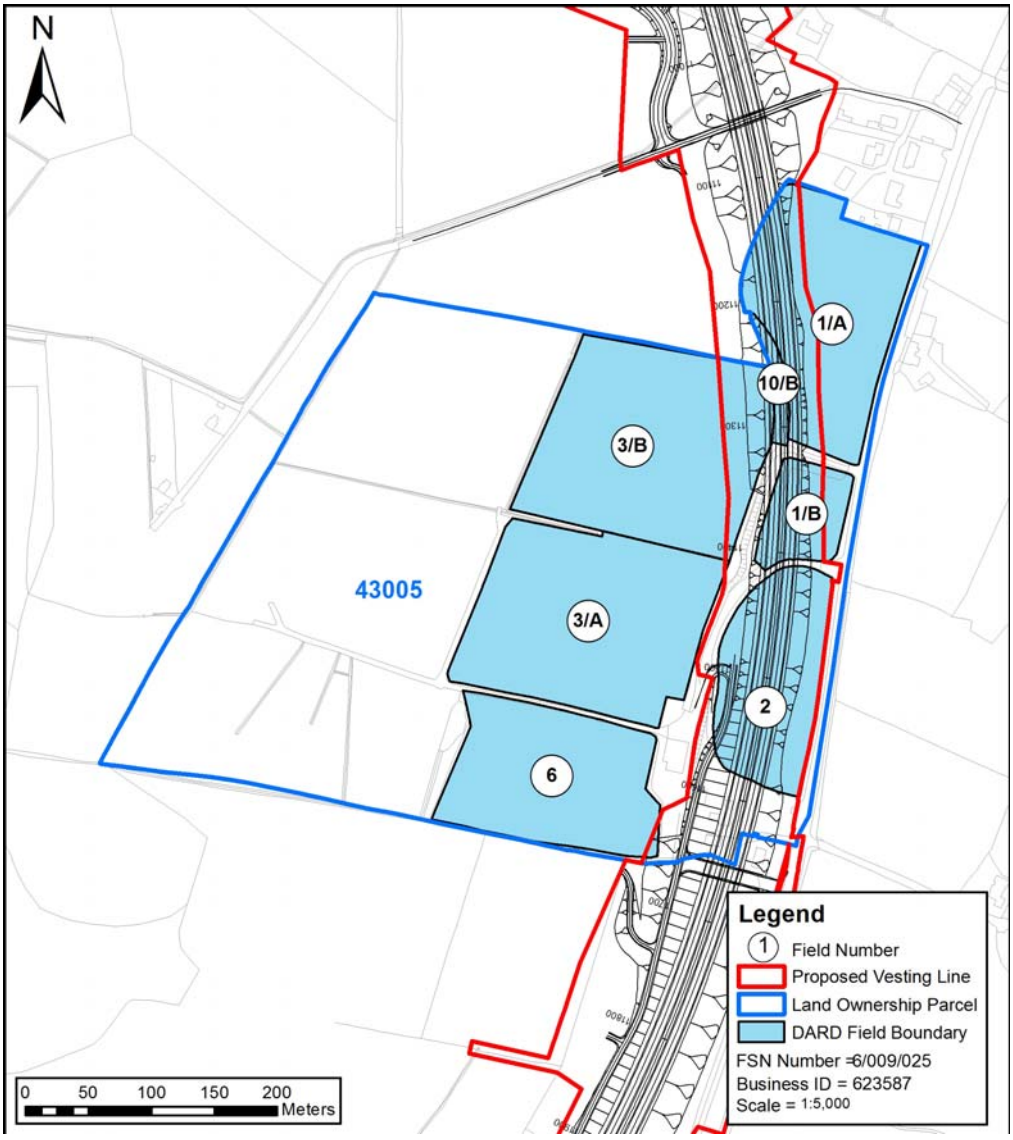
© Mouchel 2016

Predicted Effects	The loss of 5.5% if the available productive land would have a slight impact on the farms potential output and constitute a slight adverse effect on the farm.

© Mouchel 2016

Land Parcel Ref	43005	**DARD Business Ref**	623587
		Data Sources	April 2010 meeting held. 2013 AIA letter feedback stated no changes. Landowner confirmation meeting held. Minor changes to scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Let out in conacre by unaffected farmer		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 32.47ha and is all in grass.	
Type of Enterprise and Husbandry	
The land is all rented out in conacre.	
Conacre Arrangement	Let out in conacre by a farmer whose land is unaffected by the Proposed Scheme. No information held on the conacre tenant's farm and no conclusions of impact can be made on the conacre tenant.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all rented out in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 4 hectares from fields 1/A. 1/B, 2, 3/A, 3/B, 6 and 10B of the 32.47 hectare farms equating to 12.3% of the productive land.

This would include land to the east of the parcel. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

New severance would impact on the farm. Access to severed land would be maintained via an underbridge linking the field to Victoria Road (the existing A5). As the land is currently out in conacre and not farmed by the landowner directly, the severance impacts would be slight.

There would be temporary impacts during the construction phase of the Proposed Scheme.

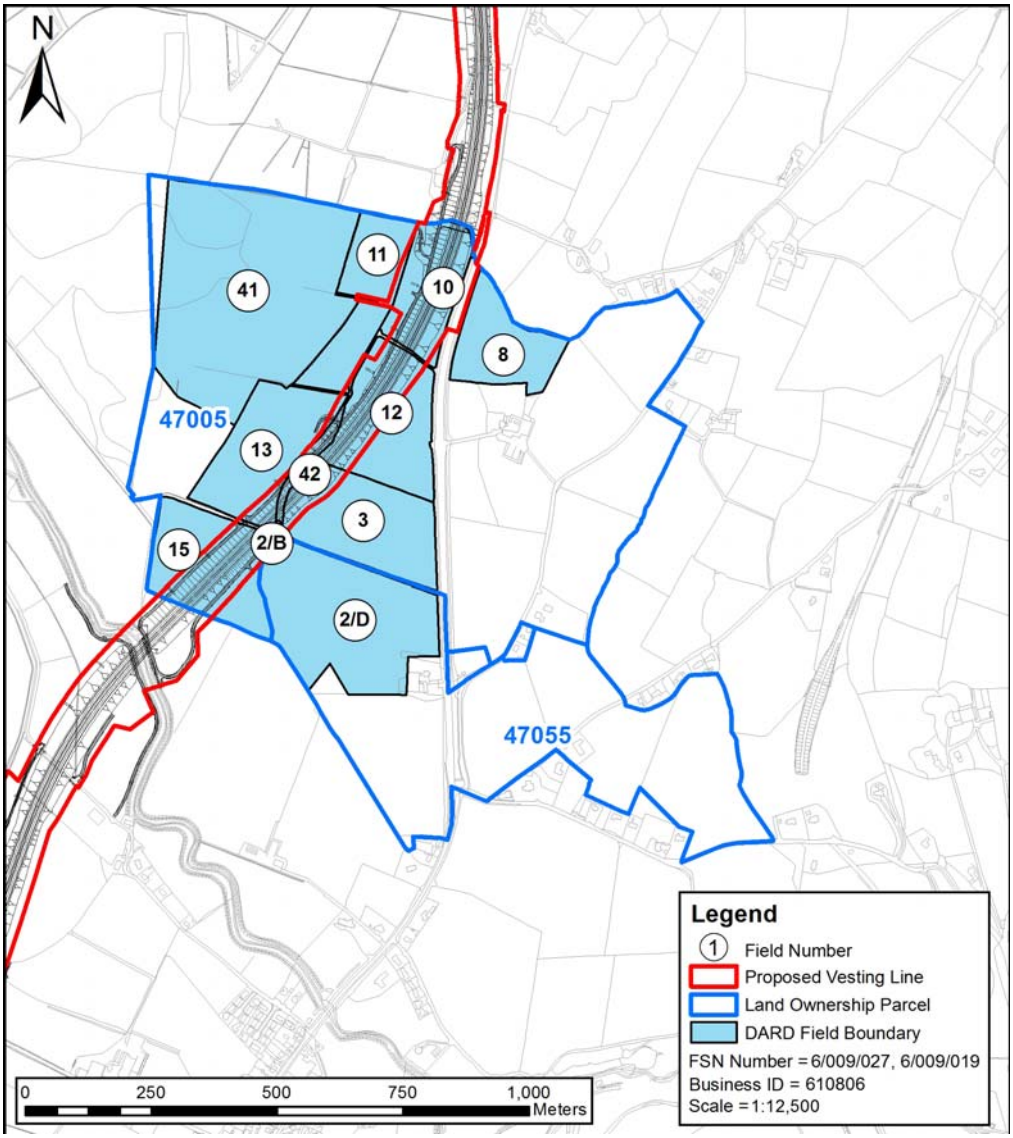
© Mouchel 2016

Proposed Mitigation	
During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 12.3% of the available productive land would have a slight impact of the landowner and constitute a slight adverse effect on the farm.

© Mouchel 2016

Land Parcel Ref	47005, 47055	**DARD Business Ref**	610806
		Data Sources	March 2010 meeting. No AIA letter feedback. Land Confirmation meeting stated no change to farm. Minor scheme changes only, therefore no 2014 revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 96.45ha, which is normally all in grass.	
Type of Enterprise and Husbandry	
The farm runs a herd of 20 suckler cows and 1 bull, with all the progeny being finished for beef. Approximately 200 store cattle are purchased at 350-400kg liveweight and carried through to finish. In addition, the farm breaks and trains approximately 5 show-jumping horses, with the laneways on the western side of the A5 being used to exercise the horses.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	Given the beef cattle stocking rate, the farm may be close to the upper limit of 170kg organic nitrogen per ha.
Countryside Management Scheme	The farm is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Lowland (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 10.12 hectares from fields 2/B, 2/D, 3, 8, 10, 11, 12, 13, 15, 41 and 42 of the 96.45 hectare farm equating to 10.5% of the productive land.

This would include land on the west of Victoria Road (existing A5) that is currently used for exercising horses. Under the Nitrates Directive, the landtake may impact on future compliance.

New severance would impact on the farm. Access would be provided to all severed land via an overbridge off the existing A5 and an underbridge adjacent to the river to the south of the land parcel.

There would be temporary impacts during the construction phase of the Proposed Scheme.

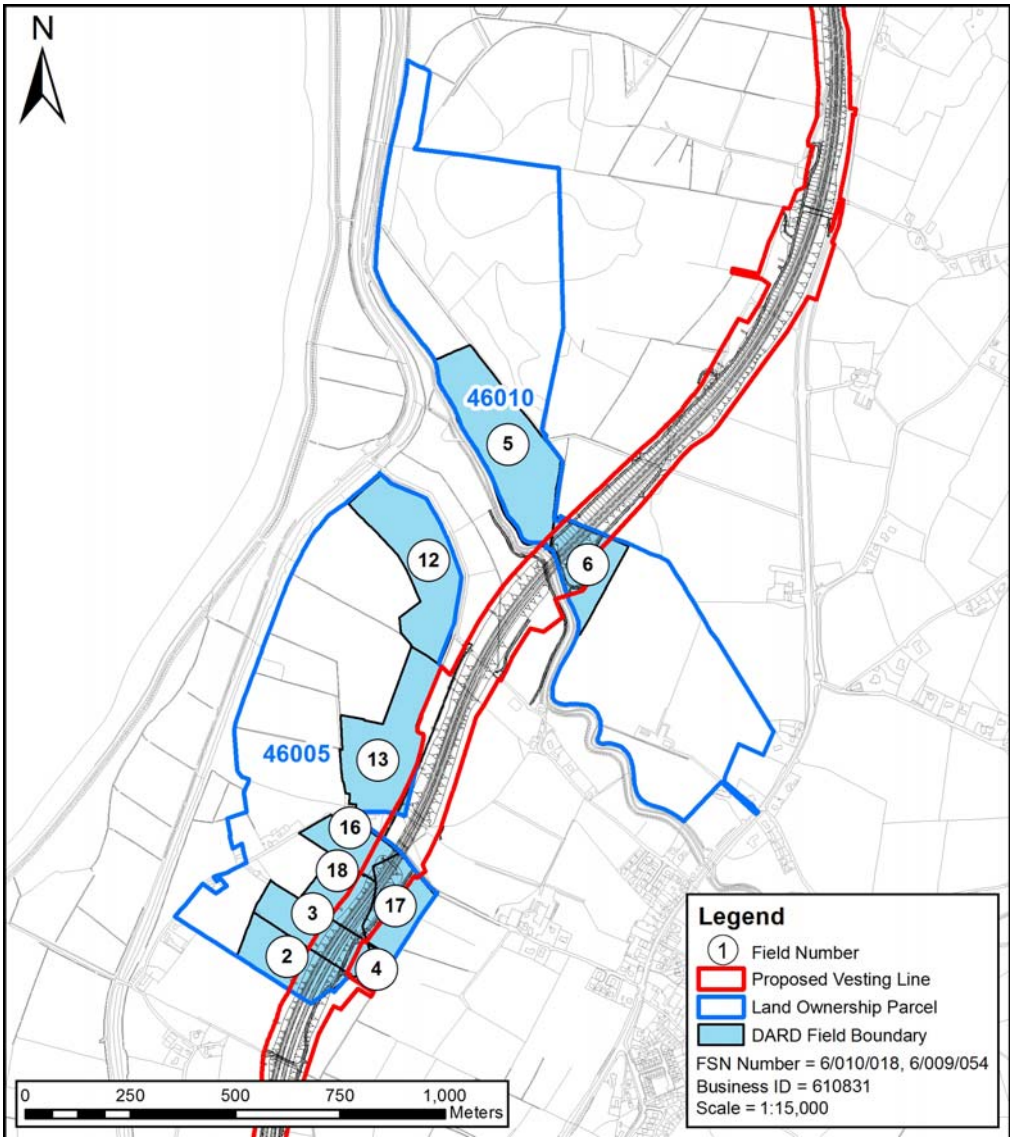
© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 10.5% of the available productive land would have a moderate impact on the farms potential output and constitute a moderate adverse effect on the farm.

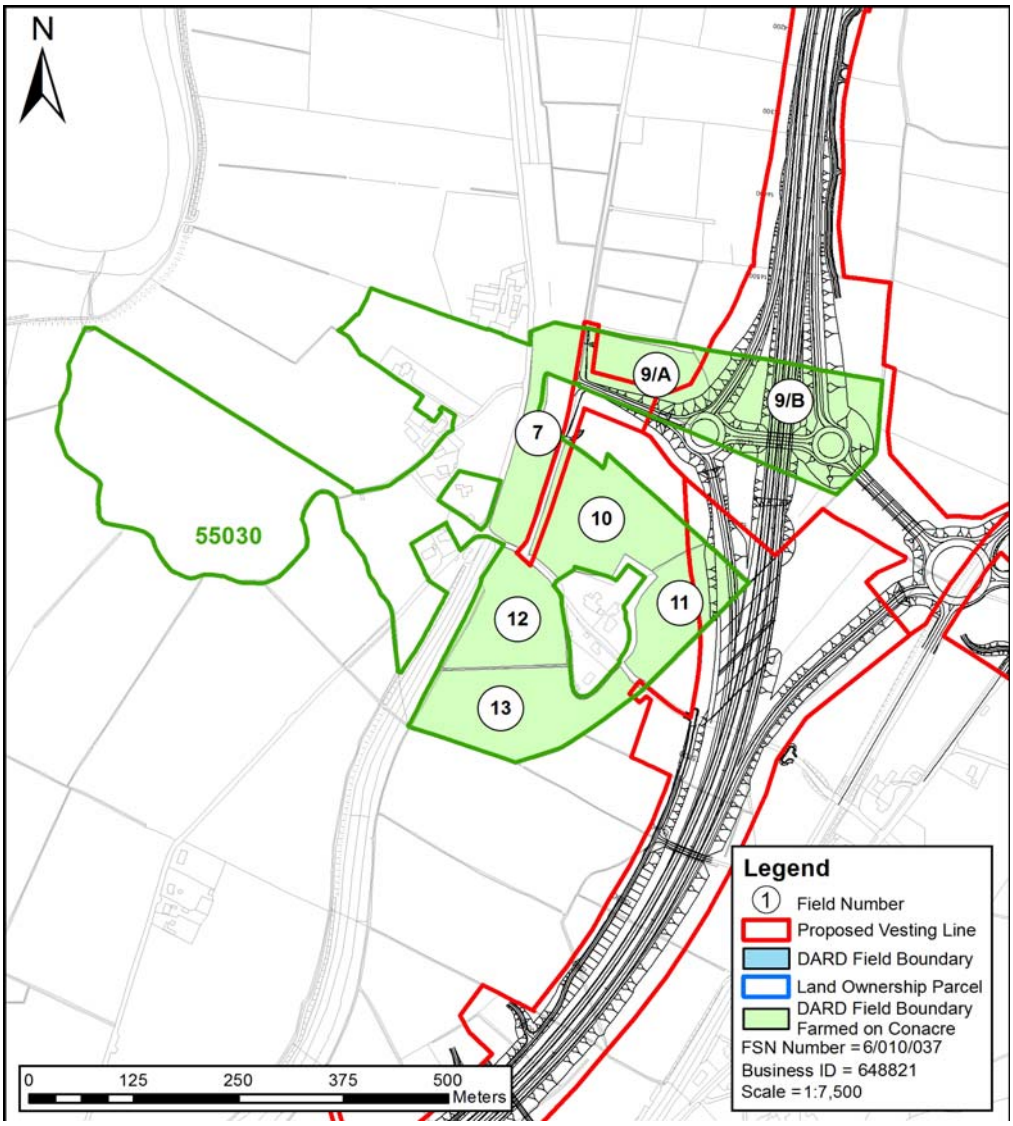
© Mouchel 2016

Land Parcel Ref	46005, 46010	**DARD Business Ref**	610831
		Data Sources	2010 AIA held. Responded to AIA letter/landowner confirmation meeting. September 2014 meeting held.
Conacre Parcel Ref	Parcel 55030 rented as conacre		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016



© Mouchel 2016

Size and Quality of Farm The farm extends to 109.01ha of owned land, with a further 23.96ha being rented in conacre. Note that part of Field No. 24 is classified ASSI. The farm is all in grass.	
Type of Enterprise and Husbandry The farm runs a herd of 70 suckler cows and 2 bulls, with all the progeny being finished for beef. There are approximately 200 cattle on the herd list. There is also a flock of 150 ewes and 5 - 6 rams, producing approximately 240 lambs, which are all carried through to finish. Approximately 50 store lambs are bought in for finishing and a further 50 ewe lambs are reared for replacements.	
Conacre Arrangement 23.96ha being rented in conacre from landowner of parcel 55030, data sheet 021-033	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all classified Low Land (LL) and is not eligible under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

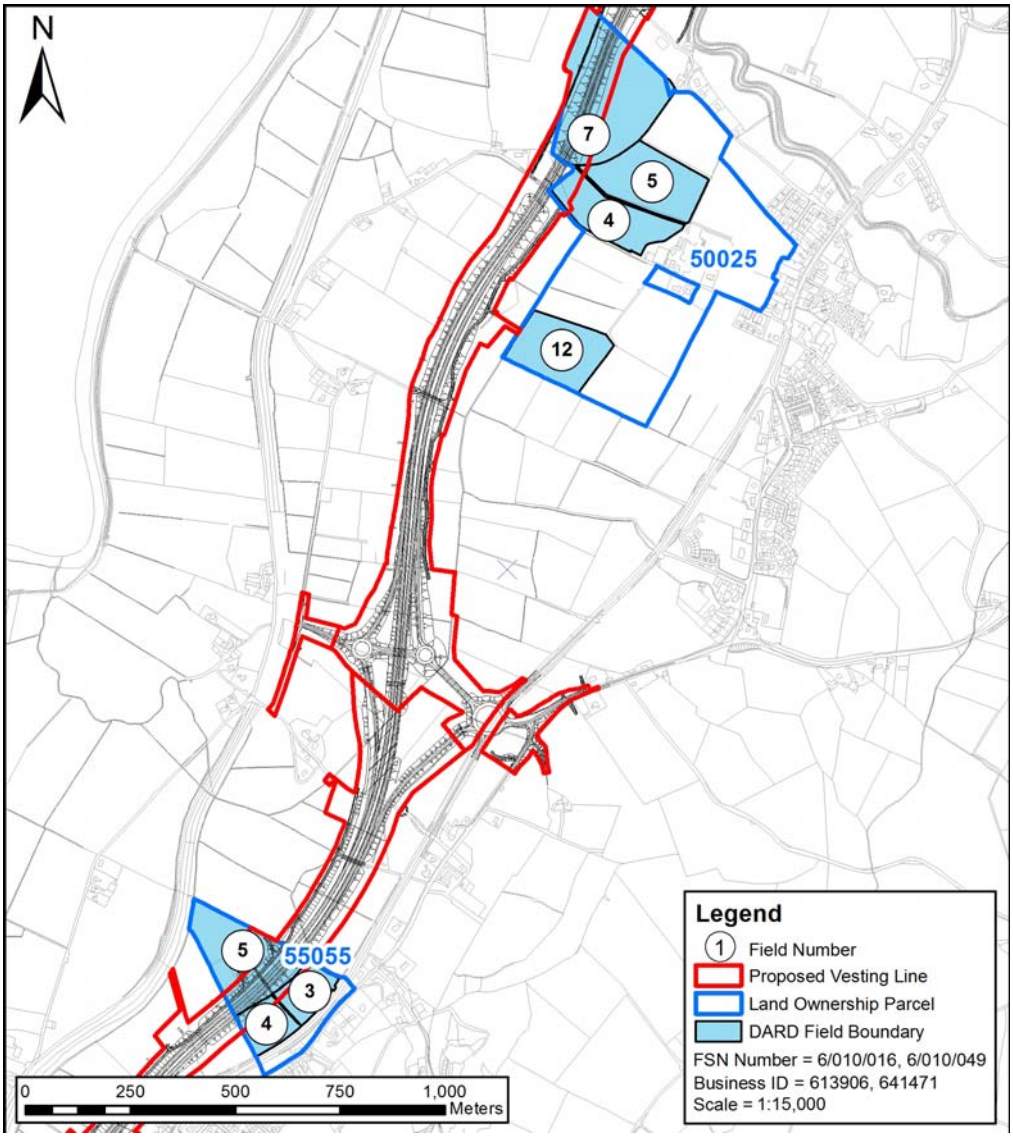
© Mouchel 2016

Predicted Impacts Total loss of 4.51 hectares from fields 2, 3, 4, 12, 13, 16, 17 and 18 from parcel 46005, loss of 1.98 hectares from fields 5 and 6 from parcel 46010 and loss of 3.97 hectares from fields 7, 9/A, 9/B, 10, 11, 12 and 13 from parcel 55030 of the 132.97 hectare farm equating to 7.9% of the productive land. The main impacts on this farm are severance and land take. The Proposed Scheme would result in severance in parcels 46010 and 46005. The Proposed scheme would cut through field 6 of parcel 46010. There will be an access track maintained along the watercourse on field 6's southern boundary, reducing severance. In parcel 46006 the unaffected portions of 4 and 17 are isolated to the east of the remainder of the parcel. Access is allowed along Park Road adjacent to field 17.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Residual Effects	The residual effect of the Proposed Scheme on the farm is **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	50025, 55055	**DARD Business Ref**	613906
		Data Sources	May 2010 meeting held. No response from 2013 AIA letters. Telephone conversation landowner stated he did not want AIA consultant to assess the scheme. Refused 2014 Landowner confirmation meeting.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm is run as a partnership. The farm extends to a total of 77.88ha, of which 38.64ha is the Home Farm (parcel 50025). Another area of owned land (18.46ha) approximately 5 miles from the home farm. Conacre is taken (16.96ha) from two landowners but this land is not affected by the Proposed Scheme.	
Type of Enterprise and Husbandry The farm runs a dairy herd of 120 cows with a herd average of 9,200 litres. Target production on the farm is 1m litres per annum. In addition, there are approximately 60 young stock reared as dairy herd replacements. Field Nos 4 & 5 are divided into paddocks as part of the grazing platform, while Field No 7 is normally cut for first-cut silage, before being divided into paddocks for grazing by the dairy herd from June onwards. Field No 8 (not shown on plan above) is currently rented out in conacre for potatoes, before being brought back into grass. Other fields also grow potatoes in rotation, before going back to grass.	
Conacre Arrangement	Conacre is taken (16.96ha) from two landowners which is not affected by the proposed scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	The land owner is on the limit with regard to the 170kg of organic nitrogen per ha and land loss may have implications under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is not eligible for payments under LFACAS.

© Mouchel 2016

Biosecurity	The herd is run as a 'closed herd', with all the outer farm boundary fences being double fenced to prevent direct contact with other stock, maintaining good biosecurity on the farm.

Predicted Impacts

Total loss of 6.69 hectares from fields 4, 5, 7 and 12 in parcel 50025 and fields 3, 4 and 5 from parcel of 55055 of the 77.88 hectare farm equating to 8.6% of the productive land.

Landtake in parcel 50025 forms part of the grazing platform for the dairy herd. Under the Nitrates Directive there may be implications to the farm from the loss of land.

New severance would impact on the farm. Parcel 55055 would be severed and access provided in the design via a shared farm lane off Spruce Road.

There would be temporary impacts during the construction phase of the Proposed Scheme.

As the farm is currently run as a 'closed herd' there would be implications for the farms biosecurity, particularly in parcel 55055 where a shared farm lane is proposed. The biosecurity risk would be substantial.

Proposed Mitigation

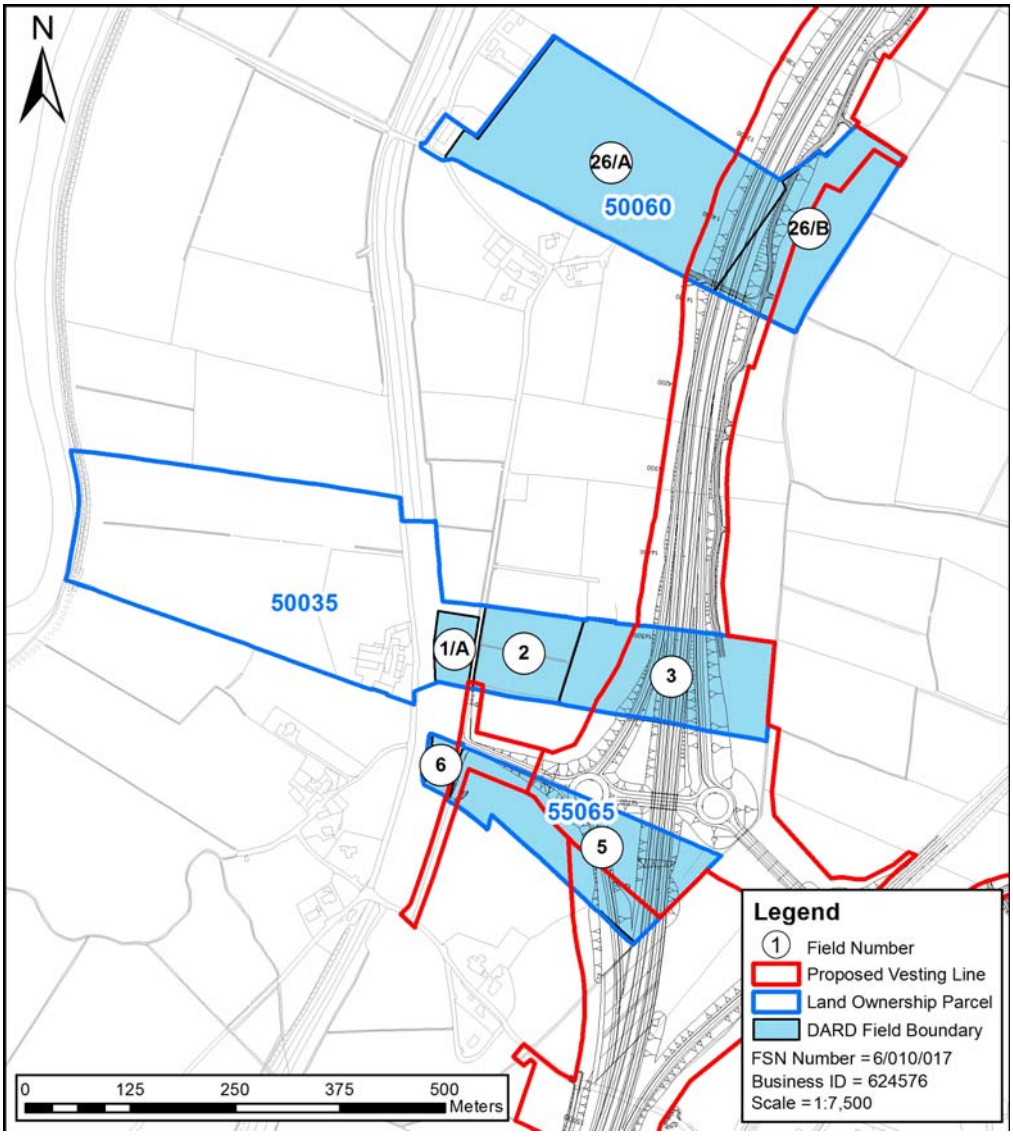
During the construction phase access to severed land would be maintained.
Double fencing to DARD biosecurity standards would be maintained during the works.

Predicted Effects	The loss of 8.6% of the available productive land and would result in implications under the Nitrates Directive and implications for biosecurity have been identified. This would constitute a substantial adverse effect on the farm.

© Mouchel 2016

Land Parcel Ref	50035, 50060 & 55065	**DARD Business Ref**	624576
		Data Sources	June 2010 meeting held. No response to 2013 AIA letters. Landowner confirmation meeting stated no change to farm. Minor scheme changes only, therefore no 2014 revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 81.97ha of which 75.2ha is owned land, and the remaining 6.76ha is conacre land.

Type of Enterprise and Husbandry

The farm runs a herd of 70 suckler cows and 2 bulls, with the progeny being sold as suckled calves, with the exception of small, late-born calves which are wintered and sold as stores in the spring. There are approximately 150 cattle on the herd list.

In addition, the farm grows approximately 8ha of barley (Field No 3 at present) for use on the farm.

Conacre Arrangement	6.76ha taken in conacre
Single Farm Payment	The landowner collects the Single Farm Payment on both owned land, and on conacre land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Low Land (LL) and is not eligible for payments under LFACAS).
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 6.64 hectares from fields 26/A and 26/B in parcel 50060, fields 1/A, 2 and 3 in parcel 50035 and fields 5 and 6 in parcel 55065 of the 81.97 hectare farm equating to 8.1% of the productive land

New severance would impact on the farm. Access would be provided to all severed land. Severed land in parcel 50060 would be accessed via a shared farm lane and under bridge. Other parcels would be accessed off Park Road. The severance impacts would be slight.

© Mouchel 2016

There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land will be provided.	
Predicted Effects	The loss of 8.1% of the available productive land and resulting severance would constitute a moderate adverse effect on the farm.

© Mouchel 2016

Did not accept invitation to for 2014 AIA meeting. 2013 consultation response identified that changes had occurred to the farm. No further information provided

Size and Quality of Farm

The farm extends to 43.48ha of owned land, some of which is currently in barley (Field No 6), with the rest being in grass.

Type of Enterprise and Husbandry

The farm runs a suckler herd containing 20 cows and 1 bull, with the calves all being finished as beef. There are approximately 60 cattle on the herd list. Barley is grown in the rotation on the farm.

Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 3.37 hectares from fields 4, 5 and 6 of the 43.48 hectare farm equating to 7.7% of the productive land. The landtake impacts would be moderate.

New severance would impact on the farm. Access to severed land would be provided via a shared underbridge to the north of the land. The severance impacts would be slight.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

During the construction phase access to severed land would be maintained

© Mouchel 2016

Predicted Effects	The loss of 7.7% of the available productive land and resulting severance would constitute a moderate adverse effect on the farm.

Size and Quality of Farm The farm extends to 23.96ha of owned land, which is either in grass or arable in a rotation.	
Type of Enterprise and Husbandry The land is all rented out in conacre.	
Conacre Arrangement The land is all rented out in conacre to the parcel 46006 landowner. The assessment of the scheme impacts on the conacre tenant is outlined in datasheet 021-027	
Single farm payment	The landowner does not collect the Single Farm Payment on owned land, leaving this to be collected by Robert McKean.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all rented out in conacre and is not eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity
Predicted Impacts Total loss of 3.96 hectares from fields 7, 9/A, 9/B, 10, 11, 12 and 13 of the 23.96 hectare farm equating to 16.5% of the productive land.	
Proposed Mitigation The mitigation measures proposed are considered to be adequate. Severed access to Field No 9 via Park Road.	

© Mouchel 2016

Predicted Effects	The loss of 16.5% of the available productive land would have a slight impact on the farms potential output and constitute a slight adverse effect on the farm.

© Mouchel 2016

Land Parcel Ref	55040	**DARD Business Ref**	630336
		Data Sources	2010 meeting held. No response to 2013 AIA letters. Landowner confirmation meeting identified change in farm. Landowner declined 2014 meeting

© Mouchel 2016

Landowner refused 2014 meeting request. Assessment based on 2010 assessment and 2013 consultation.

Size and Quality of Farm

The farm extends to 34.18ha of owned land which is all in grass. The landowner also owns land in Co Donegal.

Type of Enterprise and Husbandry

The Landowner Farms the land himself. No information provided on husbandry.

Conacre Arrangement	No conacre interest identified.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The Landowner has applied to join the Current Countryside Management Scheme, but has not as yet been accepted.
Less Favoured Area Compensatory Allowances Scheme	No information.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 8.5 hectares of the 34.18 hectare farm equating to 24.9% of the productive land. This would include land for the junction with the existing A5. The landtake impact will be slight.

New severance would impact on the farm. Access would be provided to all severed land via Spruce Road and Woodend Road. As the land is currently in conacre the severance impacts would be slight.

Proposed Mitigation

During the construction phase access to severed land would be maintained.

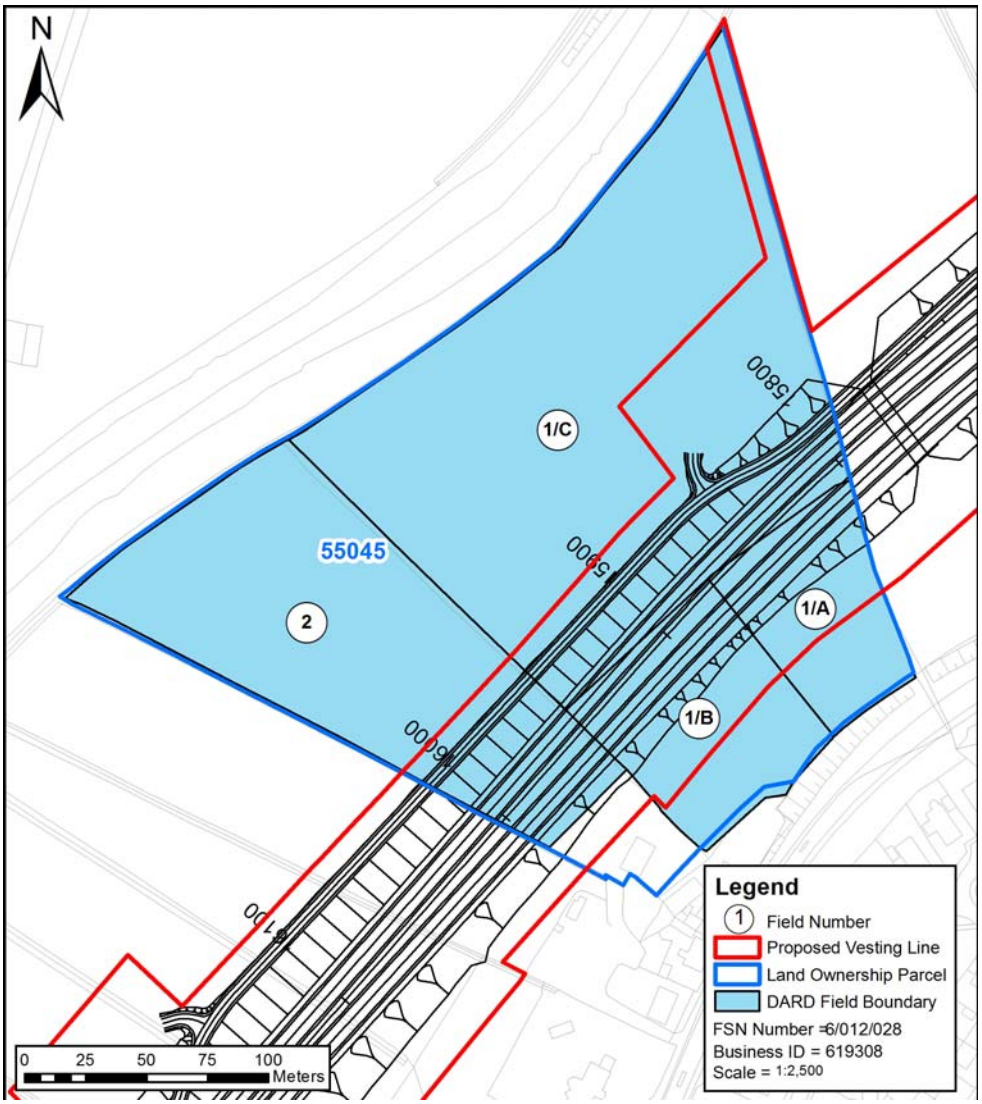
© Mouchel 2016

Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	55045	**DARD Business Ref**	619308
		Data Sources	March AIA 2010 meeting held. 2013 AIA letter feedback stated no change to farm. Minor change to scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 5.75ha of owned land.	
Type of Enterprise and Husbandry The land is grazed by cattle purchased at marts and held for a period before being sold on.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Lowland (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts Total loss of 2.21 hectares from fields 1/A, 1/B, 1/C and 2 of the 5.75 hectare farm equating to 38.4% of the productive land. The landtake impacts would be substantial.New severance would impact on the farm. Access would be provided to all severed land via an underbridge from the realigned Spruce Road. The severance impacts would be moderate. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 38.4% of the available productive land would have a substantial impact on the farms potential output and constitute a substantial effect on the farm.

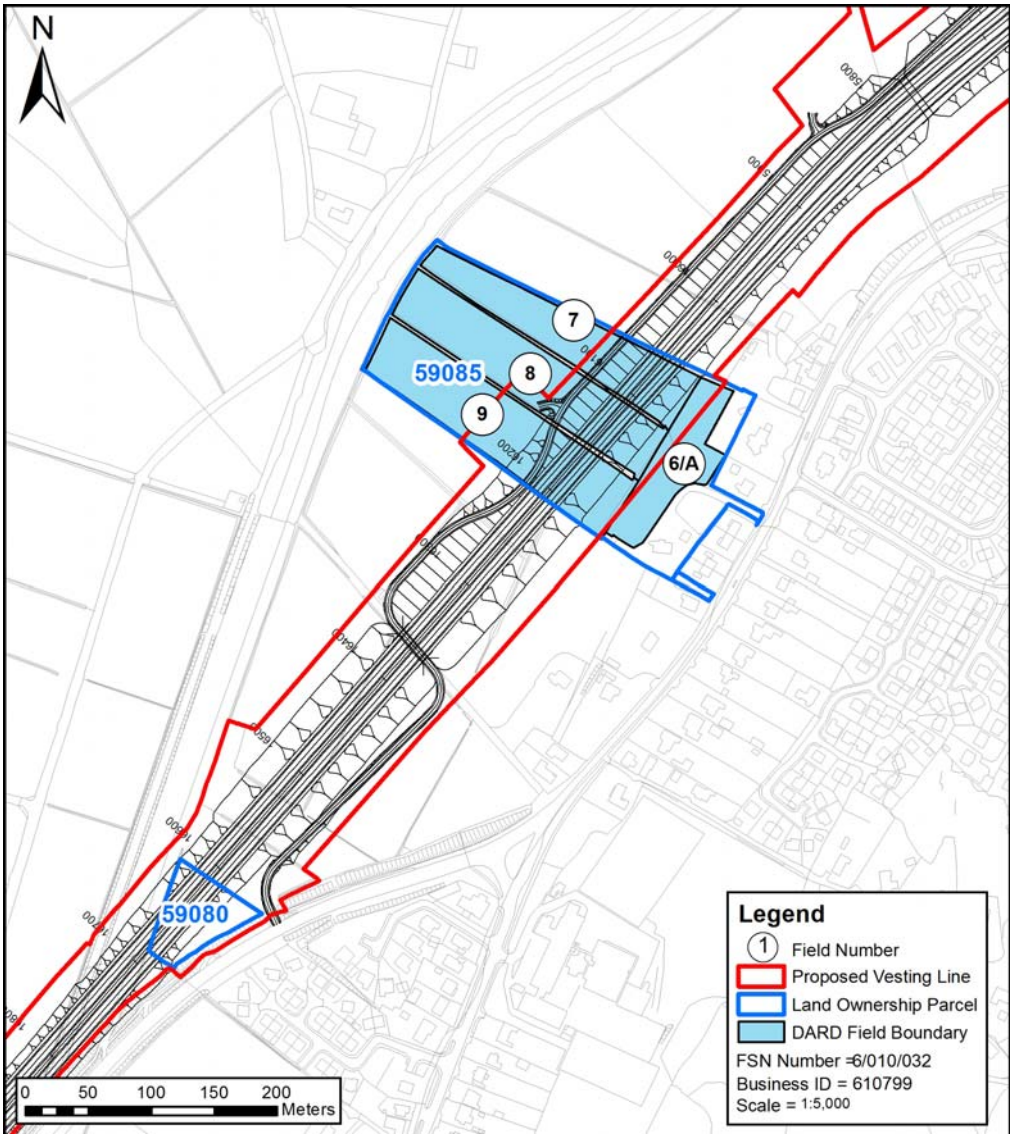
Land Parcel Ref	59080, 59085	**DARD Business Ref**	610799
		Date of Visit	May 2010 meeting held. Land confirmation meeting/AIA letter feedback identified no change to farm. Minor changes to scheme only. No 2014 AIA revisit required.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 11.21ha in 3 parcels, which are all in grass.	
Type of Enterprise and Husbandry	
This is a beef farm which buys in approximately 35 store cattle at 350kg-400kg live-weight, carrying them through to finish or alternatively, selling them as heavy stores.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Schemed.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
Total loss of 3.08 hectares from field 6/A, 7, 8 and 9 in parcel 59085 and parcel 59080 of the 11.21 hectare farm equating to 24.5% of the productive land. New severance would impact on the farm. Access would be provided to all severed land via an under bridge connecting from the existing A5. The severance impacts would be slight. There would be temporary impacts during the construction phase of the Proposed Scheme.
Proposed Mitigation
During the construction phase access to severed land would be maintained.

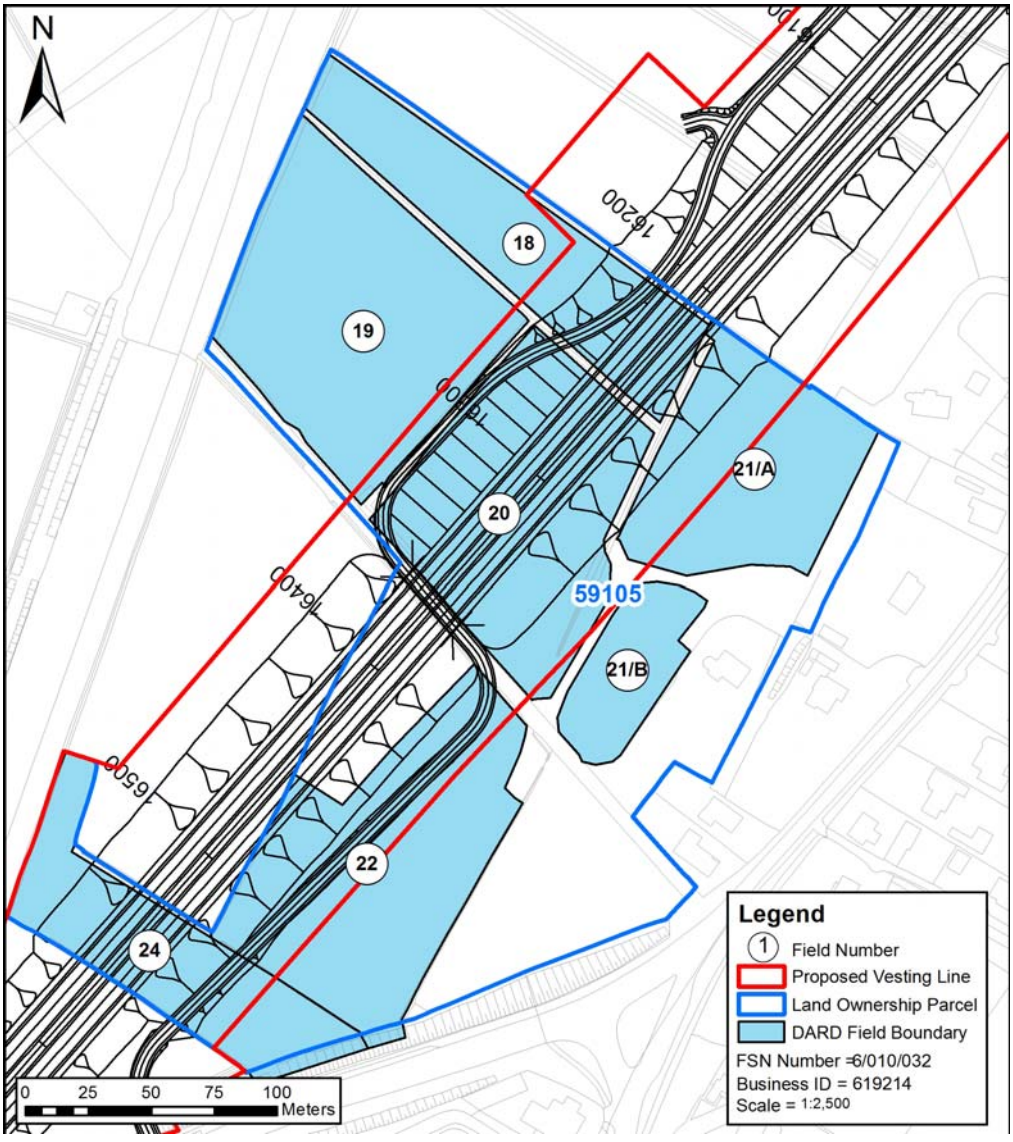
© Mouchel 2016

Predicted Effects	The loss of 24.5% of the available productive land and severance would constitute a moderate adverse effect on the farm.

© Mouchel 2016

Land Parcel Ref	59105	**DARD Business Ref**	619214
		Data Sources	May 2010 AIA meeting held. 2013 AIA letters not returned/declined land confirmation meeting. Minor changes to the scheme only, therefore no 2014 AIA revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 23.44ha of owned land which is all in grass.	
Type of Enterprise and Husbandry This is a beef farm, with approximately 100 – 150 store cattle being purchased annually at 350kg – 400kg live weight and carried through to finish. The home farm is mainly used for grazing, with silage being cut on the out farm.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Schemed.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts Total loss of 2.93 hectares from fields 18, 19, 20, 21/A, 21/B, 22 and 24 of the 23.44 hectare farm equating to 12.5% of the productive land. The landtake impacts would be moderate. New severance would impact on the farm. Access would be provided to all severed land via an under bridge off the existing A5. The severance impacts would be slight. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 12.5% of the available productive land and new severance would constitute a moderate adverse effect on the farm.

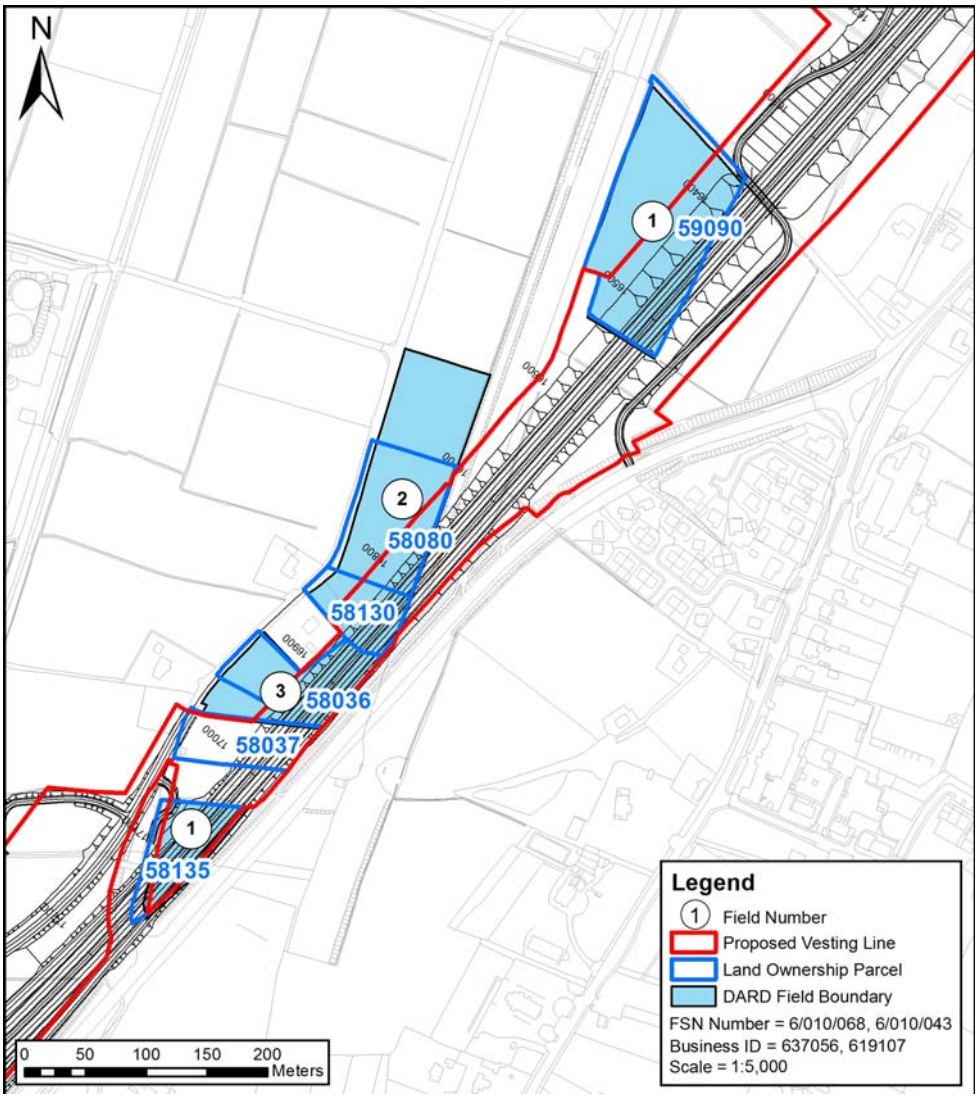
Land Parcel Ref	59090, 58080, 58036, 58037, 58130, 58135	**DARD Business Ref**	181272 (Applicant Ref)
		Data Sources	June 2010 AIA meeting. 2013 AIA letter/landowner confirmation feedback identified no change to farm. Minor change in scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Let in conacre		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



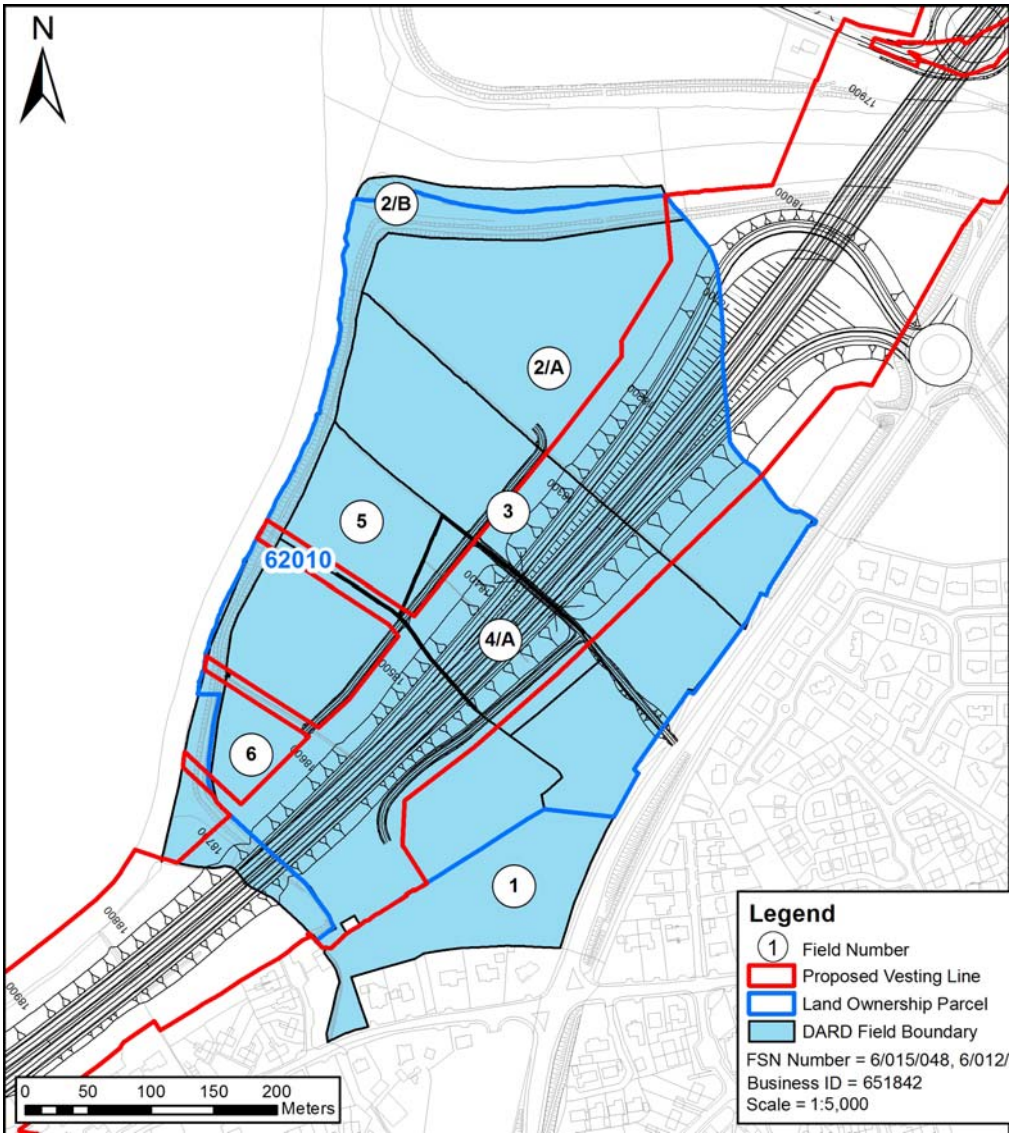
© Mouchel 2016

Size and Quality of Farm The farm extends to 3.87ha and is all in grass. N.B. Parcel 58036 is part-owned by 3 landowners	
Type of Enterprise and Husbandry The land is all let out in conacre. Land grazed for horses	
Conacre Arrangement	Land let in conacre to daughter for grazing horses.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is rented out in conacre and is not eligible for payments for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts Total loss of 2.42 hectares of the 3.87 hectare farm equating to 62.5% of the productive land. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight. There would be no severance as a result of the Proposed Scheme.	
Proposed Mitigation No mitigation is proposed.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	62010	**DARD Business Ref**	616384
		Data sources	March 2010 AIA meeting. Did not respond to 2013 AIA letter. Landowner feedback stated no change in farm. Minor change in scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Rents parcel 71005 in conacre		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 120-130ha, varying from year to year, depending on the area taken in conacre. Owned land extends to 57.80ha in 2 parcels, field Nos. 2-6 (as shown on the map) being located several miles from the home farm.	
Type of Enterprise and Husbandry This is an intensive beef farm running approximately 400-450 beef cattle, which are bought in at approximately 350kg live weight and taken through to finish. In addition, to grass for grazing and for silage, the farm also grows a considerable area of wheat, barley and oats, mainly on conacre land, for use on the farm. The farm also has 6 broiler breeder sheds, housing a total of 62,000 birds for Moy Park, with birds being reared from 1 day old to point of lay pullets.	
Conacre Arrangement	Landowner rents a small area of land in conacre which is affected by the Proposed Scheme in parcel 71005 – see Appendix 15C for assessment of Parcel 71005.
Single Farm Payment	The farm collects Single Farm Payment on owned land and some of the conacre land.
Nitrates Directive	The farm is currently producing approximately 165kg organic nitrogen per ha. In order to meet the requirements of the Nitrates Directive and IPPC, the farm exports approximately 2,000m^3 of slurry.
Countryside Management Scheme	Owned land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Some of the fields on the home farm are registered Disadvantaged Area (DA) and are eligible for payments under LFACAS. In addition, most of the conacre land is also registered Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity

© Mouchel 2016

Predicted Impacts

Total loss of 7.18 hectares from fields 1, 2/A, 2/B, 3, 4/A, 5 and 6 of the 120-130 hectare farm equating to between 5.5% and 6.0% of the productive land. 0.4ha form parcel 71005, taken in conacre, will be affected by the Proposed Scheme.

This would include land from fields 2, 3, 4 and 6 which are several miles from the home farm. Under the Nitrates Directive, the farm currently exports slurry and landtake would have further implications for future compliance. The landtake impacts would be moderate.

New severance would impact on the farm. Access would be provided via an underbridge between fields 4 and 5. The severance impacts would be slight.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

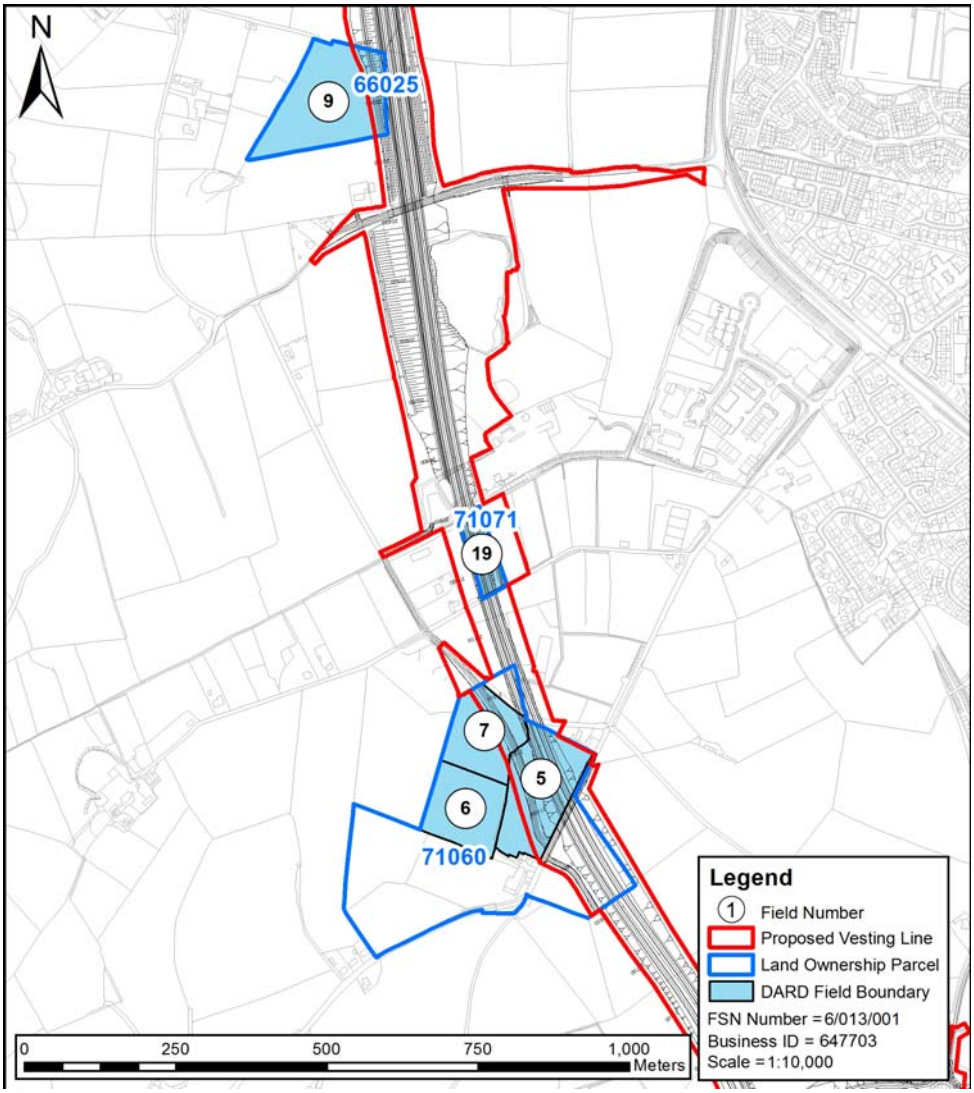
During the construction phase access to severed land would be maintained.

Predicted Effects	The loss of between 5.5% and 6.0% of the available productive land would have a moderate impact on the farms potential output and constitute a moderate adverse effect on the farm.

© Mouchel 2016

Land Parcel Ref	66025, 71060, 71071	**DARD Business Ref**	140627 (Applicant ref)
		Data sources	September 2010 meeting held. 2013 AIA letter not returned. Landowner confirmation meeting held. Minor change to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Let in conacre to an unaffected farmer.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 27.1ha of owned land, some of which is in grass/rough ground, and some of which is arable land.	
Type of Enterprise and Husbandry	
The land is all let out in conacre.	
Conacre Arrangement	The land is all let out in conacre to a farmer whose land is unaffected by the Proposed Scheme. Conacre tenant declined AIA phone discussion. Therefore, no conclusions can be made about the Proposed schemes impacts on the conacre tenant's farm.
Single Farm Payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all rented in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 5.01 hectares from field 9 in parcel 66025, field 19 in parcel 71071 and field 5, 6 and 7 in parcel 71060 of the 27.1 hectare farm equating to 18.5% of the productive land. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

New severance would impact on the farm. Access would be provided to all severed land via the realigned Knockroe Road going through parcel 71060. As the land is currently out in conacre and not farmed by the landowner directly, the severance impacts on the landowner

© Mouchel 2016

would be slight. There would be temporary impacts during the construction phase of the Proposed Scheme. .	
Proposed Mitigation During the construction phase access to severed land would be provided.	
Predicted Effects	The loss of 18.5% of the available productive land would have a slight impact on the farms potential output and constitute a slight adverse effect on the landowner.

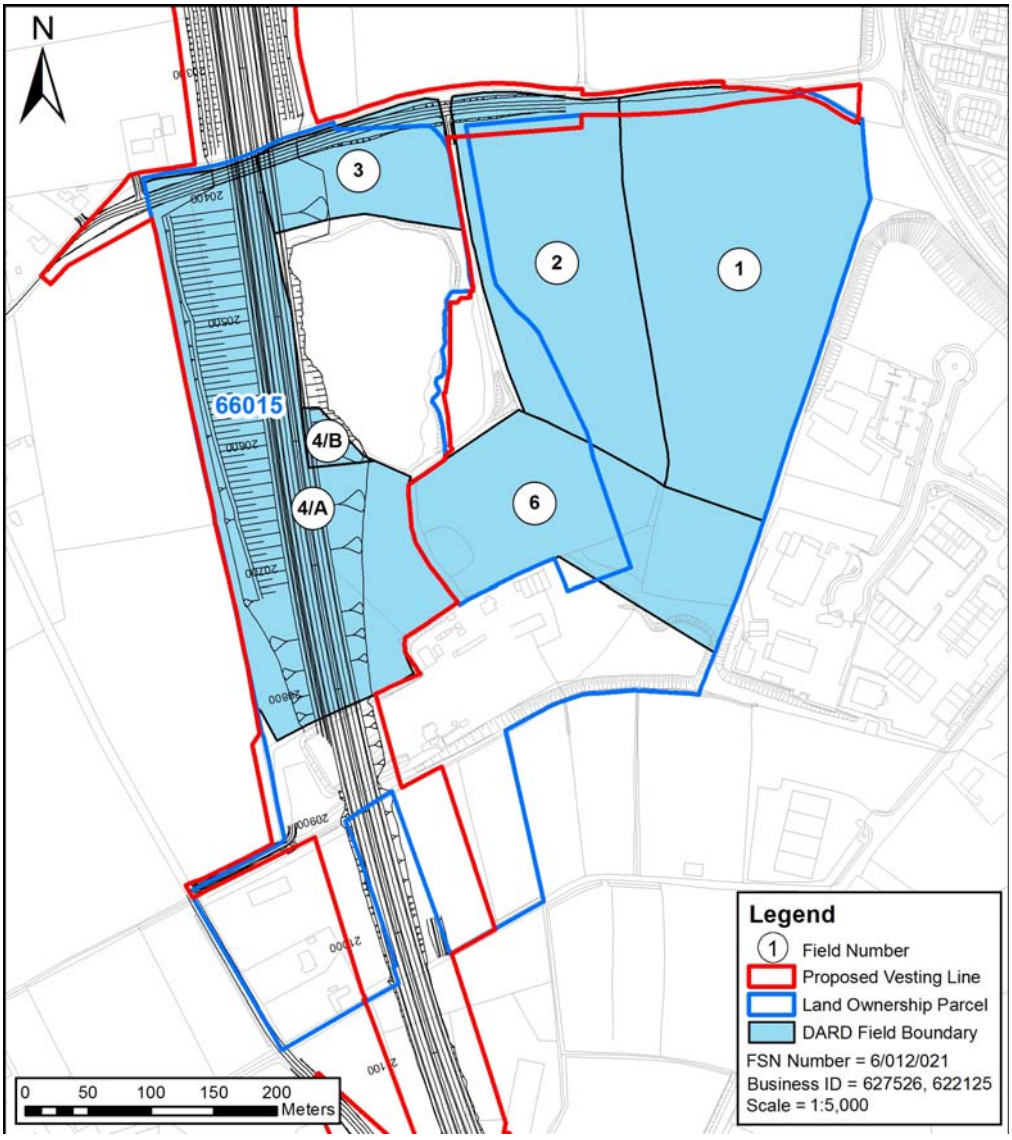
Land Parcel Ref	66015	**DARD Business Ref**	627526
		Data sources	September 2010 meeting held. Did not respond to 2013 AIA letters. Landowner confirmation meeting feedback stated no change to farm. Minor change to scheme only, therefore no 2014 revisit
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm This is a large farm, extending to approximately 159ha spread over 2 parcels of land. Approximately 100ha of arable land is situated in Donegal.	
Type of Enterprise and Husbandry Most of the land of the farm is arable, growing cereals and potatoes. In addition, the farm buys in store cattle (350kg live-weight), which are grazed during the summer and sold either as strong store cattle or finished off the land. Approximately 200 store lambs are purchased each autumn and carried through to finish.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Some of the land on the farm is classified Disadvantaged Area (DA) and is eligible for payments under LFACAS
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts Total loss of 10.6 hectares from field 1, 2, 3, 4/A, 4/B and 6 of the 159 hectare farm equating to 6.7% of the productive land. This would include land proposed to be used for a deposition area and land that is not currently used for agricultural production. The landtake impacts would be slight. There would be no severance as a result of the Proposed Scheme.
Proposed Mitigation No mitigation is proposed.

© Mouchel 2016

Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	71015	**DARD Business Ref**	624027
		Data sources	2010 AIA meeting held. Feedback from AIA letters/ landowner confirmation meeting received. September 2014 meeting
Conacre Parcel Ref	Let in conacre. Including Data sheet 021-044

© Mouchel 2016

Size and Quality of Farm The farm extends to 33.14ha, some of which is grass or arable.	
Type of Enterprise and Husbandry The land is not farmed by the landowner. The land is all let out in coancre to two landowners.	
Conacre Arrangement The first landowner takes field Nos. 2, 3 5 – 7. Taken by parcel 75025 landowner. The impacts on this conacre tenant are outlined in datasheet 718736-3000-R-021-044. The second landowner takes field Nos. 1, 8, 9, 11 – 13, 15. This conacre tenants owned land is not affected by the proposed scheme. No further information held and no conclusions can be made on the impacts on the conacre tenant's farm. Field Nos affected are 5 – 7, 9 and 16.	
Single farm payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive, as there are no stock on the farm.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all classified Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity as there are no stock on the land.

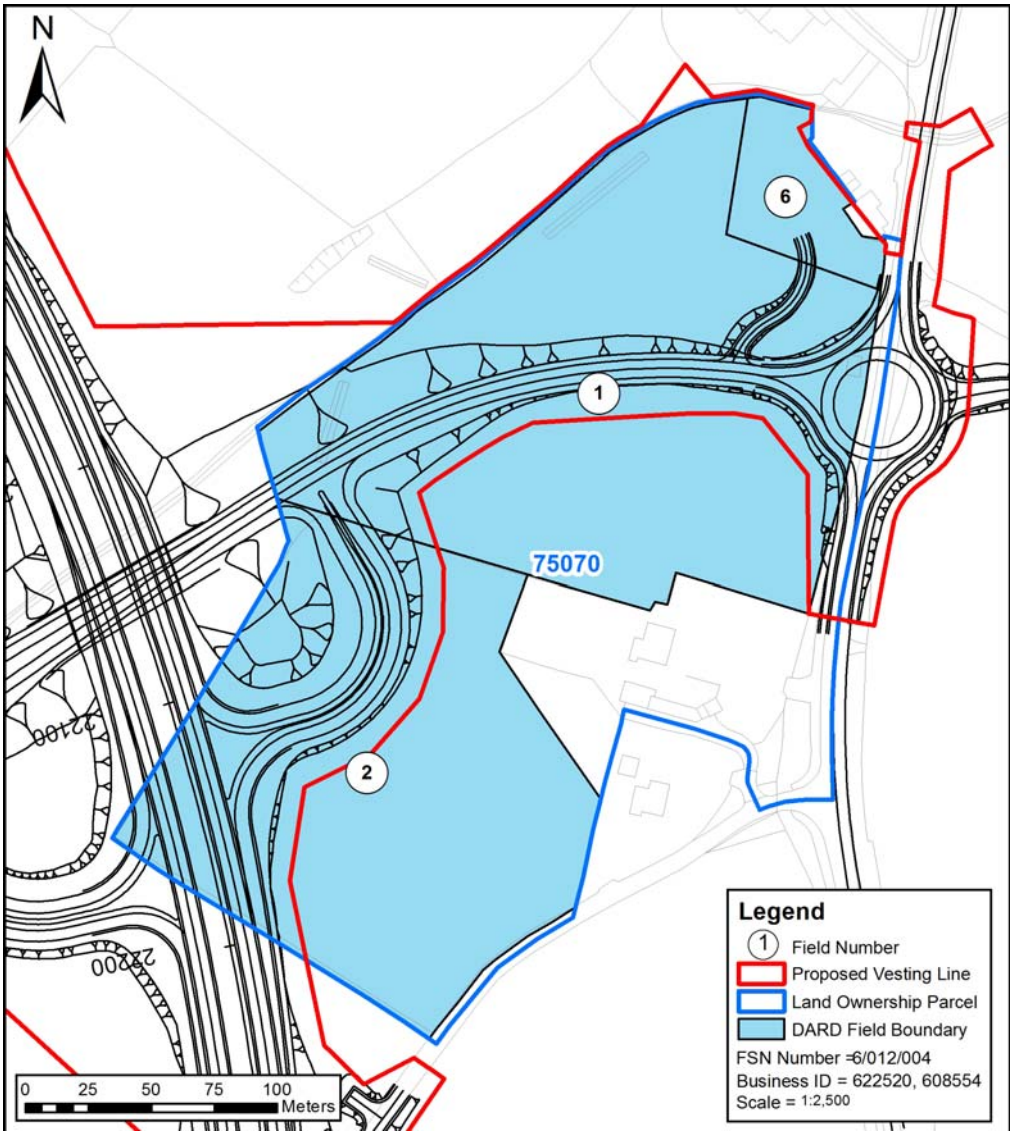
© Mouchel 2016

Predicted Impacts Total loss of 4.61 hectares from field 5, 6, 7, 9 and 12 of the 33.14 hectare farm equating to 13.9% of the productive land. The overall impact of the scheme on the farm is considered to be **moderate adverse**.	
Proposed Mitigation The mitigation measures proposed provide access to the severed land via a track from Orchard Road.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm is **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	75070	**DARD Business Ref**	Not available
		Data sources	September 2010 AIA meeting. 2013 AIA letter/landowner confirmation meeting feedback identified no changes to farm and minor changes to scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

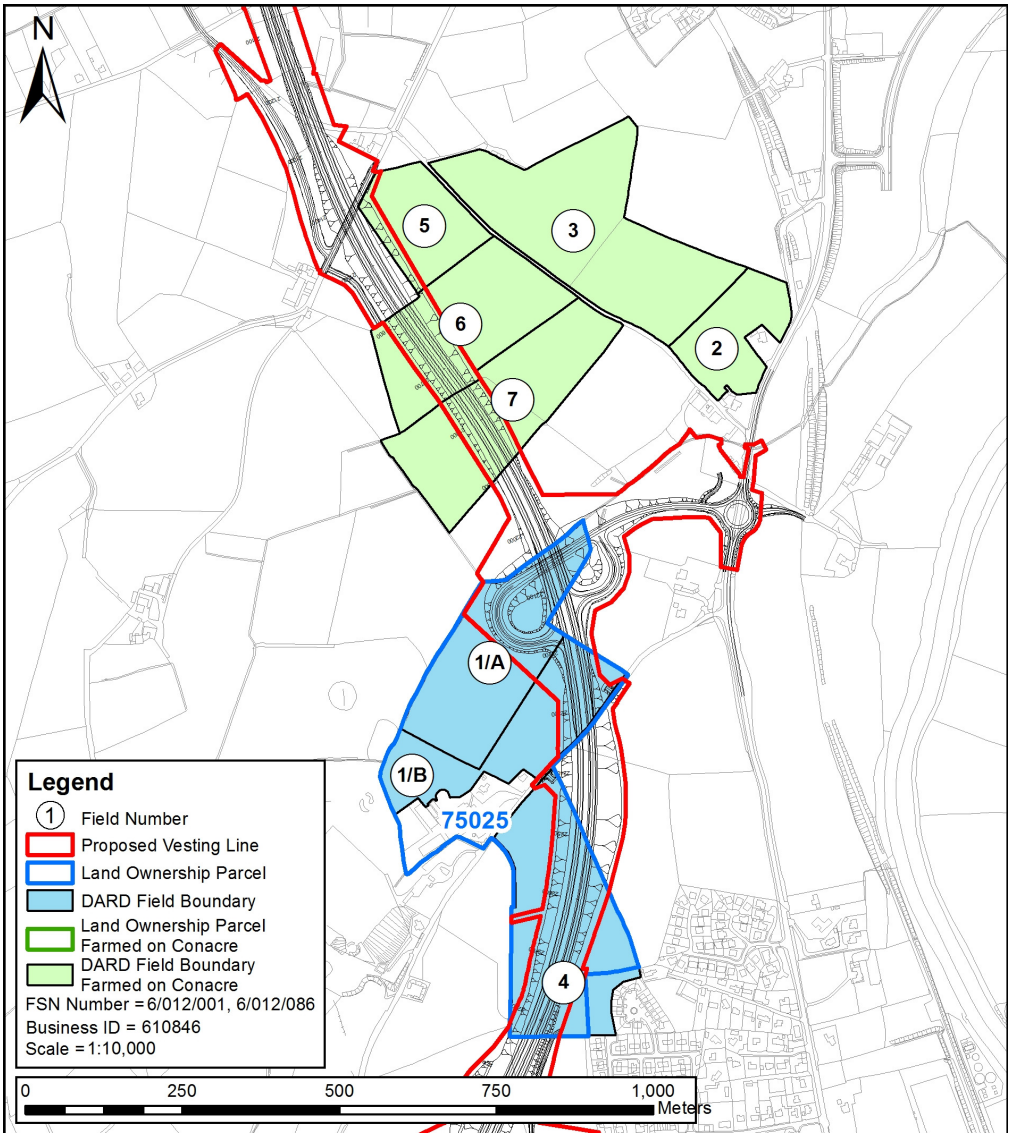
Size and Quality of Farm	
The farm extends to 5.67ha of owned land in three fields, which are both in grass.	
Type of Enterprise and Husbandry	
The Landowner cuts and bales grass produced on the land for sale as baled silage. Any after-grass is grazed.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is not eligible under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts	
Total loss of 3.57 hectares from field 1, 2 and 6 of the 5.67 hectare farm equating to 63.0% of the productive land. New severance would impact on the farm. Access would be provided to all severed land off the proposed junction with the scheme. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation	
During the construction phase access to severed land would be required.	
Predicted Effects	The loss of 63.0% of the available productive land would constitute a substantial adverse effect on the farm.

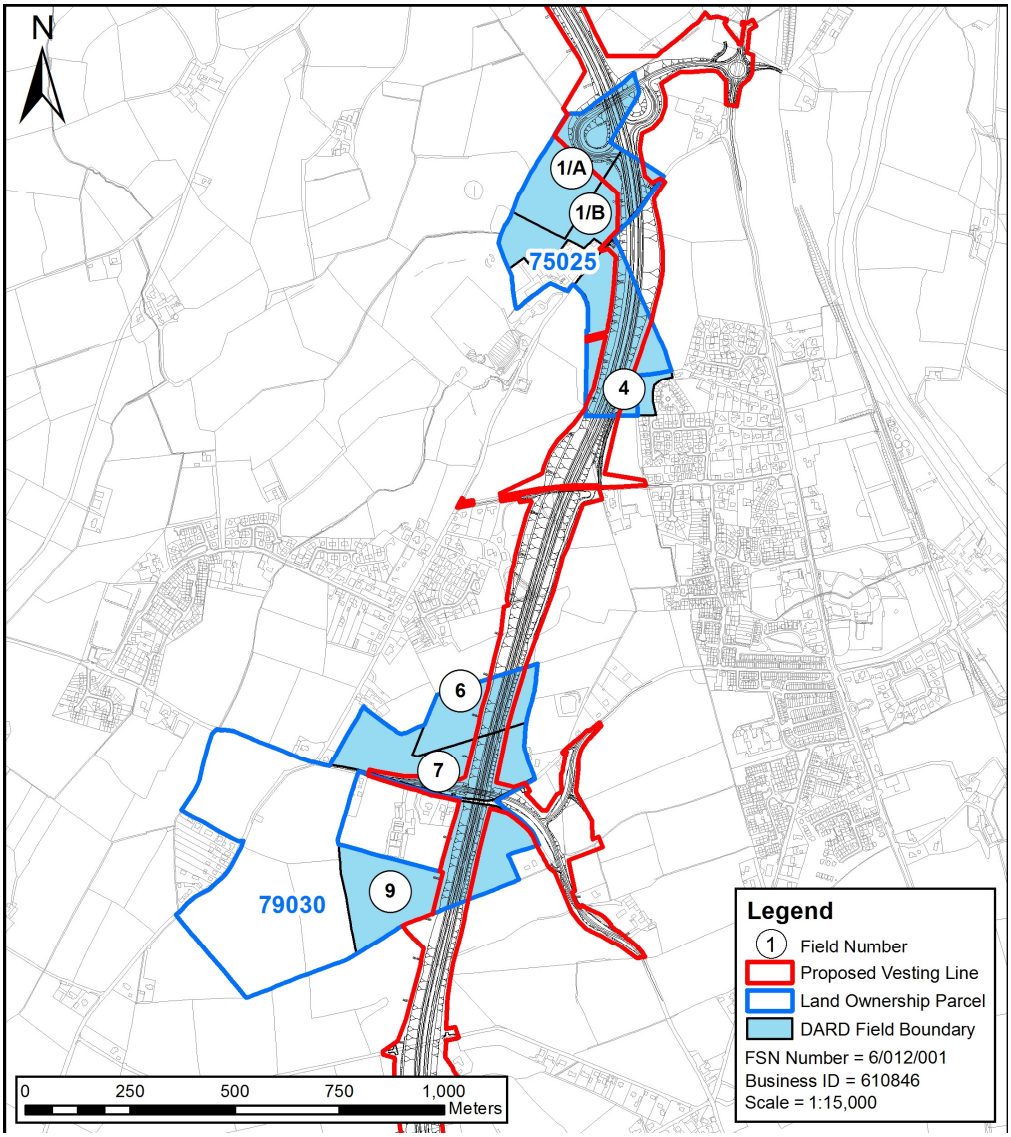
© Mouchel 2016

Land Parcel Ref	75025, 79030	**DARD Business Ref**	610846
		Data sources	2010 AIA meeting held. Feedback received for 2013 AIA letter and 2014 land confirmation meeting. October 2014 meeting.
Conacre Parcel Ref	42.3ha rented in conacre from Parcel 71005 and 71015 (datasheet 021-042)		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016



© Mouchel 2016

Size and Quality of Farm The farm extends to 52.6ha of owned land, with a further 42.3ha taken in conacre from parcels 71005 and 71015.	
Type of Enterprise and Husbandry The farm runs a pig unit containing 160 sows, producing approximately 4,000 finished pigs per annul. Cereals grown on the farm are utilised for the pig unit, with most of the straw being sold off the farm.	
Conacre Arrangement	42.3ha taken in conacre from parcels 71005 and 71015. Impact on the parcel 71005 landowner are outlined in appendix 15C. Impacts on landowner of parcel 71015 is assessed in 021-042.
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	Given that the farm runs an intensive pig unit, there may be implications under the Nitrates Directive as organic nitrogen is currently borderline on 170kg organic nitrogen per ha. Phosphorus output is also likely to be an issue under the Nitrates Directive.
Countryside Management Scheme	The owned land and some of the conacre land is registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is not eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity

© Mouchel 2016

Predicted Impacts	
Total loss of 11.85 hectares from fields 1/A, 1/B, 2, 3, 4, 5, 6 and 7 in parcel 75025 and fields 6, 7 and 9 in parcel 79030 of the 94.9 hectare farm equating to 22% of the owned productive land. In addition fields 5,6 and 7 of land taken in conacre from parcel 71015 will be affected, Under the Nitrates Directive, land-take may impact on future compliance.	
Proposed Mitigation	
During the construction phase, access to land would be maintained.	
Predicted Effects	The loss of available productive land would have a substantial impact on the farms potential output and constitute a substantial adverse effect on the farm.

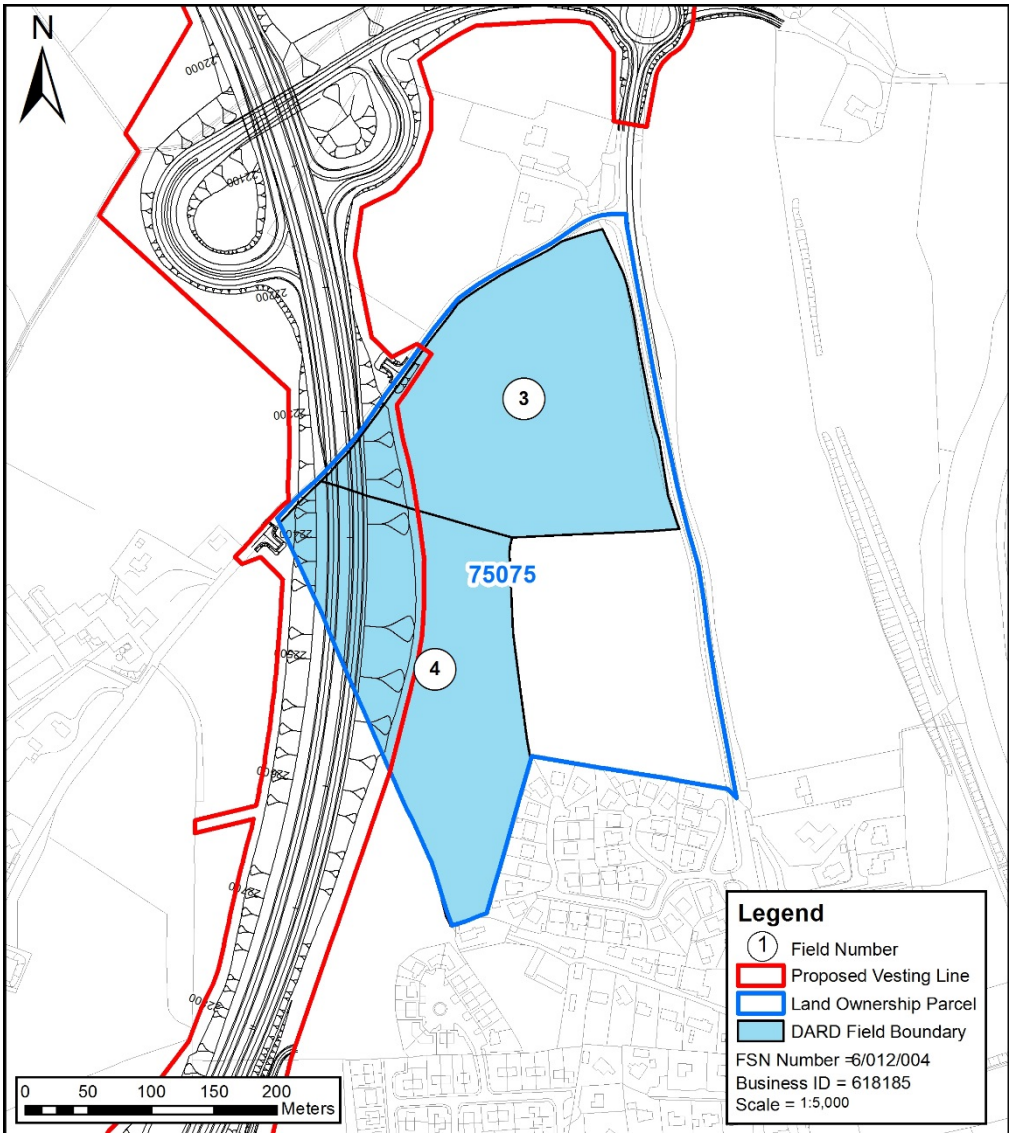
Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 154.51ha and is all in grass.	
Type of Enterprise and Husbandry The farm runs a herd of 220 dairy cows plus young stock. All bull calves are sold. There are approximately 350 cattle on the herd list. Heifer calves are reared and either retained as replacements or sold if surplus to requirements. The out-farm affected by the road scheme is utilised for silage, with 3 cuts being taken. No stock graze the out-farm since fencing is not stockproof.	
Conacre Arrangement	N/a
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	This is an intensive dairy farm and there may be implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	Most of the land is registered as Disadvantaged Area (DA) and is eligible for payments under LFACAS, with the exception of the Landowner's land, which is registered as Lowland (LL) and is therefore not eligible for payments.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

© Mouchel 2016

Predicted Impacts Total loss of 1.89 hectares from fields 3 and 4 of the 154.51 hectare farm equating to 1.2% of the productive land.	
Proposed Mitigation During the construction phase access to land will be required.	
Predicted Effects	The loss of 1.2% of the available productive land would have a slight impact on the farms potential output and constitute a slight adverse effect on the farm.

© Mouchel 2016

Size and Quality of Farm The farm extends to 8.53ha of owned land, which is all in grass.	
Type of Enterprise and Husbandry The land is all rented out in conacre.	
Conacre Arrangement	All land is let in conacre to parcel 75025 landowner. Impacts on the conacre tenant are outlined in datasheet 021-044.
Single Farm Payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is rented in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
The loss of 1.67 hectares from fields 11 and 13 of the 8.53 hectare farm equating to 19.6% of the productive land. This would include land to the east of the farm. As the land is all rented in conacre, the landtake impacts would be slight. There would be no severance as a result of the Proposed Scheme. The overall impact of the Proposed Scheme on the farm would be **slight adverse.**
Proposed Mitigation No mitigation is proposed.

© Mouchel 2016

Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

Size and Quality of Farm	
The farm extends to 16.26ha of owned land, which is all in grass.	
Type of Enterprise and Husbandry	
The farm runs a herd of 12 suckler cows and 1 bull. There are approximately 25 cattle on the herd list. Field No 4 is normally cut twice for silage, after which, the aftermath is grazed.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	With the exception of 3 fields, which are classified Lowland (LL), the remainder of the land is classified Disadvantaged Area (DA), and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts	
Total loss of 1.01 hectares from fields 1 and 4 of the 16.26 hectare farm equating to 6.2% of the productive land. This would include land for the realigned Primrose Park Road. The landtake impacts would be slight. There would be no severance as a result of the Proposed Scheme.	
Proposed Mitigation	
During the construction phase access to severed land would be provided.	
Potential Effects	The loss of 6.2% of the available productive land would have a slight adverse effect on the farm.

Size and Quality of Farm

The farm extends to 34.7ha of which 22.76ha is owned land, with the remaining 11.94ha being rented in conacre.

The farm runs a grass/arable rotation, with Field Nos 4, 6, 8 & 12 being in cereals, and the remainder being in grass.

Type of Enterprise and Husbandry

This is a mixed arable/grass farm, with the grass being used for grazing/silage for approximately 50 calves which are bought in and reared through to finish for beef.

The landowner indicated that a well situated in adjacent land to the south-west of Field Nos 11/12, provides water fed by gravity to the farmyard and dwelling house.

Conacre Arrangement	Rents parcel 79120 as conacre which is affected by the proposed scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Field Nos 11 & 12 are classified Disadvantaged Area (DA) and are eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 4.57 hectares of owned land and 1.6ha of conacre in parcel 79120 results in the loss of 17.7% of the productive land.

This would include land for the proposed route and the new alignment of Bells Park Road and Garden Road. The landtake impacts would be moderate.

New severance would also impact on the farm. Access would be provided to severed land along the existing Garden Road. Access to fields 10 and 11 would remain by crossing Bells Park Road. The severance impacts would be slight.

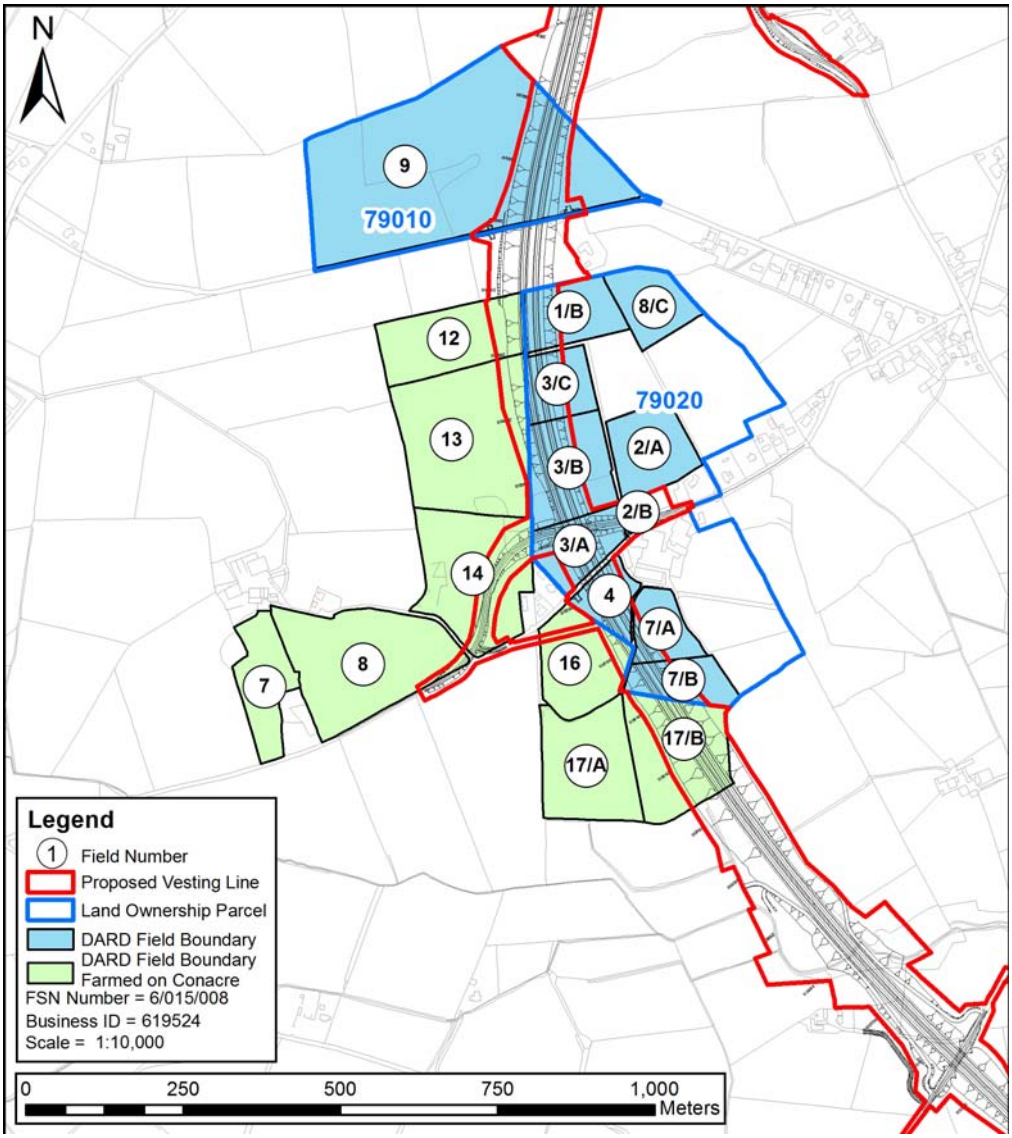
© Mouchel 2016

There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation No mitigation is proposed.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	79010 & 79020	**DARD Business Ref**	619524 & 623217
		Data sources	February 2010 meeting held. 2013 AIA letters not returned and refused landowner confirmation meeting. Minor changes in the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Lets land in conacre from Parcel 83035, datasheet 021-052		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm is run as a partnership. This is a large arable, diary and beef farm, extending to over 200ha approximately, of which 61.9ha is owned land, with the remainder being taken in conacre.

Type of Enterprise and Husbandry

The farm runs a herd of approximately 270 diary cows with an average yield of 7,800 litres. There are also 4 bulls on the farm. Approximately 40-50 heifers are reared each year as replacements giving young stock numbers totalling approximately 100.

All calves not required as herd replacements are reared and finished indoors as beef. In the case of bull calves these are finished as bulls.

The farm grows approximately 93ha of cereals, mainly as winter wheat, with approximately 32ha being cut for whole crop silage and the remaining 61ha being grown for grain, which is subsequently crimped and stored on the farm for feeding.

The water supply for the farm is from a well/spring situated in centre of field No 9, with the water being piped to the underground water storage tank in the yard, from where it is pumped indoors to two, header tanks (approximately 2,000 litres each) to provide water pressure to drinkers etc in the sheds.

The farm is already severed by minor roads, which do not impact on the management of the farm. Cattle are moved, either across minor roads or by trailer from the home farm to out-lying conacre land.

The farm provides employment for 2 full-time staff in addition to the landowner and his son.

Conacre Arrangement	Approximately 138.1ha of land is takenin conacre. Affected conacre land is rented from Parcel 83035, datasheet 021-052.
Single Farm Payment	The farm collects Single Farm Payment on owned land and also on all conacre land.
Nitrates Directive	The high stocking rate of the farm means it is close to the upper limit of Nitrates under the Nitrates Directive.
Countryside Management Scheme	Owned land, and most of the conacre land, is registered under the Countryside Management Scheme.

© Mouchel 2016

Less Favoured Area Compensatory Allowances Scheme	Some of the land is registered as lowland (LL), which is not eligible for payments under LFACAS, with the remainder being registered Disadvantaged Area (DA), which is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 7.68 hectares from field 9 in parcel 79010, fields 1/B, 2/A, 2/B, 3/A, 3/B, 3/C, 4, 7/A, 7/B and 8/C in parcel 79020 under ownership. Land taken in conacre affected by the Proposed Scheme includes 4.23 ha from fields 7, 8, 12, 13, 14, 16 and 17/A from in parcel 83035. Overall landtake equates to 5.96% of the productive land.

Landtake would include land from the dairy herd grazing platform. There may be implications for the farm under the Nitrates Directive due to the landtake that would be required.

The landtake impacts would be substantial.

New severance would impact on the farm. The severance of parcel 79010 would result in a long diversion to access to severed land to the east. The conacre land currently used for grazing the dairy herd (part of parcel 83035) would also be severed from the home farm. As this land it currently rented in conacre it is not considered as a permanent impact. The severance impacts would be moderate.

As a result of the Proposed Scheme 2 farm buildings would be demolished. The demolition of the buildings would be a moderate impact to the farm.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

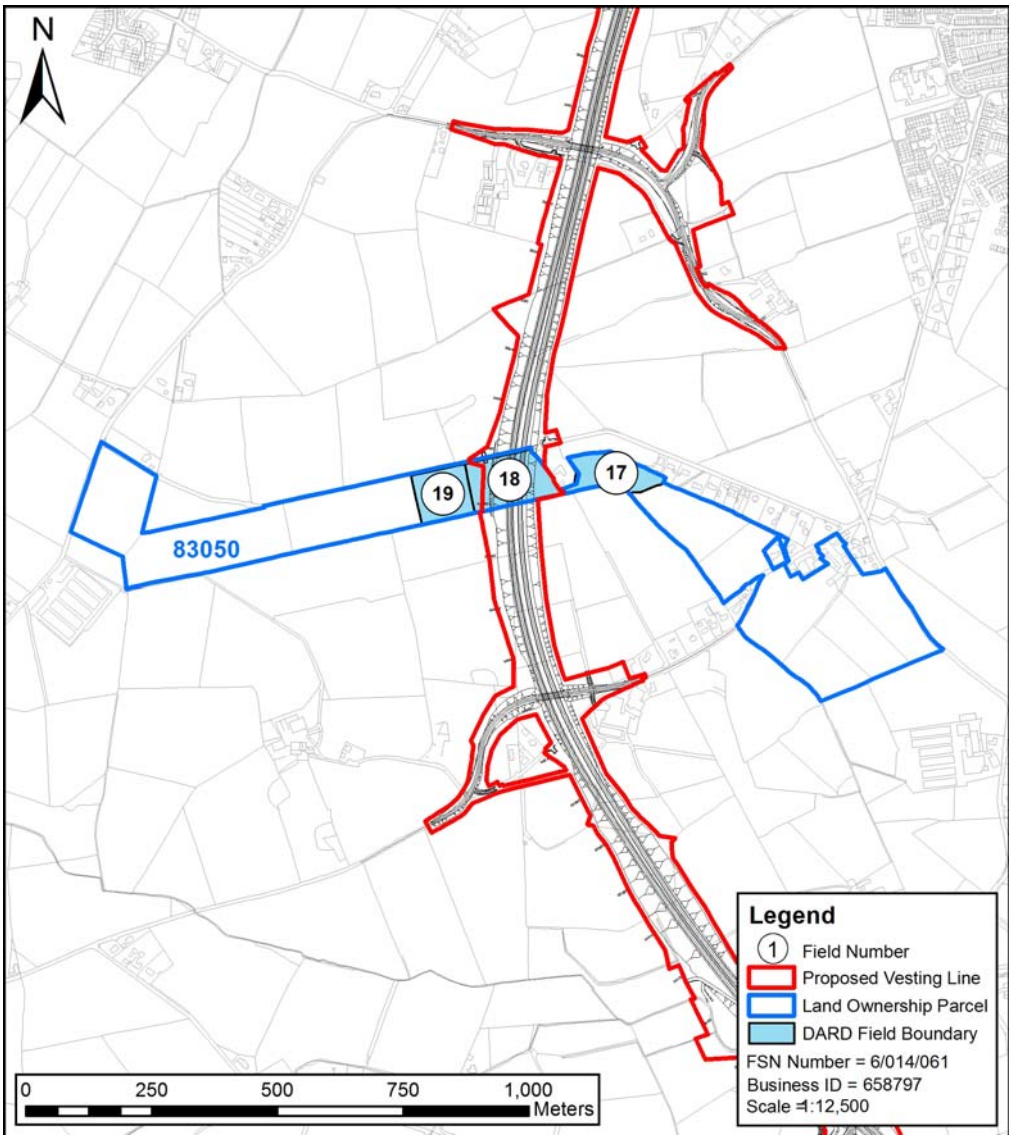
During the construction phase access to severed land would be maintained.

Predicted Effects	The loss of 5.96% of the available productive land, severance and implications under the Nitrates Directive would have a substantial impact on the farms potential output and constitute a substantial adverse effect on the farm.

© Mouchel 2016

Land Parcel Ref	83050	**DARD Business Ref**	610832
		Data sources	November 2014 meeting
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm business. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 55.2ha, of which 43.09ha is owned land, with a further 12ha taken in conacre. The conacre land is not affected by the Road Scheme.

Type of Enterprise and Husbandry

The farm runs a dairy herd of 45 cows, plus a further 70 young stock, being reared as heifer replacements or calves reared for beef.

In addition, the farm runs a sheep flock of 60 ewes and 2 rams, with approximately 100 lambs carried through to finish.

Field Nos 20 - 22 along the High Road are utilised for silage (2 cuts), with the High Road providing access. Field Nos 18 & 19 form part of the grazing platform for the dairy herd. The after-grass on Field Nos 20 – 22 would normally be grazed by the dairy herd. In addition, access to the out-farm is via the High Road. Not all fields are shown on the plan above.

Conacre Arrangement	12ha of land is taken in conacre. This land I not affected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	As this is a dairy herd, the land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The main impacts on this farm business are severance and land take.

There will be the loss of 1.38 ha of the 55.2ha farm equating to some 2.5% of the productive

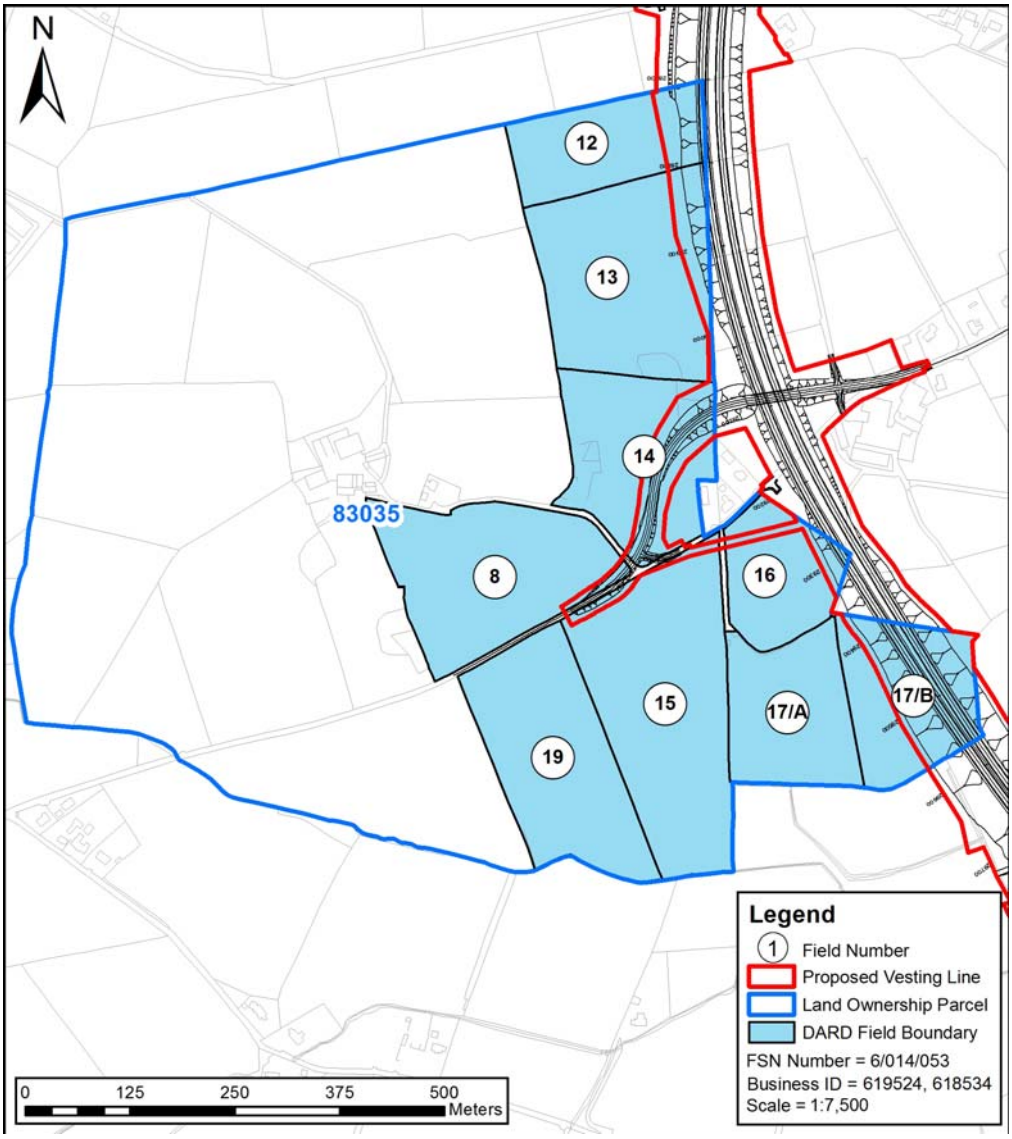
© Mouchel 2016

land. During the construction phase, access to land severed along the High Road will need to be maintained. Stopping off the High Road will create severe problems for this Landowner, since it provides direct access to the out-farm. A new access track will be provide from Seein Road to the south to connect land west of the A5WTC.
Proposed Mitigation During the construction phase access to severed land would be maintained.
Residual Effects The residual effect of the Proposed Scheme on the farm business would be **substantial adverse.**

© Mouchel 2016

Land Parcel Ref	83035	**DARD Business Ref**	Not available
		Data sources	2010 AIA meeting held. No response from 2013 AIA letters or 2014 land confirmation pack. September 2014 AIA meeting held.
Conacre Arrangement	Affected fields let in conacre to Parcel 79010 landowner, Datasheet 021-050		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 70.22ha and is all in grass.	
Type of Enterprise and Husbandry The land is all in conacre and is currently rented out to three different farmers.	
Conacre Arrangement	The entire parcel is let in conacre. Affected fields let in conacre to Parcel 79010 landowner. The assessment of impacts on this conacre tenant are outlined in datasheet 021-05. The remaining area, which is unaffected, is let to two other landowners.
Single Farm Payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is rented out in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The main impacts on this farm business is land take. There will be a total loss of 4.23ha of the 70.2ha farm equating to 6% of the owned land. This would include the edges of land to the east of the farm and the accommodation of the realigned Seein Road. The landtake impacts would be slight. There would be no severance as a result of the Proposed Scheme.	
Proposed Mitigation No mitigation is proposed.	

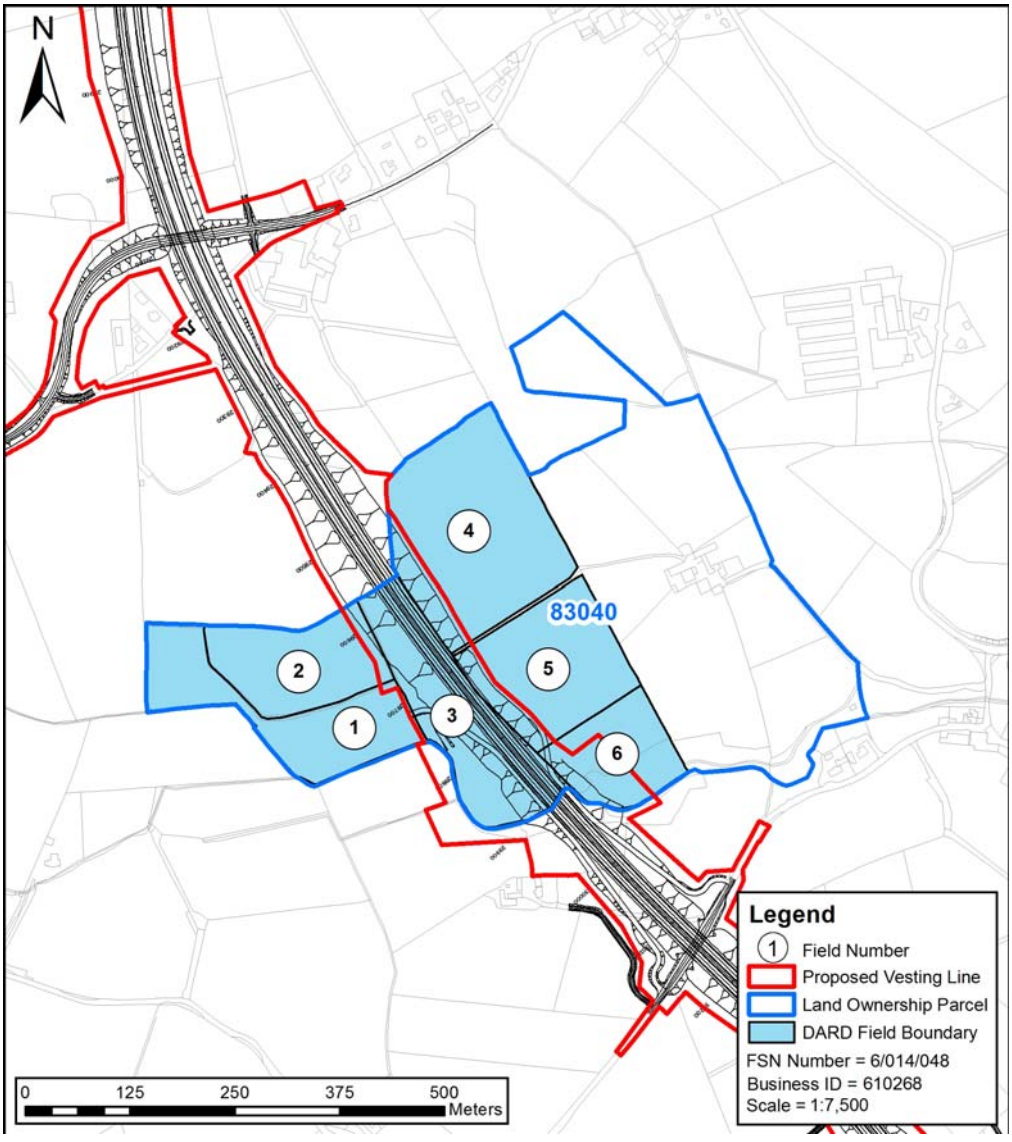
© Mouchel 2016

Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	83040	**DARD Business Ref**	610268
		Data sources	March 2010 AIA meeting held. No response to 2013 AIA letter. Landowner confirmation meeting identified no change to farm. Minor changes to scheme only, no 2014 revisit.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 51.76ha of which 25.67ha is owned land, with the remainder being taken in conacre.	
Type of Enterprise and Husbandry	
The farm runs a herd of 40 suckler cows and 2 bulls, with all the progeny being sold as stores at approximately 18 months of age.	
Conacre Arrangement	26.09ha of land is rented in conacre, which is unaffected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land and on some conacre land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area/Severely Disadvantaged Area (DA/SDA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The landtake required by the Proposed Scheme would total 2.73ha. This would result in the loss of 5.3% of the productive land. The landtake impacts would be moderate.

New severance would also impact on the farm. Access would be provided to severed land via a farm lane that links onto the existing Concess Road. The severance impacts would be moderate.

There would be temporary impacts during the construction phase of the Proposed Scheme.

© Mouchel 2016

Proposed Mitigation	
During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	83045	**DARD Business Ref**	610845
		Data sources	2010 AIA meeting. 2013 AIA letters not returned. Landowner confirmation meeting held. September 2014 AIA meeting

© Mouchel 2016

Size and Quality of Farm The farm extends to 14.69ha of owned land. The farm is all in grass.	
Type of Enterprise and Husbandry The farm runs a suckler cow herd of 18 cows and 1 bull, with the progeny being either sold as suckle calves or carried through to finish. In addition, approximately 10-12 store cattle (live-weight 350 kg) are bought in annually for finishing.	
Conacre Arrangement N/a	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all classified Disadvantage Area (DA) and is eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

© Mouchel 2016

Predicted Impacts Land take would result in the loss of 3.26 ha of the 14.69ha farm equating to some 22.2% of the productive land. This includes land for a shared farm lane connecting Concess Road. The land take is considered to be a moderate adverse impact. New severance will also impact on the farm. Concess Road will remain open and will provide access to the severed land. The severance is considered to be a slight impact to the farm. During the construction phase, access to severed land may be compromised.
Proposed Mitigation During the construction phase access to severed land will need to be maintained.
Predicted Effects The residual effect of the proposed A5WTC on the farm is a **moderate adverse** impact.

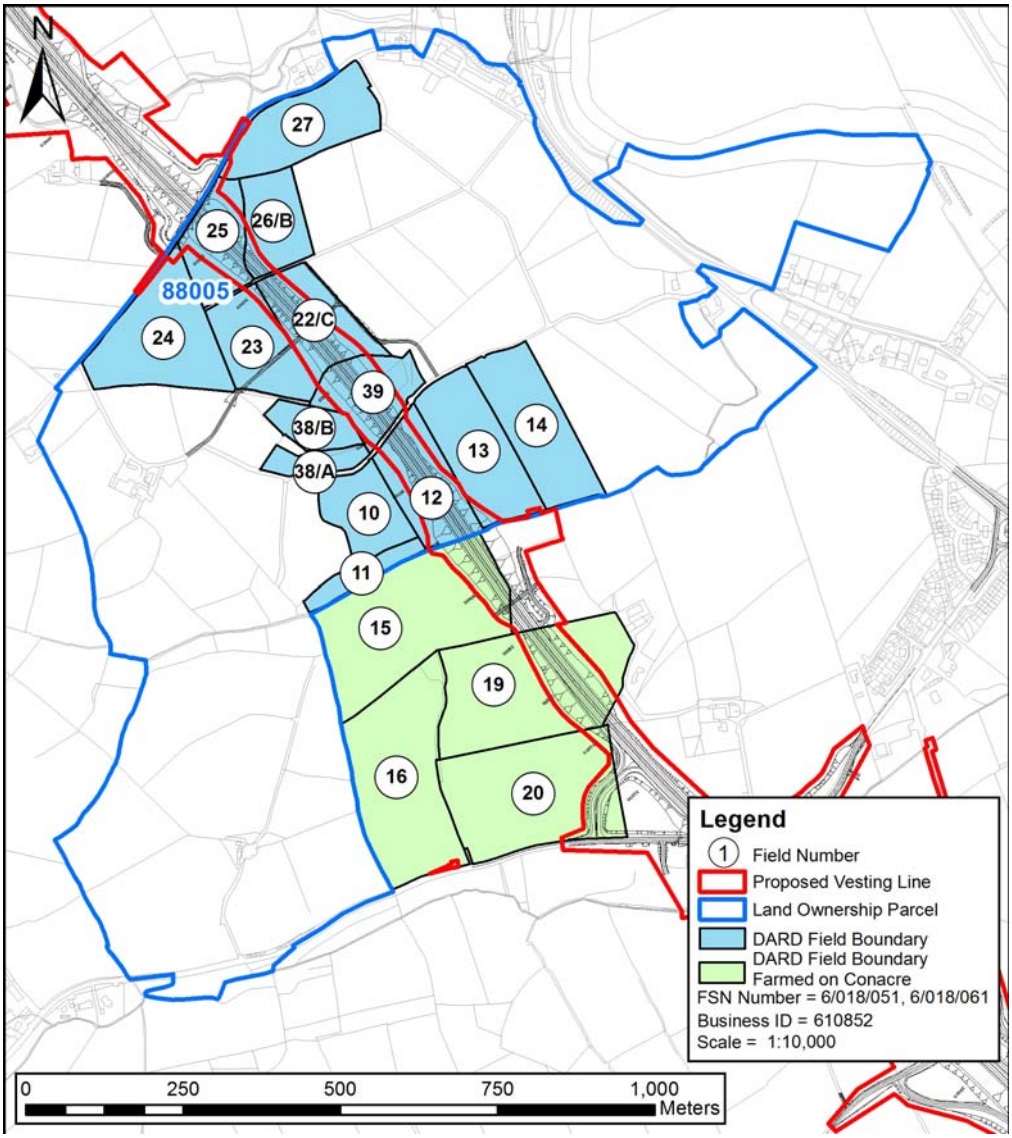
Land Parcel Ref	88005	**DARD Business Ref**	610852
		Data sources	2010 AIA meeting held. No response to 2013 AIA letters. Landowner confirmation meeting held. Refused 2014 AIA meeting
Conacre Parcel Ref	Conacre taken from parcel 88040		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

Information is based on 2010 assessment. Landowner refused 2014 meeting.

The farm extends to 137.57ha of which 102.99ha is owned land. The remainder of land is rented in conacre some of which is affected by the proposed scheme.

The farm is all in grass with some areas of woodland/scrub.

Type of Enterprise and Husbandry

The landowner's father is the tenant. The farm runs a large dairy herd of 200 cows, with a herd average of 8,700 litres. In addition, there are approximately 160 young stock, including beef cattle, with all bull calves reared for beef. There are approximately 355 cattle on the herd list.

The farm also runs 4 thorough-bred horses (2 mares for breeding, plus 2 geldings).

The farm is well laid out with an excellent system of farm laneways, which provide access to the grazing platform for the dairy herd, leading out to field No 24, alongside the Concess Road. In addition, a laneway connects the main farmyard (by field 28) to another farmyard situated at the opposite end of the farm, adjacent to field No 1.

The system of laneways allows the dairy herd to graze the entire home farm, with the exception of field Nos 1-5 and field No 11. Field Nos 29 – 31, on the opposite side of the A5 (not shown on the map), are utilized for maize silage. Grass silage is mainly grown on conacre land at Sion Mills and also on other land.

Conacre Arrangement	Conacre taken from parcel 88040, see Datasheet 021-056.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, and also on conacre land at Sion Mills.
Nitrates Directive	Given the intensive stocking rate, there may be implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	With the exception of 3 fields, the most of the farm is classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts

The landtake required by the Proposed Scheme would total 5.58ha of owned land from the grazing platform. This is equates to 4.1% of loss of the 137.57ha farm. Conacre taken in parcel 88040 is also affected. This may have implications for the farm under the Nitrates Directive as it is presently close to the limit. The landtake impacts would be moderate.

New severance would also impact the farm. Access would be provided across Concess Road to the north and through an underbridge to the south of the land joining fields 12 and 13. The severance impacts would be moderate.

During the construction phase, the dairy herds access to the grazing platform may be compromised as it would be severed from the main farmyard.

Proposed Mitigation

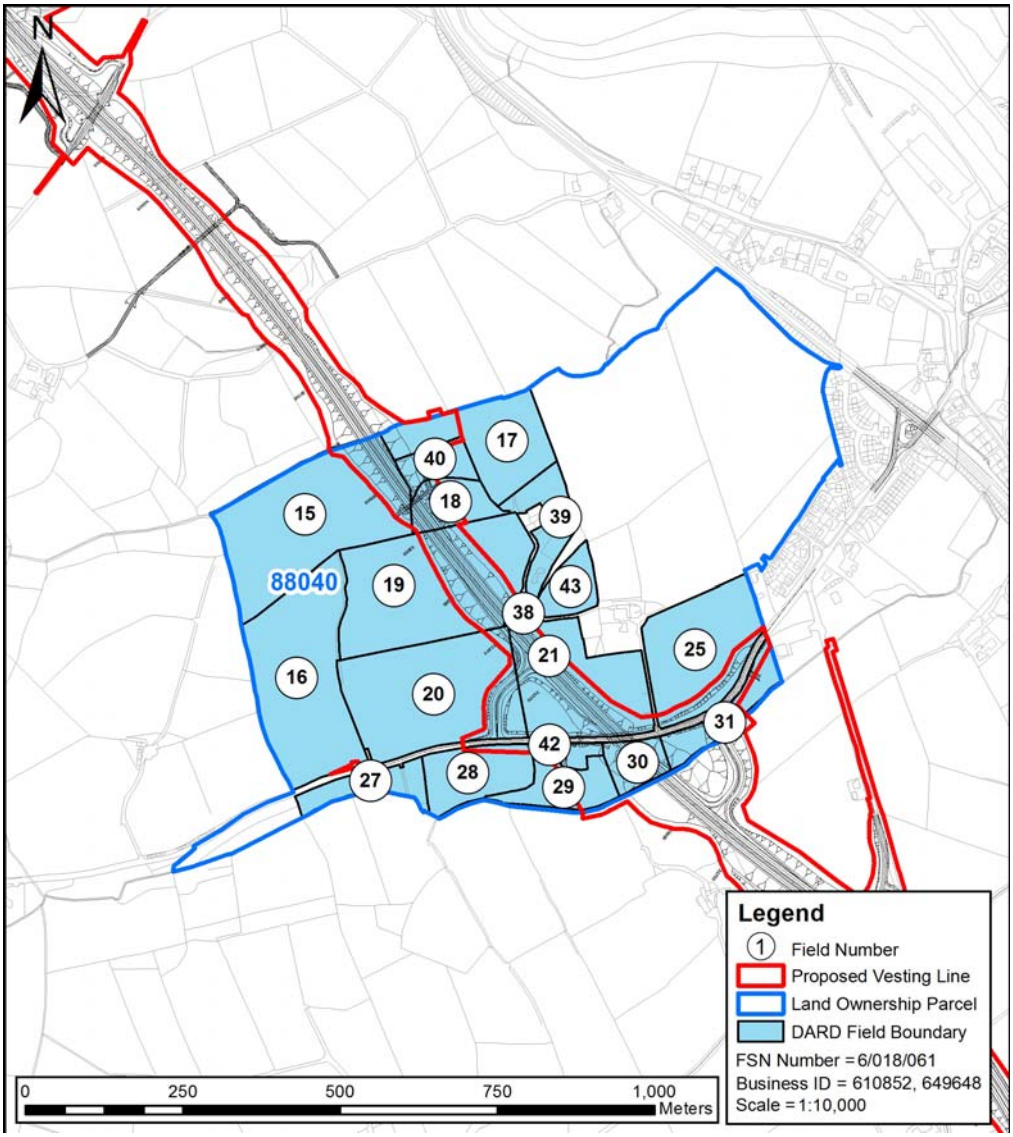
During the construction phase access to severed land would be provided.

Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	88040	**DARD Business Ref**	631694
		Data sources	2010 AIA meeting held. Landowner confirmation meeting held. Refused 2014 Meeting
Conacre Parcel Ref	Parcel let in conacre to parcel 88005 landowner		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends 153.61ha of owned land. The farm is all in grass.	
Type of Enterprise and Husbandry	
The farm is all rented out in conacre.	
Conacre Arrangement	Parcel is let out in conacre to two landowners. Fields 15, 16, 19 and 20 are let out to parcel 88005. Impacts on the conacre tenant are outlined in Datasheet 021-055. Affected fields 17, 21, 25. 40, 42, 27-31 are let out to an unaffected landowner (no confirmed contact details). No conclusion could be made for the second conacre tenant with the information available.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all rented out in conacre, and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Fields affected include 15, 16, 17, 18, 19, 20, 21, 25, 27, 28, 29, 30, 31, 38, 39, 40, 42, 43.

The Proposed Scheme would result in a total loss of 10.05ha of the 153.61 ha farm equating to some 6.5% of the productive land. This would include the junction with Fyfin Road to the south of the land parcel. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

New severance would also impact on the farm. Access would be provided across the Proposed Scheme on Fyfin Road to the south and via an underbridge to the north of the land

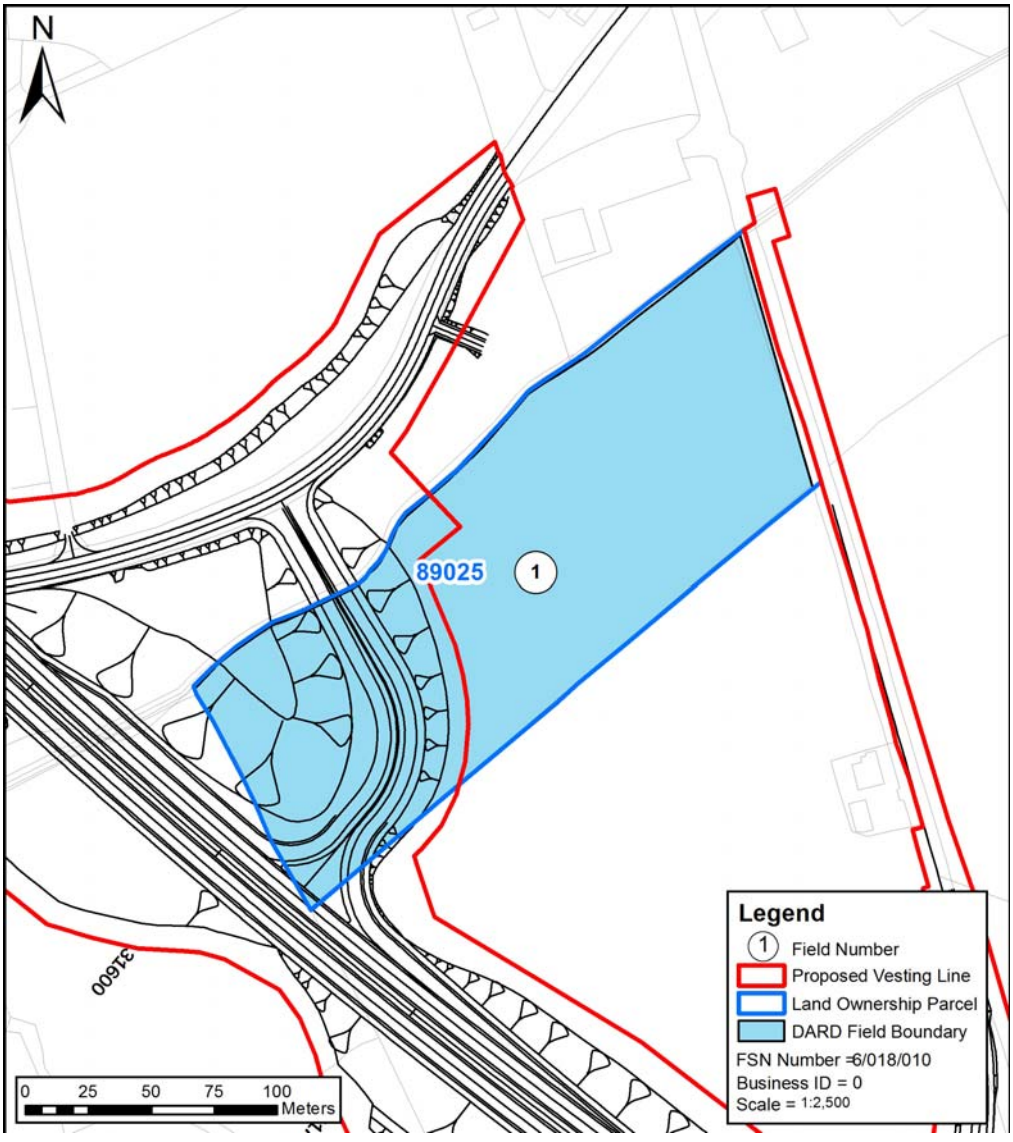
© Mouchel 2016

parcel. As the land is currently out in conacre and not farmed by the landowner directly, the severance impacts would be slight. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the landowner would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	89025	**DARD Business Ref**	621936
		Data sources	September 2010 meeting. Minor change in scheme. No response to 2013 AIA letters. Landowner confirmation meeting held. No significant change in the farm or scheme, therefore no 2014 revisit.
Conacre Parcel Ref	Let in conacre to unaffected farmer.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 2.83ha of land in one field.	
Type of Enterprise and Husbandry The land is utilised for growing grass, which is sold 'as seen' for silage. After two cuts, the land is grazed by sheep.	
Conacre Arrangement	Let in conacre to famer not affect by the Proposed Scheme. No contact details. No conclusions about the impact on the conacre have been determined as a result of the Proposed Scheme.
Single Farm Payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Since there are no livestock on the land, the land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts Loss of 0.97ha of the 2.83ha farm equating to some 34% of the productive land. This would include land for the junction with Fyfin Road. There would be no severance as a result of the Proposed Scheme.	
Proposed Mitigation No mitigation is proposed.	

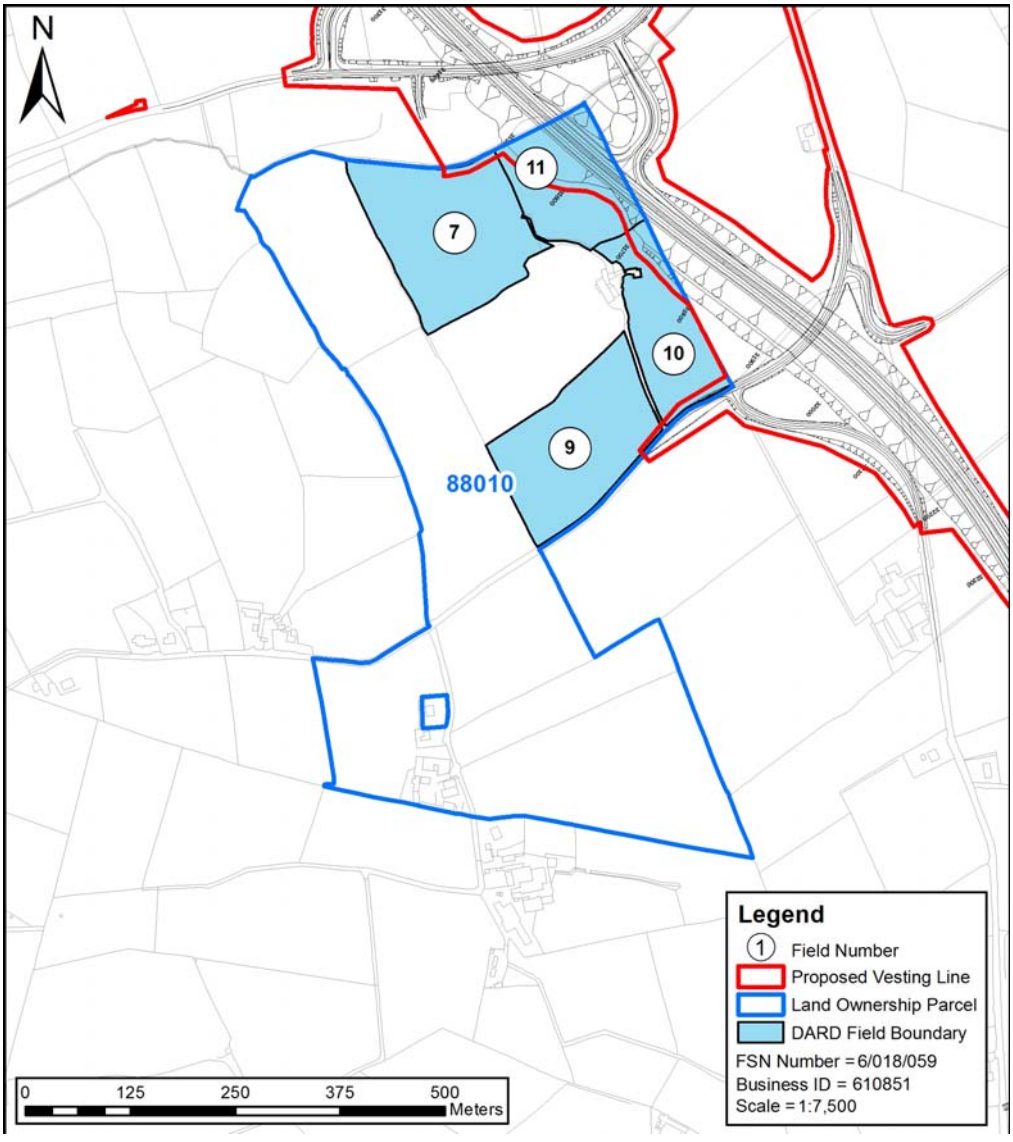
© Mouchel 2016

Predicted Effects	The loss of some 34% of the available productive land would have a substantial impact on the farm's potential output and constitute a significant effect on the farm. The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	88010	**DARD Business Ref**	610851
		Data sources	2010 AIA meeting held. No feedback from 2013 AIA letters or 2014 Landowner confirmation Meeting. November 2014 meeting
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 59.98ha of which 28.47ha is owned land, with the remaining 31.51ha being taken in conacre from two separate parcels of land not affected by the proposed scheme.

Type of Enterprise and Husbandry

The farm runs a herd of 11 suckler cows and 1 bull, with all the calves being finished for beef. In addition, approximately 130-140 store cattle are bought in for finishing for beef. There are approximately 150 cattle on the herd list.

Conacre Arrangement	31.51ha taken in conacre from two separate parcels of land not affected by the Proposed Scheme.
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all classified Disadvantaged Area (DA), and is eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

Predicted Impacts

Land take required by the proposed scheme totals 1.49ha, 2.5% of the farm area. This includes the eastern edge of parcel 88010. The land take is considered to be a slight impact to the farm.

There will be no severance caused by the proposed scheme.

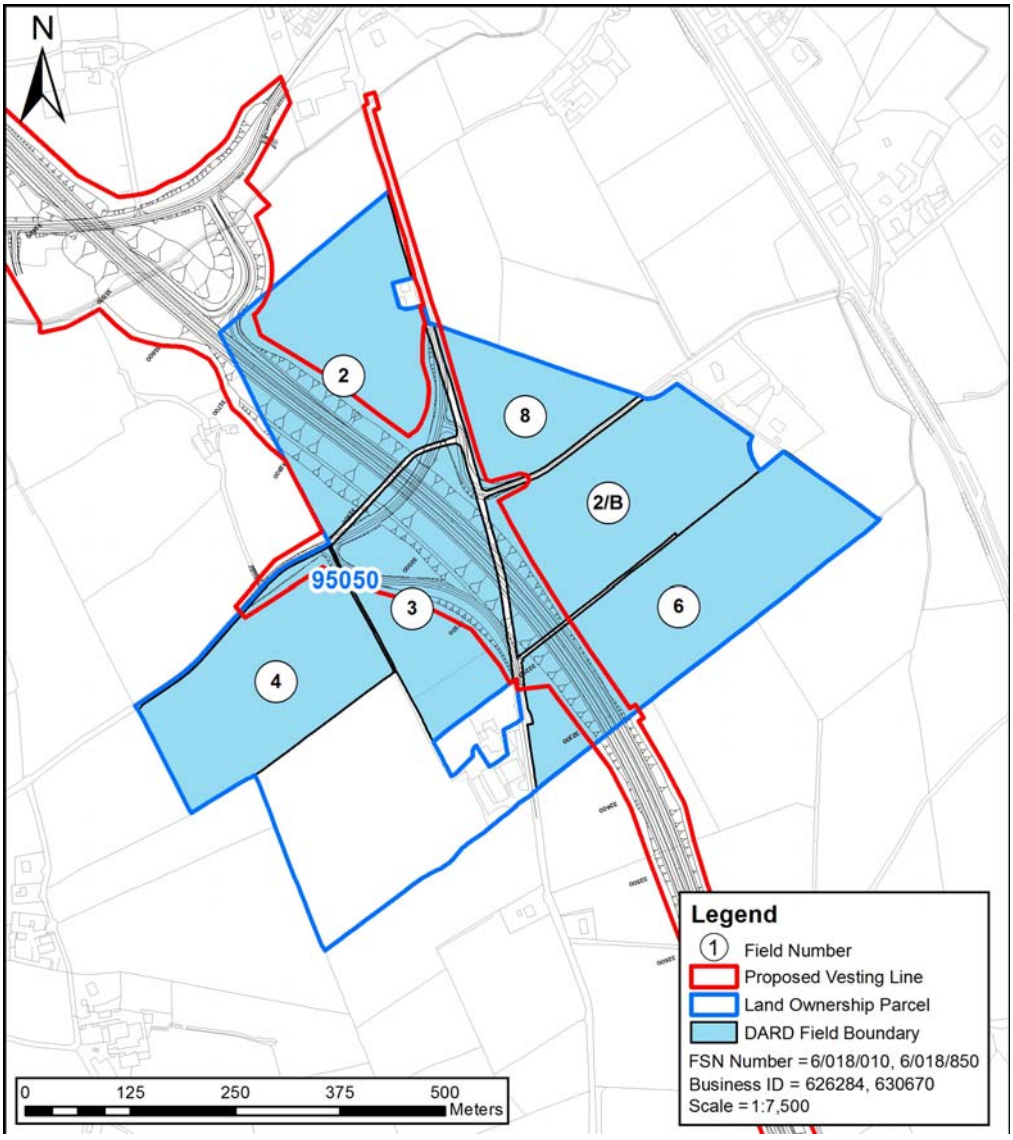
© Mouchel 2016

Proposed Mitigation No mitigation required	
Predicted Effects	The loss of some 2.5% of the available productive land would have a **slight adverse** impact on the farm's potential output. This is unlikely to constitute a significant effect on the farm.

© Mouchel 2016

Land Parcel Ref	95050	**DARD Business Ref**	626284
		Data sources	2010 AIA meeting held. No response to 2013 AIA letters. 2014 Land confirmation meeting held over the phone. October 14 AIA meeting held.
Conacre Parcel Ref	Let in conacre		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to approximately 34.8ha of owned land, which is all in grass. 12ha are rented in conacre.	
Type of Enterprise and Husbandry The farm runs 40 suckler cows and 1 bull, with the calves being carried through to finish. There are approximately 120 cattle on the herd list. In addition, the farm runs a flock of 150 ewes and 5 rams, producing approximately 220 lambs, which are carried through to finish. The affected out farm is rented in conacre to an offline farmer. The Landowner indicated that, prior to purchase approximately 7 years ago, the farm had been run as a dairy farm. The farm was purchased with the intention that his son would re-establish a dairy herd on the farm.	
Conacre Arrangement	The affected out farm land is rented in conacre to an offline farmer whose land is not affected by the Proposed Scheme. No contact details. No conclusions could be made on the impacts of the Proposed Scheme on the coancre tenant.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is rented in conacre and is not eligible for payments under LFACAS.
Biosecurity	No issues of biosecurity have been identified.

Predicted Impacts The Proposed Scheme would require approximately 8.55ha of land. The main impacts on this farm will be severance and land-take. Severance will result from the

© Mouchel 2016

alignment of the A5 WTC through parcel 95050.
Proposed Mitigation Access to severed land would be maintained during construction. Relief from severance will be provided by the realignment of Stone Road and Urbalreagh Road across the A5 WTC.
Predicted Effects The residual effect of the Proposed Scheme on the farm would be **substantial adverse**.

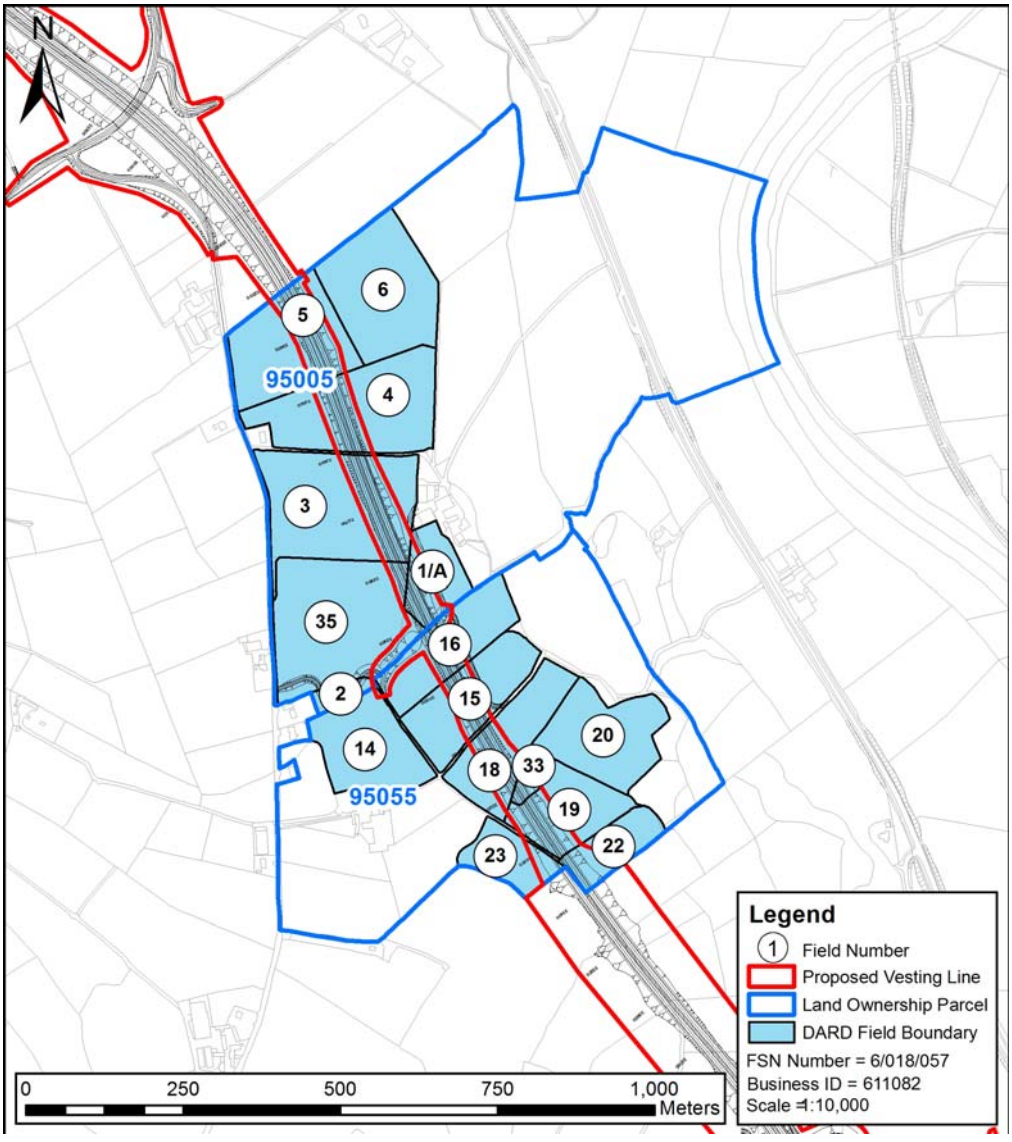
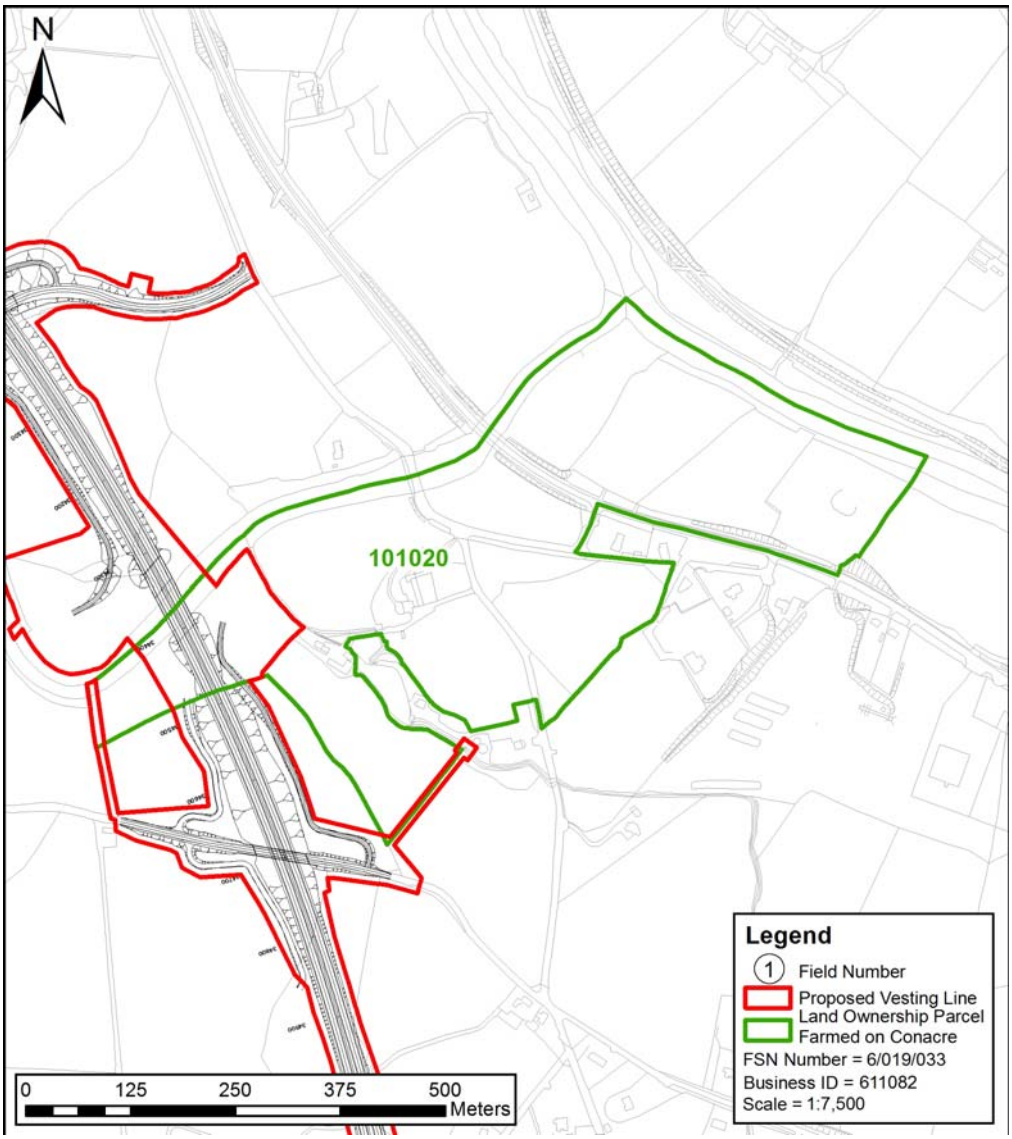
Land Parcel Ref	95055, 95005	**DARD Business Ref**	611082
		Data sources	March 2010 meeting. 2013 AIA letters not returned. Declined landowner confirmation meeting. Minor changes to the scheme only, therefore no 2014 AIA revisit
Conacre Parcel Ref	Conacre rented from parcel 101020		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016



© Mouchel 2016

Size and Quality of Farm

The farm extends to 100.95ha, of which 75.05ha is owned. The remaining land is being taken in conacre, none of which is affected by the scheme.

The farm is all in grass, with the exception of one or two fields (currently 12A, which has been in maize silage).

Type of Enterprise and Husbandry

The farm currently runs a dairy herd of approximately 70 cows, with the intention to build the herd back up to approximately 120 cows. The current herd average is approximately 7,000 litres. There are 2 bulls on the farm, approximately 60 heifers (to 15 months), and approximately 50 calves. Normally, there are approximately 350 cattle on the herd list.

The grazing platform for dairy herd, which is housed in the yard adjacent to field No 14 and 24, extends behind the farmyard and is accessible via a series of farm lanes leading from the farmyard between field Nos 14 and 24, 14 & 15, 24 & 18 and 15 & 16. The lanes give access for the herd to field Nos 14 – 27A. Depending on grazing requirements later in the season grazing, may also extend into field Nos 1, 2, 3, 9, with the remainder being either grazed by young stock and dry cows, or cut for silage.

Dairy cows and young stock are normally stocked on the conacre land.

A well in field No 14 supplies potable water, meeting all the water requirements for the farm and the dwelling house.

Conacre Arrangement	25.9ha of land rented in conacre. The conacre rented from parcel 101020 is affected by the Proposed Scheme. See Datasheet 021-063
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, but not on conacre land.
Nitrates Directive	At the higher stocking rate of 120 cows plus followers, any significant loss of land is likely to have implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Low Land (LL) and is not eligible for payments under LFACAS.

© Mouchel 2016

Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The landtake required by the Proposed Scheme is 6.82ha of owned alnd and 2/09ha od land taken in conacre, equating to some 8.8% of the productive land. This would include a large amount of the dairy herd grazing platform. The intention of the landowner to increase stock numbers and the loss of land may cause the Proposed Scheme to have implications for the landowner under the Nitrates Directive. The landtake impacts would be moderate.

New severance would impact on the farm. Severance would also restrict access between the grazing platform and the home farm. The severance impacts would be slight.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

During the construction phase access to severed land would be maintained.

Access would be provided via an underbridge between parcels 95055 and 95005.

Predicted Effects	The loss of some 8.8% of the available productive land and associated severance would have a **moderate adverse** impact on the farm's potential output. This will constitute a significant effect on the farm.

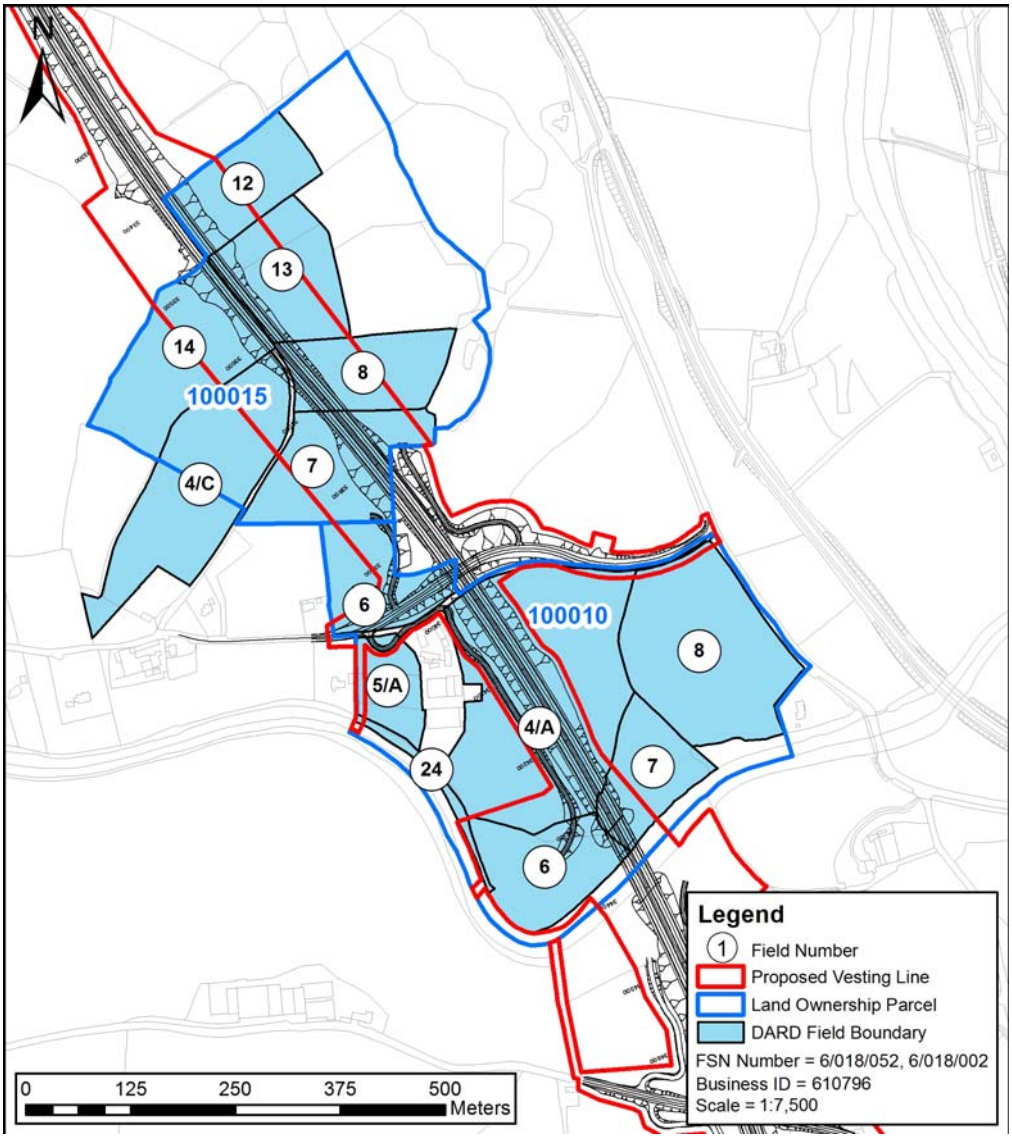
Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm Since there are no farm maps available, the landowner indicated that the area owned extended to 26.32ha The farm is all in grass, for either grazing or for hay / haylage for the horses, with the exception of one field, which has been rented out as conacre to parcel 100025 who is affected by the road scheme.	
Type of Enterprise and Husbandry The farm runs approximately 40 show-jumping horses which 25 are owned with a further 15 being in livery. The land in grass is either grazed by the horses or cut and utilised for hay/haylage for the horses. Field No 10 is utilized as a jump training area and also for exercising horses, while Field No 8 & 9 are cut and grazed (with the exception of the steepest areas). Field No 6 is currently being utilised for hay, after which it will be grazed. Sand is currently being extracted from Field No 1, while Field Nos 2-5 are grazed by the horses. The land is also utilised for training horses in cross-country in winter, with Field No 8 also being used in the summer for cross-country training. While sand is being extracted from Field No 1, the landowner has the use of the mineral extraction operation, fields to replace the area utilised for extraction. Since Field No 10 is a relatively flat, dry field on sand, it is regularly used for training and exercising horses, the landowner maintains that any land-take from this field would be critical.	
Conacre Arrangement N/a	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	Since there are no cattle on sheep on the land, the land is not eligible for payments under LFACAS.

© Mouchel 2016

Biosecurity	There are no issues of biosecurity that are not already being addressed.

Predicted Impacts

The main impacts on this farm are severance and land take.

The proposed scheme will cause a total loss of 9.84ha hectares of the 26.32ha farm equating to some 37.4% of the productive land. Land take will likely be most severe from Field No 10 (Parcel No 100010), which is currently used for training and exercising horses, will impact on this equine.

The alignment of the Proposed Scheme would result in severance to both 100010 and 100015 land parcels.

Proposed Mitigation

Access lanes off the Derg Road have been proposed and existing laneways may require realignment to access to several fields.

During the construction phase access to severed land may be compromised and will need to be maintained.

Predicted Effects	The residual effect of the proposed A5WTC on the farm is considered to be **substantial adverse.**

© Mouchel 2016

Land Parcel Ref	100025	**DARD Business Ref**	614267
		Data sources	2010 AIA meeting held. Landowner confirmation meeting held. November 2014 AIA meeting held.

© Mouchel 2016

Size and Quality of Farm The farm extends to 191.21ha of owned land, which is all arable.	
Type of Enterprise and Husbandry This is a large arable farm, growing winter and spring barley and wheat, winter oats, and occasionally oil seed rape, in the rotation. There are no stock on the farm.	
Conacre Arrangement N/a	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all classified Lowland (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will cause a total loss of 4.09ha hectares of the 191.21ha farm equating to some 2.1% of the productive land. The land take is considered to be a slight adverse impact to the farm.

New severance will also impact on the farm. Access is provided via shared farm lanes connecting to Deerpark Road. The severance is considered to be a slight impact to the farm.

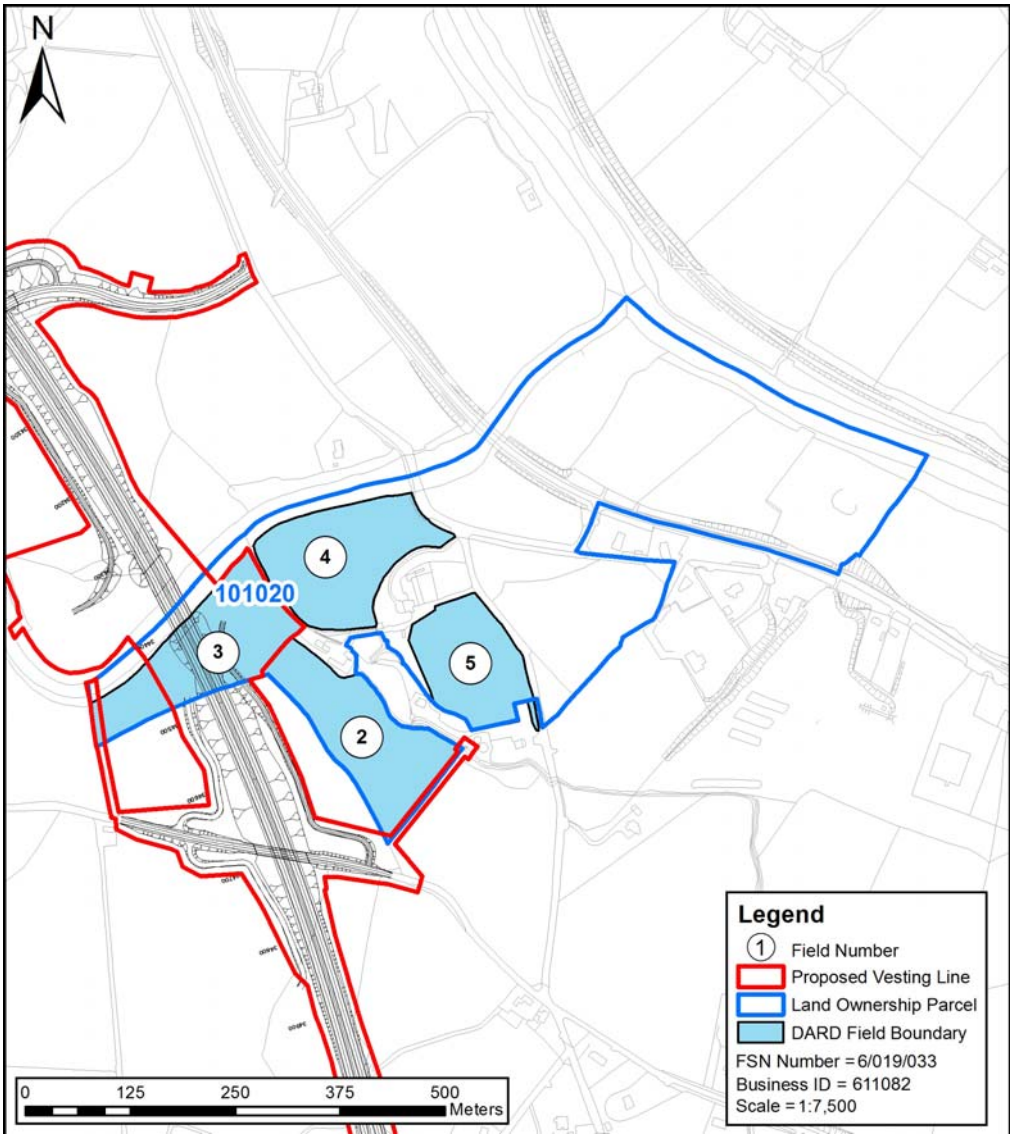
© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land will be required.	
Predicted Effects	The loss of some 2.1% of the available productive land and associated severance would have a **slight adverse** impact on the farm's potential output. This will not constitute a significant effect on the farm.

© Mouchel 2016

Land Parcel Ref	101020	**DARD Business Ref**	140380
		Data sources	2010 AIA meeting held. No response to 2013 AIA letters or land confirmation meeting. September 2014 AIA meeting
Conacre Parcel Ref	Let in conacre to parcel 95055 owner.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 20ha of owned land, which is mainly in grass, with the exception of Field No 1 (not shown on plan), which is currently in barley in a rotation.	
Type of Enterprise and Husbandry Let in conacre.	
Conacre Arrangements	The farm is all rented out in conacre to the owner of parcels 95055 and 95005, who is affected by the Road Scheme. Impacts on the conacre tenant are outlined in datasheet 021-060.
Single farm payment	No information was available as to whether the landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is not eligible under LFACAS, as it is rented out in conacre.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts	

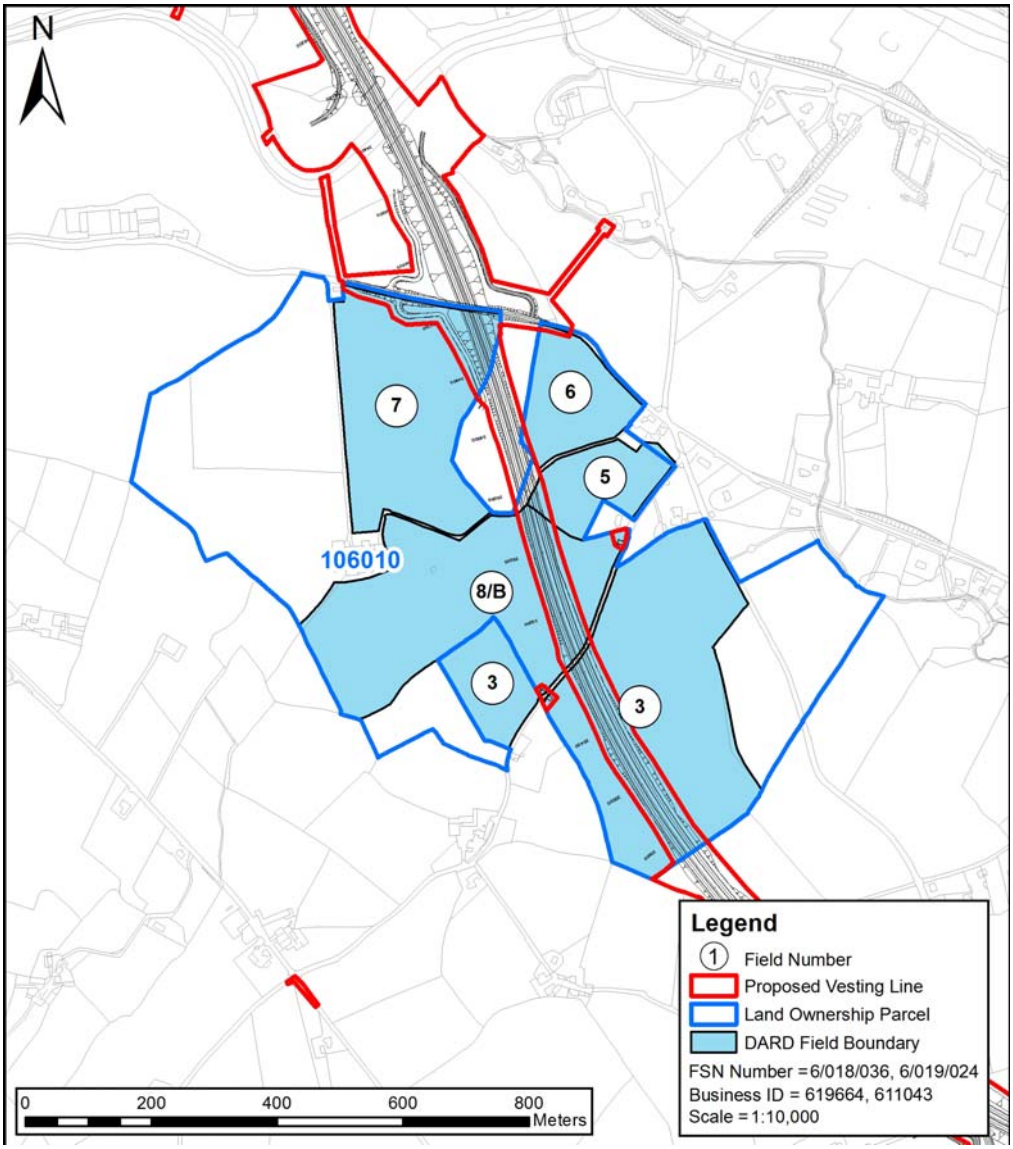
© Mouchel 2016

The proposed scheme will cause a total loss of 2.09ha hectares of the 20ha farm equating to some 10.5% of the owned land. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight. New severance will also impact on the farm. Access is provided to all severed land. As the land is currently out in conacre and not farmed by the landowner directly, the severance impacts would be slight. Impacts on the conacre tenant are outlined in datasheet 021-060.	
Proposed Mitigation During the construction phase access to severed land will need to be maintained.	
Predicted Effects	The loss of some 10.5% of the available productive land and associated severance would have a **slight adverse** impact on the landowner. The residual effect of the proposed A5WTC on the farm is a **slight adverse** impact.

© Mouchel 2016

Land Parcel Ref	106010	**DARD Business Ref**	619664
		Data sources	June 2010 meeting. 2013 AIA letter feedback stated no change in farm. 2014 landowner confirmation meeting held. Minor changes to the scheme only, therefore no 2014 revisit
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 112.3ha, of which 51.95ha is owned land, with a further 60.3ha being rented in conacre.	
Type of Enterprise and Husbandry This is a mainly arable farm growing wheat, barley and oil seed rape, together with a small area of grass. The grass sustains a flock of 30 ewes and 1 ram, producing approximately 50 lambs, which are all carried through to finish. The sheep are normally maintained on Field Nos 2 & 11 (not shown on plan). Access to the yards at 35 & 37 Deerpark Road is important since grain is dried at 35 Deerpark Road and stored sheds in both farmyards. Currently, there is access between the 2 farmyards via a private laneway running between Field Nos 5 & 6, which is wide enough to get tractors with grain trailers, whereas, between Field Nos 7 & 8 it is too narrow. Access to Field No 9 and Field No 3 is also important, since the Colaghy Road is too narrow for a 12.5 ft combine. Water for spraying is sourced at 37 Deerpark Road, before being transported out to owned farmland and conacre land. A chemical store is situated at 37 Deerpark Road. A spring in Field No 8 supplies potable water to both farm yards and dwelling houses.	
Conacre Arrangement	Approx. 60.3ha of land is rented in conacre which in not affected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme, but application has been made to join the 2009 Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all registered Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts The proposed scheme will cause a total loss of 5.08ha hectares of the 112.3ha farm equating to some 4.5% of the productive land. This would include land through the centre of the owned land. The landtake would be a moderate impact to the farm. New severance would impact on the farm. Access would be provided to all severed land via a farm land connecting to Deerpark Road. Milltown Road would be stopped up as part of the Proposed Scheme and the diversion would increase journey time. The severance impacts would be moderate. There would be temporary impacts during the construction phase of the Proposed Scheme.
Proposed Mitigation During the construction phase access to severed land would be maintained.

Predicted Effects	The loss of some 4.5% of the available productive land and associated severance would have a **moderate adverse** impact on the farm's potential output.

© Mouchel 2016

Size and Quality of Farm

This is a large farm, encompassing approximately 300ha, depending on how much conacre is rented annually. Owned land extends to 136.22ha, with the remainder being taken in conacre.

Two parcels of owned land are affected by the Road Scheme, namely the Home Farm on Beltany Road (144005) and also a parcel off the Magheracoltan Road (107050).

A deep well close to the farmyard supplies all the water, plus drinkers in fields grazed by the dairy herd.

Type of Enterprise and Husbandry

The farm runs a large dairy herd of 400 cows with a herd average of approximately 8,000 litres. There are approximately 850 cattle on the herd list, of which 350 are reared as herd replacements, with a further 50-100 store cattle being carried through to finish.

The grazing platform for the dairy herd is in field Nos 1, 2, 5, 7, 8, 9, 10A, 10B & 11 (not all fields are shown on plan above), plus conacre land directly across the A5 from the farmyard. With the aid of 3 staff, the dairy herd crosses the A5 to this grazing land 4 times per day.

The Home Farm, close-by land and some of the conacre land is all in grass, while the remainder is cropped for whole-crop wheat.

Conacre Arrangement	Approx. 164ha of land is rented in conacre. Parcel 132080 is rented in conacre and affected by the proposed scheme. See datasheet 021-074.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	The farm is currently close to the maximum 170kg organic nitrogen per ha. Consequently, land loss may have implications under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	A small area of the farm is registered Disadvantaged Area/Severely Disadvantaged Area (DA/SDA) FSN6/046/052 field Nos 31-40, and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts

The proposed scheme will cause a total loss of 20.12ha hectares of owned land and 0.8ha of land taken in conacre equating to some 7% of the productive land (approximately 300ha in total). At the home farm (parcel 144005) the land take would be from the dairy herd's grazing platform. Under the Nitrates Directive there would be implications for the farm. The landtake impacts would be substantial.

New severance would impact on the farm. On the home farm (parcel 144005) access would be provided via an overbridge from the farm to a junction on the Proposed Scheme. In parcel number 107050, access would be provided to Magheracoultan Road as Milltown Road would be stopped up. The severance impacts would be moderate.

Proposed Mitigation

During the construction phase access to severed land would be maintained.

Predicted Effects	The loss of some 7% of the available productive land and associated severance would have a **substantial adverse** impact on the farm's potential output. This will constitute a significant effect on the farm.

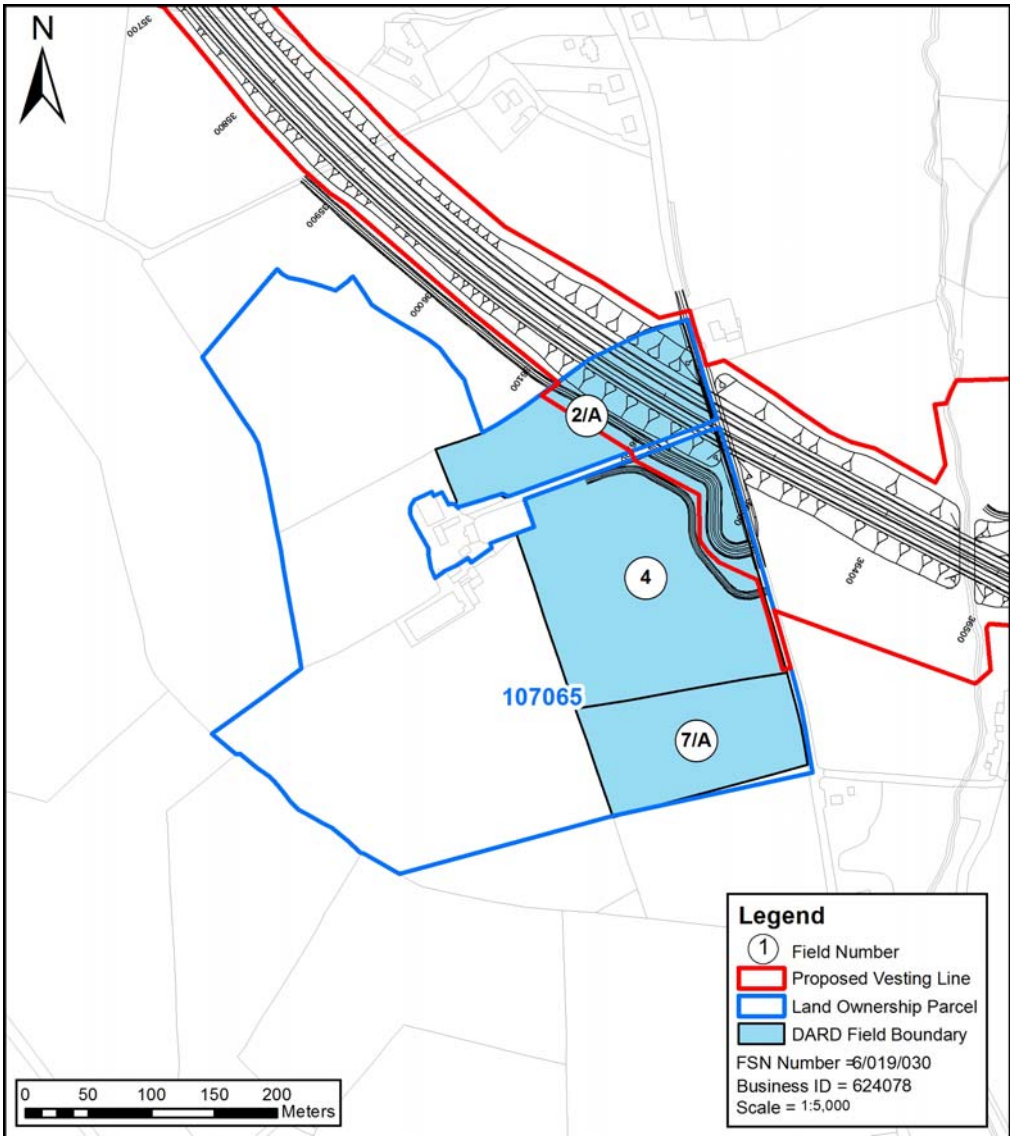
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to approximately 95ha of owned land, which is mainly in grass, with the exception of approximately 11ha which is utilised for growing barley in a rotation.	
Type of Enterprise and Husbandry Approximately 50 store cattle are purchased in for finishing. There are approximately 50 cattle on the herd list. The farm runs a flock of 30 ewes and 2 rams, producing approximately 45 lambs, which are carried through to finish. A further 20 store lambs are normally purchased in autumn for finishing. N.B. : The outfall for the stream in the corner of Field No 4 is vital for the drainage of a large area and the landowner was concerned that adequate provision is made for the outfall.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts The main impact on this farm is land take. There would be no severance as a result of the Proposed Scheme. Construction of the proposed scheme will result in a total loss of 1.38ha hectares of the 95ha farm equating to some 1.5% of the productive land. This would include land taken from the north east corner of the farm where the farm lane joins Maghercoltan Road. This access would be maintained by realignment in the design of the proposed scheme. The landtake

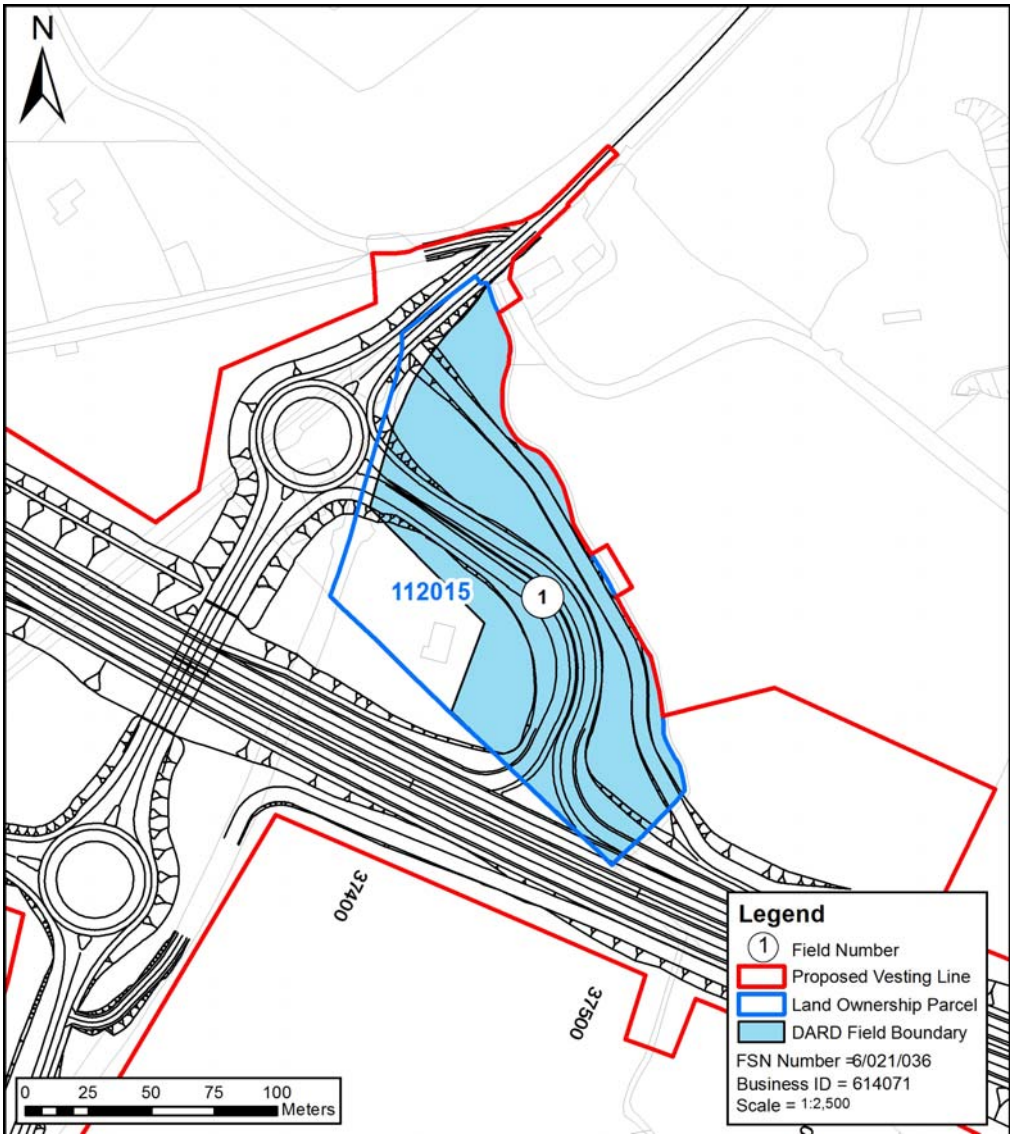
© Mouchel 2016

impacts would be slight. There would be no severance as a result of the Proposed Scheme.	
Proposed Mitigation The mitigation measures proposed are considered to be adequate.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	112015	**DARD Business Ref**	No DARD map available
		Data sources	April 2010 AIA meeting. AIA letter/Land confirmation meeting feedback received. Minor change in scheme therefore no 2014 revisit.
Conacre Parcel Ref	Let out in conacre		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 1.57ha and is all in one field in grass.	
Type of Enterprise and Husbandry	
The land is all rented out in conacre.	
Conacre Arrangement	The land is all let out in conacre. No information provided on conacre tenant. No conclusions on the impact on the conacre tenant can therefore be determined.
Single Farm Payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all rented out in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts	
The proposed scheme will result in a total loss of 1.57ha hectares of the 1.57ha farm equating to 100% of the productive land. This is the entire land parcel. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.	
Proposed Mitigation	
No mitigation would be required.	
Predicted Effects	The loss of 100% of the available productive land and associated severance would have a **slight adverse** impact on the farm's potential output. This will not constitute a significant effect on the farm.

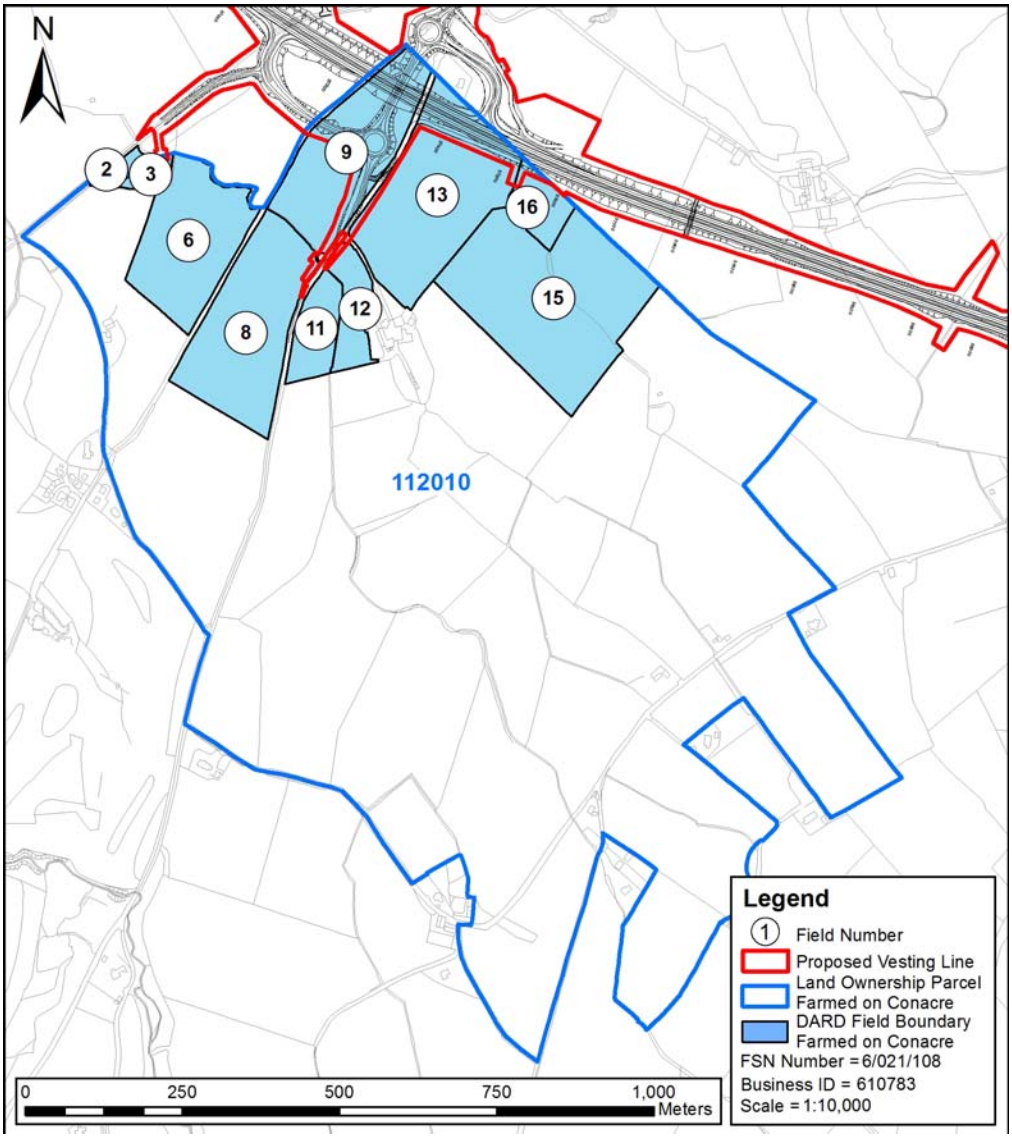
Land Parcel Ref	112010	**DARD Business Ref**	140346 (Applicant ref)
		Data sources	2010 AIA meeting. Feedback from 2014 landowner confirmation meeting. October 2014 AIA meeting.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to approximately 805ha of owned land, of which 125.65ha is situated on the Baronscourt Road and is all in grass. A further 600ha is hill/marginal land situated 9 miles away near Omagh, with a further 72ha 2 miles away near Newtownstewart. The land at Omagh and Newtownstewart is not affected by the Road Scheme.

Type of Enterprise and Husbandry

The farm runs a herd of approximately 100 suckler cows and 7 bulls, with the calves being sold as either suckled calves, or over-wintered and grazed, before being sold as store cattle.

The farm also runs a flock of approximately 2,000 ewes and 50 rams, producing 2,500 to 3,000 lambs which are either finished or sold as ewe lambs for replacements (approximately 500/annum).

Both cattle and sheep are currently walked along the road, providing access to land away from the farmyard. Movement of stock along the road involves one person in front and one behind, with the assistance of dogs.

Field No 9 is utilised as an isolation field for the purposes of biosecurity on the farm, since it is largely free draining and has a separate, mains-water supply. It also provides a wintering facility for breeding bulls. During the construction phase of the road scheme, access will be required.

A well in the vicinity of Field No 26 supplies water to both the dwelling house and the farmyard.

The landowner emphasised that the drainage across Field Nos 13, 14, 15, 16 & 17A is all through one out-fall. Not all fields are shown on the plan above.

Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.

© Mouchel 2016

Less Favoured Area Compensatory Allowances Scheme	Some fields on the farm are classified Disadvantaged Area (DA) and are eligible for payments under LFACAS, with the remainder of the land classified as Low Land (LL), which is not eligible for payments under LFACAS.
Biosecurity	Field No 9 is currently utilised for the purposes of isolating animals purchased in onto the farm, before they are introduced to the remainder of the farm. Otherwise, there are no issues of biosecurity that are not already being addressed.

Predicted Impacts

The proposed scheme will result in a total loss of 4.02ha hectares of the 805ha farm equating to 0.5% of the productive land. This would include land for the realigned Baronscourt Road. The landtake impacts would be slight.

Field No 9 is currently used as an isolation field which would be lost as a result of the Proposed Scheme.

There would be no severance as a result of the Proposed Scheme.

Proposed Mitigation

During the construction phase access to land would be maintained.

Predicted Effects	The loss of some 0.5% of the available productive land would have a **slight adverse** impact on the farm's potential output.

© Mouchel 2016

Size and Quality of Farm	
The farm extends to 66.48ha of owned land, with a small area of conacre taken from another landowner.	
Type of Enterprise and Husbandry	
An area of the farm is currently arable, growing cereals, and the intention is that in 2015, the remaining land will be converted to arable.	
Conacre Arrangement	No details of the small area of conacre rented by the landowner.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all registered Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
The proposed scheme will result in a total loss of 6.63ha hectares of the 66.48ha farm equating to 10% of the productive land.
The main impacts on this farm are severance and land take.
The overall impact of the Proposed Scheme on the farm would be **Substantial adverse.**
Proposed Mitigation
Access for large agricultural equipment is provided via an access road off Baronscourt Road and accommodation will be provided across the A5 WTC in field 4.
During the construction phase access to severed land will need to be maintained.

Predicted	The loss of some 10% of the available productive land and resulting

© Mouchel 2016

Effects	severance would have a substantial adverse impact. This will constitute a significant effect on the farm.

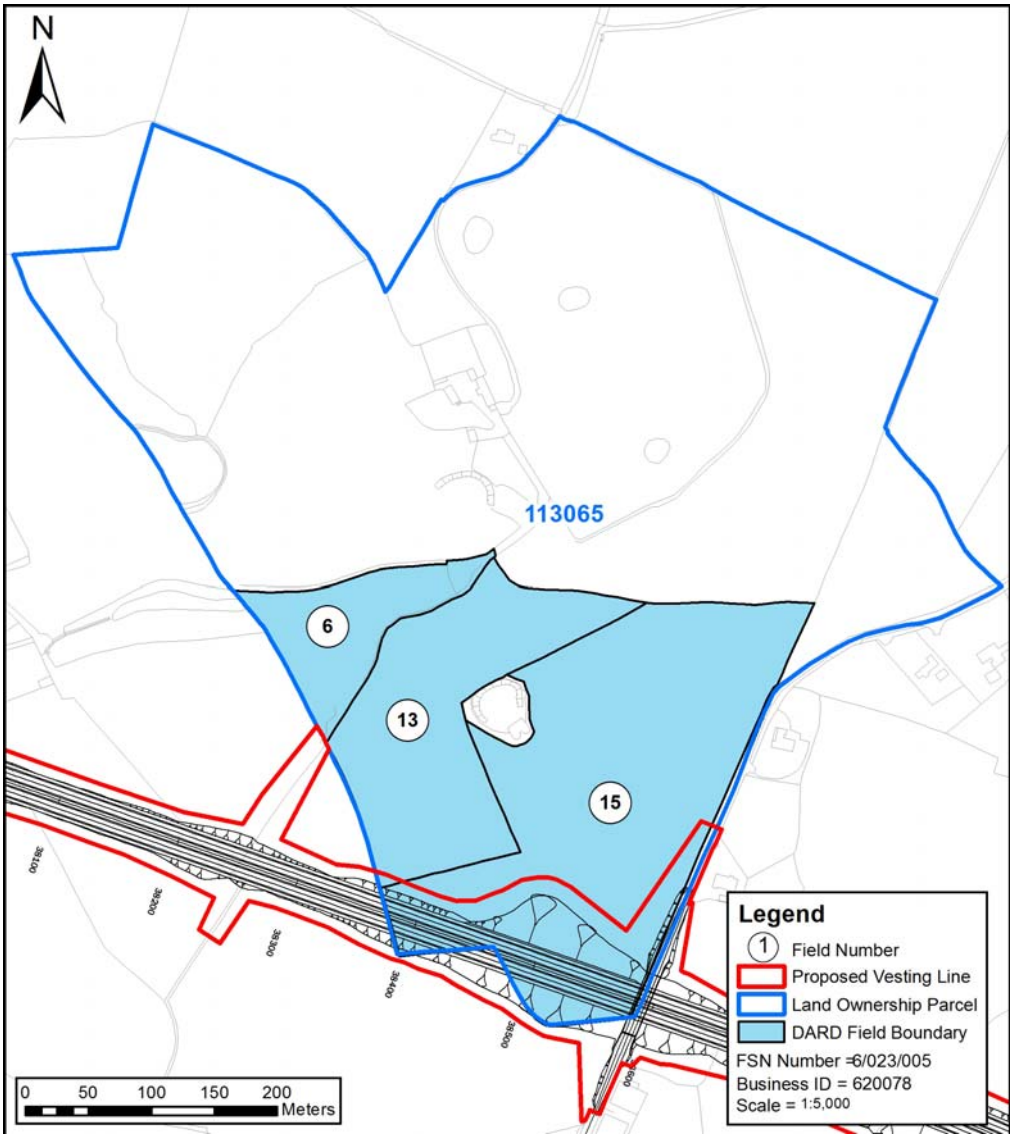
Land Parcel Ref	113065	**DARD Business Ref**	640344
		Data sources	September 2010 AIA meeting. No change in farm identified in 2014 Land confirmation meeting. Minor changes to scheme only. No 2014 revisit.
Conacre Parcel Ref	All let in conacre to unaffected farmer		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 30.13ha which is all in grass.	
Type of Enterprise and Husbandry The land is all rented out in conacre.	
Conacre Arrangement	All let in conacre to landowner whose farm is unaffected by the Proposed Scheme. No details of the landowner's farm known, therefore no conclusions can be determined on the impact on the Proposed Scheme on the conacre tenant.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Part of the land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The proposed scheme will result in a total loss of 1.74ha hectares of the 66.48ha farm equating to 2.6% of the productive land. This would include land from the south of the land parcel. As the land is rented out in conacre, the landtake impacts would be slight. There would be no severance as a result of the Proposed Scheme.	
Proposed Mitigation No mitigation is proposed.	
Predicted Effects	The loss of 2.6% of the available productive land and associated severance would have a **slight adverse** impact on the farm's potential output.

© Mouchel 2016

Land Parcel Ref	113095	**DARD Business Ref**	No DARD map available
		Data sources	April 2010 AIA meeting. No response to 2013 AIA letters or land confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit.

© Mouchel 2016

Size and Quality of Farm	
The farm extends to approximately 27.7ha, of which 15.6ha is owned land, with the remainder being rented in conacre.	
Type of Enterprise and Husbandry	
The farm runs a suckler herd of 20 cows and 1 bull with all the progeny being sold as suckled calves. In addition, approximately 100 store cattle (live weight 350 – 400 kg) are bought in November and carried through the winter for grazing and finishing off grass. Approximately 150 dropped calves are also bought in and reared, with approximately 50% being sold as stores, with the remainder being finished as beef. Approximately 100 store lambs are bought-in in the autumn for winter finishing.	
Conacre Arrangement	Approximately 12.1ha of land rented in conacre.
Single Farm Payment	This land is not registered for Single Farm Payment.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is not eligible under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 1.7ha hectares of the 27.7ha farm equating to 6.3% of the productive land.

This would include land from the north of the farm. The landtake impacts would be moderate.

New severance would impact on the farm. Access would be provided to all severed land via the existing Oldcastle Road. The severance impacts would be slight.

There would be temporary impacts during the construction phase of the Proposed Scheme.

© Mouchel 2016

Proposed Mitigation	
During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 6.3% of the available productive land and associated severance would have a **moderate adverse** impact on the farm.

Size and Quality of Farm	
This is a large farm extending to 252ha, all of which is owned land. Most of the farm is in grass, with barley (approximately 20ha per year) grown in a rotation.	
Type of Enterprise and Husbandry	
The farm runs a suckler herd of approximately 75 cows and 1 bulls, with all the progeny being finished as beef. There are approximately 350 cattle on the herd list. In addition, the farm runs a flock of 400 ewes plus 8 rams, producing approximately 600 lambs, which are all carried through to finish. Approximately 200-300 store lambs are bought in for winter finishing. The farm grows approximately 20ha of cereal (barley) in rotation.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all registered Disadvantaged Area/Severely Disadvantaged Area (DA/SDA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
The proposed scheme will result in a total loss of 12ha hectares of the 252ha farm equating to 4.8% of the productive land. This would include land from several land parcels as shown on the map. The landtake impacts would be slight. New severance would impact the farm. Access would be provided to all severed land off the Beltany Road. The farm lane in field 2 would connect to the other side of the proposed route. The severance impacts would be slight. There would be temporary impacts during the construction phase of the Proposed Scheme.

© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 4.8% of the available productive land and associated severance would have a **slight adverse** impact on the farm's potential output. The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

Size and Quality of Farm The farm extends to 18.52ha of owned land, which is all in grass.	
Type of Enterprise and Husbandry The farm runs a herd of 20 suckler cows and 1 bull, with all the progeny being finished for beef. In addition, approximately 20 suckled calves are bought in annually for finishing. There are approximately 60 cattle on the herd list. Field No 2 is normally cut for silage (one or two cuts), and the after-grass is grazed.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts The proposed scheme will result in a total loss of 3.06ha hectares of the 18.52ha farm equating to 16.5% of the productive land. This would include the majority of field 2 and some of field 4. The landtake impacts would be moderate. New severance would impact on the farm. A small section of field 2, to the north east, would be severed. Access would be provided by the overbridge adjacent to the land. The severance impacts would be slight. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 16.5% of the available productive land and associated severance would have a **moderate adverse** impact on the farm's potential output. The residual impact of the Proposed Scheme on the farm would be **moderate adverse**.

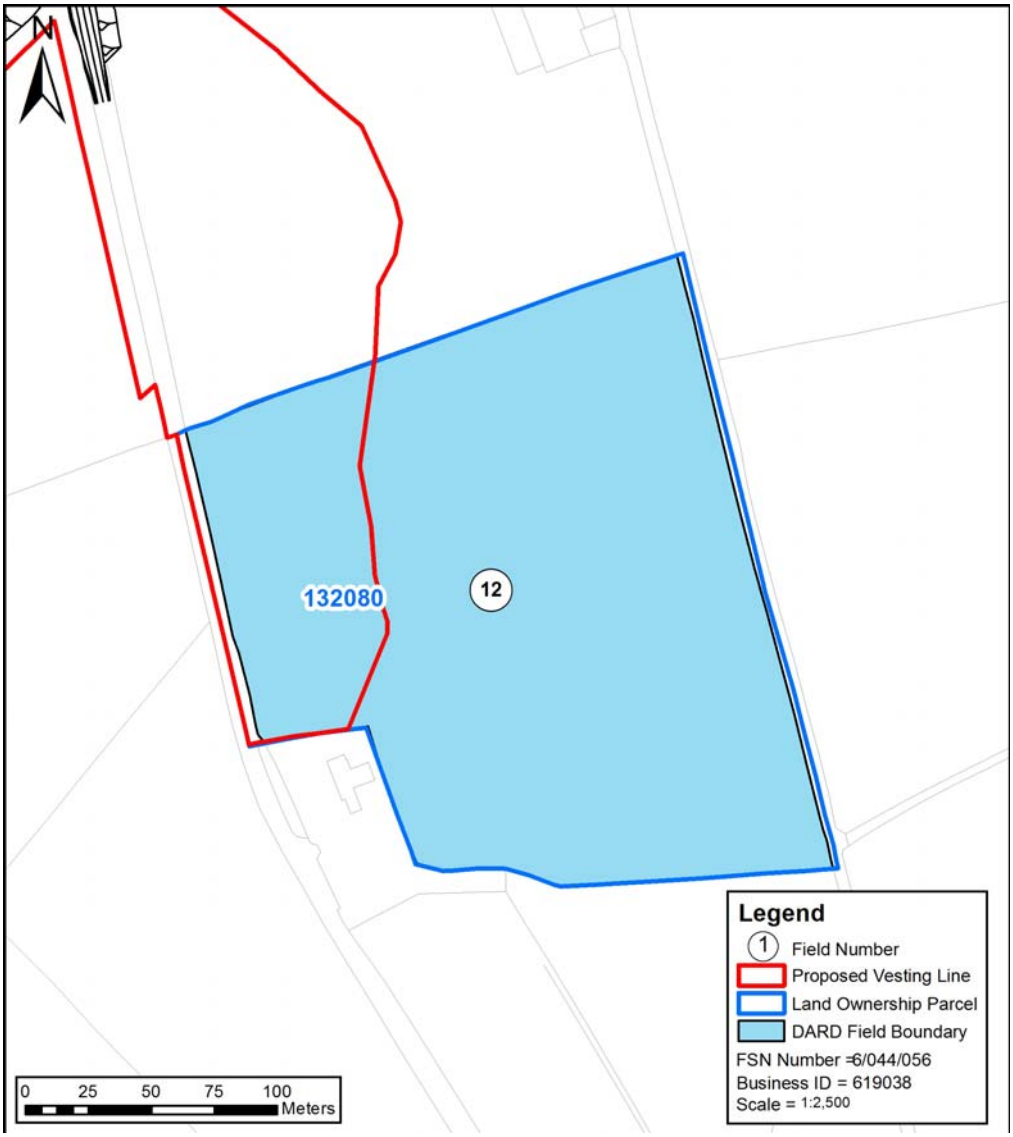
Land Parcel Ref	132080	**DARD Business Ref**	619038
		Data sources	2010 AIA meeting. 2013 AIA letters not returned and no landowner confirmation meeting feedback. Minor changes to the scheme only. No 2014 AIA revisit.
Conacre Parcel Ref	Let in conacre to parcel 107050 landowner, Datasheet 021-065		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

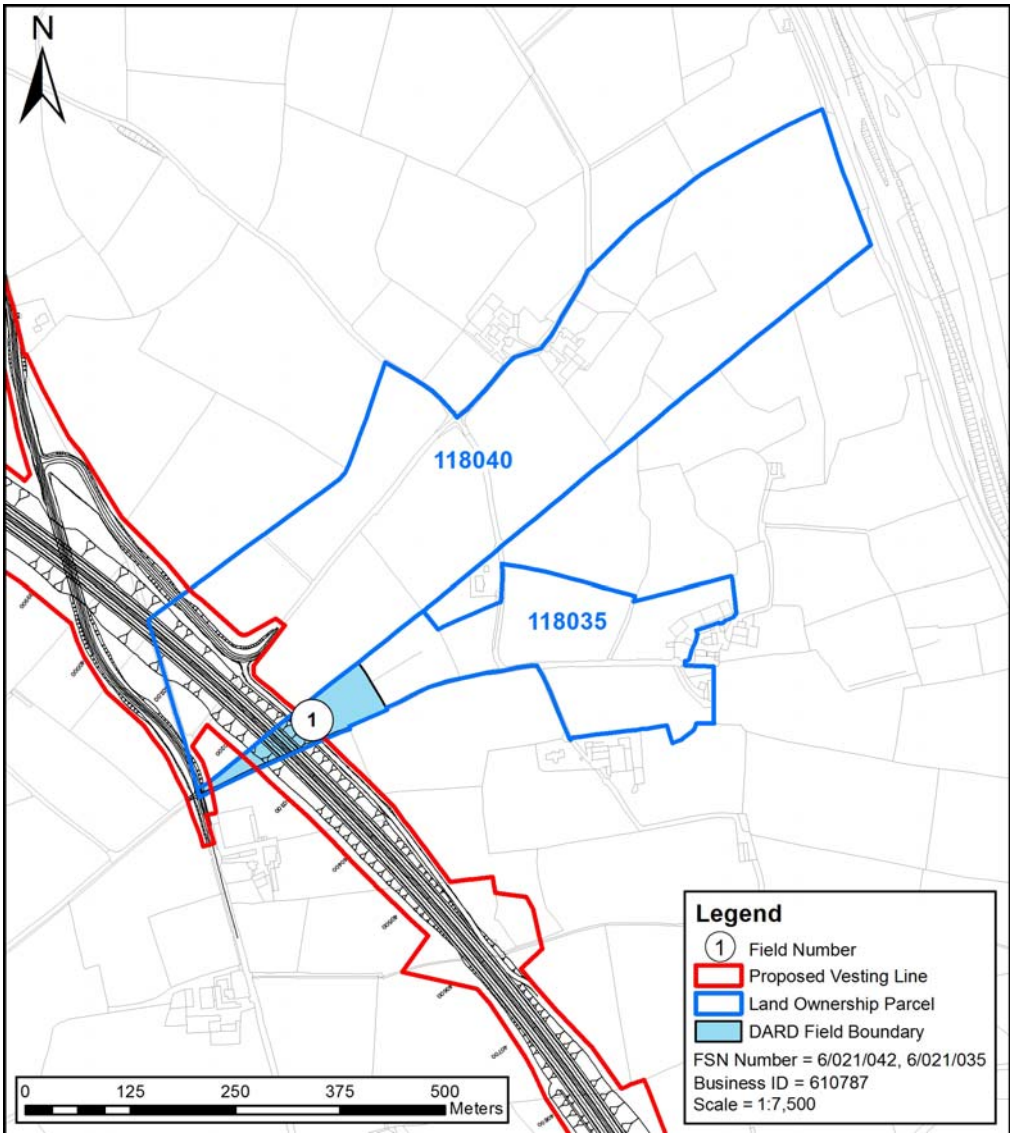
Size and Quality of Farm The affected parcel extents to 4.3ha all in grass.	
Type of Enterprise and Husbandry All the land is let in conacre.	
Conacre Arrangement Let in conacre to parcel 107050 landowner. The impact of the Proposed Scheme on the conacre tenant is outlined in datasheet 021-065.	
Single farm payment	No information
Nitrates Directive	There are no implications to the parcel landowner for the Nitrates Directive.
Countryside Management Scheme	No information
Less Favoured area Compensatory Allowance Scheme	No information
Biosecurity	No Biosecurity issues have been identified

Predicted Impacts The proposed scheme will result in a total loss of 0.8ha hectares of the 4.3ha farm equating to 18.6% of the productive land. The land is let in conacre and not farmed directly by the landowner. The impacts on the landowner is considered **slight adverse.**	
Proposed Mitigation During the construction phase access to severed land will be required.	
Residual Effects	The loss of 18.6% of the available productive land and associated severance would have a **slight adverse** impact on the farm landowner.

© Mouchel 2016

Land Parcel Ref	118035 & 118040	**DARD Business Ref**	610787
		Data sources	July 2010 AIA meeting. 2013 AIA letter/ landowner confirmation meeting feedback identified no change to farm. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	118035 takes 118040 as conacre		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends 33.7ha, of which 15.34ha is owned land, with a further 18.36ha being rented in conacre.

Most of the farm is in grass, with approximately 4ha currently in whole crop wheat, grown in a rotation and under-sown with grass.

Type of Enterprise and Husbandry

The farm runs a herd of 20 suckler cows and 1 bull, with calves being over-wintered, grazed the following season and sold in the autumn as strong stores. In addition, 110 dropped calves (50:50 Holstein and continental crosses) are reared and sold as strong stores.

Conacre Arrangement	Landowner of parcel 118035 takes parcel 118040 as conacre
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 2.34ha of the 15.34ha farm equating to 15.25% of the productive land. This would be to the west of the farm in the corner of three fields. The landtake impacts would be slight.

There would be no severance as a result of the Proposed Scheme.

Proposed Mitigation

No mitigation would be proposed

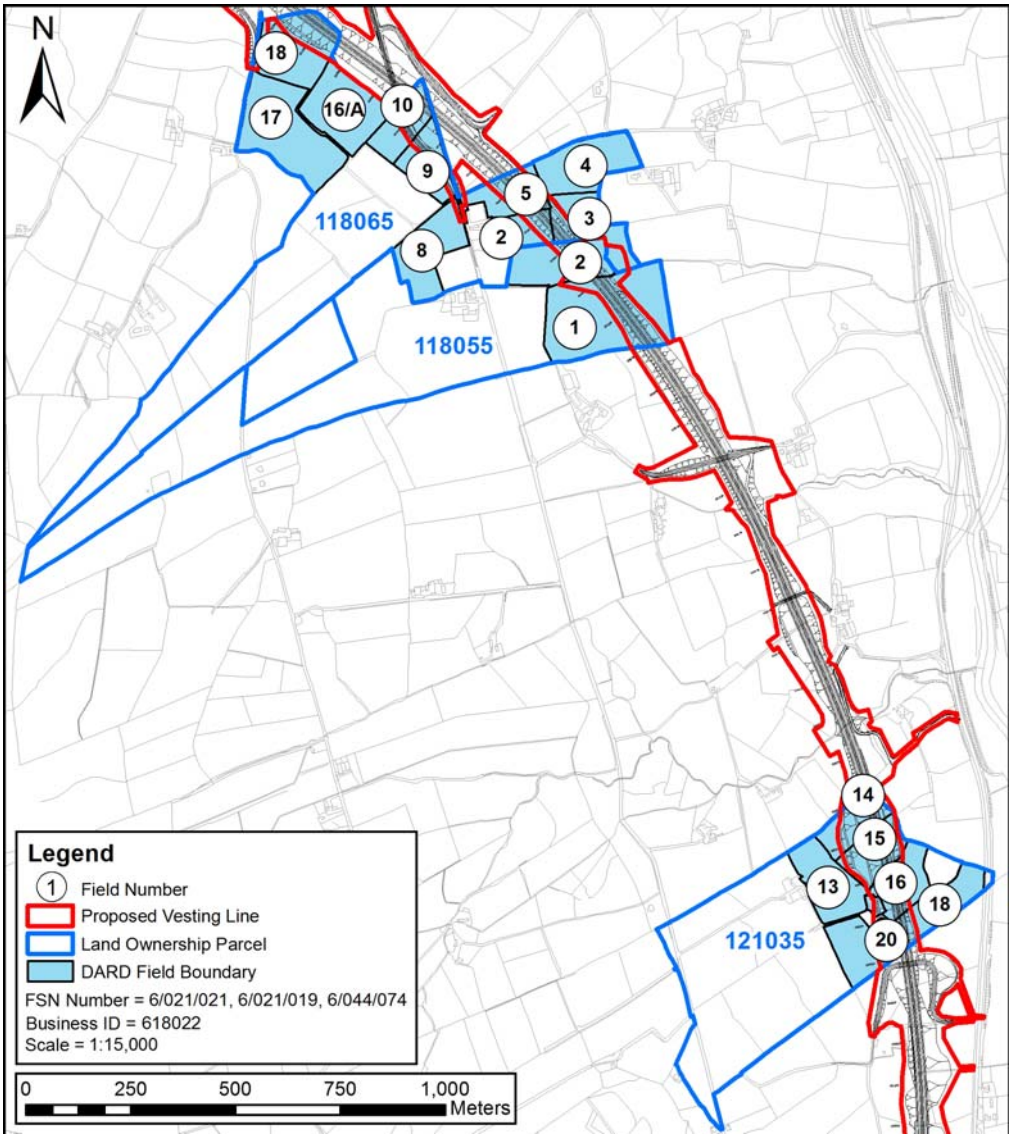
© Mouchel 2016

Predicted Effects	The loss of 15.25% of the available productive land would have a **slight adverse** impact on the farm.

© Mouchel 2016

Land Parcel Ref	118065, 118065, 121035	**DARD Business Ref**	618022
		Data sources	2010 AIA meeting. Landowner Confirmation meeting held. September 2014 AIA meeting.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 117ha. The owned land is all in grass.	
Type of Enterprise and Husbandry The farm runs a dairy herd of 76 cows plus 1 bull. There are approximately 250 cattle on the herd list, of which approximately 50 are young stock, reared as herd replacements, with the remainder being beef cattle. In addition, the farm runs a sheep flock of 60 ewes plus 1 ram, producing approximately 100 lambs, which are carried through to finish. The cow grazing platform is based on field Nos 1-5, recently purchased land in Field Nos 1 and 2, and Field No 6. Additional land directly across the Castletown Road is used as required. Land further away from the farmyard is cut for silage and/or grazed by dry cows/young stock.	
Conacre Arrangement N/a	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There may be implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is all registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all registered Disadvantaged Area/Severely Disadvantaged Area (DA/SDA) and is eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

© Mouchel 2016

Predicted Impacts During the construction phase, access to severed land will need to be maintained. The main impacts on this farm are severance and land take. The proposed scheme will result in a total loss of 11.72ha of the 117ha farm equating to 10% of the productive land. Under the Nitrates Directive, land-take may have implications for this farm. Land in close proximity to the farmyard, which is currently used as the grazing platform for the dairy herd, and will experience severance.
Proposed Mitigation Accessed is proposed to severed land via the shared laneway.

Predicted Effects	After mitigation there will still be severance for part of the grazing platform. The loss of 10% of the available productive land, associated land-take and severance would have a **substantial adverse** impact. This will constitute a significant effect on the farm.

© Mouchel 2016

© Mouchel 2016

Size and Quality of Farm The farm extends to 189.1ha, which includes 40.22ha of owned land. The remaining land is taken in conacre. The farm is all in grass.	
Type of Enterprise and Husbandry The farm runs a suckler herd of 40 cows and 4 bulls, with all the progeny being finished for beef. In addition, a dairy herd extending to 60 cows, with 12 springing heifers has been established, with the intention of increasing dairy cow numbers. There are approximately 260 cattle on the herd list. In addition, the farm runs a flock of approximately 700 ewes and 20 rams, producing over 1,000 lambs which are carried through to finish.	
Conacre Arrangement	148.88ha of land is rented in conacre which is not affected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	With the exception of Field Nos 15, 16, & 18 – 20, which is registered Low Land (LL) and is not eligible for payments under LFACAS, the remainder of the farm is registered Disadvantage Area (DA), and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts The Proposed Scheme will result in a total loss of 5.83ha hectares of the 189.1ha farm equating to 3.1% of the productive land. The majority of land parcel 143030 would be affected although this is a small proportion of the overall farm. The landtake impacts would be slight. There would be no severance caused by the Proposed Scheme.	
Proposed Mitigation Access to land will be maintained during the construction phase.	
Predicted Effects	The loss of 3.1% of the available productive land would have a **slight adverse** impact on the farm's potential output. The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Size and Quality of Farm	
The farm extends to 24.79ha of owned land, which is all in grass.	
Type of Enterprise and Husbandry	
The farm runs a flock of 35 pedigree Kerry Hill ewes and 4 rams, with 12 ram lambs being reared for breeding and a further 12 ewe lambs also being reared for breeding. The farm also runs an equine enterprise extending to 6 brood mares, 1 Appaloosa Stallion, 1 teaser Stallion, 1 thoroughbred (flat racing) and several Appaloosa/Connemara cross progeny of varying ages. There are approximately 18 horses stabled.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
The proposed scheme will result in a total loss of 3.26ha hectares of the 24.79ha farm equating to 13.1% of the productive land. All of the land taken would be from the east of the farm in fields 8 and 9. The landtake impacts would be slight. There would be no severance as a result of the Proposed Scheme.
Proposed Mitigation
No mitigation is proposed.

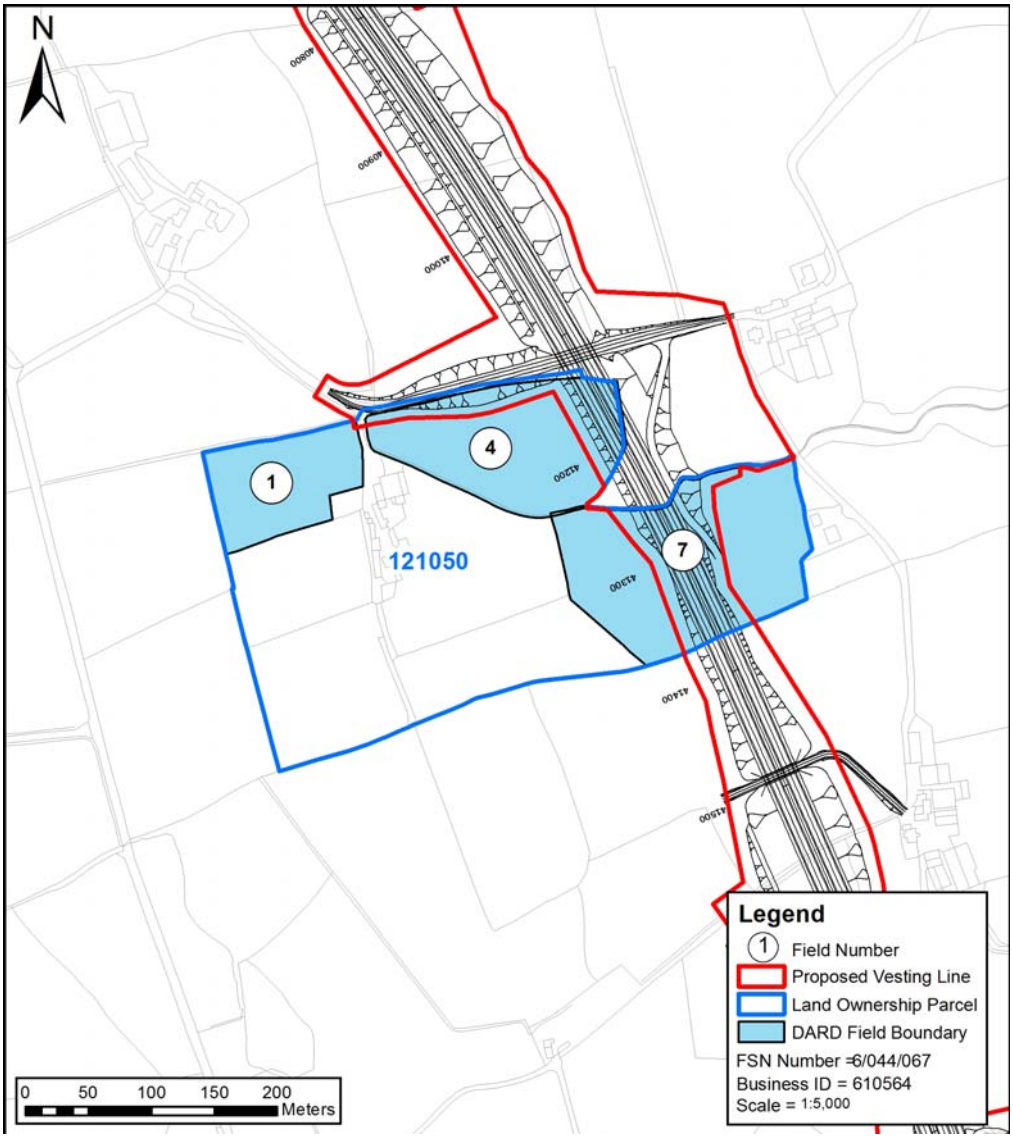
© Mouchel 2016

Residual Effects	The loss of 13.1% of the available productive land would have a **slight adverse** impact on the farm's potential output. The residual effect of the Proposed Scheme on the farm business would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	121050	**DARD Business Ref**	No DARD map available
		Date of Visit	June 2010 meeting. 2013 AIA letters not returned. No feedback from landowner confirmation meeting. Minor changes to the scheme only. No 2014 revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to approximately 17.8ha, of which 8.9ha is owned land, with a further 8.9ha being rented as conacre.

Type of Enterprise and Husbandry

The farm runs a dairy herd of 30 cows and one bull, with a herd average of 7,000 litres. There are approximately 24 young stock, being reared as herd replacements, all bull calves are sold as dropped calves.

In the past, the farm also ran a flock of 25 ewes which have recently been sold, but may be replaced.

The affected fields are normally cut for silage or grazed by the dairy herd and access across the road scheme may be an issue.

Conacre Arrangement	8.9ha of land is rented as conacre including parcel 113015.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	The landowner is borderline in respect of organic nitrogen per ha, and any land-take may have implications under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Some of the land is classified Severely Disadvantaged Area (SDA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 1.37ha of owned land and 5.3ha of conacre in parcel 113015, equating to 737% of the productive land. This would include landtake from two fields currently used for silage and form part of the dairy herd grazing platform.

© Mouchel 2016

Under the Nitrates Directive, landtake may have implications for this farm business. The landtake impacts would be moderate. New severance would impact on the farm business. Access would be provided to severed land via an underbridge and shared farm lane. The severance impacts would be moderate. There would be temporary impacts during the construction phase of the Proposed Scheme.
Proposed Mitigation During the construction phase access to severed land would be maintained.
Predicted Effects The loss of 37% of the available productive land and associated severance would have a **moderate adverse** impact on the farm.

© Mouchel 2016

© Mouchel 2016

Size and Quality of Farm The farm is run as a partnership. The farm extends to 80.11ha, of which 40.43ha is owned land, with a further 39.68ha being rented in conacre from different landowners.	
Type of Enterprise and Husbandry The farm runs a dairy herd of 100 cows, plus young stock, which are all finished as beef. The cows are all bred to a beef bull, and all herd replacements are bought in. In addition, the farm runs a herd of 20 suckler cows and 2 bulls, with all the steers being finished as beef, and the heifers sold as replacement suckler cows, with calves at foot. There are approximately 205 cattle on the herd list. The farm also runs a flock of 80 ewes and 3 rams, producing approximately 130 lambs, which are carried through to finish. A pig unit on the farm houses 27 sows plus boars, producing pigs on a birth-to-bacon system, with a through-put of approximately 500 pigs per annum.	
Conacre Arrangement	Approximately 39.68ha of land is rented in conacre from 3 different landowners. Affected conacre is rented from Parcel 112005 (fields 13 & 14 in 2014 and 5, 6, 13, 14 and potentially more in 2015). For parcel 112005 see datasheets 021-233.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land and some of the conacre land.
Nitrates Directive	The farm is currently compliant with the Nitrates Directive as a consequence of the increase in the area of conacre land.
Countryside Management Scheme	The owned land and some of the conacre land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Most of the land is classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts

The proposed scheme will result in a total loss of 3.87ha of owned land from the 80.11ha farm equating to 4.8% of the productive land.

The landtake required by the Proposed Scheme would total 3.87ha of owned land. This is to the west of the farm.

A bore hole in Field No 2B (not shown on plan) provides the domestic water supply and this will be eliminated by the road scheme. In addition, the water supply for the farmyard is piped under gravity from a stream further up the hill to the rear of the farmyard. This supply will also be eliminated, with the result that metered mains water will be required for both the domestic and the farm supply. This will have cost implications for the farm.

New severance would impact on the farm. Access to severed land would be provided via an overbridge that links directly into the farm yard. The severance impacts would be slight.

There would be temporary impacts during the construction phase of the Proposed Scheme.

The landowner expressed concern re the impact of noise on animals housed in the shed closest to the road scheme.

Proposed Mitigation

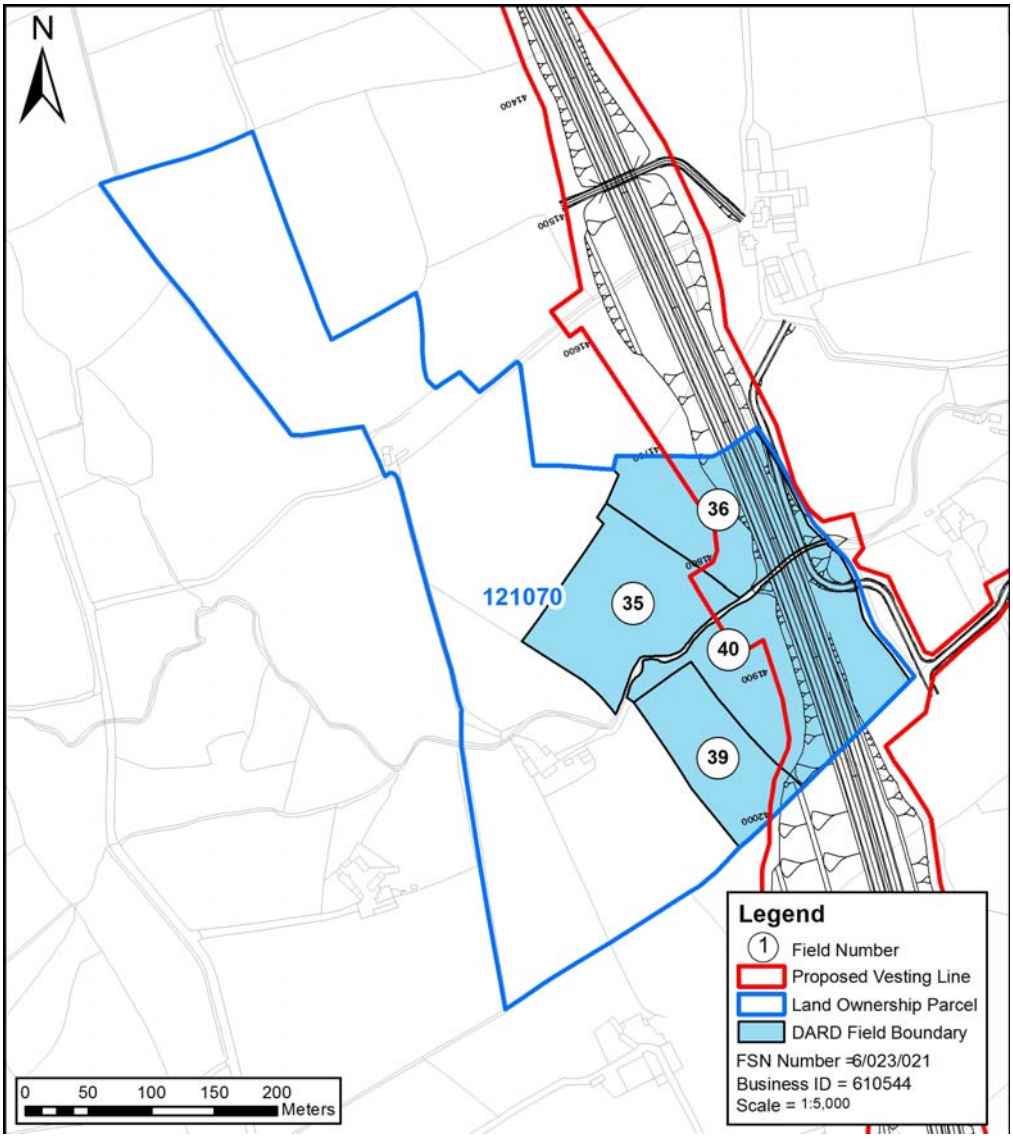
Access from the farmyard is currently provided via a lane running between Parcel No 121025 and Parcel No 121070, to Field Nos 2, 3 & 5. It should be ensured that this access lane is maintained.

Predicted Effects	The loss of 4.8% of the available productive land would have a **moderate adverse** impact on the farm's potential output. The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	121070	**DARD Business Ref**	Not applicable
		Data sources	September 2010 meeting. No feedback from 2013 AIA letters/Landowner confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Affected land is let in conacre, Datasheet 021-208		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 56.7ha of owned land in 2 parcels. The affected parcel contains 14.35ha. The land is all in grass.

Type of Enterprise and Husbandry

The affected land is currently let out in conacre.

The home farm runs a flock of 250 ewes, plus 140 hoggets, producing approximately 370-380 lambs which are carried through to finish.

Conacre Arrangement	Affected land is let in conacre to a landowner unaffected by the Proposed Scheme. The impact on the coancre tenant is outlined in datasheet 021-208.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The Proposed Scheme will result in a total loss of 2.45ha of the 56.7ha farm equating to 4.3% of the productive land. This includes land to the east of the farm. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

There would be no severance as a result of the Proposed Scheme.

Proposed Mitigation	No mitigation would be proposed.

© Mouchel 2016

Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse.**

© Mouchel 2016

Land Parcel Ref	113075	**DARD Business Ref**	610781
		Data sources	2010 AIA meeting. No response to 2013 AIA letters. Landowner confirmation meeting held. October 2014 AIA meeting.

© Mouchel 2016

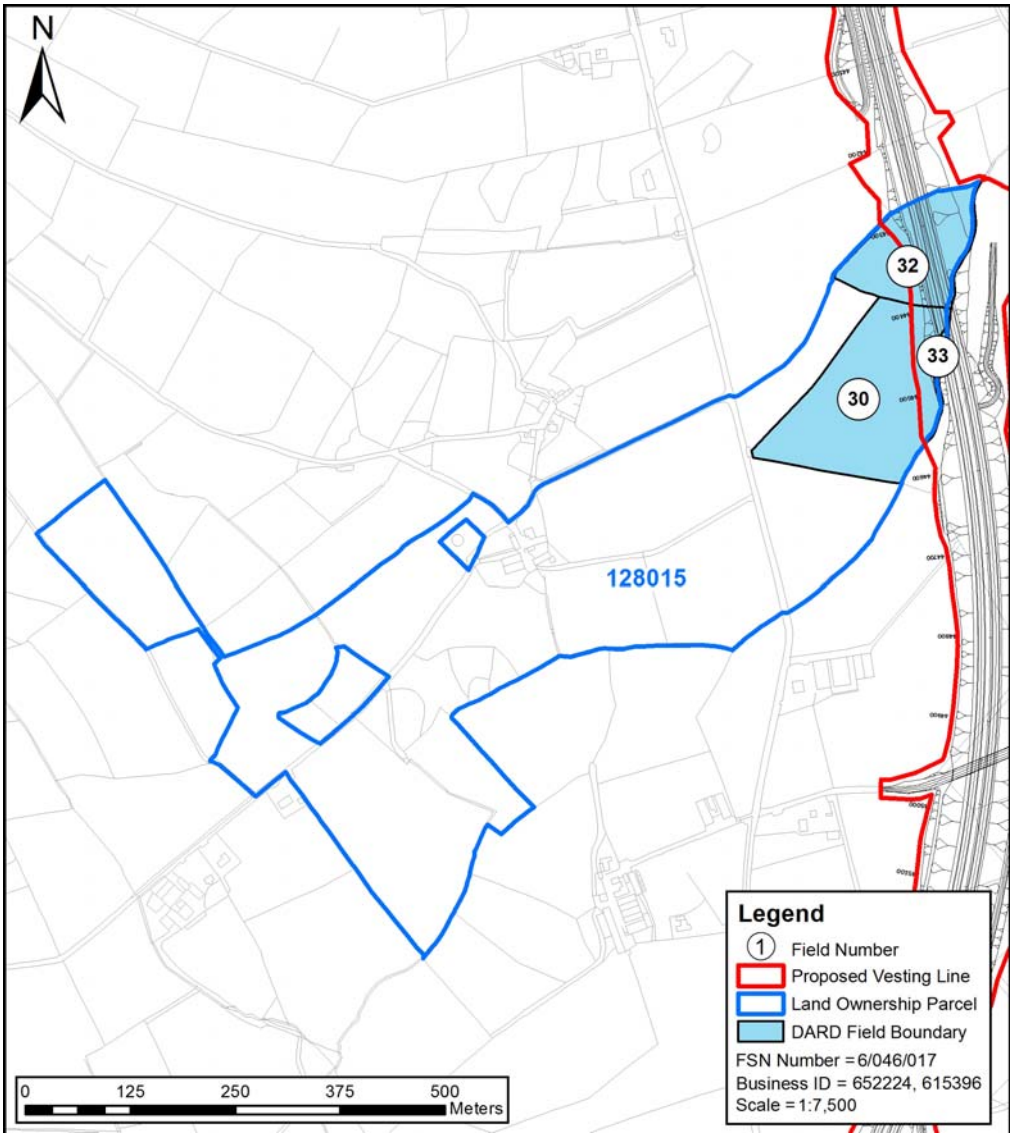
Size and Quality of Farm	
The farm extends to approximately 20ha and is all in grass.	
Type of Enterprise and Husbandry	
The land is farmed by a conacre tenant.	
Conacre Agreement	The land is let in conacre. Impacts on the conacre tenant are outlined in datasheet 021-241
Single Farm Payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts	
The main impact on this Landowner is land take and severance. 6.41 hectares of land will be taken which is approximately 32% of the owned land.	
Proposed Mitigation	
During the construction phase access to severed land will be required. Mitigation for the severance of the parcel will be achieved through the realignment of Gortgranagh Road and access tracks.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **substantial adverse.**

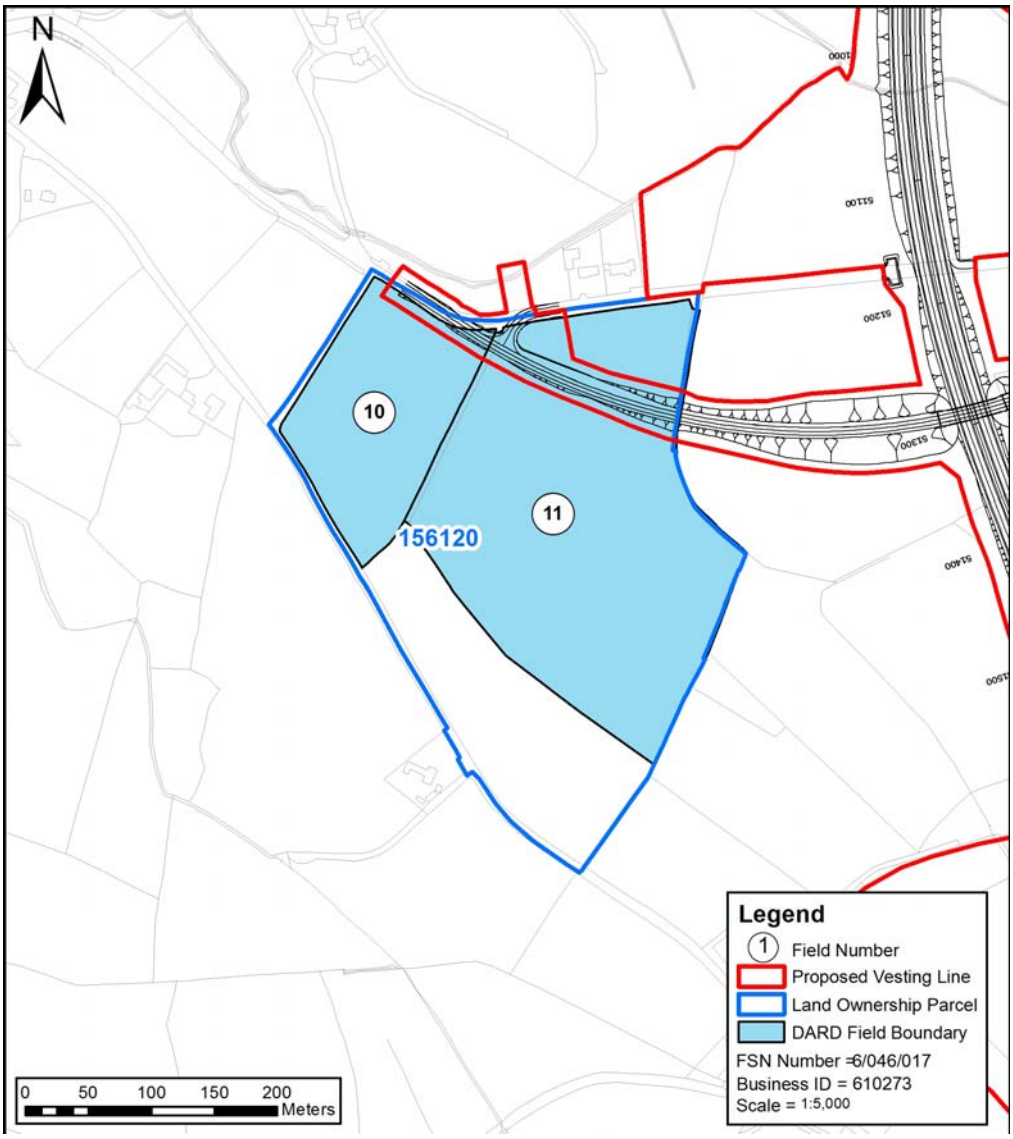
© Mouchel 2016

Land Parcel Ref	128015, 156120	**DARD Business Ref**	652224
		Data sources	2010 AIA meeting. No response to 2013 AIA letter. Landowner confirmation meeting held. November 2014 meeting
Conacre Parcel Ref	Conacre is rented from owner of parcel 128035.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016



© Mouchel 2016

Size and Quality of Farm The farm is run as a partnership between landowner and brother-in-law. The farm extends to 64.92 ha of owned land, plus land in conacre, and is all in grass. Conacre is rented from owner of parcel 128035.	
Type of Enterprise and Husbandry The farm runs a herd of 85 dairy cows plus young stock. All bull calves are sold. There are approximately 130 cattle on the herd list. Heifer calves are reared and either retained as replacements or sold, if surplus to requirements. Field Nos 10 – 15 (not all shown on the plan above) form the grazing platform for the herd.	
Conacre Arrangement	Partnership rents additional land in conacre from the owner of parcel 128035.
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	Most of the land is registered as Disadvantaged Area (DA) and is eligible for payments under LFACAS, with the exception of the Landowner's land, which is registered as Lowland (LL) and is therefore not eligible for payments.
Biosecurity	No biosecurity issues have been identified.

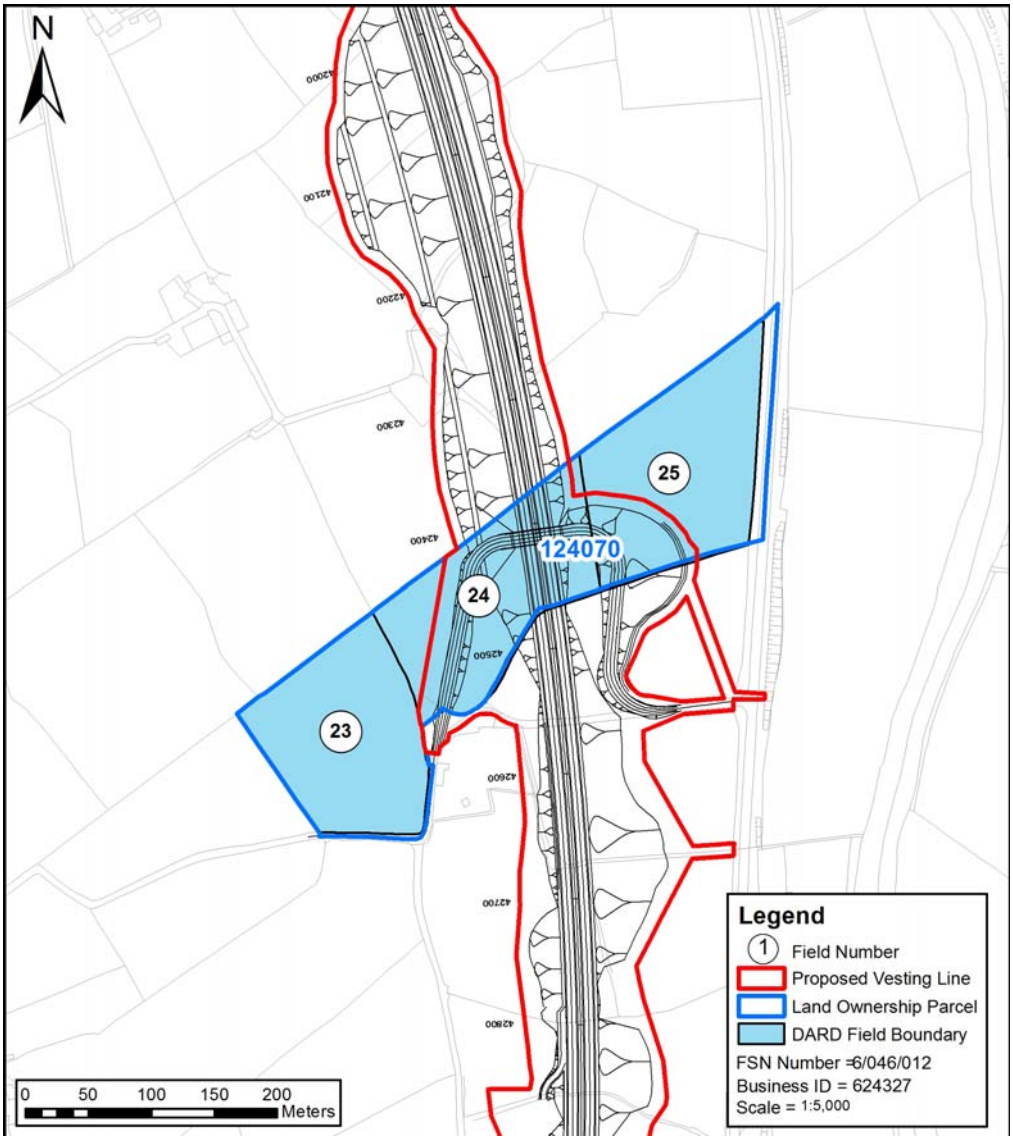
© Mouchel 2016

Predicted Impacts The proposed scheme will result in a total loss of 2.34ha of owned land from the 64.92ha farm equating to 3.6% of the productive land. The main impact on this Landowner is land take.
Proposed Mitigation During the construction phase access to severed land will be required.
Predicted Effects The loss of 3.6% of the available productive land would have a **slight adverse** impact on the farm.

© Mouchel 2016

Land Parcel Ref	124070	**DARD Business Ref**	624327
		Data sources	2010 AIA meeting. Feedback from landowner confirmation meeting. September 2014 meeting held.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 63.90ha, of which 58.78ha is owned land. The farm is all in grass.	
Type of Enterprise and Husbandry The farm runs a dairy herd of 90 cows with a herd average of 7,000 litres. In addition, there are approximately 40 young stock reared as heifer replacements. All bull calves are sold. In winter, sheep are grazed on the farm to aid grassland management.	
Conacre Arrangement 5.12ha of land is taken in conacre. Location unknown.	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	Given the intensive stocking rate, there may be implications for the farm under the Nitrates Directive, as organic nitrogen is running close to the maximum permitted 170kg per ha.
Countryside Management Scheme	Owned land is registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	A large proportion of the land is registered Disadvantaged Land (DA), which is eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

© Mouchel 2016

Predicted Impacts The main impacts on this farm are severance and land take. The proposed scheme will result in a total loss of 1.9ha of the 63.9ha farm equating to 3% of the productive land. Under the Nitrates Directive, land-take may impact on future compliance.
Proposed Mitigation During the construction phase access to severed land would be maintained.
Predicted Effects The residual effect of the Proposed Scheme on the farm is **slight adverse**.

Size and Quality of Farm	
The farm extends to 56.91ha of owned land, which is all in grass, with the exception of field Nos 20 – 23 (not shown on plan) which are wooded.	
Type of Enterprise and Husbandry	
The land is all rented out in conacre to 3 landowners.	
Conacre Arrangement	The land affected by the Proposed scheme is taken by a single tenant whose farm is not affected by the Proposed Scheme. The impact on the conacre tenant is outlined in datasheet 021-243
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	With the exception of field Nos 16 & 17 the land is all registered under the Countryside Management scheme, and application has been made to join the new scheme in 2010.
Less Favoured Area Compensatory Allowances Scheme	The land is all rented in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
The proposed scheme will result in a total loss of 5.68ha of the 56.91ha farm equating to 9.98% of the productive land. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

© Mouchel 2016

New severance would also impact the farm. Access would be provided via an overbridge connecting to Beltany Road. All fields to the east would be accessed off Beltany Road. As the land is currently out in conacre and not farmed by the landowner directly, the severance impacts on the landowner would be slight. The overall impact of the Proposed Scheme on the farm would be **slight adverse.**	
Proposed Mitigation No mitigation measures are proposed.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

Size and Quality of Farm

The farm is run as a partnership.

The farm extends to 123.07ha of owned land, which is all in grass. Some of the land is rented out in conacre.

Type of Enterprise and Husbandry

The farm runs a herd of 15 suckler cows plus 1 bull, with the progeny all being finished for beef. In addition, the farm buys in approximately 150 store cattle (300-450kg live weight) and carries them through to finish.

In winter the farm is grazed with ewes as an aid to grassland management.

Conacre Arrangement	Some of the land is rented out in conacre.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area/Severely Disadvantaged Area (DA/SDA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 3.66ha of the 123.07ha farm equating to 3% of the productive land. The landtake impacts would be slight.

New severance would impact on the farm business. Access to severed land would be provided via a shared farm lane that crosses the proposed route on adjacent land linking onto Beltany Road. The severance impacts would be slight.

There would be temporary impacts during the construction phase of the Proposed Scheme.

© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Residual Effects	The loss of 3% of the available productive land would have a **slight adverse** impact on the farm's potential output. The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

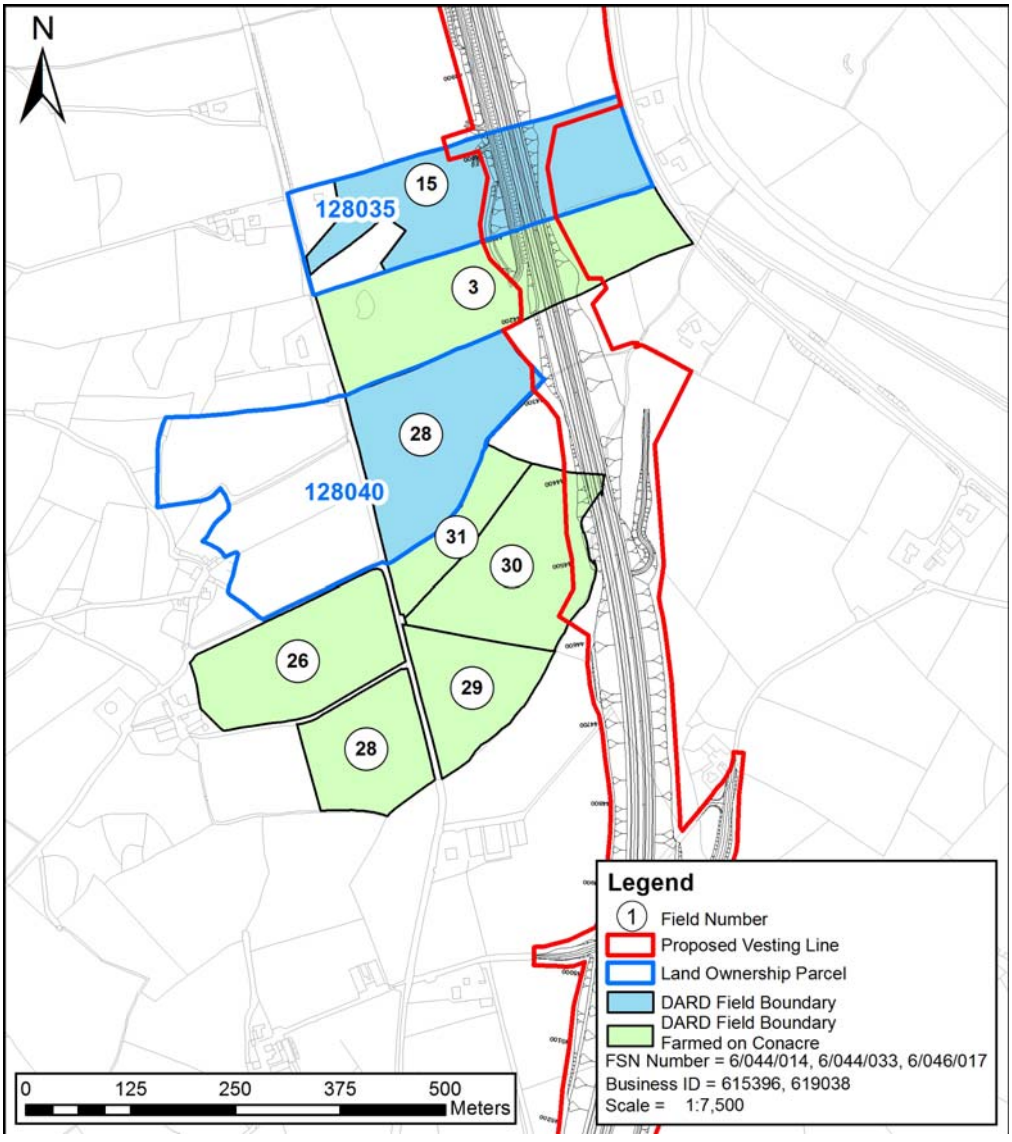
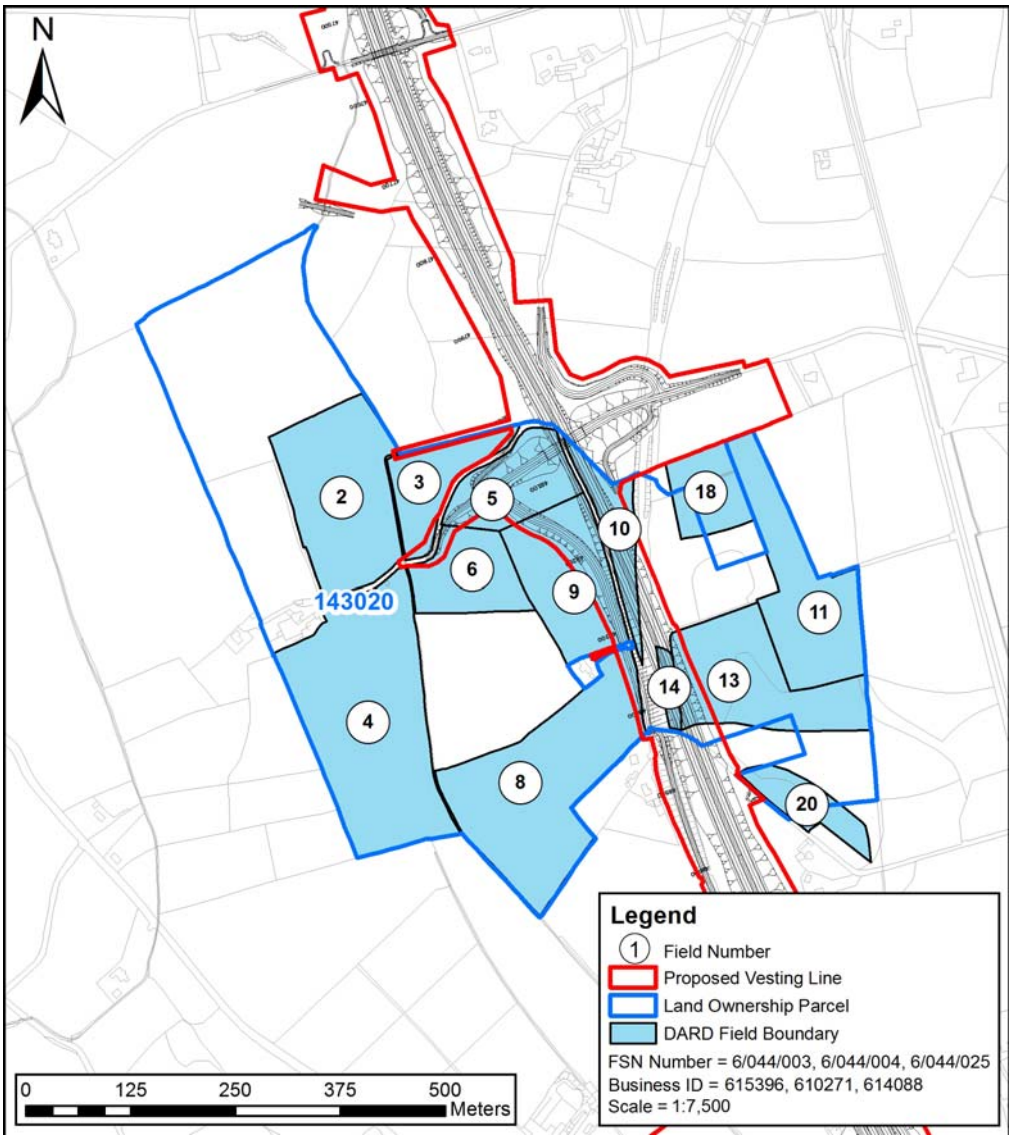
Land Parcel Ref	128035, 128040, 143020	**DARD Business Ref**	615396
		Data sources	June 2010 meeting. Feedback from landowner confirmation meeting requested review. Declined 2014 meeting request.
Conacre Parcel Ref	Affected rented conacre Parcel 128020 and 128015		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016



© Mouchel 2016

Size and Quality of Farm The farm extends to 162ha of which 122ha is owned land and the remainder is taken in conacre. The farm is all in grass.	
Type of Enterprise and Husbandry The farm runs a herd of 200 dairy cows with a herd average of 7000 litres. In addition, there are 250 herd replacements on the farm. As a result of being closed with TB, all calves are reared on the farm. There are approximately 500 cattle on the herd list, which includes 40 beef cattle. Field No15 forms part of the cow grazing platform. Cows are walked along the Castletown Road to the grazing land between the Castletown Road and the existing A5.	
Conacre Arrangement	Approx. 40ha of land rented in conacre with affected conacre parcels 128020 and 128015. See datasheet 021-214 and 021-083 respectively.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, and also on some conacre land.
Nitrates Directive	Given the high stocking rate, the farm is currently borderline on 170kg organic nitrogen per ha. There may be implications under the Nitrates Directive, as a result of land-take.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Some of the land is classified Disadvantage Area/Severely Disadvantaged Area (DA/SDA), and is eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

© Mouchel 2016

Predicted Impacts The proposed scheme will result in a total loss of 5.56ha of owned land from the 162ha farm, equating to 3.4% of the productive land. This would include land currently used as the grazing platform for the dairy herd. The landtake would be small in relation to the overall farm however it may affect future compliance under the Nitrates Directive. The landtake impacts would be slight. New severance would impact on the farm. Access would be provided to all severed land (parcel 128035) via the Castletown Road and across the Proposed Scheme on a shared farm lane. The severance impacts would be slight.
Proposed Mitigation No mitigation proposed.
Predicted Effects The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	128010	**DARD Business Ref**	632242
		Data sources	2010 AIA meeting. Response received from AIA letters and land confirmation meeting. November 2014 AIA meeting held.

© Mouchel 2016

Size and Quality of Farm	
The farm extends to 4.33ha of owned land, which is all in grass.	
Type of Enterprise and Husbandry	
The farm runs a flock of 18 ewes and 1 ram, producing approximately 18 lambs, which are carried through to finish. In addition, approximately 15 – 20 store lambs are purchased in the autumn for finishing or rearing as replacements. Hay or silage for winter forage is cut off Field No 9.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
The proposed scheme will result in a total loss of 0.81ha of the 4.33ha farm equating to 18.7% of the productive land. This would include landtake from almost all of field number 9 which is used for hay/silage. There would be no severance as a result if the Proposed Scheme.
Proposed Mitigation
No mitigation is proposed.

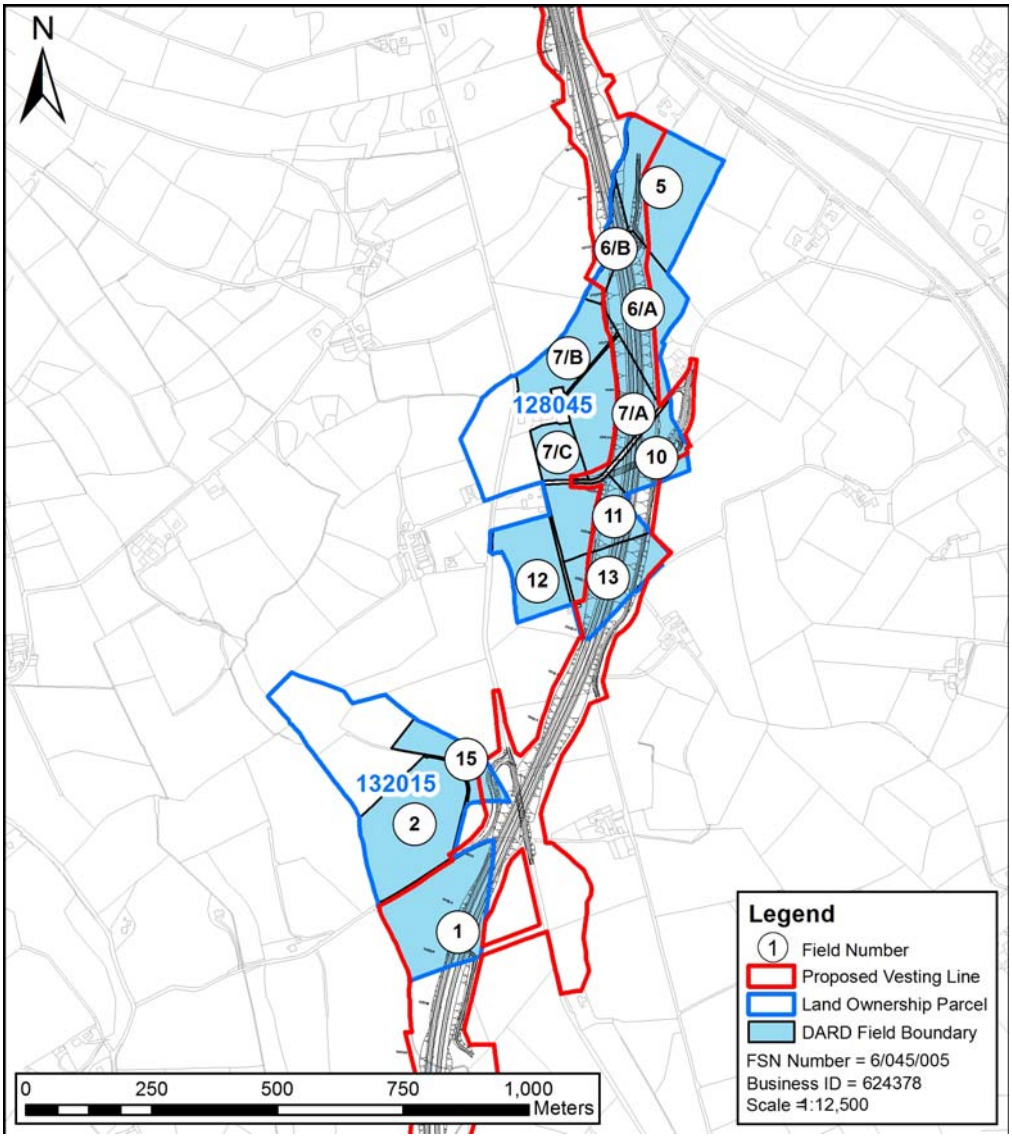
© Mouchel 2016

Predicted Effects	The loss of 18.7% of the available productive land would have a **substantial adverse** impact on the farm's potential output. This will constitute a significant effect on the farm.

© Mouchel 2016

Land Parcel Ref	128045, 132015	**DARD Business Ref**	624378
		Data sources	2010 AIA meeting. Feedback received from land confirmation meeting. October 2014 AIA meeting held.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 32.07ha of owned land, which is all in grass.

Type of Enterprise and Husbandry

The farm runs a suckler herd containing approximately 11 cows. All the progeny are retained and either sold as stores or finished as beef.

The cows all calve March/April. Silage is all baled and slurry is applied mainly to the silage ground.

The farm is already severed by minor roads, which do not impact on the management of the farm. Cattle are moved, either on foot across minor roads or by trailer from the home farm to the out farm.

Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	With the exception of field No 1, which is classified as Lowland (LL), the remainder of the farm is classified as Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 13.76ha of the 32.07ha farm equating to 42.9% of the productive land. This would include land from parcel 132015 and 128045. The landtake impacts would be substantial.

New severance would also impact on the farm. Parcel 128045 would be split in two with an area to the east severed. Access would be maintained off the realigned Killinure Road. The

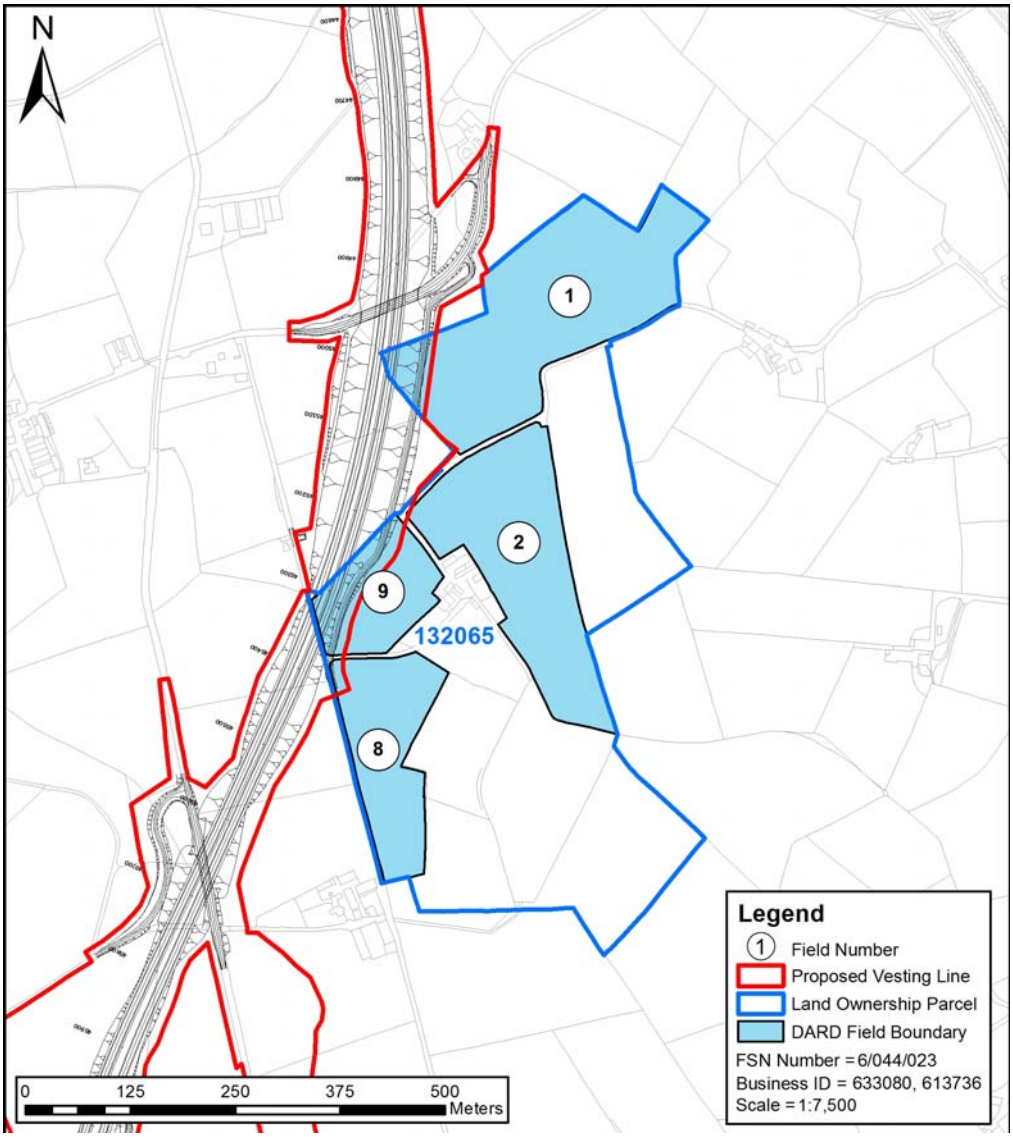
© Mouchel 2016

severance impacts would be moderate. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation Access to severed land is provided via link to the existing Killinure Road (to the east of the mainline).	
Predicted Effects	The loss of 42.9% of the available productive land and associated severance would have a **substantial adverse** impact on the farm. This will constitute a significant effect on the farm.

© Mouchel 2016

Land Parcel Ref	132065	**DARD Business Ref**	633080
		Data sources	September 2010 meeting. No 2013 AIA letter feedback. Landowner confirmation meeting feedback received. Minor changes to scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Let in conacre		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



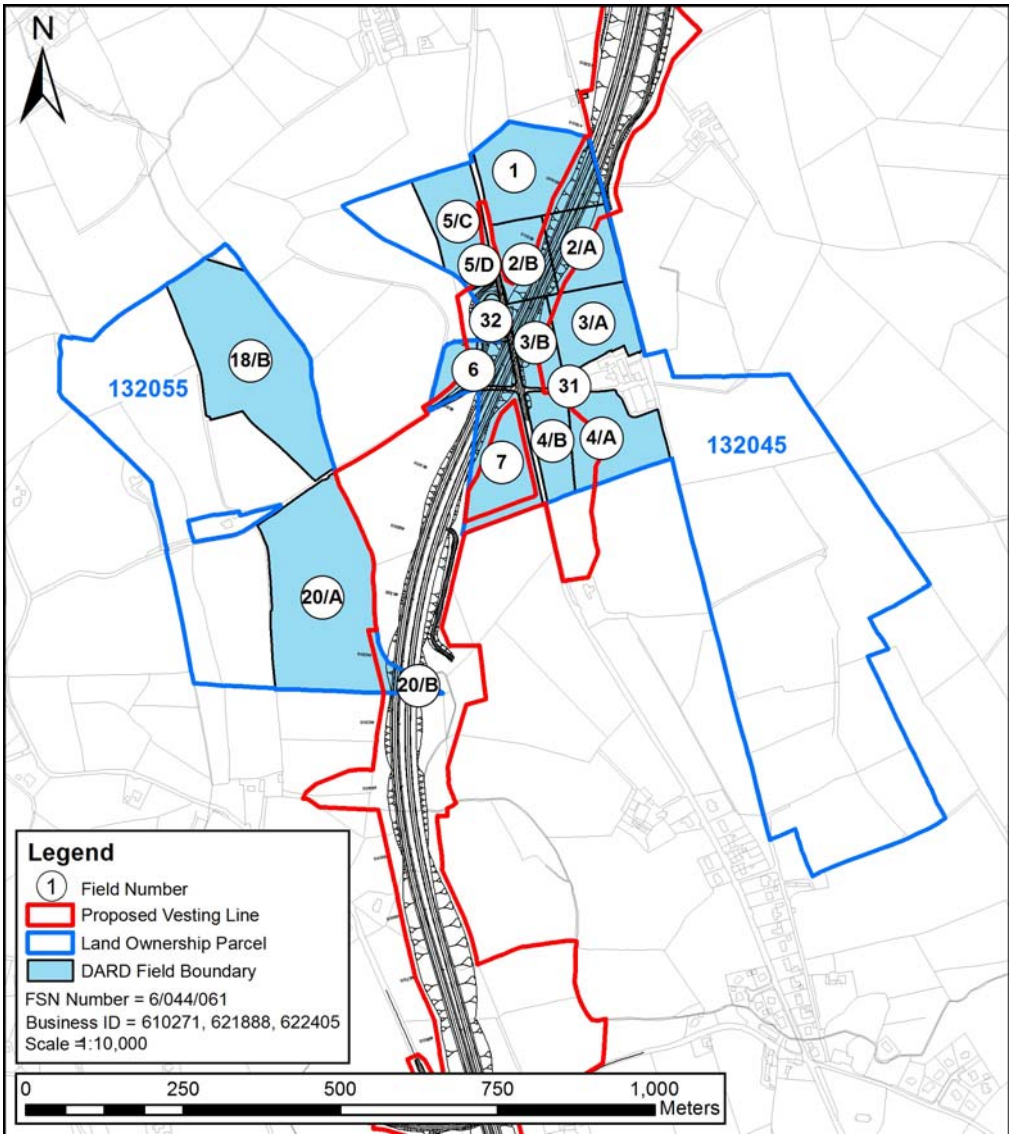
© Mouchel 2016

Size and Quality of Farm The farm extends to 24.35ha of owned land which is all in grass.	
Type of Enterprise and Husbandry The farm runs a flock of 40 ewes and 2 rams producing approximately 70 lambs, which are carried through to finish.	
Conacre Arrangement	Let in conacre
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The proposed scheme will result in a total loss of 1.2ha of the 24.35ha farm equating to 4.9% of the productive land. This would include the west of the land parcel. The landtake impacts would be slight. There would be no severance as a result of the Proposed Scheme.	
Proposed Mitigation No mitigation is proposed.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	132045, 132055	**DARD Business Ref**	621888
		Data sources	2010 AIA Meeting. Feedback received from Landowner confirmation meeting. September 2014 AIA meeting.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 59.24ha of owned land, which is all in grass.	
Type of Enterprise and Husbandry The farm runs a beef finishing enterprise, with 50-60 beef cattle being purchased in at approximately 400kg and taken through to finish. During the winter approximately 100 ewes are grazed on a B & B basis, to maintain sward quality. The farm is already severed by minor roads, which do not impact on the management of the farm.	
Conacre Arrangement	The outlying farm (field Nos. 18 to 25, 21.78ha) is currently rented out in conacre. The conacre arrangement is based on 2010 information and no information provided in 2014 assessment. The landowner would not confirm the details of the conacre tenant. There is only a small land take from these fields for the Proposed scheme. No assessment could be undertaken of the impacts on the conacre tenant.
Single Farm Payment	The landowner collects the Single Farm Payment on farmed land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Although some of the land is registered disadvantaged area (DA), payments under LFACAS are not collected.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts The proposed scheme will result in a total loss of 6.57ha of the 59.24ha farm equating to 11.09% of the productive land. This would include land from land parcel 132045 and 132055. Some of the landtake in field 4 would be used as a deposition area. The landtake impacts would be moderate. New severance would impact on the farm. Access for parcel 132045 is provided in the design via a bridge over Castletown Road. The severance impacts would be moderate. There would be temporary impacts during the construction phase of the Proposed Scheme.
Proposed Mitigation During the construction phase access to severed land would be maintained.
Predicted Effects The loss of 11.09% of the available productive land would have a **moderate adverse** impact on the farm.

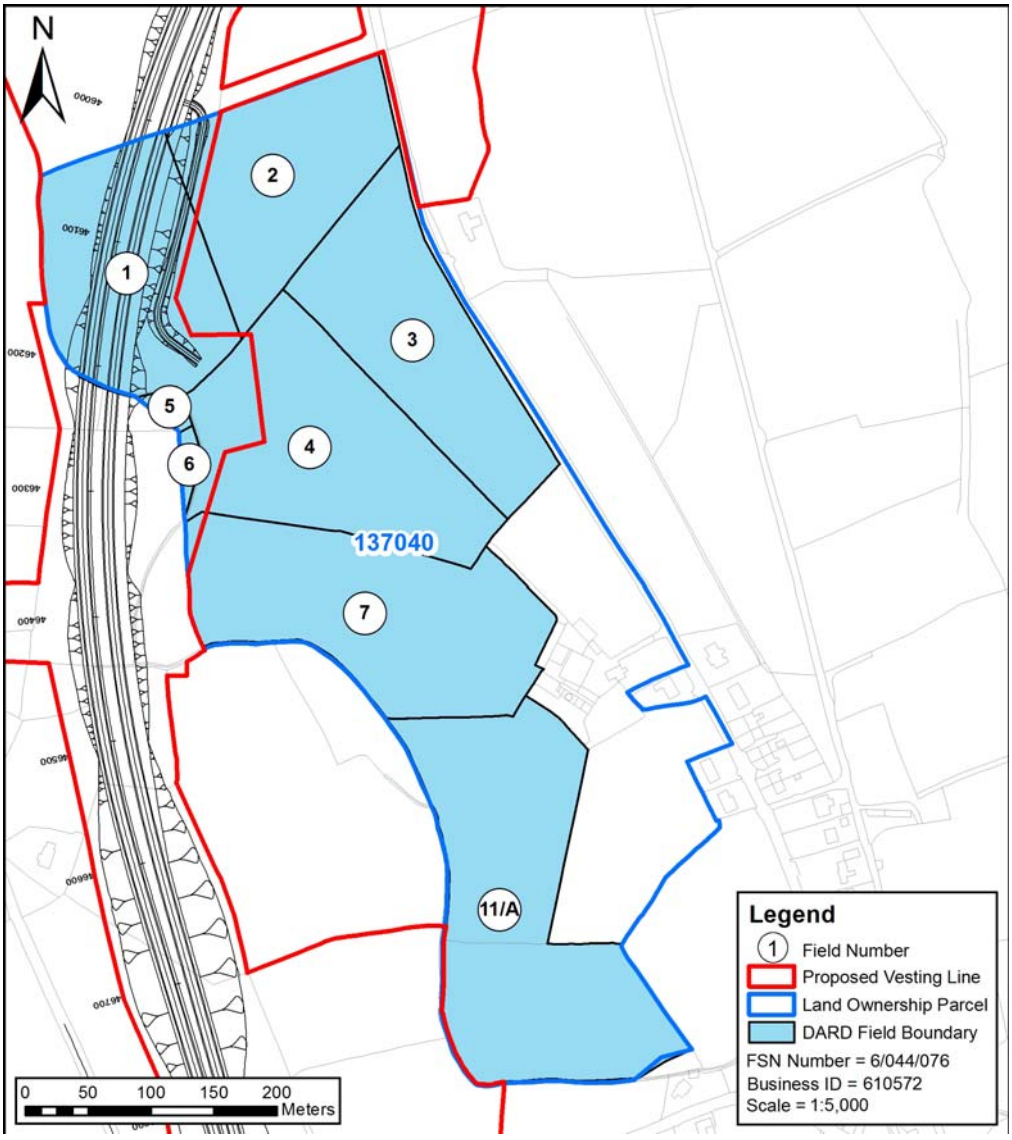
Land Parcel Ref	137040	**DARD Business Ref**	610572
		Data sources	June 2010 meeting. Feedback received for AIA letters and land confirmation meeting. Only minor changes to farm and the Proposed Scheme, therefore no 2014 revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 19.72ha of owned land, which is all in grass.	
Type of Enterprise and Husbandry The farm runs a herd of 6 pedigree Simmental cows and 4 heifers, as herd replacements. In addition there are currently 3 suckled calves, 4 one-year-old heifers and 2 bulls on the farm.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts The proposed scheme will result in a total loss of 3.05ha of the 19.72ha farm equating to 15.46% of the productive land. The landtake impacts would be slight. There would be no severance as a result of the Proposed Scheme.

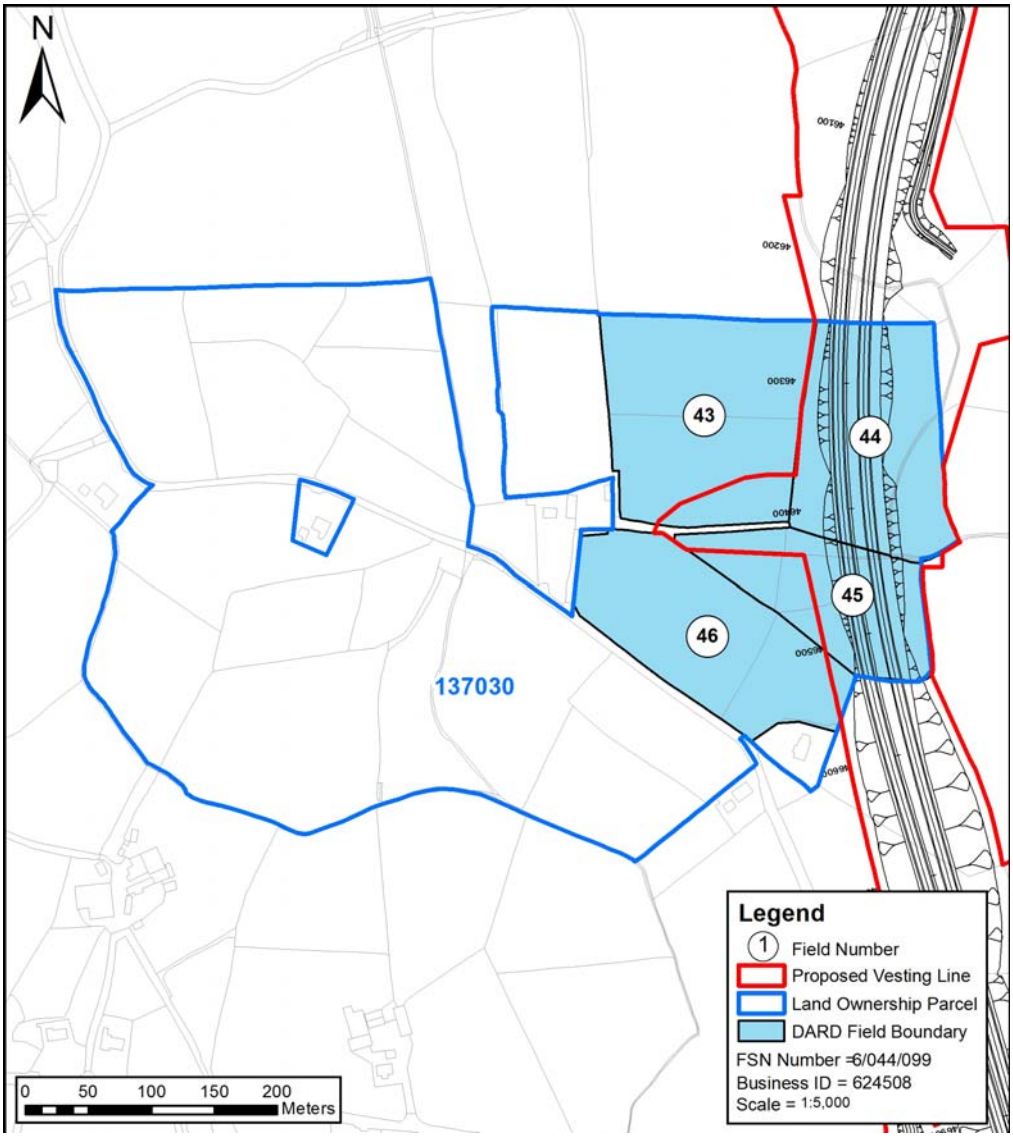
© Mouchel 2016

Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	137030	**DARD Business Ref**	621486
		Data sources	July 2010 meeting. 2014 landowner confirmation meeting feedback identified minor changes to farm. Minor changes to scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 226ha, which includes 191ha of owned land, with a further 22ha rented in conacre.

The farm is mainly in grass, with the exception of one or two fields which are in whole crop wheat on a rotation.

Type of Enterprise and Husbandry

The farm runs a large dairy herd of 240 cows and 1 bull. In addition, there are 180 heifers being reared as herd replacements.

A suckler herd of 35 suckler cows and 2 bulls produces approximately 35 suckled calves, which are transferred into a beef enterprise, containing approximately 60 cattle for finishing, with a further 20 heifers being reared as herd replacements.

A flock of 500 ewes and 12 rams produces approximately 850 lambs, which are carried through to finish.

Conacre Arrangement	22 acres of land is rented in conacre. No land rented in conacre is affected by the proposed scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	The farm currently exports 1.25m gallons of slurry to maintain compliance with the Nitrates Directive. Consequently, any land-take will have implications under the Nitrates Directive.
Countryside Management Scheme	Owned land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Some of the land is registered Disadvantaged Area (DA), which is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 4.21ha of the 226ha farm equating to 1.86%

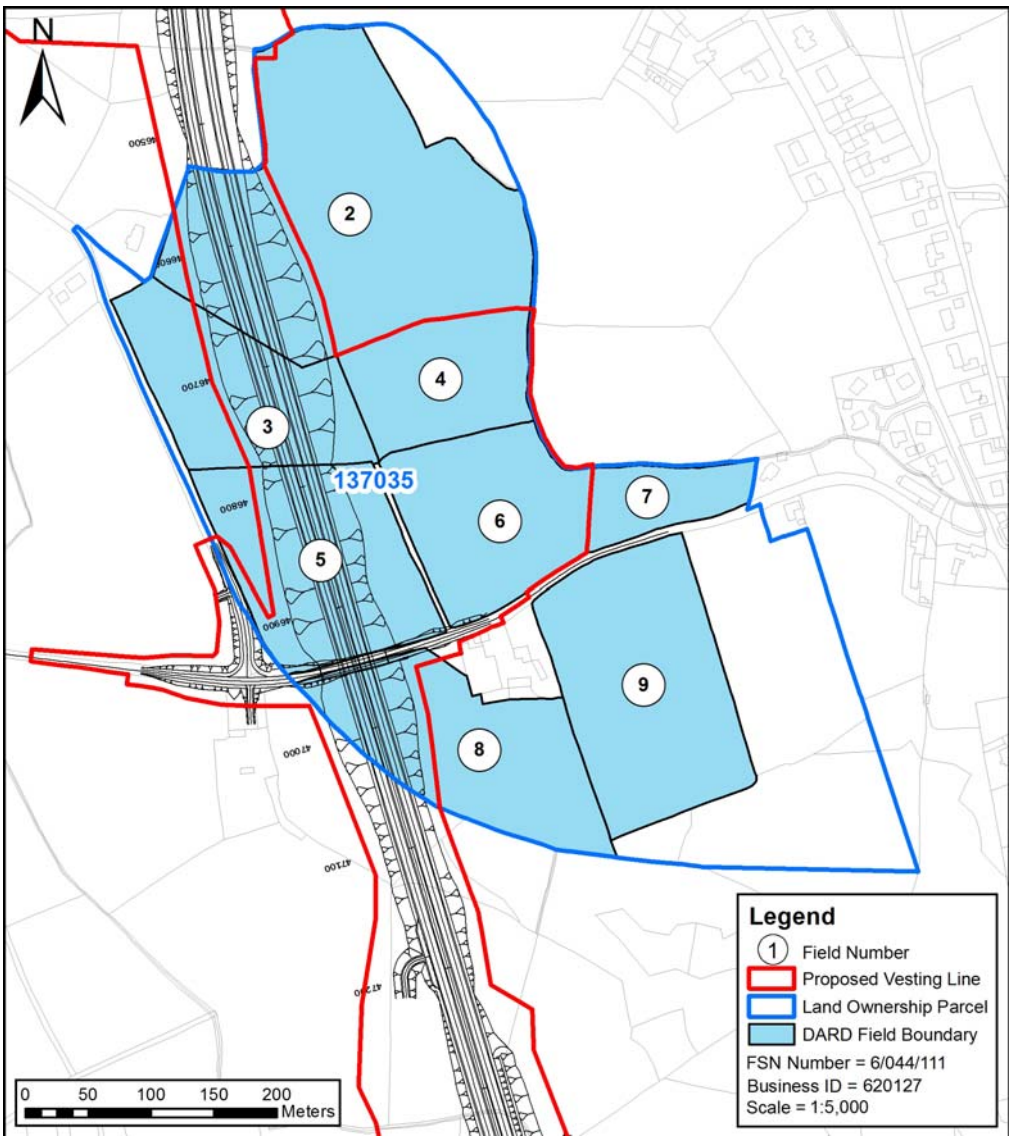
© Mouchel 2016

of the productive land. Under the Nitrates Directive, the farm currently exports slurry and landtake would have further implications for future compliance. The landtake impacts would be moderate. There would be no severance as a result of the Proposed Scheme.	
Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	137035	**DARD Business Ref**	633710
		Data source	February 2010 AIA meeting. 2014 landowner confirmation meeting identified no change to farm. Minor change to scheme only.
Conacre Parcel Ref	Let in conacre to 128065		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 22.41ha and is all in grass.	
Type of Enterprise and Husbandry	
The land is all let out in conacre. Some of the land is arable, and is currently planted out in winter wheat, with the remainder being grassland.	
Conacre Arrangement	All let in conacre to parcel 128065 landowner. The assessment of impacts on the conacre tenant are outlined in datasheet 201-215
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is not eligible under for payments LFACAS, as it is currently rented out in conacre.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 8.38ha of the 22.41ha farm equating to 37.39% of the productive land. This would include a section of land which would be used as a deposition area. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

New severance would also impact on the farm. Access would be provided to all severed land although it is not clear how the landowner would access the field adjacent to the deposition area. Due to the lack of access to this field severance impacts would be moderate.

There would be temporary impacts during the construction phase of the Proposed Scheme.

© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	137010	**DARD Business Ref**	610639

© Mouchel 2016

Size and Quality of Farm	
The farm extends to 74.06ha of owned land, which is all in grass.	
Type of Enterprise and Husbandry	
The farm runs a herd of 60 suckler cows of which 10 are pedigree Charolais or Belgian Blue. The progeny are in-wintered and either sold as strong stores or finished as beef. There are currently 150 cattle on the herd list. In addition, there is a flock of 100 ewes and 3 rams, producing approximately 170 lambs, which are carried through to finish. Approximately 300 store lambs are purchased in the autumn for finishing.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Some of the land is registered Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 5.09ha of the 74.06ha farm equating to 6.9% of the productive land. The landtake impacts would be slight.

New severance would impact on the farm. Access would be provided via two new farm lanes connecting to Duneige Road as Lisnagirr Road would be stopped up. The severance impacts would be moderate.

There would be temporary impacts during the construction phase of the Proposed Scheme.

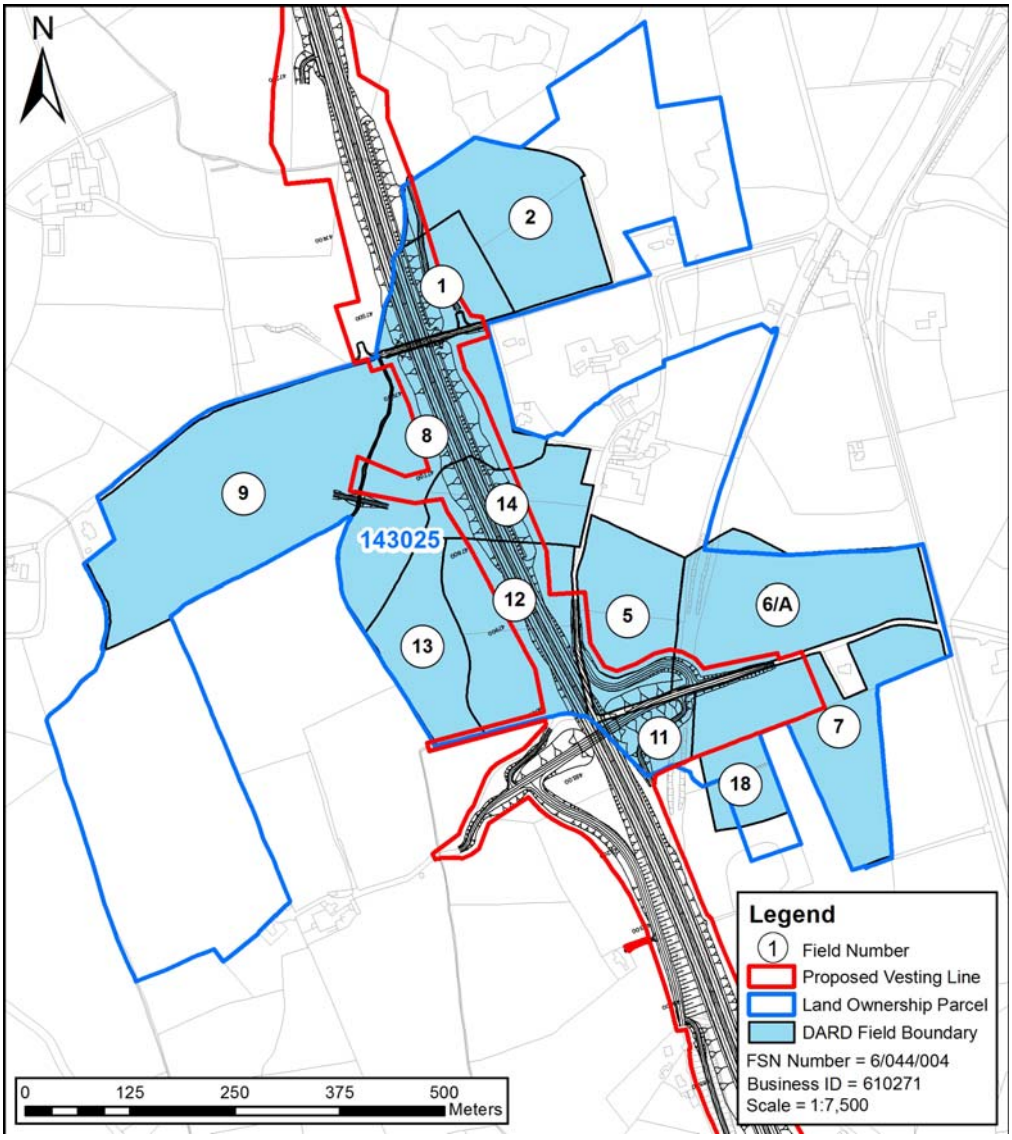
© Mouchel 2016

Proposed Mitigation	
During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	143025	**DARD Business Ref**	610271
		Data sources	2010 AIA meeting. Response received to 2013 AIA letters and 2014 landowner confirmation meeting. Declined 2014 AIA meeting.
Conacre Parcel Ref	Conacre unaffected.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

Landowner refused to meet in 2014. Baseline information based on 2010 information.

This is an intensive dairy farm extending to over 66.64ha, which includes 46.07ha of owned land and 20.57ha of conacre land rented from another landowner, who farms along the proposed scheme but is not affected. In addition, more land is rented from second unaffected landowner.

Type of Enterprise and Husbandry

The farm runs a dairy herd of 100 cows, with a herd average of approximately 7,500 litres. In addition, there are 3 bulls and approximately 60 dairy herd replacements.

All bull calves are retained on the farm and reared and finished indoors as bull beef.

Conacre Arrangement	20.57ha of land is rented in conacre. This is not affected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, but not on conacre land.
Nitrates Directive	Given the current stocking rate on the farm, there may be implications under the Nitrates Directive, depending on the extent of the land take.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Lowland (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 8.23ha of the 66.64ha farm equating to 12.34% of the productive land. This would include land for the proposed alignment and some land for a deposition area in field 7. Due to this landtake, there may be implications for the farms compliance under the Nitrates Directive. The landtake impacts would be substantial.

New severance would impact on the farm. Access would be provided to both sides of the

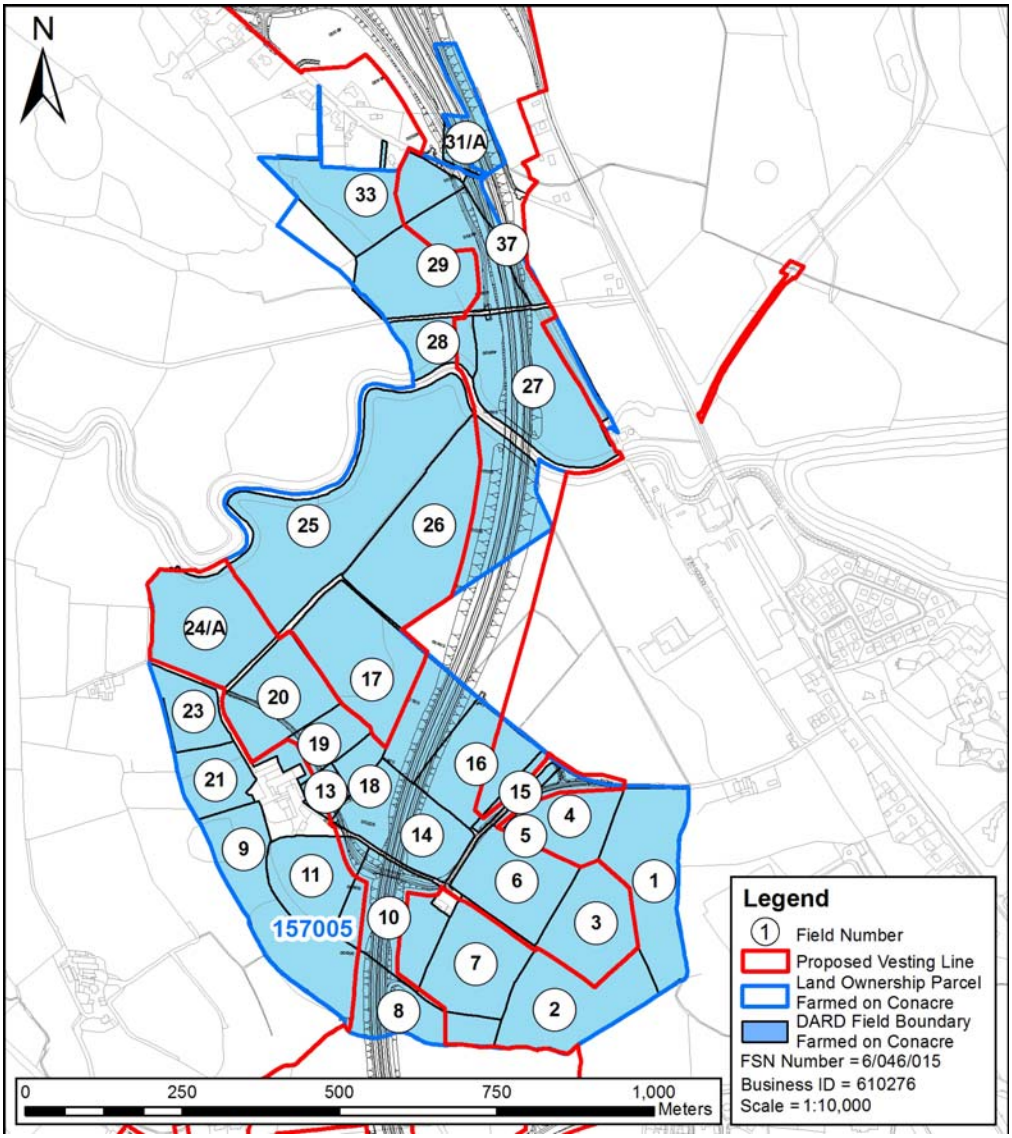
© Mouchel 2016

proposed alignment via an overbridge along Rash Road and connecting farm lanes. The severance and increased journey time would result in restricted access to the grazing platform for the dairy herd. The severance impacts would be substantial. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 12.34% of the available productive land and associated severance would have a **substantial adverse** impact on the farm. This will constitute a significant effect on the farm.

© Mouchel 2016

Land Parcel Ref	157005	**DARD Business Ref**	610276
		Data sources	2010 AIA meeting. 2014 Landowner confirmation meeting held. Declined 2014 AIA meeting
Conacre Parcel Ref	Rented conacre from Parcel 173030		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Landowner did not respond to request for 2014 AIA meeting, therefore, assessment based on 2010 data.

Size and Quality of Farm

The farm extends to 79.45ha, which includes 63.26ha of owned land. The remainder of land is rented in conacre.

The farm is all in grass, with the exception of field No 17, which has bushes.

Type of Enterprise and Husbandry

The farm runs a dairy herd of 118 cows and 2 bulls, with a herd average of 8,000 litres. In addition, there are approximately 80 young stock as herd replacements. There are 200 cattle on the herd list. All bull calves are sold.

The cow grazing platform is based around field Nos 2 (part), 3, 6, 7, 10, 11, 13, 18, 19, 20, 23 & 24. Silage is normally cut from field Nos 2, 25, 26, 27 & 29, plus the conacre land.

Conacre Arrangement	Approximately 16.19ha of land are rented in conacre which is mostly unaffected by the proposed scheme. No update since 2010 but conacre was identified from parcel 173030 that is affected - datasheet 021-105.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, but not on conacre land.
Nitrates Directive	Organic nitrogen on the farm is currently in excess of 160kg per ha, and is therefore close to the upper limit of 170kg per ha. As a result, there may be implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Lowland (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts

The proposed scheme will result in a total loss of 28.51ha of the 63.23ha of owned land, equating to 45% of the owned land. Some of the land taken in conacre will also be affected. The majority of this land would be proposed to be used as flood storage. As a result of the extensive landtake, there would be implications for the farm under the Nitrates Directive. The landtake impacts would be substantial to the extent that it would be questionable as to whether it could continue as a dairy farm.

New severance would also impact on the farm. The farm would be divided into 4 parcels either side of the proposed alignment and north and south of the flood storage areas, with one parcel north of the Fairy Water. Access to all parcels would be provided either through the flood storage areas or off Todds Road but it would lead to significantly increased journey times. The severance impacts would be substantial adverse.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

During the construction phase access to severed land would be maintained.

Predicted Effects	The loss of 45% of the owned land and associated severance would have a **substantial adverse** impact on the farm. This will constitute a significant effect on the farm.

© Mouchel 2016

Size and Quality of Farm	
The farm extends to 59.33ha of owned land, which is all in grass.	
Type of Enterprise and Husbandry	
This is a beef farm buying in approximately 60 store cattle (300-350kg) which are carried through to finish. There are approximately 50-60 cattle on the herd list at any one time. Approximately 70 store lambs are purchased in the autumn and carried through to finish.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Field Nos 23 & 25 (not shown on the map) are classified Disadvantaged Area (DA) and are eligible for payments under LFACAS
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 13.78ha of the 59.33ha farm equating to 23.23% of the productive land. The landtake impacts would be moderate.

New severance would impact on the farm. Access would be provided to all severed land off the realigned Gillygooly Road. The severance would be moderate.

There would be temporary impacts during the construction phase of the Proposed Scheme.

The overall impact of the Proposed Scheme on the farm is considered to be **moderate adverse.**

Proposed Mitigation

During the construction phase access to severed land would be provided.

© Mouchel 2016

Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	165010	**DARD Business Ref**	616131
		Data sources	2010 AIA meeting. Response received from 2013 AIA letters and landowner confirmation meeting. September 2014 meeting

© Mouchel 2016

Size and Quality of Farm The farm extends to 74.07ha, of which 61.74ha is owned land, with the remainder being rented in conacre. The farm is all in grass, with the exception of some land that grows whole crop wheat for silage occasionally.	
Type of Enterprise and Husbandry The farm runs a dairy herd of 110 cows and 2 bulls, with a herd average of 7,500 litres. In addition, there are approximately 80 young stock on the farm as herd replacements. Bull calves are normally sold but occasionally reared and finished as bull beef. The grazing platform for the dairy herd is on field Nos. 1, 3 - 8, 11 - 13, 15, 16 and 20, while silage is normally cut off field Nos. 14, 17, 22, 29 – 31, and 34 – 37. Not all fields are shown on plan above. The laneway to the rear of the farmyard provides access for the cows to field Nos. 3, 4, 6 and 10. The yard and silo adjacent to field No 35 houses young stock and dry cows in winter.	
Conacre Arrangement	12.33ha are rented in conacre which is not affected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land and also on conacre land.
Nitrates Directive	The farm is currently on 162kg/ha organic nitrogen and there may be implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is registered under the Countryside Management Scheme. Field No. 33 is in set-aside and field No. 46 is wooded.
Less Favoured Area Compensatory Allowances Scheme	A large proportion of the land is classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts

The proposed scheme will result in a total loss of 10.96ha of the 74.07ha farm equating to 14.8 % of the productive land. This would run through the east side of the farm and includes a deposition area in field 2. The landtake would include a significant amount of the dairy herds grazing platform. Under the Nitrates Directive there may be implications for the farm. The landtake impact would be substantial.

Land take for in-fill will remove Field Nos 2, 3, 10 and part of Field No 1 from the grazing platform and this is likely to create difficulties in maintaining sufficient grass during the grazing season and this will create problems and additional costs for the Landowner.

New severance would also impact on the farm. Access would be provided to severed land via an overbridge on Rosemary/Aghnamoyle Road. The severance would have a substantial impact on the farm.

Proposed Mitigation

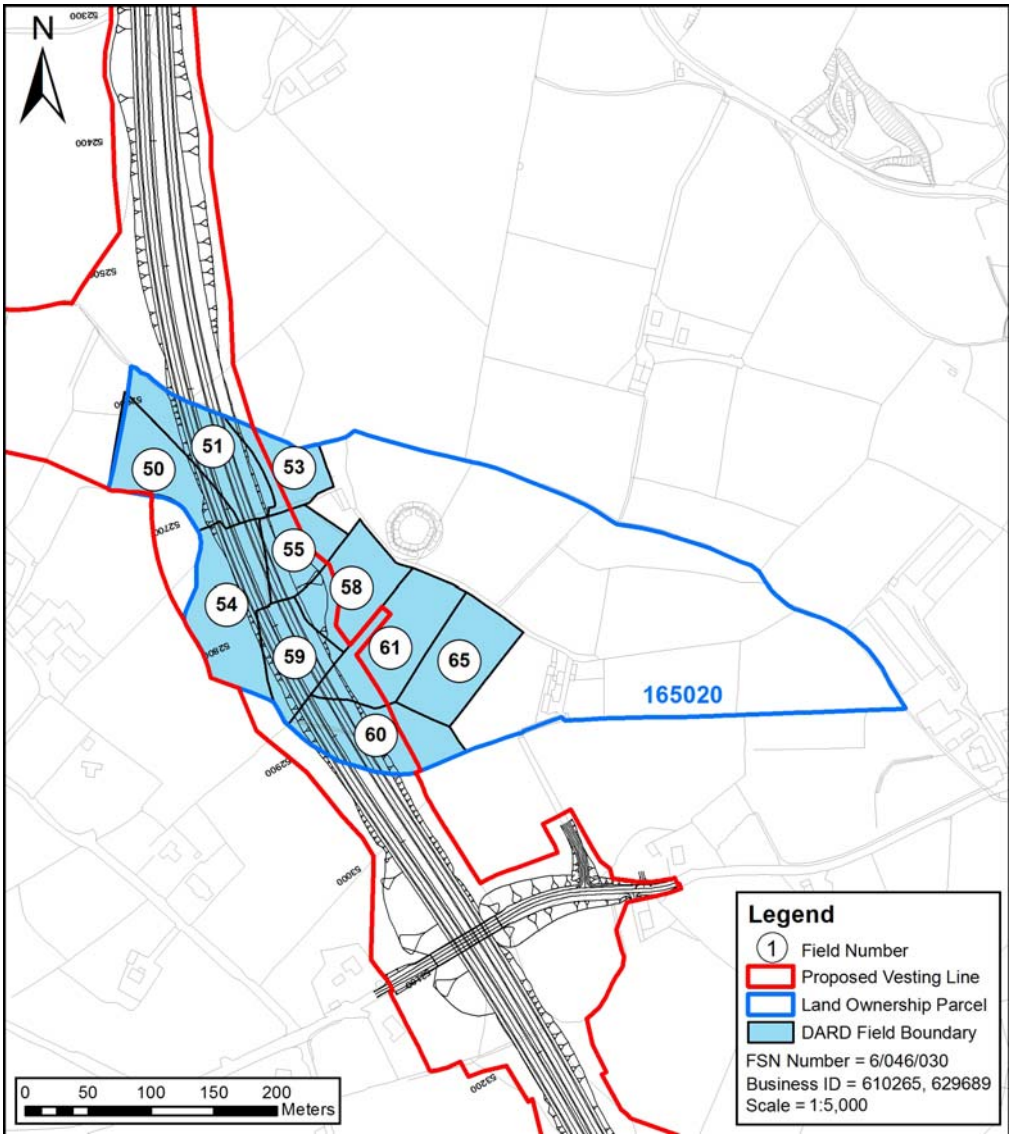
Access is provided along Rosemary/Aghnamoyle Road to provide access for the dairy herd to the severed portion of the grazing platform.

Predicted Effects	The loss of 14.8% of the available productive land and associated severance would have a **substantial adverse** impact on the farm. This will constitute a significant effect on the farm.

© Mouchel 2016

Land Parcel Ref	165020	**DARD Business Ref**	228557
		Data sources	September 2010 AIA meeting. Landowner confirmation meeting held. Minor changes in the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to approximately 20.5ha of owned land in two parcels. Only parcel 165020 above is affected by the Proposed Scheme. The farm is all in grass.	
Type of Enterprise and Husbandry	
The farm buys in approximately 12 store cattle and carries them through to finish. In addition, the farm buys in store lambs, which are carried through to finish.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme, although application has been made to join the 2009 scheme.
Less Favoured Area Compensatory Allowances Scheme	While the land is classified Disadvantaged Area (DA) the landowner does not qualify to collect payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
Total loss of 3.10 hectares from fields 50, 51, 53, 54, 55, 58, 59, 60, 61 and 65 of the 20.5 hectare farm equating to 15.1% of the productive land. . This would include land for a deposition area. The landtake impacts would be slight. There would be no severance as a result of the Proposed Scheme

© Mouchel 2016

Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	173070	**DARD Farm Map Ref**	648095
		Data sources	June 2010 AIA meeting. Landowner confirmation meeting feedback identified no change to farm. Minor changes to the scheme only, therefore no 2014 revisit.

© Mouchel 2016

Size and Quality of Farm The farm extends to 23.81ha of owned land, which is all in grass.	
Type of Enterprise and Husbandry The farm runs a suckler herd of 6 cows, using AI. The progeny are sold as suckled calves. In addition the farm has 2 flat bred mares retained for breeding, the foals being sold either as foals or as yearling.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme but application has been made to join the new scheme opened in 2009.
Less Favoured Area Compensatory Allowances Scheme	The land is all registered Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts Total loss of 0.79 hectares from fields 18, 19 and 20 of the 23.81 hectare farm equating to 3.3% of the productive land. The landtake impacts would be slight. There would be no severance affecting this farm. The overall impact of the scheme on the farm is considered to be **slight adverse.**	
Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

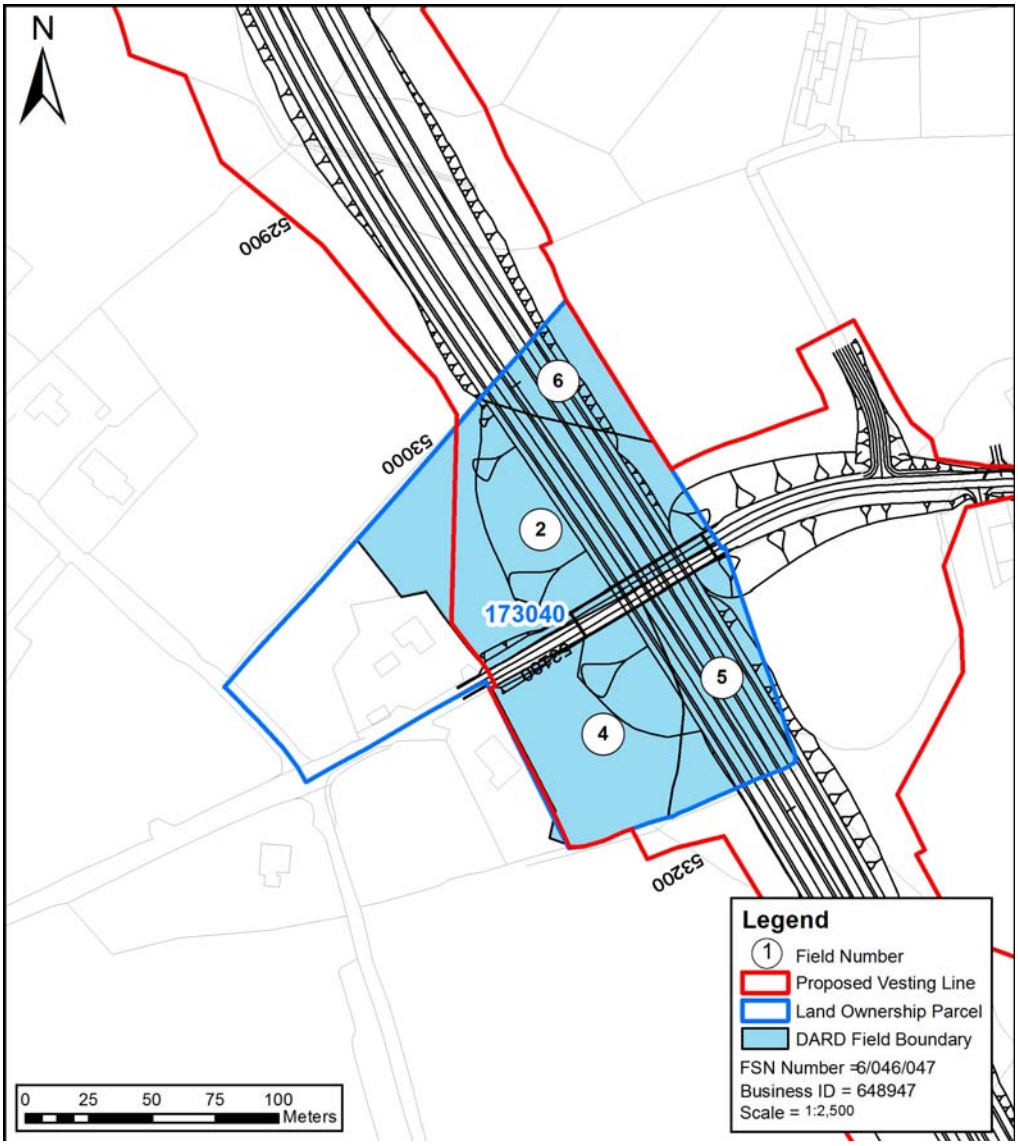
Land Parcel Ref	173040	**DARD Business Ref**	213953
		Data sources	June 2010 AIA meeting. Landowner confirmation feedback identified no change to the farm. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Let in conacre to Datasheet 021-236		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



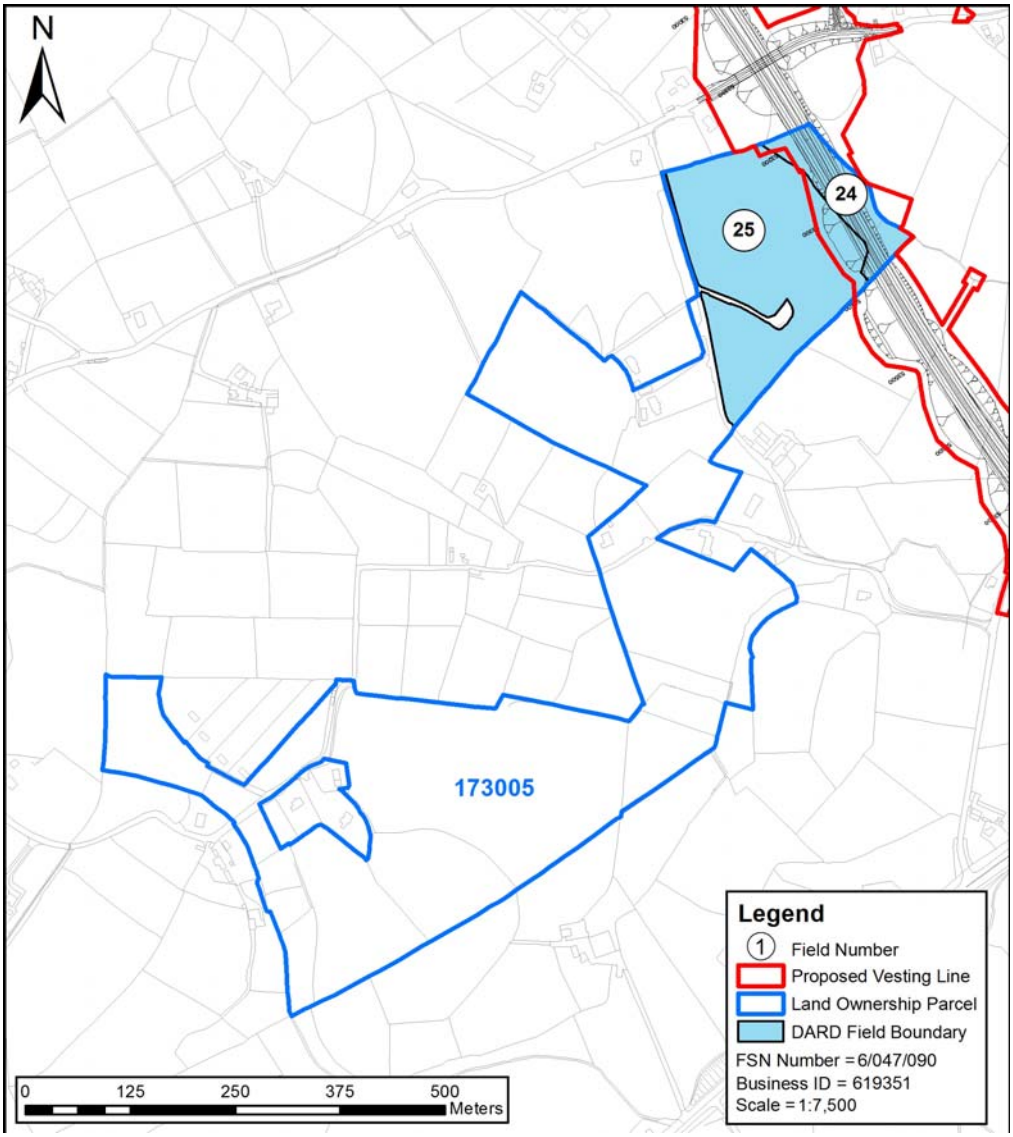
© Mouchel 2016

Size and Quality of Farm The farm extends to 2.11ha, which is all in grass, with the exception of Field No 6, which is wooded.	
Type of Enterprise and Husbandry The land is all let out in conacre.	
Conacre Arrangement	Land is all let in conacre to conacre tenant not affect by the Proposed Scheme. Impacts on the conacre tenant are outlined in Datasheet 021-236
Single Farm Payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all rented out in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts Total loss of 1.76 hectares from fields 2, 4, 5 and 6 of the 2.11 hectare farm equating to 83.4% of the productive land. This would include the majority of the farm land. As the farm is rented out in conacre, the landtake impacts would be slight. There would be no severance as a result of the Proposed Scheme	
Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The residual effect of the Proposed Scheme on the landowner would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	173005	**DARD Business Ref**	619351
		Data sources	June 2010 AIA meeting. 2013 AIA letters not returned. No landowner confirmation meeting feedback. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 71.02ha, of which 63.87ha is owned land, with the remaining 7.15ha being taken in conacre. The farm is all in grass, with the exception of Field 39 (not shown on plan), which is in barley.	
Type of Enterprise and Husbandry The farm runs a suckler herd of 50 cows and 2 bulls, with all the progeny being carried through to beef. In addition, approximately 50 store cattle or suckled calves are bought in and carried through to finish for beef. The farm also runs a flock of 100 ewes and 3 rams, producing approximately 170 lambs, which are carried through to finish. The broiler breeder house houses 10,000 broiler breeders. There is no piped water supply to Field No 25, since live-stock have access to water from the stream, which runs along the northern field boundary of Field No 24.	
Conacre Arrangement	7.15ha of land is rented in conacre, which is unaffected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts Total loss of 1.33 hectares from fields 25 and 24 of the 71.02 hectare farm equating to 1.9% of the productive land. The landtake impacts would be slight. There would be no severance as a result of the Proposed Scheme.	
Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

Landowner did not respond to request for AIA meeting in 2014. Assessment based on 2010 data and 2013 consultation responses.

Size and Quality of Farm

The farm extends to 10.82ha of owned land, plus a further 6ha taken in conacre.

The farm is all in grass.

Type of Enterprise and Husbandry

The farm buys culled dairy cows for finishing for beef, and dropped calves to be reared and sold as store cattle.

There are currently 30 cattle on the herd list.

Conacre Arrangement	6ha of land is rented in conacre which is unaffected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, and also on some conacre land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The farm used to be a dairy farm, and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The landtake required by the Proposed Scheme would total 2.94 ha which is approximately 17% of the farm are, including conacre. The landtake impacts would be substantial.

New severance would impact on the farm. Access would be provided along Brookmount Road which will remain open. Severance impacts would be moderate.

During the construction phase, access to severed land would need to be maintained.

The overall impact of the Proposed Scheme on the farm would be **substantial adverse**.

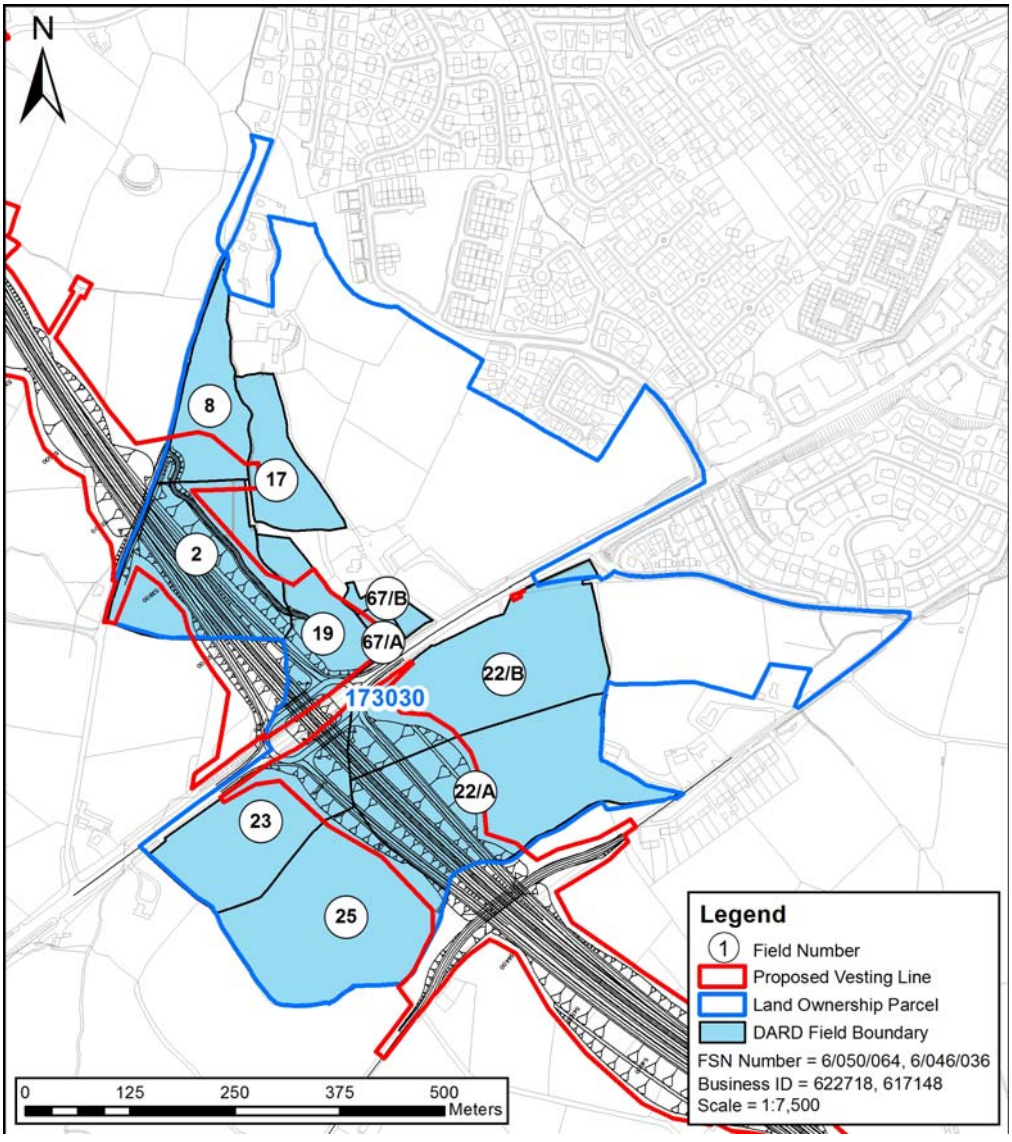
© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **substantial adverse**.

© Mouchel 2016

Land Parcel Ref	173030	**DARD Business Ref**	622718
		Data sources	March 2010 AIA meeting. 2013 AIA letters not returned. No landowner confirmation meeting response. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Conacre let to 718736-3000-R-021-097		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 145.23ha which is all in grass. Field Nos 22, 23, 25 and 26 are rented out in conacre to 718736-3000-R-021-097, and unaffected field Nos. 42 – 60B (not shown on the map) are rented out in conacre to a different landowner.	
Type of Enterprise and Husbandry The farm buys in approximately 70 – 80 store cattle (350kg liveweight) for grazing and finishing. In addition, the farm buys in approximately 40-50 store lambs which are all carried through to finish.	
Conacre Arrangement	Field Nos 22, 23, 25 and 26 are rented out in conacre. The impact on the conacre tenant is outlined in datasheet 021-097. The fields unaffected by the Proposed Scheme, Nos. 42 – 60B (not shown on the map), are rented out in conacre to a different landowner.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) or Severely Disadvantaged Area (SDA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts Total loss of 8.28 hectares from fields 2, 8, 17, 19, 67/A, 67/B, 22/A, 22/B, 23 and 25 of the 145.23 hectare farm equating to 5.7% of the productive land. Fields 22, 23 and 25 are let in conacre to another farm.	

© Mouchel 2016

. The landtake impacts would be slight for the land owner New severance would impact on the farm. Access would be provided to the severed land via Clanabogan Road which would remain open. The severance impacts would be moderate. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

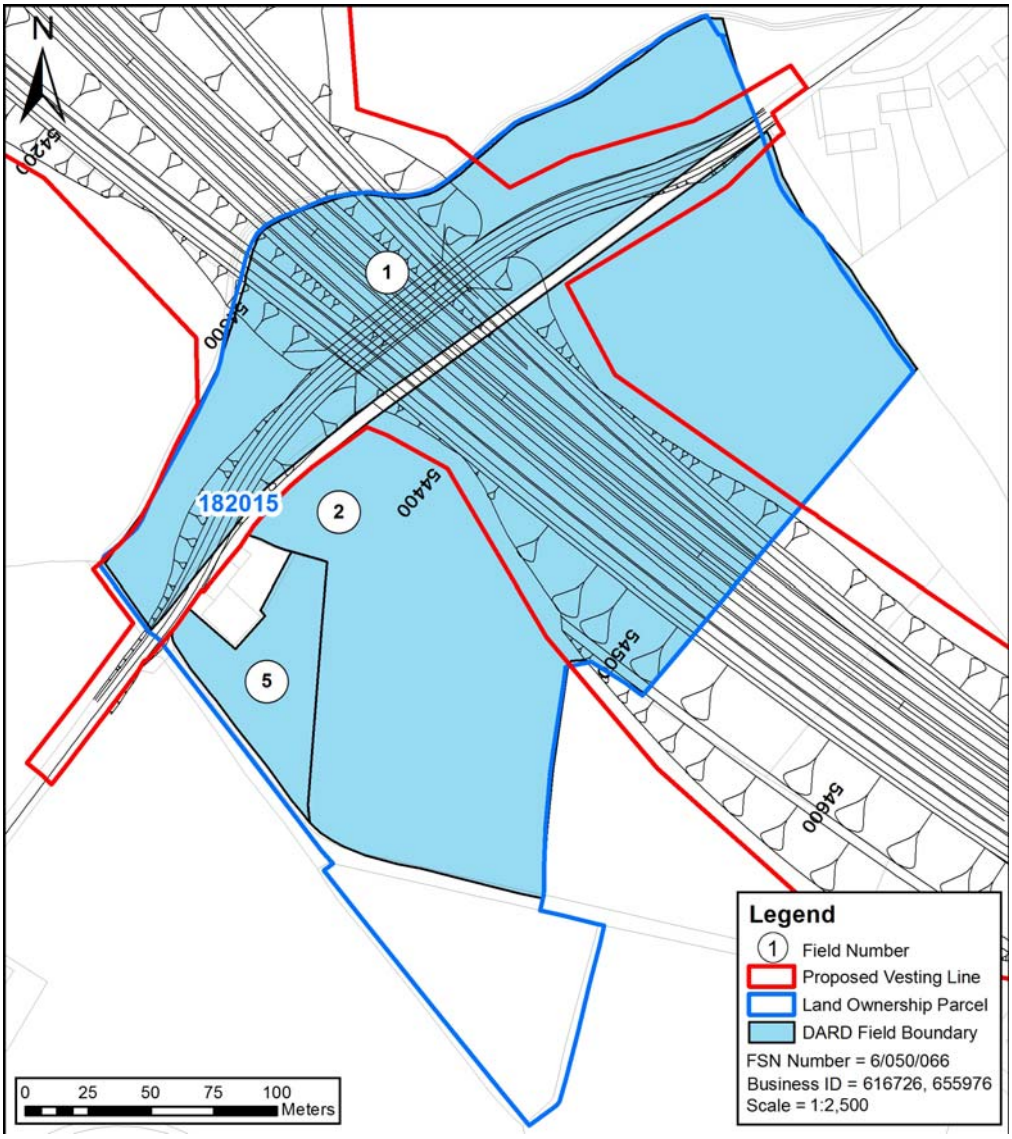
Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The Landowner confirmed in a telephone conversation on 16th October 2014 that he was not interested in a meeting. Consequently, the report refers to the situation on the farm, as it was in 2010.

The farm extends to 154.27ha, of which 93.57ha is owned land, and the remaining 60.7ha is rented in conacre. The land is all in grass.

Type of Enterprise and Husbandry

The farm runs a large dairy herd containing 200 cows, with a herd average of 7,500 litres. There are approximately 210 young stock on the farm, including heifer replacements and beef cattle. All bull calves and heifers not required as replacements are reared and finished for beef.

Conacre Agreement	Approximately 60.7ha of land is rented in conacre. Conacre unaffected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land and also on conacre land.
Nitrates Directive	The farm is currently over 160kg/ha, close to the maximum of 170kg/ha. There may be implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) or Severely Disadvantaged Area (SDA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 2.99 hectares from fields 1, 2 and 5 of the 154.27 hectare farm equating to 1.94% of the productive land. This would include land used for the realigned Loughmuck Road. Under the Nitrates Directive, landtake may impact on future compliance. The landtake impacts would be moderate.

New severance would impact on the farm. Access would be provided via the realigned

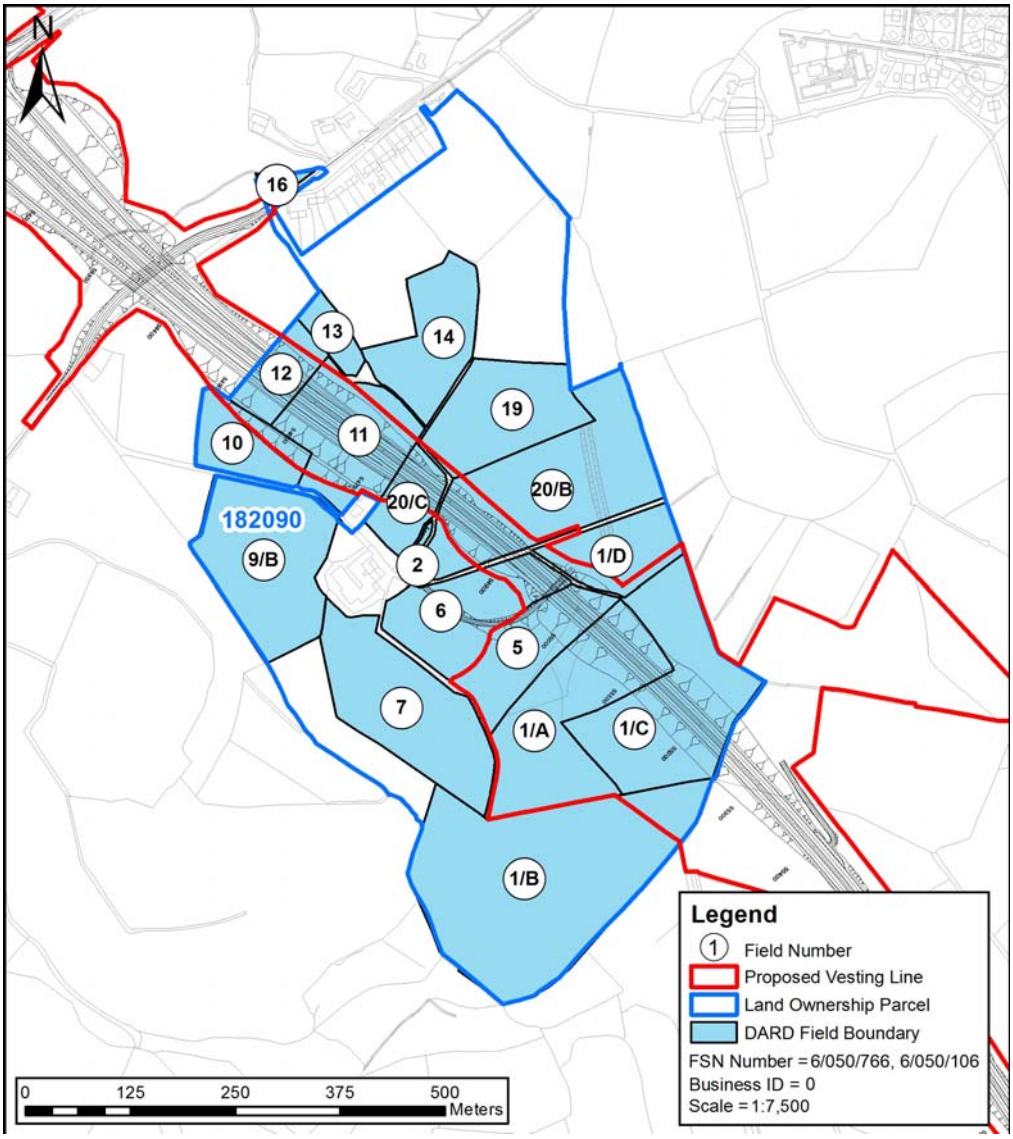
© Mouchel 2016

Loughmuck Road. The severance impacts would be slight. There would be temporary impacts during the construction phase of the Proposed Scheme. The overall impact of the Proposed Scheme on the farm would be **moderate adverse.**
Proposed Mitigation During the construction phase access to severed land would be maintained. Access would be provided via the realigned Loughmuck Road.
Predicted Effects The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	182090	**DARD Business Ref**	611089
		Data sources	July 2010 AIA meeting. Landowner confirmation meeting held. Declined 2014 AIA meeting.
Conacre Parcel Ref	Unknown		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
Landowner refused 2014 meeting. From previous AIA in 2010, 38.85ha of land is now owned. The farm extended to 90.22ha, part of which is rented in conacre. The farm is all in grass.	
Type of Enterprise and Husbandry	
The farm was utilised for grazing cattle and cutting silage.	
Conacre Arrangement	No information. Landowner refused meeting.
Single Farm Payment	No information is available regarding the Single Farm Payment.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	No information is available.
Less Favoured Area Compensatory Allowances Scheme	No information is available.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 11.92 hectares of the 90.22 hectare farm equating to 13.21% of the productive land.

The main impact on this farm will be land-take and severance.

New severance would also impact on the landowner and the farm. Access is provided to severed land via an underbridge from the home farm. This would enable the dairy cows to access the grazing platform on the other side of the proposed scheme. The severance impacts would be moderate.

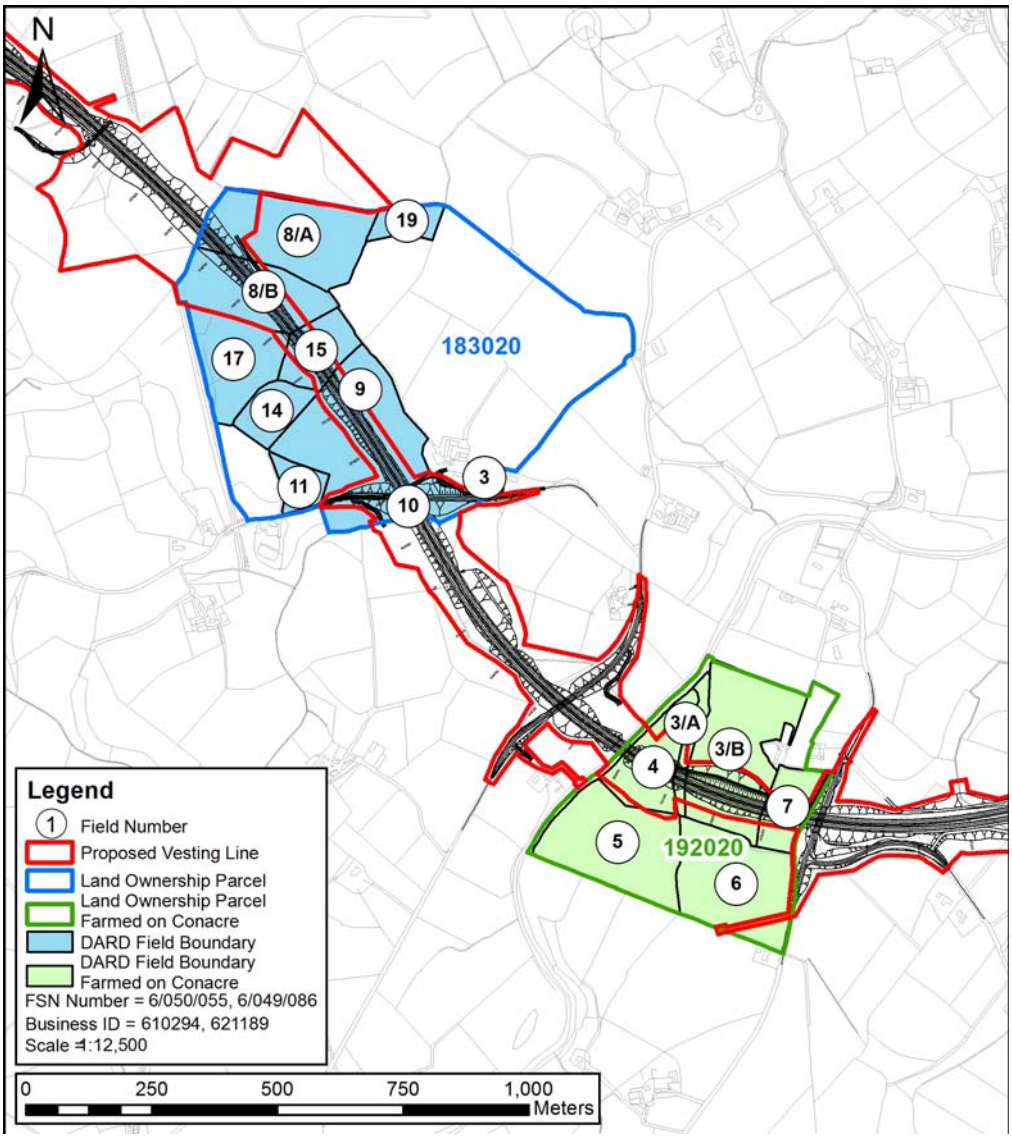
© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would need to be maintained.	
Predicted Effects	The loss of 13.21% of the available land and associated severance constitutes a substantial adverse effect.

© Mouchel 2016

Land Parcel Ref	183020	**DARD Business Ref**	610294
		Data sources	2010 AIA meeting. No 2013 AIA letter response. Landowner confirmation meeting held. October 14 AIA meeting
Conacre Parcel Ref	Rents parcel 192020, Datasheet 021-111		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 90.39ha, of which 41.46ha is owned land, with the remainder being taken in conacre form three landowners.	
Type of Enterprise and Husbandry The farm runs a dairy herd of 150 cows with a herd average of 7,000 litres. There are approximately 80 heifer replacements on the farm. Bull calves are sold as dropped calves. There are 2 bulls on the farm. There are approximately 260 cattle on the herd list. In the autumn approximately 150 store lambs are bought in and carried through to finish. The grazing platform for the dairy herd is based on Field Nos 2, 4, 5, 11-17, 18A, 18B. Silage is cut from Field Nos 1, 7, 8, 9 & 19 (2 or possibly 3 cuts, with the aftermath being grazed). Land rented in conacre is used for silage/aftermath grazing and for grazing by the cows. The landowner is particularly concerned about access for both farm and delivery vehicles along the Beagh Road. The additional land-take to provide access to a suds-pond is also of concern.	
Conacre Arrangement	Approximately 48.93ha of land is rented in conacre from 3 landowners. Parcel 192020 is affected by the Proposed scheme (Datasheet 021-111).
Single Farm Payment	The landowner collects the Single Farm Payment on owned land and on some conacre land.
Nitrates Directive	Given the high stocking rate and the extent of land take, there may be implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Given that this is a dairy farm, the land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts

Total loss of 8.10 hectares of owned land and 4.53ha of land taken in conacre from the overall 90.39 hectare farm, equating to 14% of the productive land.

The landtake would include a large area of the dairy herd's grazing platform and land used for silage. Under the Nitrates Directive, the landtake may have implications for the farm. The landtake impacts would be substantial.

New severance would impact on the farm. Access would be provided to owned land over the Beagh Road. Severance would restrict access to the grazing platform for the dairy herd. The severance impacts would be substantial.

There would be temporary impacts during the construction phase of the Proposed Scheme.

The overall impact of the Proposed Scheme on the farm would be **substantial adverse.**

Proposed Mitigation

Access is provided to severed land via the Beagh Road overbridge.

Predicted Effects	The loss of 14% of the available land and potential implications under the Nitrates Directive, would have a substantial impact on the farms potential output and constitute a substantial adverse effect.

© Mouchel 2016

Land Parcel Ref	192050	**DARD Business Ref**	637156
		Data sources	2010 AIA meeting. No response to 2013 AIA letters and Landowner confirmation meeting. Declined 2014 AIA meeting.

Landowner did not respond to request for 2014 AIA meeting, therefore, 2010 assessment data and 2013 consultation feedback have been used for this assessment. **Size and Quality of Farm** The farm extends to 47.31ha, which is all in grass.	
Type of Enterprise and Husbandry The land is all rented out in conacre.	
Conacre Arrangement	No update on conacre arrangements provided. In 2010 Fields 1-5, 18A, 18B, 19-23, 26-28 are let to an offline conacre tenant and the remainder to a second landowner
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme, although application was made to join the scheme during 2009.
Less Favoured Area Compensatory Allowances Scheme	The land is not eligible under LFACAS, as it is all rented out in conacre.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts Total loss of 5.34 hectares from fields of the 47.31 hectare farm equating to 11.29% of the farm. The landtake impacts would be slight. There would be no severance as a result of the Proposed Scheme.	
Proposed Mitigation	No mitigation would be proposed.
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

© Mouchel 2016

Land Parcel Ref	192025	**DARD Business Ref**	620605
		Data sources	2010 AIA meeting. Landowner confirmation meeting directed to son who farms the land. 2014 phone call undertaken.

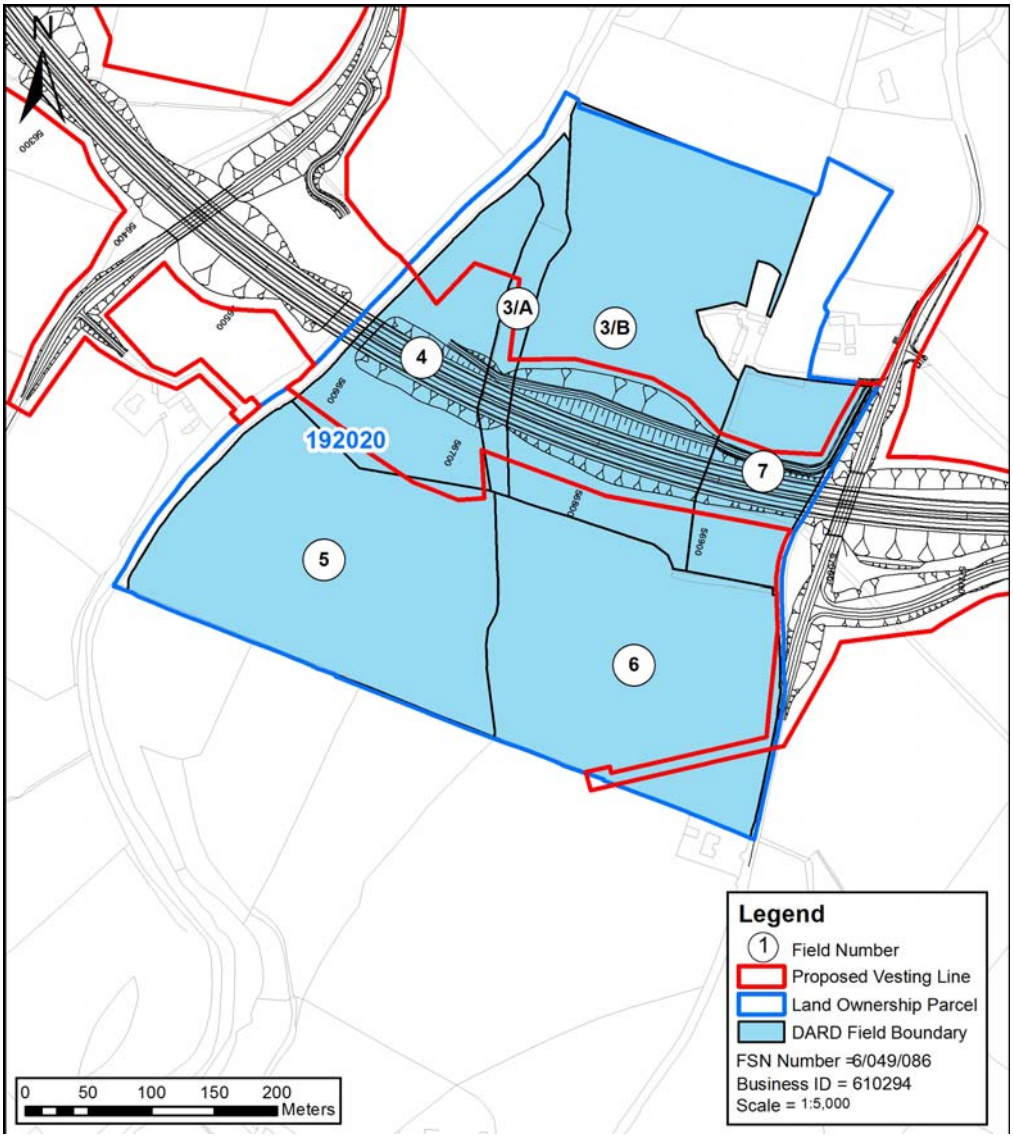
Size and Quality of Farm	
The farm extends to 16.15ha, which is all in grass.	
Type of Enterprise and Husbandry	
The farm runs a herd of 10 suckler cows and 1 bull, with all the progeny being over-wintered and sold as strong stores in the spring. There are approximately 30 cattle on the herd list.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts	
Total loss of 3.76 hectares of the 16.15 hectare farm equating to 23.28% of the productive land. There would be no severance as a result of the Proposed Scheme as impacts will be landtake only.	
Proposed Mitigation	
No mitigation would be proposed.	
Predicted Effects	The loss of 23.28% of the available land would have a substantial impact on the farm and constitute a substantial adverse effect.

© Mouchel 2016

Land Parcel Ref	192020	**DARD Business Ref**	637254
		Data sources	September 2010 meeting. 2013 AIA letter/landowner confirmation meeting feedback identified no change. Minor change to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Let out in conacre to parcel 183020 landowner, Datasheet 021-108		

Land parcel reference, farm map filed surveys and the proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 26.31ha in 2 parcels, with the parcel off Blackfort Road being affected. The farm is all in grass.	
Type of Enterprise and Husbandry	
The affected parcel is all rented out in conacre.	
Conacre Arrangement	The land is all let out in conacre to Parcel 18302 landowner. The impacts on the conacre tenant are outlined in datasheet 021-108.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all rented in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 4.53 hectares of the 26.31 hectare farm equating to 17.22% of the productive land. The landtake required by the Proposed Scheme would total 4.53ha. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

New severance would impact on the farm. Access would be provided to all severed land via Blackfort Road to the east. As the land is currently out in conacre and not farmed by the landowner directly, the severance impacts on the landowner would be slight.

There would be temporary impacts during the construction phase of the Proposed Scheme.

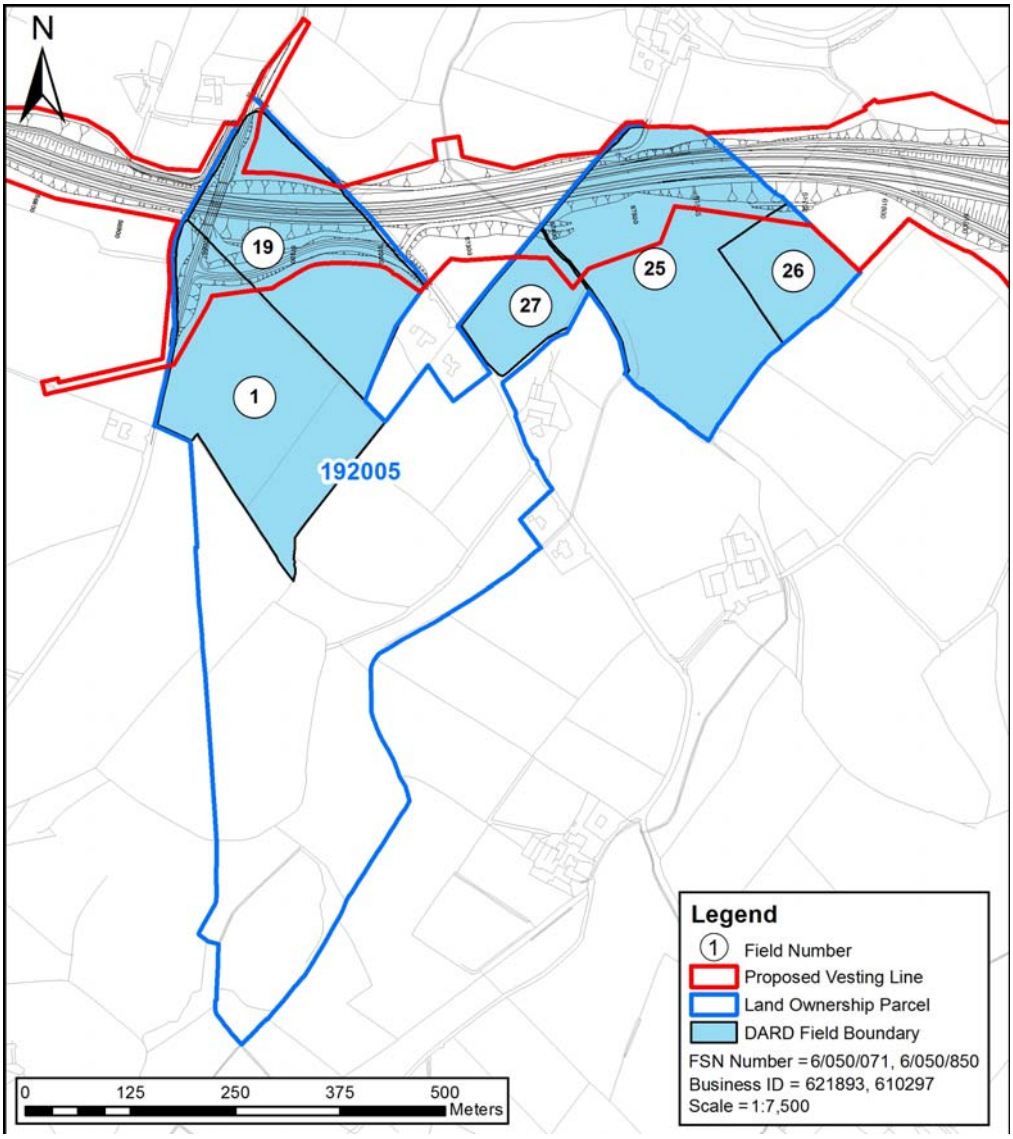
© Mouchel 2016

Proposed Mitigation	
During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	192005	**DARD Business Ref**	621893
		Data sources	2010 AIA meeting. Response to landowner confirmation meeting. November 2014 meeting
Conacre Parcel Ref	Rented conacre unaffected. Field 19 let in conacre to Datasheet 021-234		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 70.08ha of owned land, with a further 28.93ha taken in conacre.	
Type of Enterprise and Husbandry Land is mostly arable in cereals (barley, wheat and oats). Field No 19 is currently rented out in conacre which is affected by the Proposed Scheme. In addition, there are approximately 20 horses on the farm, of which 2 are thoroughbreds, 2 are yearlings, several foals and riding horses, plus 13 -14 in livery. Approximately 18ha of grass is grown for hay/haylage for the horses. Field No 19 is currently in grass, before going back into cereals in the rotation. Field No 25 is currently in spring barley.	
Conacre Arrangement Approximately 28.93ha of land taken in conacre from parcel 192060 which has a negligible landtake from the Proposed Scheme. Field No 19 is currently rented out in conacre. The impacts on this coancre tenant are outlined in datasheet 021-234.	
Single farm payment	The landowner collects the Single Farm Payment on owned land plus the land they rent in conacre.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is all registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is not eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity identified

© Mouchel 2016

Predicted Impacts Total loss of 6.3 hectares from the 70.08 hectare farm equating to 8.99% of the productive land. The land take is considered to be a moderate impact to the farm. New severance will also impact on the farm. Access is provided to the small section of severed land, which will be unusable for agricultural production, via the realigned Blackfort Road. The severance is considered to be a moderate impact to the farm. During the construction phase access to severed land will need to be maintained.
Proposed Mitigation During the construction phase access to severed land will be required.

Predicted Effects	The residual effect of the proposed A5WTC on the farm is a **moderate adverse** impact.

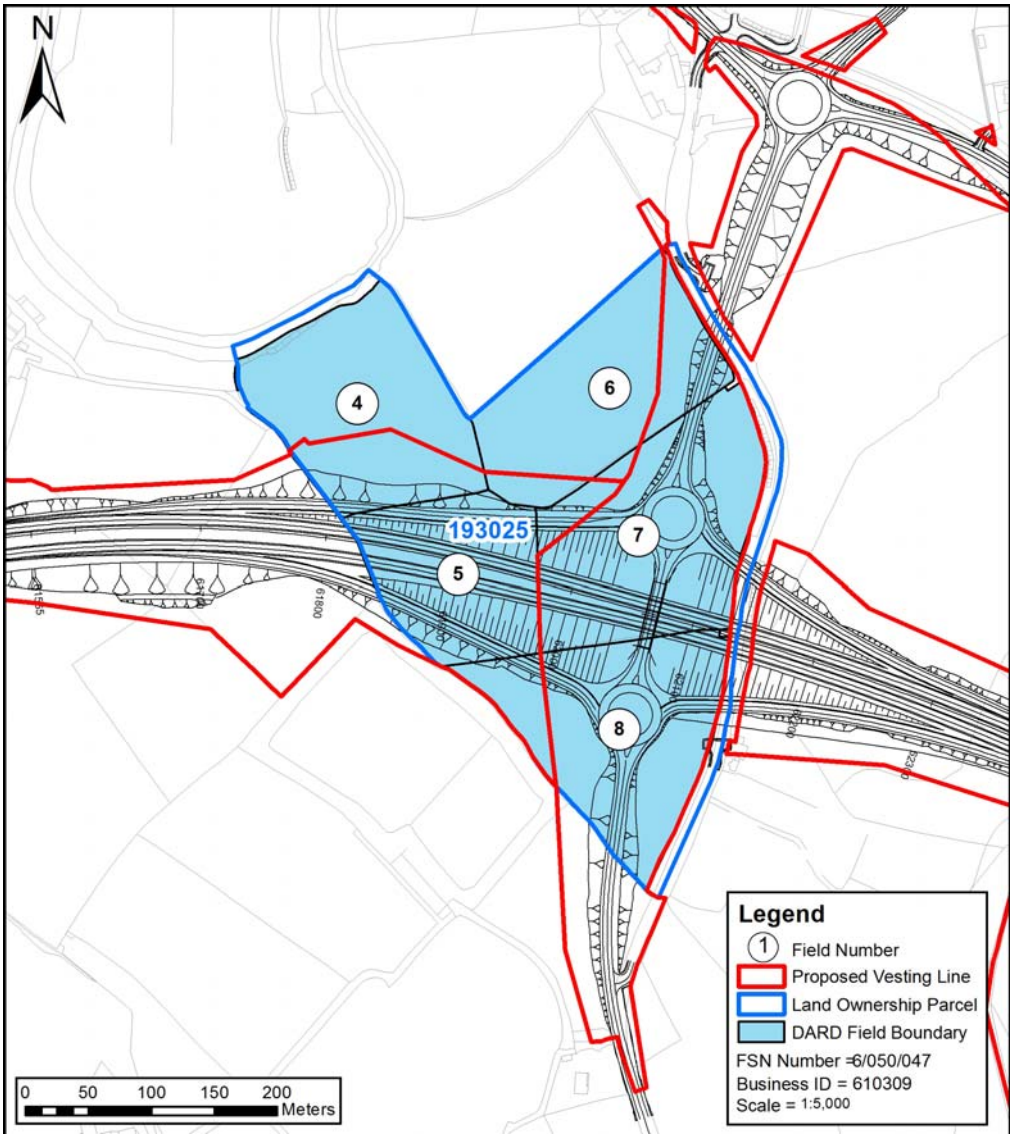
Land Parcel Ref	193025	**DARD Business Ref**	637275
		Data sources	2010 AIA meeting. Landowner confirmation meeting response. Declined 2014 meeting.
Conacre Parcel Ref	Let in conacre to unaffected farm		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
Note: The Landowner was contacted by telephone and refused a meeting to update the AIA. Consequently, the report refers to the situation on the farm, as it was in 2010. The farm extends to 31.49ha of owned land. The farm is all in grass.	
Type of Enterprise and Husbandry	
Let in conacre to unaffected farm	
Conacre Agreement	In 2010 the parcel was let in conacre by 3 farms unaffected by the Proposed Scheme. Meeting with landowner declined and conacre arrangement could not be confirmed. As such there is not sufficient information for conclusions to be made on the impact of the Proposed Scheme on the conacre tenants.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
Total loss of 7.85 hectares of the 31.49 hectare farm equating to 24.85% of the productive land. The land take impacts would be slight on the parcel landowner. New severance would impact on the farm. Access would be provided via the realigned Seskinore Road. The remaining small parcels of land may be difficult to rent out in the future due to their size and access. The severance impacts would be moderate.

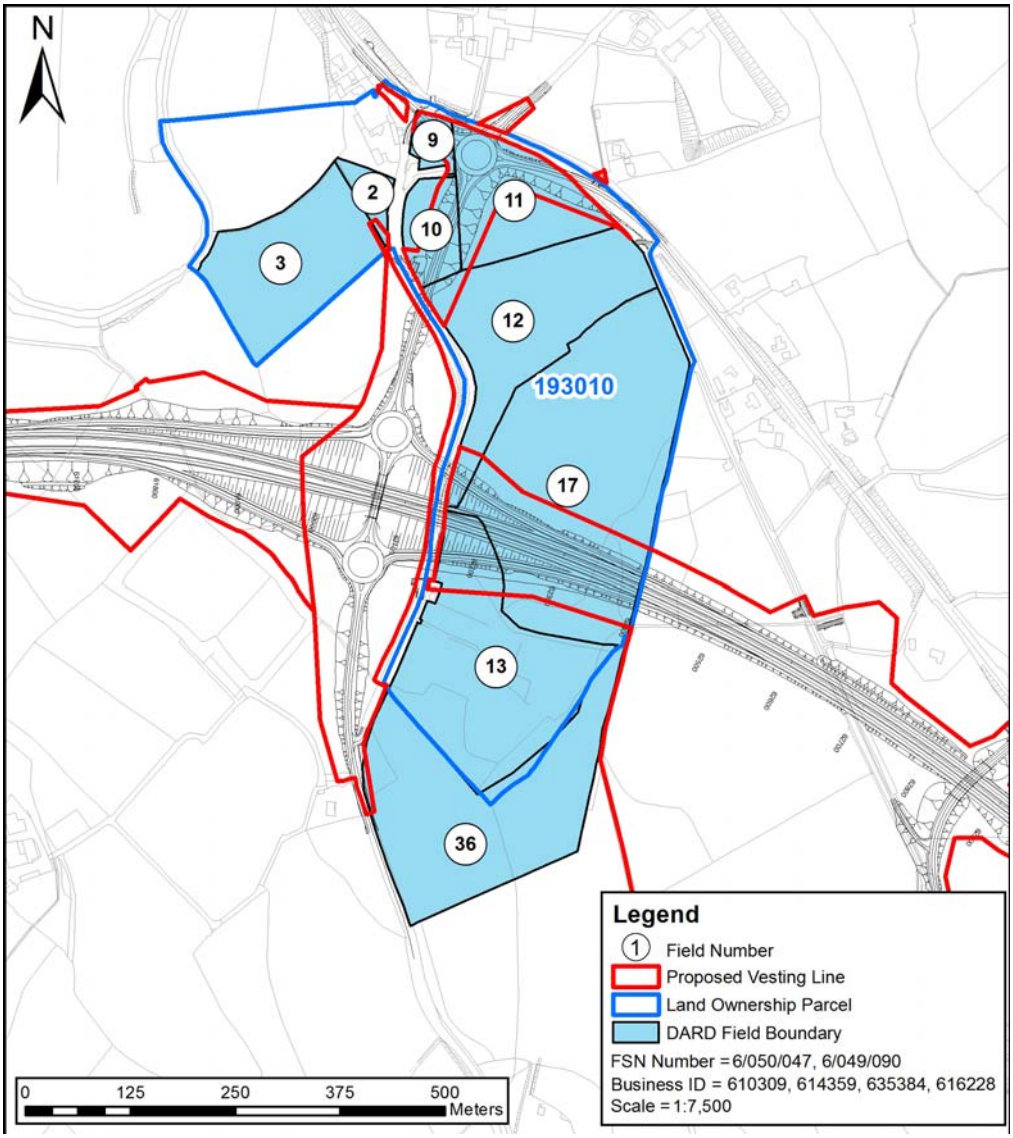
© Mouchel 2016

Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse.**

© Mouchel 2016

Land Parcel Ref	193010	**DARD Business Ref**	633503
		Data sources	September 2010 AIA meeting. Phone call logged on 15th October with landowner, content not to meet - no change to AIA since 2010.
Conacre Parcel Ref	Let in conacre		

Land parcel reference, farm map filed surveys and the proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Phone call logged on 15th October with landowner - happy not to meet - no change to AIA.

Size and Quality of Farm

The farm extends to 23.47ha of owned land, which is all in grass.

Type of Enterprise and Husbandry

Fields Nos 13-17 are farmed by the landowner, being grazed with up to 6 pedigree Charolais cows and calves. There are approximately 12 cattle on the herd list.

The remainder of the farm is rented out in conacre.

Conacre Arrangement	The farm is let in conacre to 2 landowners. A small area of land let to one of the land owners s affected by the Proposed scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Lowland (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 5.22 hectares from fields of the 23.47 hectare farm equating to 22.24% of the productive land. This area is let in conacre with the exception of field 13 and 17 which is farmed by the land owner

This would include land for a junction with Doogary Road (existing A5).

New severance would also impact on the farm. Access would be provided to severed land via the proposed junction. Severance impacts would be slight.

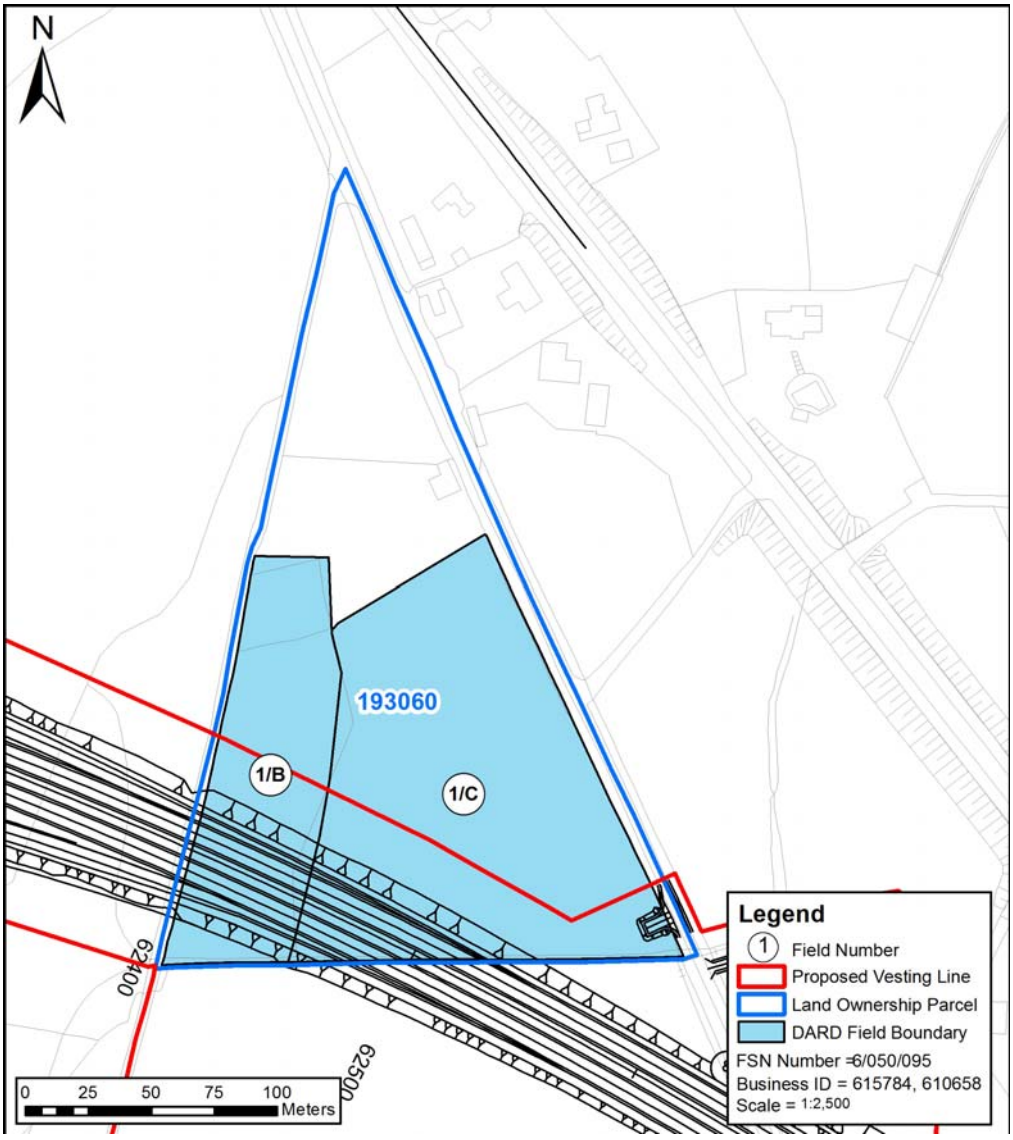
© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land will need to be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm landowner would be **slight adverse.**

© Mouchel 2016

Land Parcel Ref	193060	**DARD Business Ref**	615784
		Data sources	June 2010 meeting. Not farmed in 2014 states in landowner confirmation meeting. Minor changes to the scheme only.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



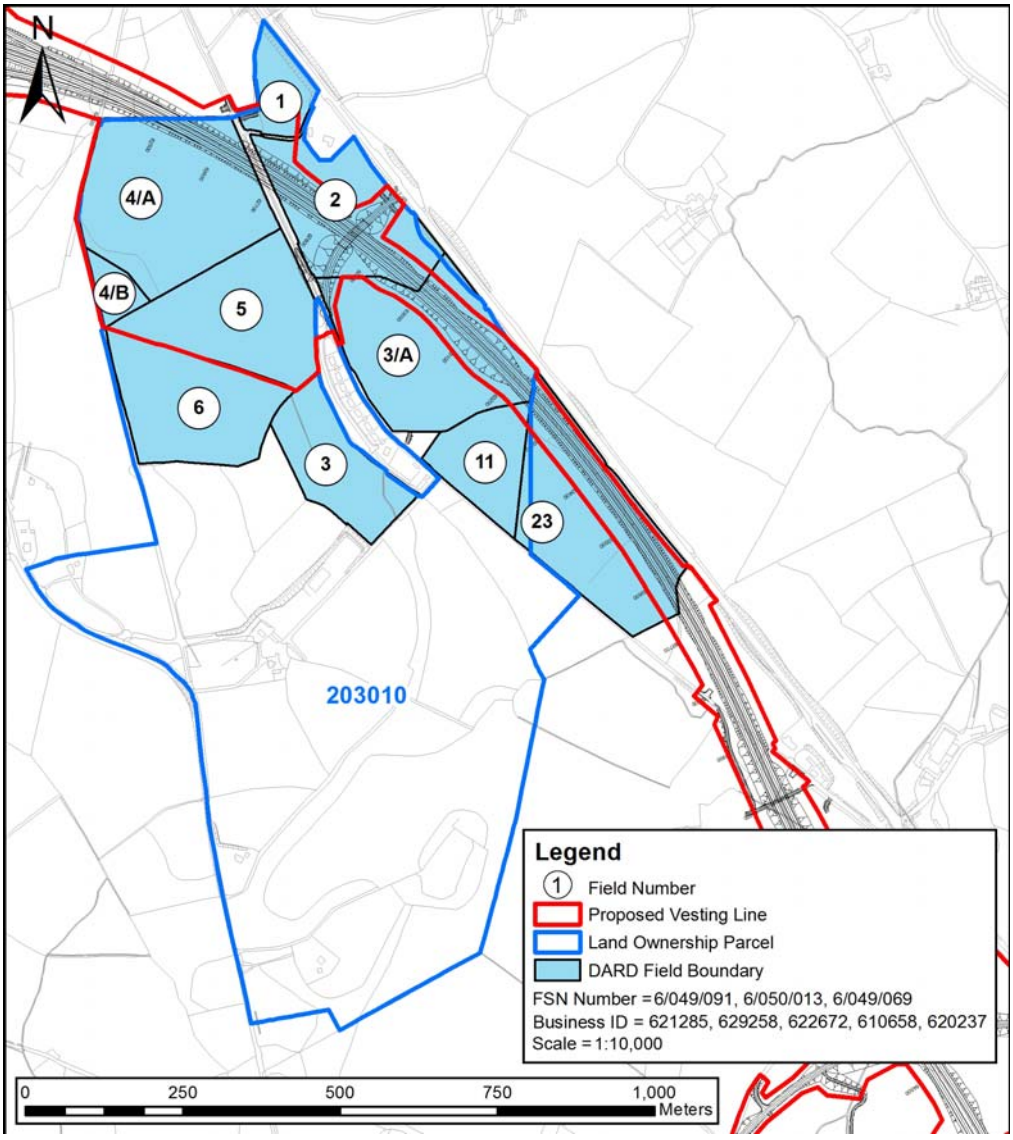
© Mouchel 2016

Size and Quality of Farm The farm extends to 3.07ha of owned land, which includes a small area of woodland, with the remainder being in grass.	
Type of Enterprise and Husbandry The land was unfarmed in 2014. Farm practices likely to restart in the near future. The farm previously ran 5 beef cattle, which were either be sold as strong stores or over-wintered. In addition, there were 2 leisure horses, 2 ewes and 2 lambs on the farm.	
Conacre Agreement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is classified Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts Total loss of 1.04 hectares from fields 1/B and 1/C of the 3.07 hectare farm equating to 33.88% of the productive land. The landtake impacts would be moderate. There would be no severance as a result of the Proposed Scheme.	
Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	203010	**DARD Business Ref**	641436
		Data sources	Responses received for AIA letters and landowner confirmation meeting. November 2014 AIA meeting
Conacre Arrangement	All in conacre. Fields 1, 2, 3A, 11, 23 rented to parcel 258065 landowner, Datasheet 021-138		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 99.8ha. The farm is all in grass, with the exception of some areas of bog-land.	
Type of Enterprise and Husbandry	
The land is all rented out in conacre.	
Conacre Arrangement	The land is all rented out in conacre. Fields 1, 2, 3A, 11, 23 rented to parcel 258065 landowner. Impact on this conacre tenant are outlined in datasheet 021-138. Negotiations are ongoing with a second landowner for fields 4A, 4B and 5. A third conacre tenant takes other unaffected areas.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 17.70 hectares from fields of the 99.80 hectare farm equating to 17.74% of the productive land. This would include land to be used as a deposition area. Due to the land being rented out in conacre the landtake impacts would be slight.

New severance would impact on the farm. Access would be provided to severed land via a new overbridge. The severance impacts would be moderate due to the remaining land being too small to rent out.

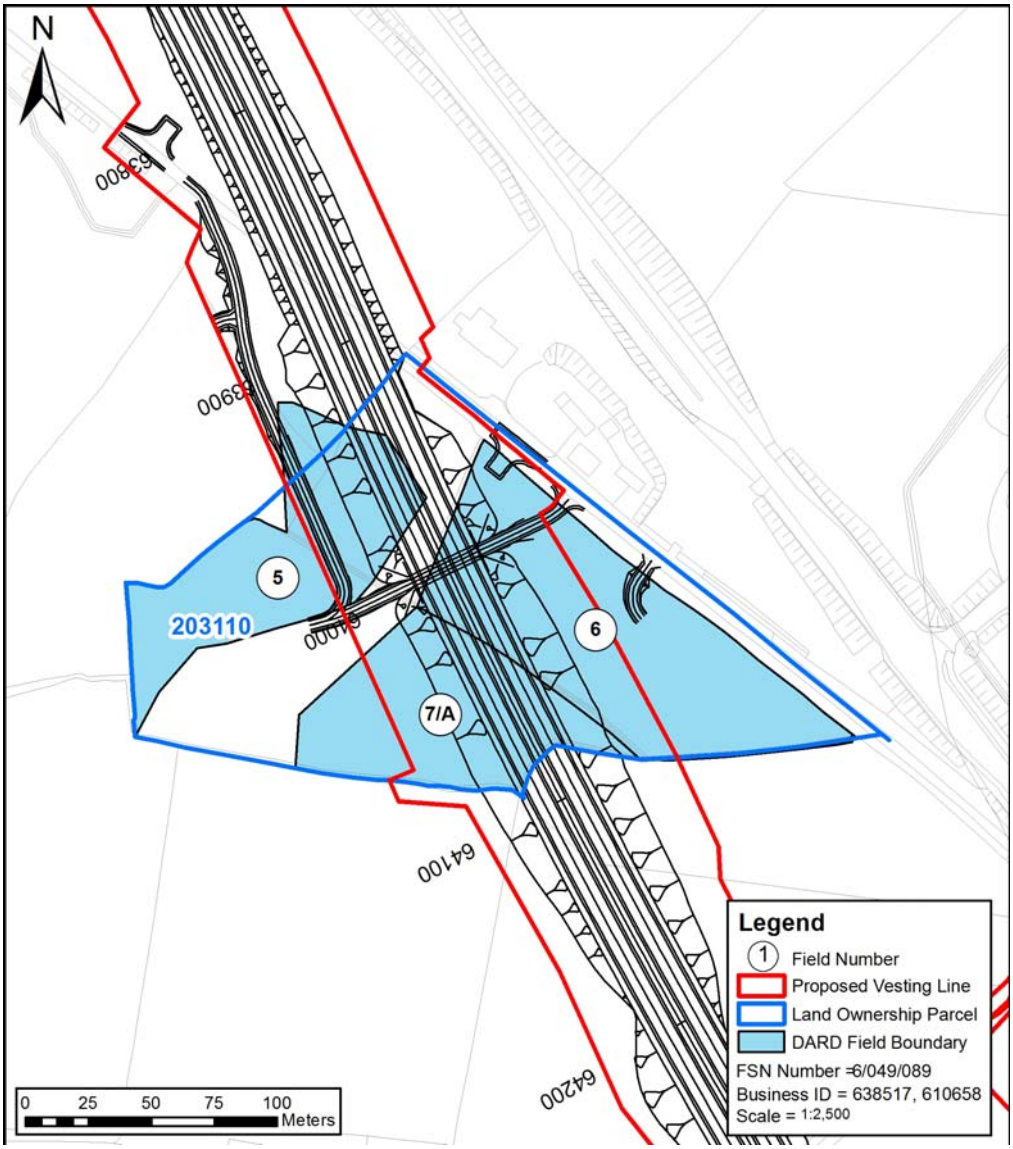
© Mouchel 2016

Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	203110	**DARD Business Ref**	638517
		Data sources	March 2010 AIA meeting. 2013 AIA letter feedback state no change to farm. Minor changes to scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
This is a small farm extending to 6.48ha of owned land. The farm is all in grass.	
Type of Enterprise and Husbandry	
The land is cut for baled silage, which is sold off as a cash-crop, and the after-grass is rented out for grazing. There are no livestock on the farm.	
Conacre Arrangement	N/a
Single Farm Payment	The Single Farm Payment is collected by the landowner.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is classified Low Land (LL), and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

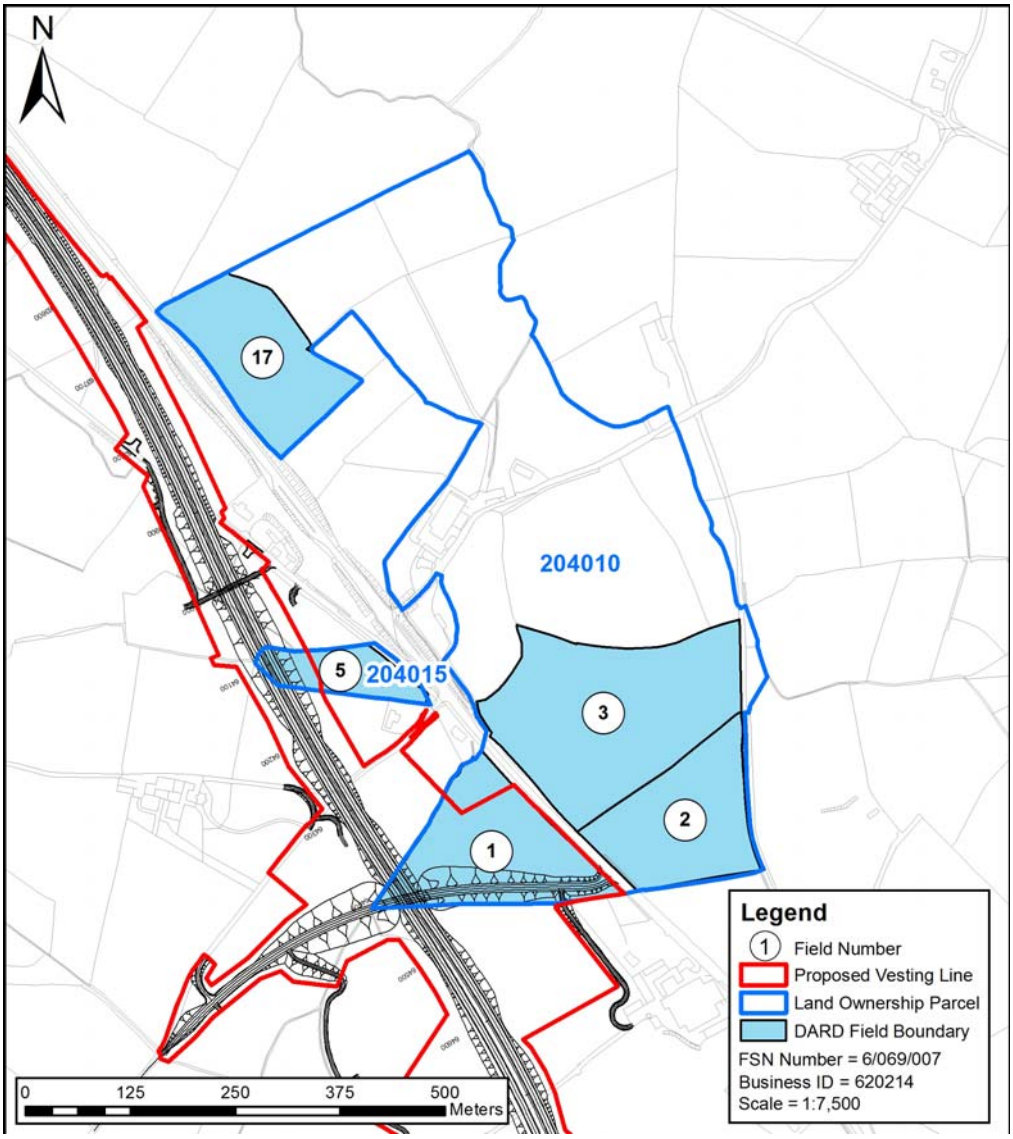
Predicted Impacts	
Total loss of 1.42 hectares from fields 5, 6 and 7/A of the 6.48 hectare farm equating to 21.91% of the productive land. The landtake impacts would be moderate. New severance would impact on the farm by cutting off a small corner of the farming land in field 6. Access would be provided via a farm lane and the realigned Drumconelly Road. The severance impacts would be moderate.	
Proposed Mitigation	
During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

© Mouchel 2016

Land Parcel Ref	204010, 204015	**DARD Business Ref**	610658
		Data sources	2010 AIA meeting. Landowner confirmation meeting held. October 2014 meeting
Conacre Parcel Ref	-		

Land parcel reference, farm map filed surveys and the proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to approximately 132.34ha, of which 43.04 ha is owned land, with the remaining 89.3ha being rented in conacre from 4 landowners. The farm is all in grass.	
Type of Enterprise and Husbandry The farm runs a herd of 150 pedigree Holsteins, with a herd average of 8,300 litres. In addition, there are approximately 100 young stock being reared as herd replacements. Bull calves are normally sold as dropped calves. There are approximately 250-300 cattle on the herd list.	
Conacre Arrangement	Approximately 89.3ha is rented in conacre from 4 landowners.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land and from once conacre parcel.
Nitrates Directive	The landowner is currently close to the upper limit of 170kg of organic nitrogen per ha and any loss of land to the road scheme is likely to have implications under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	This being a dairy farm, the land does not qualify for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

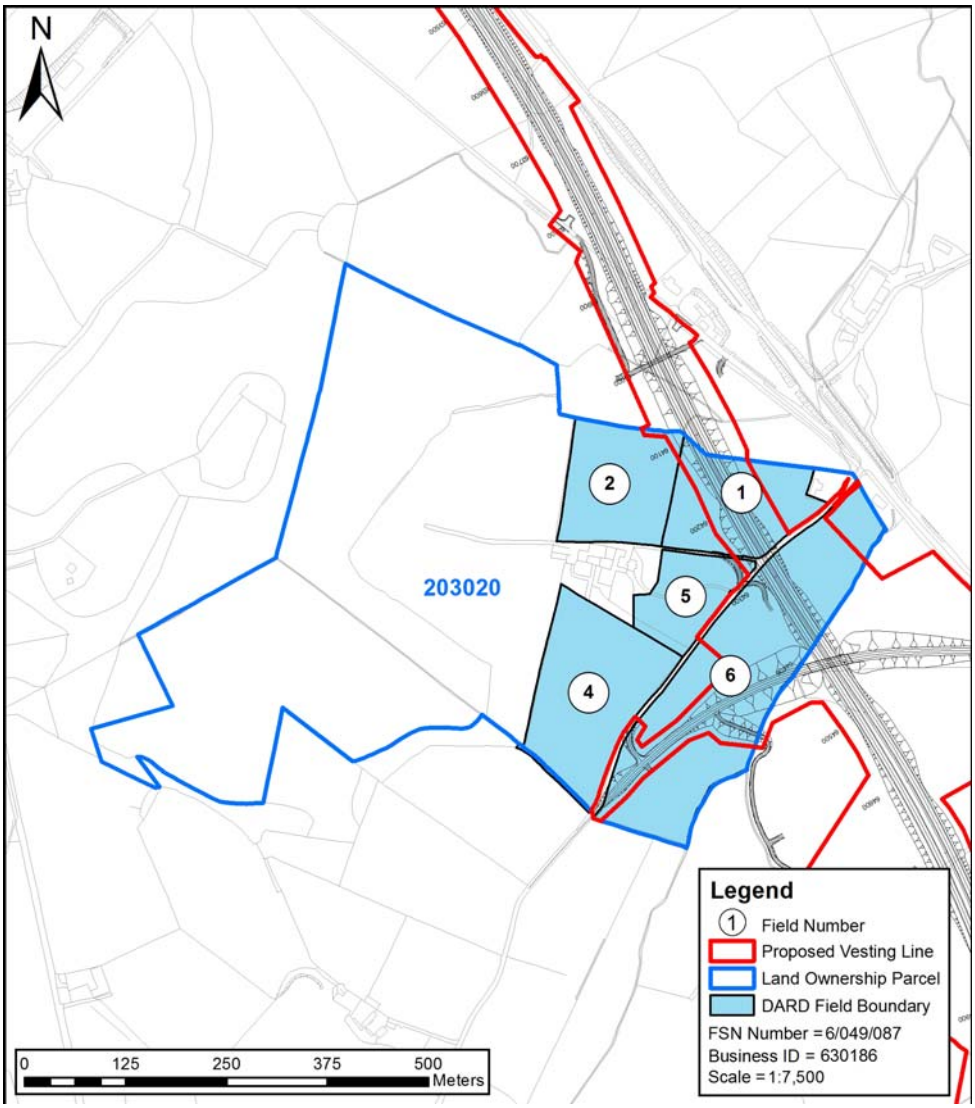
© Mouchel 2016

Predicted Impacts Total loss of 2.54 hectares from fields of the 132.34 hectare farm equating to 1.92% of the productive land. This would include land for the realigned Drumconnelly Road. The small remaining areas of land in field Nos 1 and 5 would be of an impractical size for farming. The landtake impacts would be moderate. There would be no severance as a result of the Proposed Scheme.
Proposed Mitigation The mitigation measures proposed are considered to be adequate.
Predicted Effects The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	203020	**DARD Business Ref**	Not available
		Data sources	September 2010 AIA meeting. 2013 AIA letters not returned, Landowner confirmation meeting declined. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map filed surveys and the proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to approximately 20ha of owned land, which is all in grass.	
Type of Enterprise and Husbandry	
During 2010, whole crop wheat was grown as a cash-crop, with the land being ploughed and re-seeded into grass.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	There are no stock on the land and it is therefore not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 4.84 hectares from fields of the 20 hectare farm equating to 24.2% of the productive land. This would include land for the proposed road and realigned Drumconnelly Road. The landtake impacts would be moderate.

New severance would affect the farm. Access would be provided via the realigned Drumconnelly Road. The severance impacts would be moderate as the landowner would be left with small parcels of land not practical for agricultural production.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

During the construction phase access to severed land would be maintained.

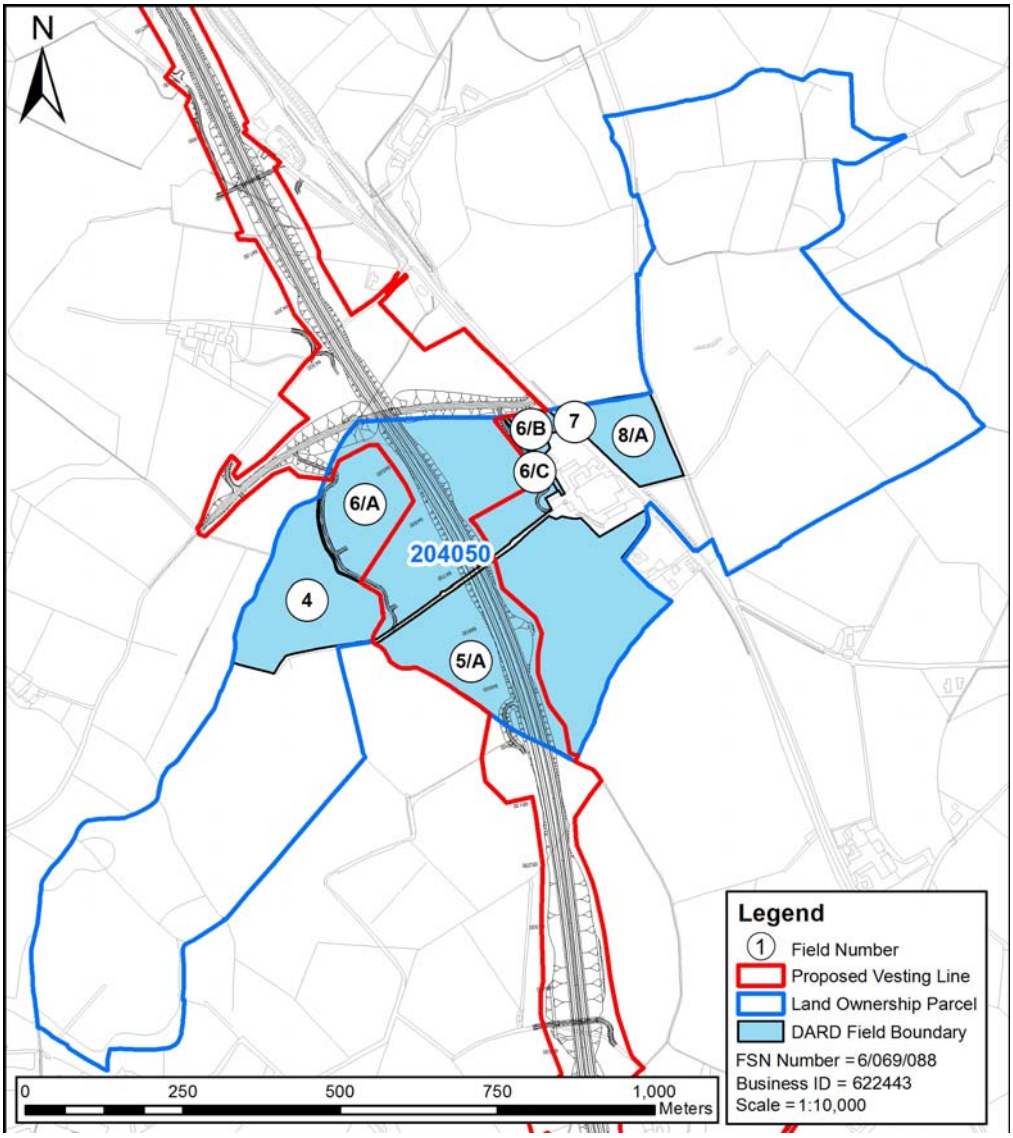
© Mouchel 2016

Residual Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	204050	**DARD Business Ref**	622443
		Data sources	2010 AIA meeting. Landowner confirmation meeting requested AIA review. Declined 2014 AIA Meeting
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map filed surveys and the proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Landowner refused 2014 meeting. Baseline information based on 2010 assessment.

Size and Quality of Farm

The farm extends to 105.55ha, of which 65.31ha is owned land. The remaining land is taken in conacre from 2 different landowners who are not affected by the proposed scheme.

The farm is all in grass or cereals.

Type of Enterprise and Husbandry

Part of farm is rented out in conacre, however this area is not affected by the Proposed Scheme. The remainder of the land grows cereals, to be ensiled as whole crop wheat, which is sold as a cash crop.

Conacre Arrangement	Approx. 40.24ha of land is rented in conacre from 2 landowners. This land is not affected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, and also on conacre land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Lowland (LL) and is not eligible for payments under LFACAS.
Biosecurity	As there are no livestock on the farm, there are no issues of biosecurity to be addressed.

© Mouchel 2016

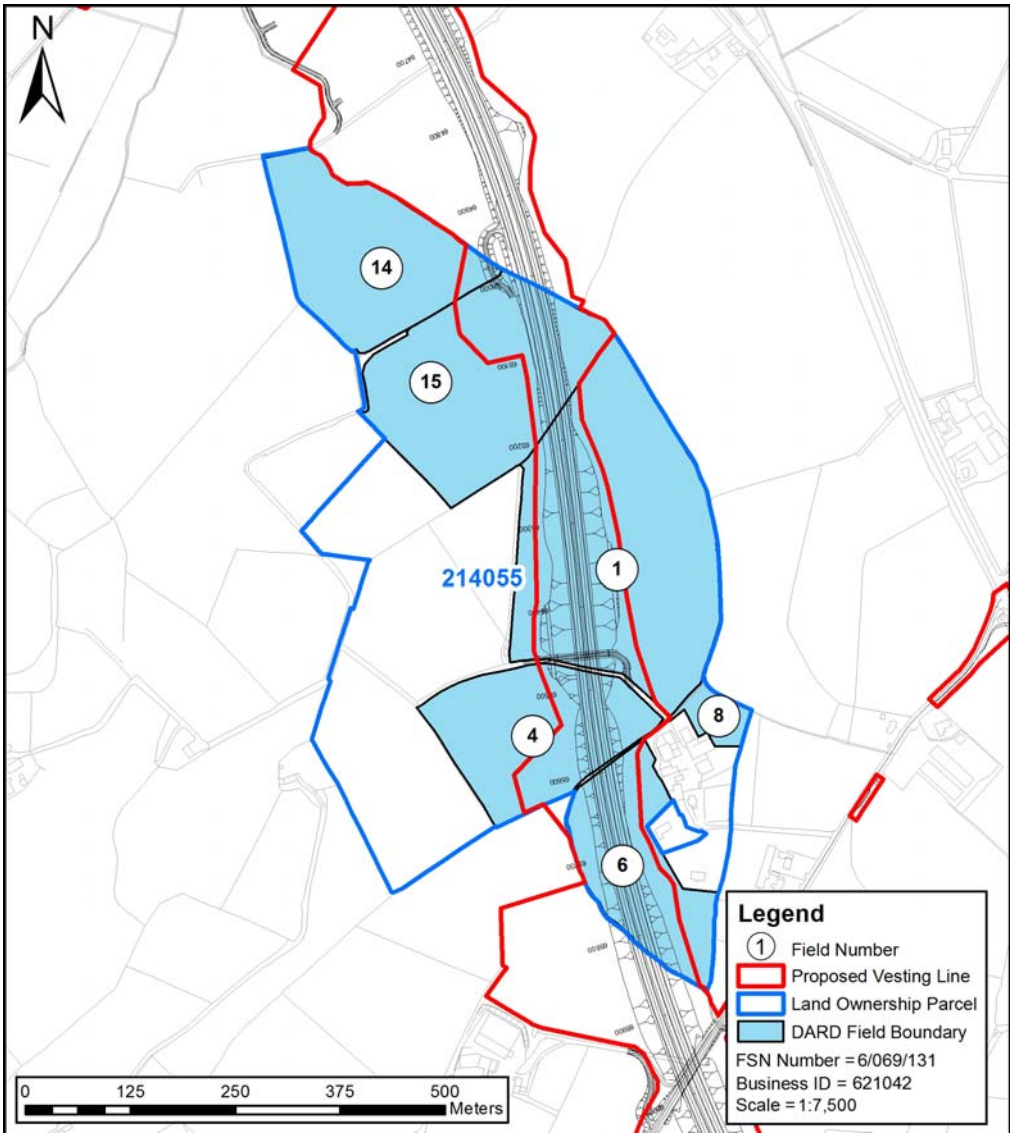
Predicted Impacts Total loss of 9.78 hectares from the 105.55 hectare farm equating to 9.27% of the productive land. This would include land for a deposition area. The landtake impacts would be moderate. New severance would impact on the farm. Access would be provided to severed land via the realigned Drumconnelly Road. The severance impacts would be moderate. The borehole which supplies the farm will be lost to the proposed scheme. There would be temporary impacts during the construction phase of the Proposed Scheme.
Proposed Mitigation During the construction phase access to severed land would be provided.

Residual Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	214055	**DARD Business Ref**	621042
		Data sources	March 2010 AIA meeting. Land confirmation meeting stated no change. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Part of land let in conacre to parcel 214040, Datasheet 021-122.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 32ha of owned land. Field Nos. 1, 2, & 3, 5A & 5B are rented out in conacre, with the remainder being farmed by the landowner. Field Nos 9A, 9B, 10 – 13, and 19 (not shown on the map) are owned by a family relative. Not all fields are labelled on the plan above.	
Type of Enterprise and Husbandry This is a beef farm which buys in approximately 50 store cattle 200-250kg live-weight, for grazing, selling them as heavy stores or as beef. The farm also runs a sheep flock of 50 ewes and 2 rams, with approximately 80 lambs being carried through to finish. A shed in the farmyard houses approximately 180 finishing pigs, which are owned another farmer, with the landowner providing management. As part of this arrangement the landowner must also dispose of the pig slurry produced.	
Conacre Arrangement	Field Nos. 1, 2, & 3, 5A & 5B are let out in conacre to parcel 214040. Impact on this conacre tenant are outlined in Datasheet 021-122. The remainder being farmed by the landowner.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all registered Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts Total loss of 8.68 hectares from fields 1, 4, 6 and 15 of the 32 hectare farm equating to 27.13% of the productive land. Field 1 is rented out in conacre, with the remaining affected fields farmed by the landowner. The landtake impacts would be substantial. New severance would impact the farm. Access to severed land would be provided between field 4 and field 1 by an overbridge. The severance impacts would be slight. There would be temporary impacts during the construction phase of the Proposed Scheme.
Proposed Mitigation During the construction phase access to severed land would be maintained.

Predicted Effects	The loss of 27.13% of the available land and severance would have a substantial impact on the farm and constitute a substantial adverse effect.

© Mouchel 2016

Land Parcel Ref	214040	**DARD Business Ref**	629717
		Data sources	June 2010 AIA meeting. No response to 2013 AIA letter. Declined 2014 meetings. Minor change to the scheme only.

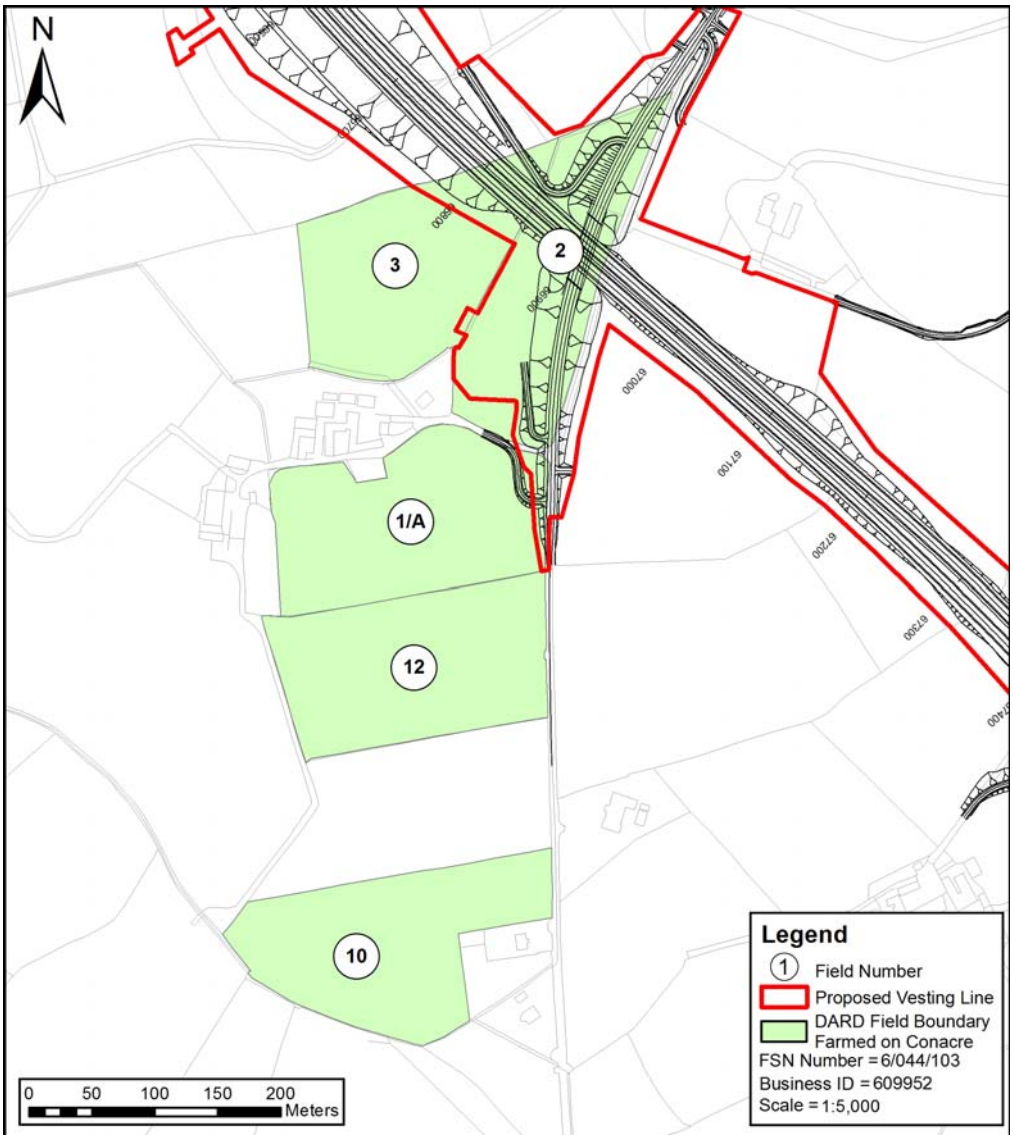
© Mouchel 2016



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 122.42ha, of which 26.68ha is owned land. The remaining land is being taken in conacre from 7 different landowners, 4 of which are affected by the scheme. With the exception of a small area of kale, which is grown in a rotation in order to out-winter cattle, the farm is all in grass.	
Type of Enterprise and Husbandry	
The farm runs a large dairy herd of 230 cows with a herd average of 6,500 litres. The herd in maintained on a high forage/grazing and low-input system of approximately 800kg of concentrate, with the emphasis being on grazed grass. In addition, the farm rears approximately 200 heifers, as herd replacements. There are 5 or 6 bulls on the farm, with all bull calves being sold as dropped calves. There are approximately 420 cattle on the herd list. The landowner is concerned about access for the dairy herd to and from grazing land during the grazing season. At present the farmer uses cow lanes to connect the home farm and grazing land including to field 8. Daily access to the farmyard must also be maintained for milk-collection and also for dairy concentrate deliveries, both of which normally use articulated vehicles.	
Conacre Arrangement	95.74ha of land is rented in conacre from 7 different landowners, 3 of which are affected by the scheme. Includes parcels 214055 (Datasheet 021-121), 224035 (Datasheet 021-124), 235080, 236030 (Datasheet 021-225)
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, but not on conacre land.
Nitrates Directive	Given the high stocking rates on the farm, any land-take from the farm, including conacre land, may have implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	This is a diary farm and is not eligible for payments under LFACAS.

© Mouchel 2016

Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 4.15 hectares of the 26.68 hectare farm equating to 15.6% of the owned land. Additionally some areas of the 95.74ha of conacre is affected.

Under the Nitrates Directive, the landtake may have implications for the farm. The landtake impacts would be substantial.

New severance would impact upon the farm. Access would be provided to severed land via Tullyrush Road. The severance impacts would be substantial.

There would be temporary impacts during the construction phase of the Proposed Scheme, as access to severed land on the opposite side of the Tullyrush Road may be compromised.

Proposed Mitigation

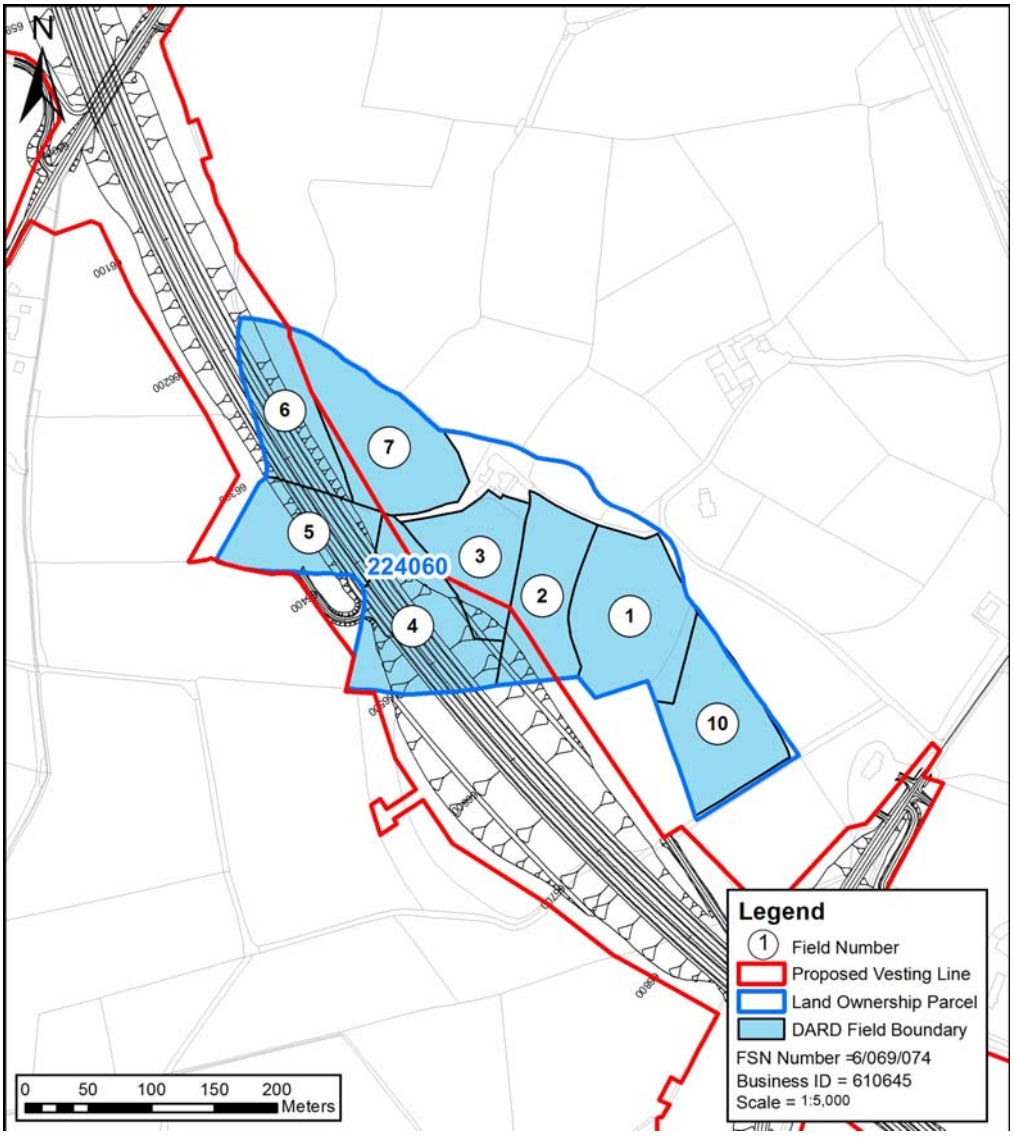
During the construction phase access to severed land would be maintained.

Predicted Effects	The overall impact of the Proposed Scheme on the farm is considered to be **substantial adverse.**

© Mouchel 2016

Land Parcel Ref	224060	**DARD Business Ref**	644425
		Data sources	June 2010 AIA meeting. Land confirmation meeting feedback stated no change in the farm. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Let out in conacre offline landowner, Datasheet 012-238.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 6.23ha of owned land. The land is all in grass, with the exception of an area of rough ground to the south-east of Field No 1, which is rough ground/scrub.	
Type of Enterprise and Husbandry The land is let out in conacre to landowner.	
Conacre Arrangement	Land is let out in conacre offline landowner. Impacts on the conacre tenant are outlined in datasheet 021-238.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all rented out in conacre land is not eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.
Predicted Impacts Total loss of 2.79 hectares from fields of the 6.23 hectare farm equating to 44.70% of the productive land. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight. There would be no severance as a result of the Proposed Scheme.	
Proposed Mitigation	No mitigation would be proposed.

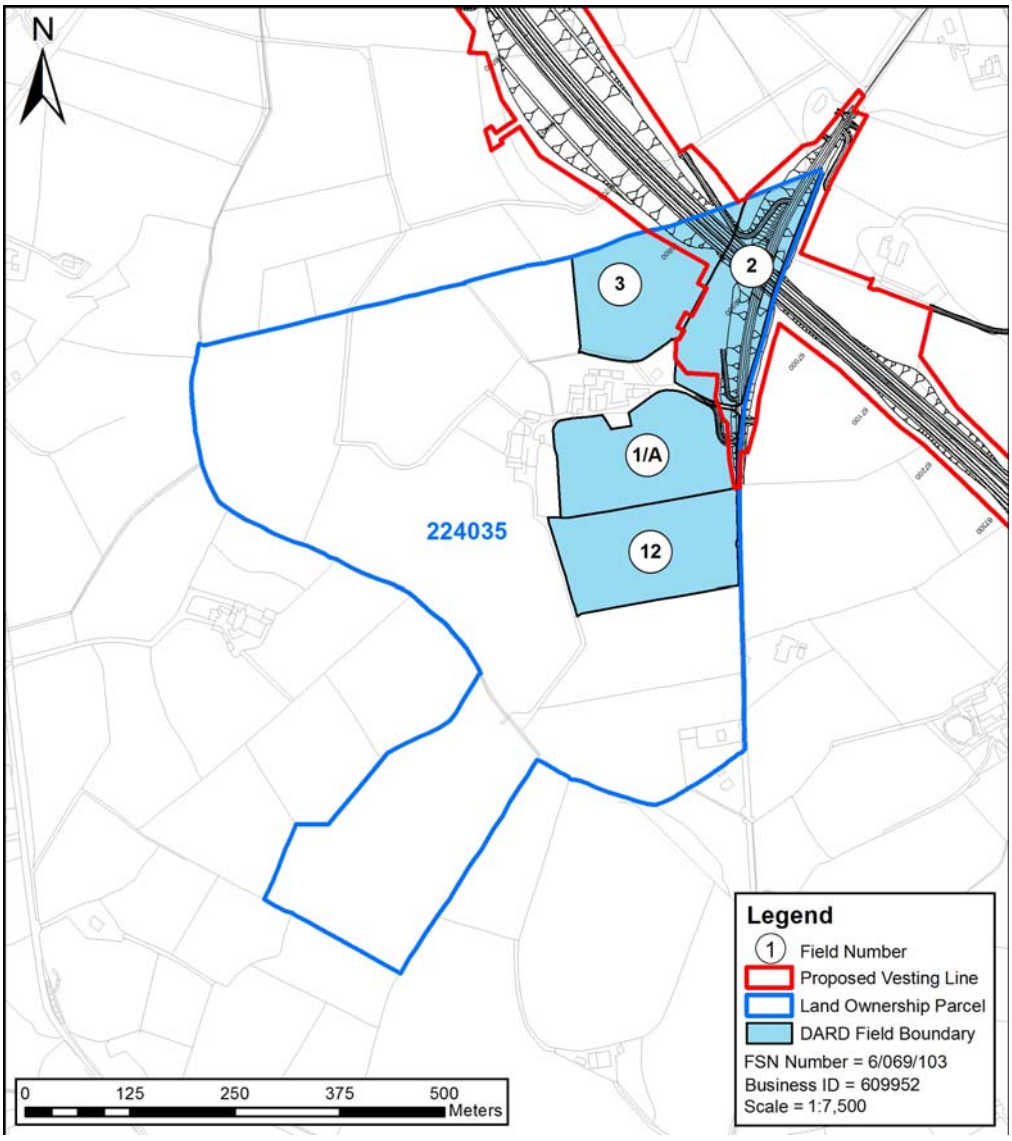
© Mouchel 2016

Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	224035	**DARD Business Ref**	609952
		Data sources	May 2010 AIA meeting. No response to 2013 AIA letters. Landowner confirmation meeting held. Declined 2014 AIA meeting.
Conacre Parcel Ref	Affected conacre let to Parcel 214040 landowner, Datasheet 021-122, field 1/A		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm is run as a Partnership and extends to 39.54ha of owned land, which is all in grass, with the exception of Field 3 which is used for growing kale.

Type of Enterprise and Husbandry

The farm runs a heifer rearing enterprise, rearing heifers under contract. At present there are over 80 heifers on the farm which are reared from 200kg live-weight to 20 months of age.

In addition the farm runs 50 ewes and 1 ram, producing approximately 80 lambs, which are carried through to finish.

Pig houses let to offline tenant. Facilities are unaffected by the proposed scheme.

Conacre Arrangement	Affected land let in conacre to Parcel 214040 landowner. The impacts on the conacre tenant are outlined in datasheet 021-122.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not currently registered under the Countryside Management Scheme, but application has been made to join the Scheme launched in 2009.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 2.71 hectares from fields of the 39.54 hectare farm equating to 6.85% of the productive land. The land take impact would be moderate to the farm due to loss of Field Nos 2 and 3 which are both good quality agricultural land.

There would be no severance as a result of the Proposed Scheme.

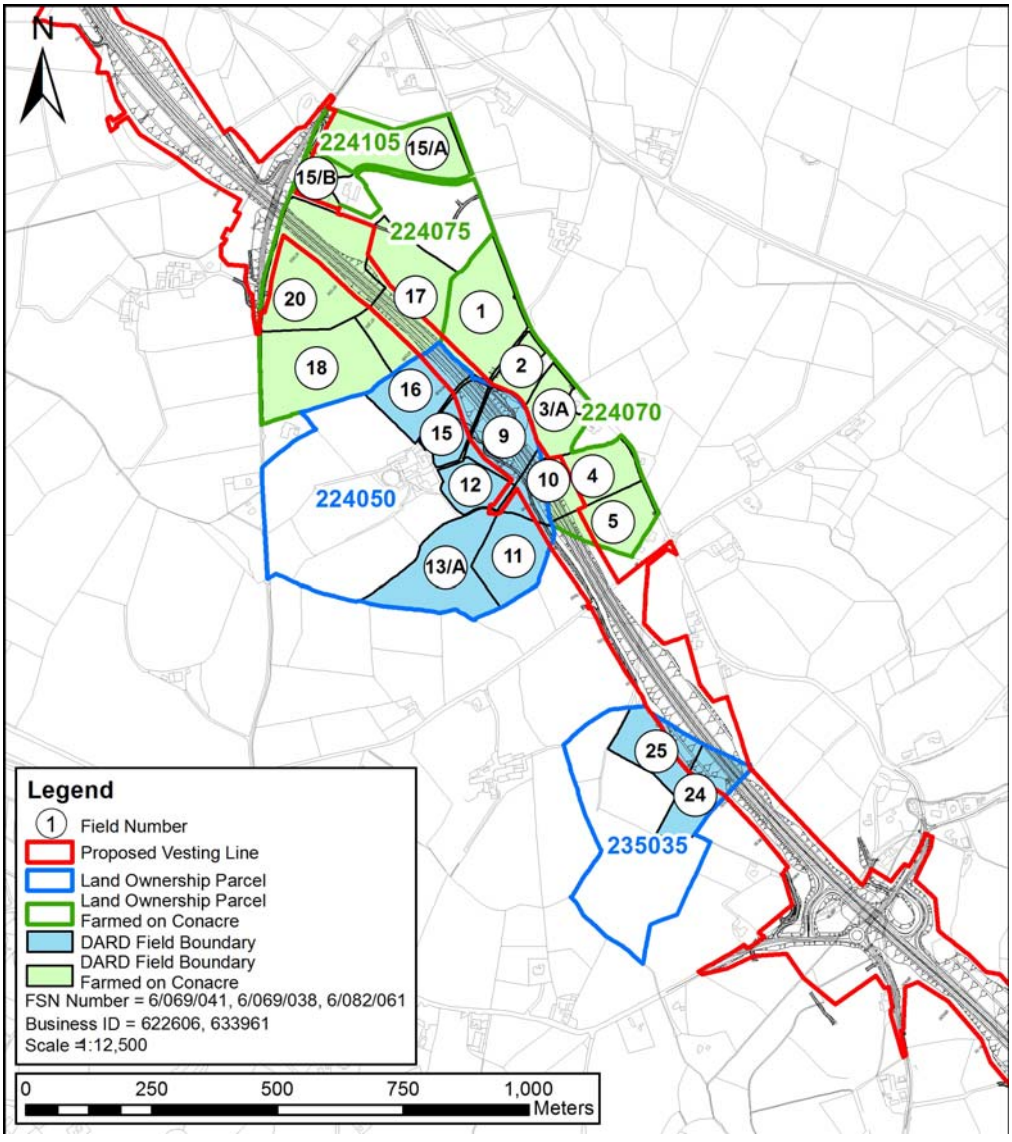
© Mouchel 2016

Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	224050, 235035	**DARD Business Ref**	622606
		Data sources	March 2010 AIA meeting. No response to 2013 AIA letters. Declined landowner confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Conacre rented from Parcels 224105, 224015, 224075, 224070.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 78.35ha, with 44.83ha of owned land. The remaining land is taken in conacre which is affected by the proposed scheme. The farm is all in grass.	
Type of Enterprise and Husbandry The farm runs a diary herd of 100 cows, plus a further 60 young stock, with all calves being reared. Housing for diary herd is in the yard at 15 Augher Point Road, with the grazing land surrounding the yard (field Nos. 9-22 – not all marked on plan above). The yard at 10 Augher Point Road, surrounded by field Nos. 1-8 is utilized mainly for dry stock and beef cattle. The farm is all in grass (grazing or silage). Silage (2 cuts) is normally taken from various land around the farm.	
Conacre Arrangement	33.52ha rented in conacre. Affected conacre rented from Parcels 224105, 224015, 224075, 224070.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, and also on some conacre land.
Nitrates Directive	The farm is currently registering 165kg organic nitrogen per ha, which is close to the upper limit of 170kg per ha.
Countryside Management Scheme	Owned land is registered under the Countryside Management Scheme, but not conacre land.
Less Favoured Area Compensatory Allowances Scheme	The land is all registered Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

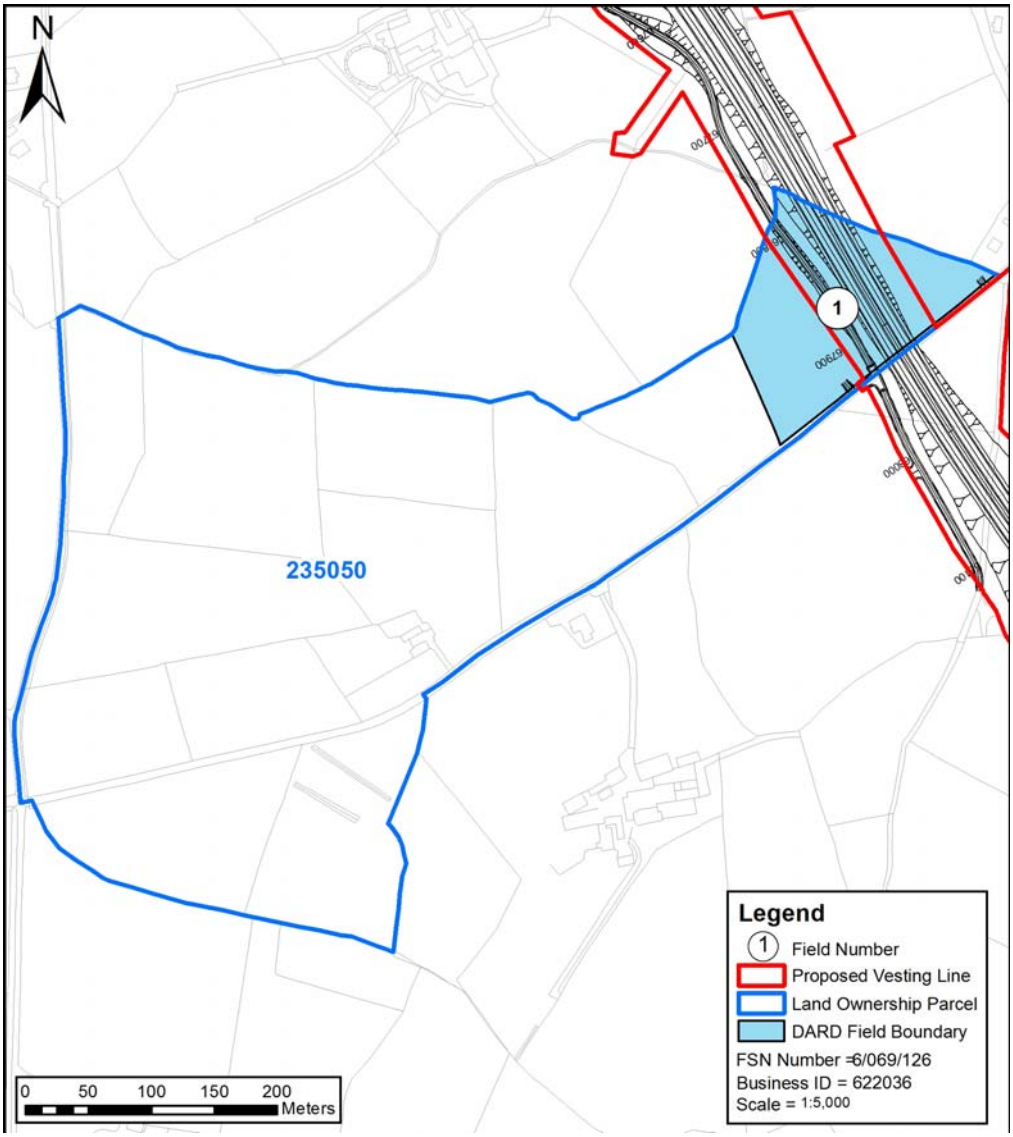
Predicted Impacts Total loss of 4.39 hectares of owned land and 4.94 ha of land taken in conacre. From the total farm area of 78.35 hectares, this equates to 11.9% of the productive land. Under the Nitrates Directive, landtake may have implications for this farm. The landtake will be from the dairy herds grazing platform. The landtake impact would be substantial. New severance between land parcels 224050 and 224055 would impact upon the farm. Due the construction of an overpass severance would be slight.
Proposed Mitigation No mitigation would be proposed.

Predicted Effects	The loss of 11.9% of the available land and severance would have a substantial impact on the farms potential output and constitute a substantial adverse effect.

© Mouchel 2016

Land Parcel Ref	235050	**DARD Business Ref**	611140
		Data sources	September 2010 AIA meeting. 2013 AIA letters not returned. Declined landowner confirmation meeting. Minor changes to the scheme only, therefore no 2014 AIA revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map filed surveys and the proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 53.39ha of owned land in 3 parcels, with the home farm and farmyard being situated on approximately 6 miles away. The farm is all in grass.	
Type of Enterprise and Husbandry The farm runs a herd of 12 suckler cows, with all the progeny being carried through to finish. In addition the farm buys in store cattle (350kg live-weight) and carries them through to finish. There are approximately 120 cattle on the herd list. A flock of 70 – 80 ewes and 3 rams produce approximately 120 lambs, which are carried through to finish. Given the distance of the out-farm from the home farm, the land is grazed rather than cut for silage.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Two parcels of land on the farm are classified Disadvantaged Area (DA) and are eligible for payments under LFACAS, while the third parcel of land (FSN6/069/126), is classified Lowland (LL), and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

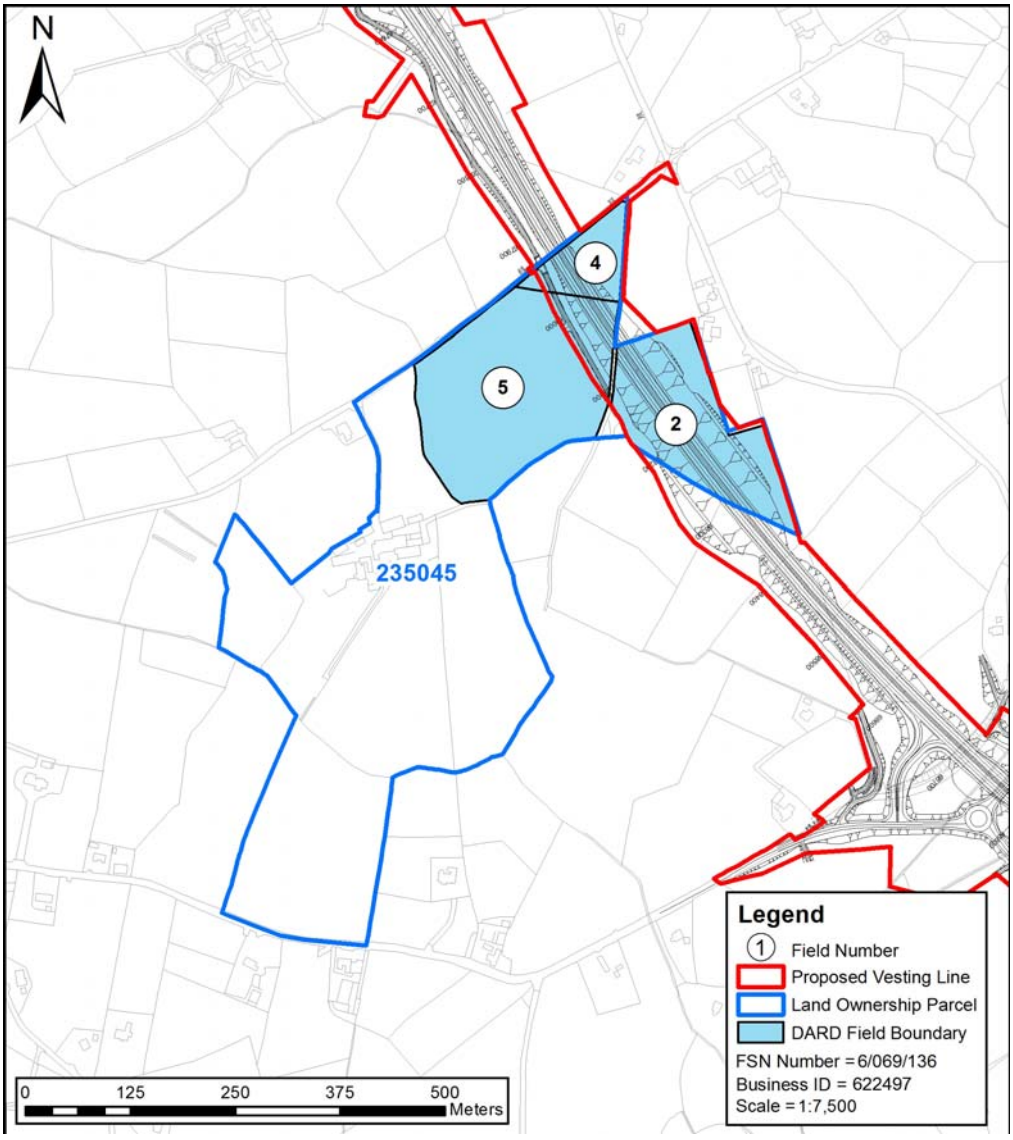
© Mouchel 2016

Predicted Impacts Total loss of 1.02 hectares from field 1 of the 53.39 hectare farm equating to 1.91% of the productive land. This would include land for the proposed alignment and a shared farm lane. The land take impacts would be slight. The closing of Drumconnolly Road would result in an increase in travel time between the home farm to this land. Severance impacts would be slight.	
Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	235045	**DARD Business Ref**	622497
		Data sources	2010 meeting. Landowner confirmation meeting held. Did not accept 2014 meeting request
Conacre Parcel Ref	Exact location of conacre unknown.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Landowner did not reply to meeting invitation in 2014 therefore information is based on 2010 data and 2013 consultation response.

Size and Quality of Farm

The farm extends to 63.42ha, of which 23.97ha is owned land, with the remainder being taken in conacre. The landowner also farms mothers holding (not affected by the proposed scheme).

The land is all in grass.

Type of Enterprise and Husbandry

The farm runs a herd of 70 dairy cows with a herd average of 6,000 litres. All herd replacements are bought in.

In addition, the farm runs a herd of 10 suckler cows and a bull, with all progeny being carried through and sold as strong stores.

Access will be required to severed land along the laneway running between Field Nos 3/4 and 2/5. This laneway is also a right-of-way providing access for a landowner to other land.

Conacre Arrangement	Approximately 39.45 of land is rented in conacre. Conacre taken in Tattyreagh, exact location unknown. Field 15 let in conacre from parcel 330070. Impacts on the 33070 landowner are outlined on datasheet 021-195.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Low Land (LL), and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

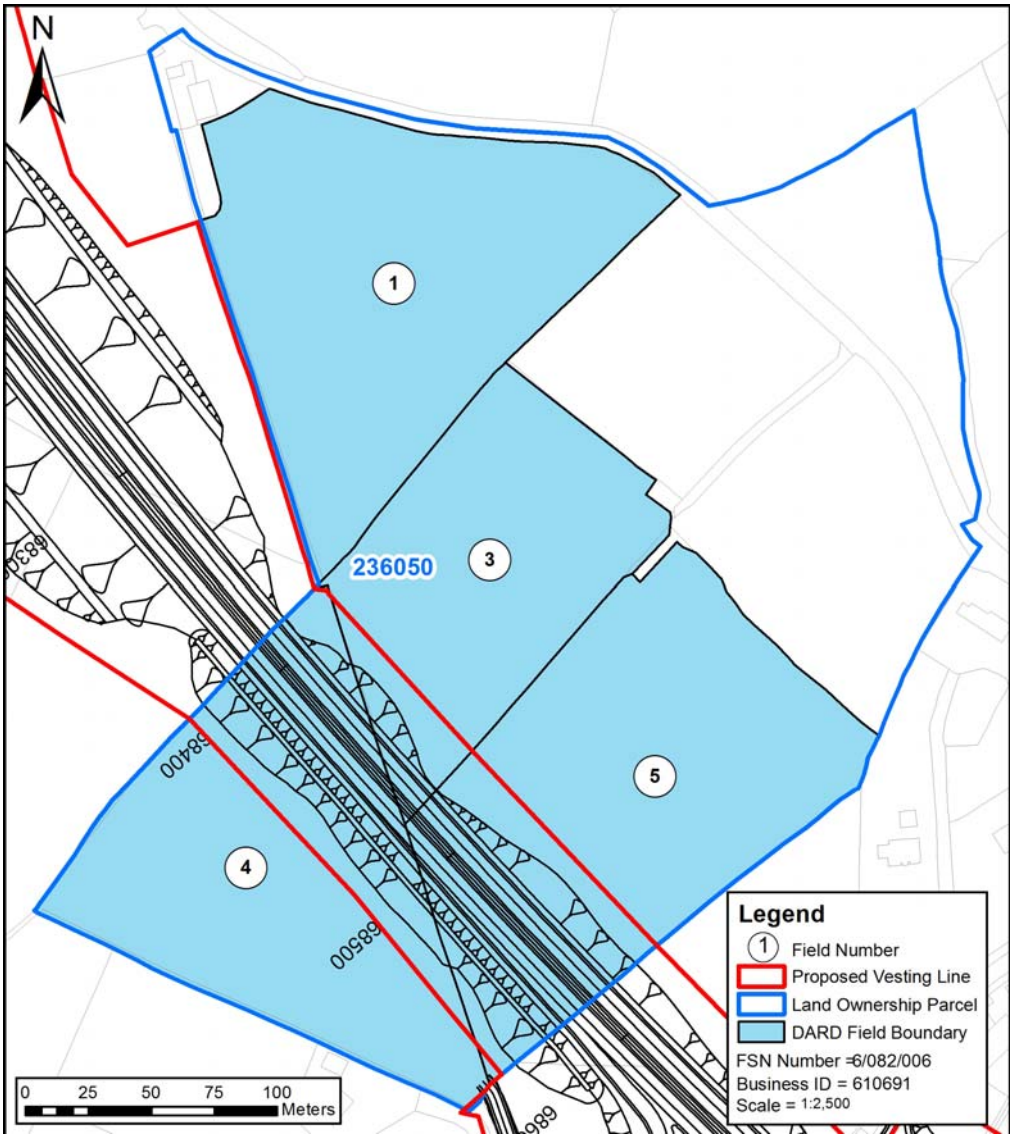
© Mouchel 2016

Predicted Impacts Total loss of 4.05 hectares from fields 4, 2 and 5 of the 63.42 hectare farm equating to 6.39% of the productive land. Under the Nitrates Directive, landtake may impact on future compliance. The landtake impacts would be moderate. There would be no severance as a result of the Proposed Scheme.
Proposed Mitigation No mitigation would be proposed.
Predicted Effects The loss of 6.39% of the available land would constitute a moderate adverse effect.

© Mouchel 2016

Land Parcel Ref	236050	**DARD Business Ref**	610691
		Data sources	2010 AIA meeting. Landowner confirmation meeting held. October 2014 AIA meeting
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 26.7ha, which includes 16.44ha of owned land. The remainder is taken in conacre.	
Type of Enterprise and Husbandry	
The farm runs a suckler cow herd of 5-6 cows, which rely on AI, with all the progeny being finished for beef. In addition, approximately 50 store cattle (350kg liveweight) are bought in annually for finishing as beef. The farm also runs a flock of 90 ewes and 3 rams, producing approximately 150 lambs, which are carried through to finish.	
Conacre Arrangement	Conacre unaffected
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	Since the pig enterprise, that was operational in 2010, has now ceased, there are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Some of the land is classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
Total loss of 1.45 hectares from fields 4, 3 and 5 of the 26.7 hectare farm equating to 5.43% of the productive land. The main impacts on this farm are severance and land take. There would be temporary impacts during the construction phase of the Proposed Scheme.

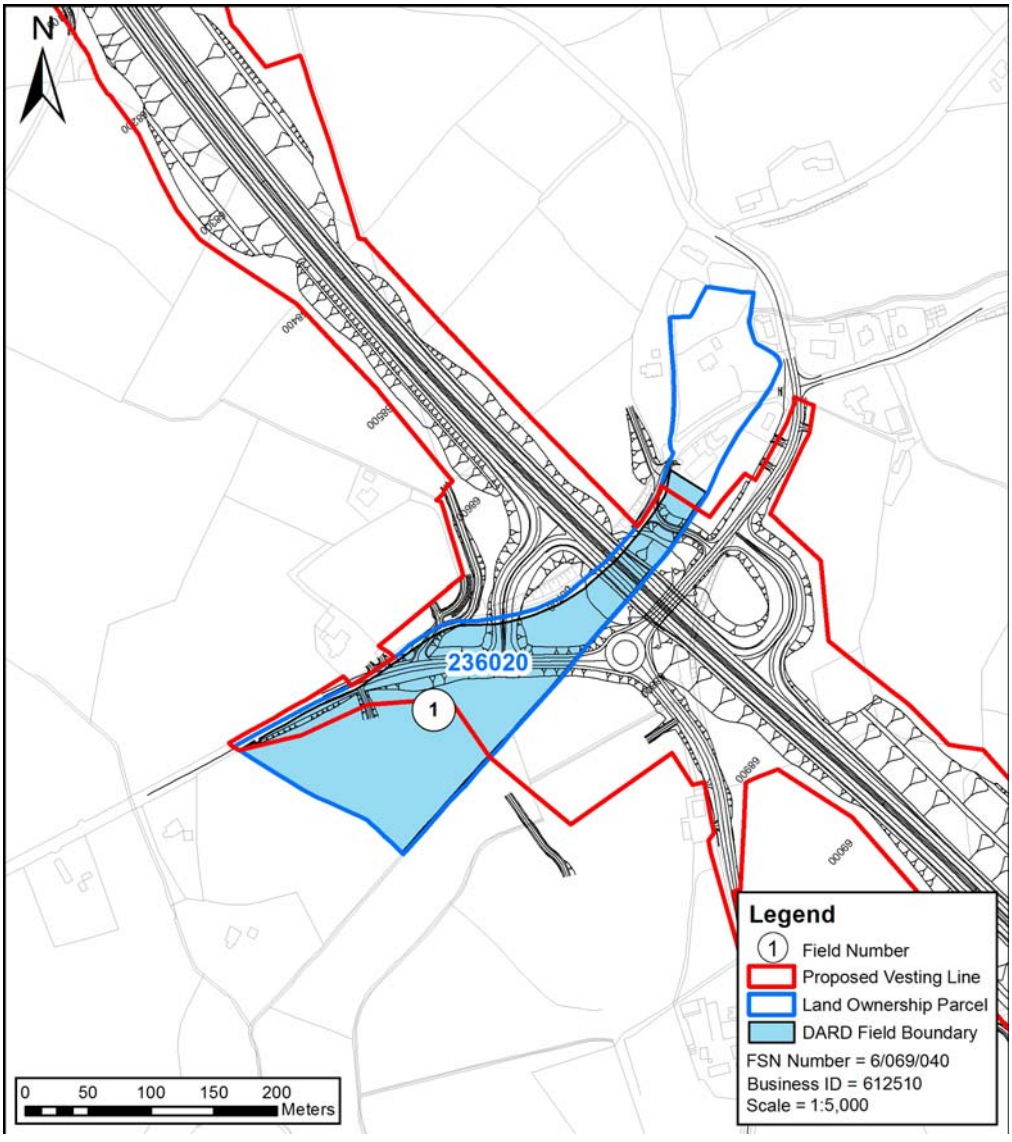
© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	236020	**DARD Business Ref**	No DARD map available
		Data sources	September 2010 AIA meeting. 2013 AIA letters not returned. Declined landowner confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

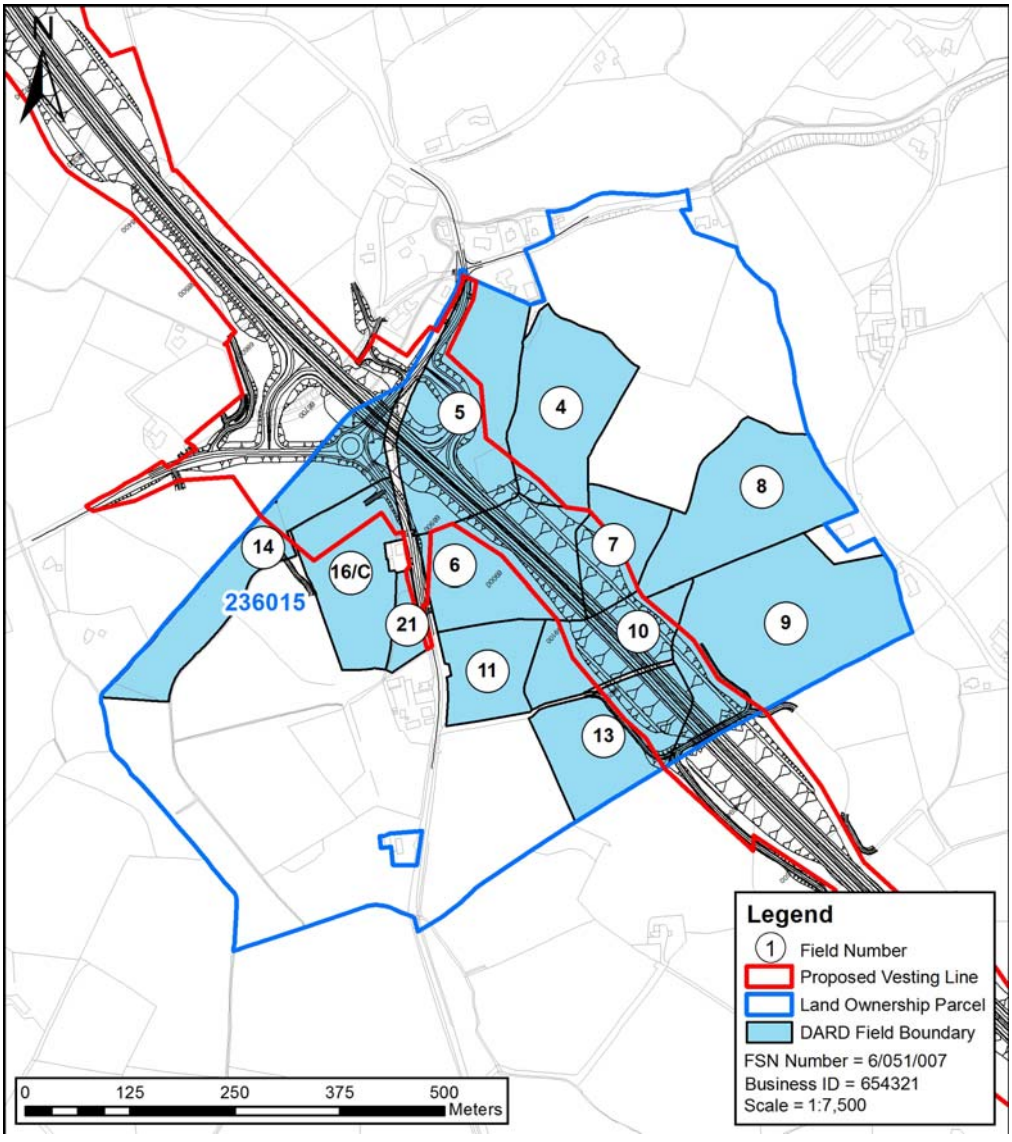
Size and Quality of Farm	
The farm extends to approximately 3ha, which is all in grass.	
Type of Enterprise and Husbandry	
The farm buys in approximately 15 store cattle, (350kg live-weight) which are carried through and sold as strong stores, or alternatively finished for beef.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	No information is available regarding land classification, and consequently payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts	
Total loss of 1.73 hectares from field 1 of the 3 hectare farm equating to 57.67% of the productive land. This would include land taken for the proposed Moylagh Road junction. The landtake impacts would be substantial. New severance would impact on the farm. Access to severed land is provided via the realigned Moylagh Road Junction. Severance impacts would be moderate. During the construction phase access to severed land may be compromised.	
Proposed Mitigation	
During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 57.67% of the available land would have a substantial impact on the farms potential output and constitute a substantial adverse effect.

© Mouchel 2016

Land Parcel Ref	236015	**DARD Business Ref**	Not Applicable
		Data sources	June 2010 AIA meeting. 2013 AIA letters not returned. Landowner confirmation meeting declined. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to approximately 48.5ha of owned land, plus a further 14.5ha taken in conacre. The farm is all in grass.	
Type of Enterprise and Husbandry	
The farm runs a dairy herd of approximately 30 heifers which are currently not in calf, but are scheduled to calve down in the next 12 months. The farm is currently rebuilding a dairy herd, which in the past numbered approximately 75 cows. In addition the farm runs approximately 75 store cattle, which are currently finished for beef. There is a turn-over of approximately 100-150 cattle per year.	
Conacre Arrangement	Conacre unaffected by the proposed scheme
Single Farm Payment	The landowner collects the Single Farm Payment on owned and conacre land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is currently not registered under the Countryside Management Scheme, but application has been made to join the 2009 Scheme.
Less Favoured Area Compensatory Allowances Scheme	This being a diary farm, the land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 8.86 hectares from the farm equating to 14% of the productive land. The landtake impacts would be moderate.

New severance would impact the farm. Access would be provided by a new roundabout junction across the Proposed Scheme. The severance impacts would be moderate. There would be temporary impacts during the construction phase of the Proposed Scheme.

.

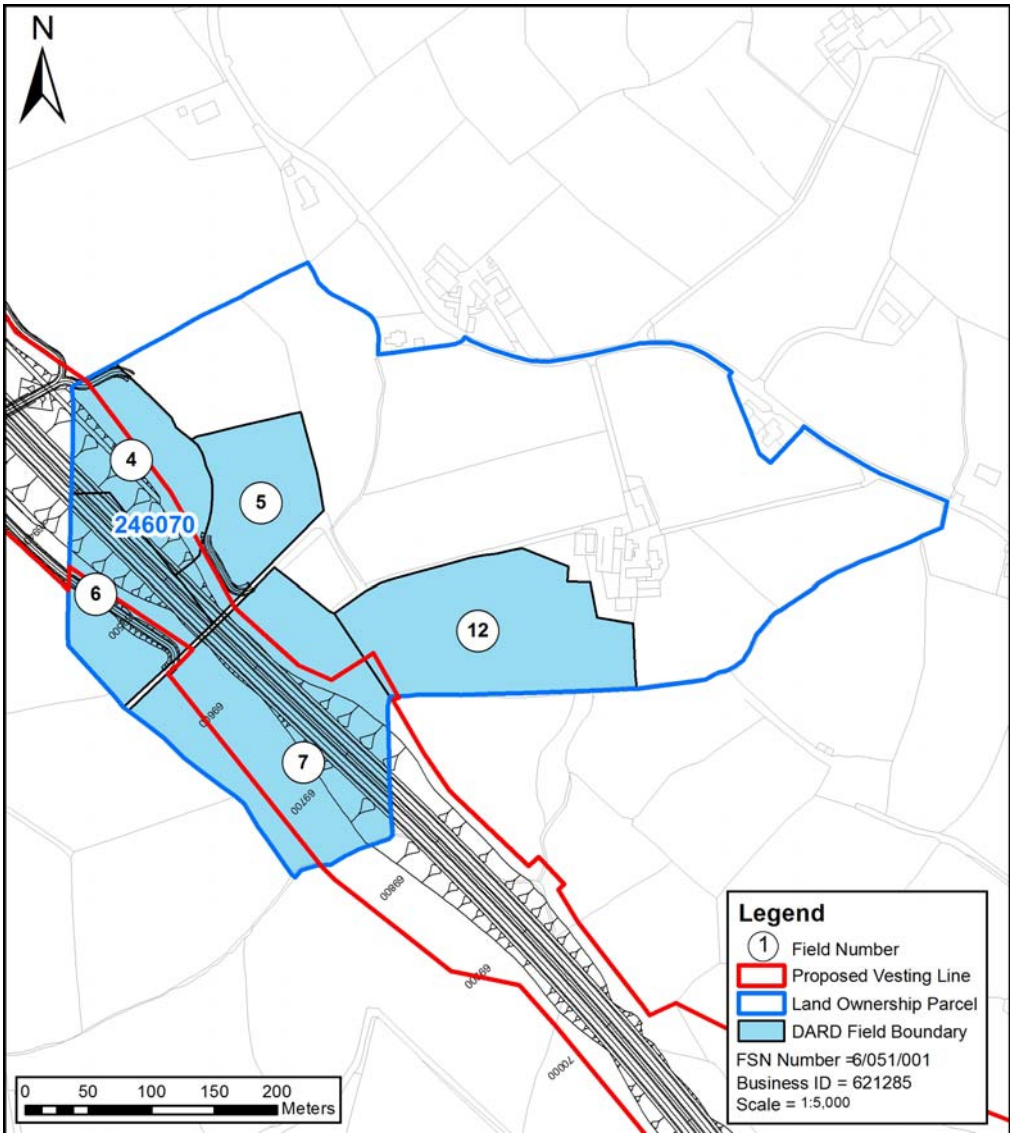
© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	246070	**DARD Business Ref**	621285
		Data sources	2010 AIA meeting. Landowner confirmation meeting held. October 2014 AIA meeting
Conacre Parcel Ref	Includes Parcel 246030 affected by the Proposed Scheme.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to approximately 100ha, of which 17.33ha is owned land and the rest being taken in conacre from 12 landowners.	
Type of Enterprise and Husbandry	
The farm runs a suckler cow herd of 35 cows and 1 bull, with progeny being sold as strong stores. In addition, the farm buys in store cattle, (approximately 350kg liveweight), and carries them through for sale as strong stores. The farm has a turn-over of approximately 600-700 cattle per annum, with the capacity to carry 450 at any one time. In the autumn, approximately 600-700 store lambs are purchased for winter finishing.	
Conacre Agreement	Landowner rents approximately 83ha of land in conacre. Includes Parcel 246030 affected by the Proposed Scheme - see Datasheet 021-135.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, and also on some conacre land.
Nitrates Directive	Given the high stocking rate on the farm, there may be implications under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Some of the conacre land is classified Disadvantaged Area (DA) and is eligible for payment under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
Total loss of 3.45 hectares of owned land and 3.6ha of land taken in conacre of the 100 hectare farm equating to 7% of the productive land. The landtake impacts would be moderate. New severance would also impact on the farm. Access would be provided to all severed land

© Mouchel 2016

via a shared farm lane and overbridge to the west of the parcel. Severance would be moderate as the severed land would be too small to be agriculturally useful. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be a **moderate adverse**.

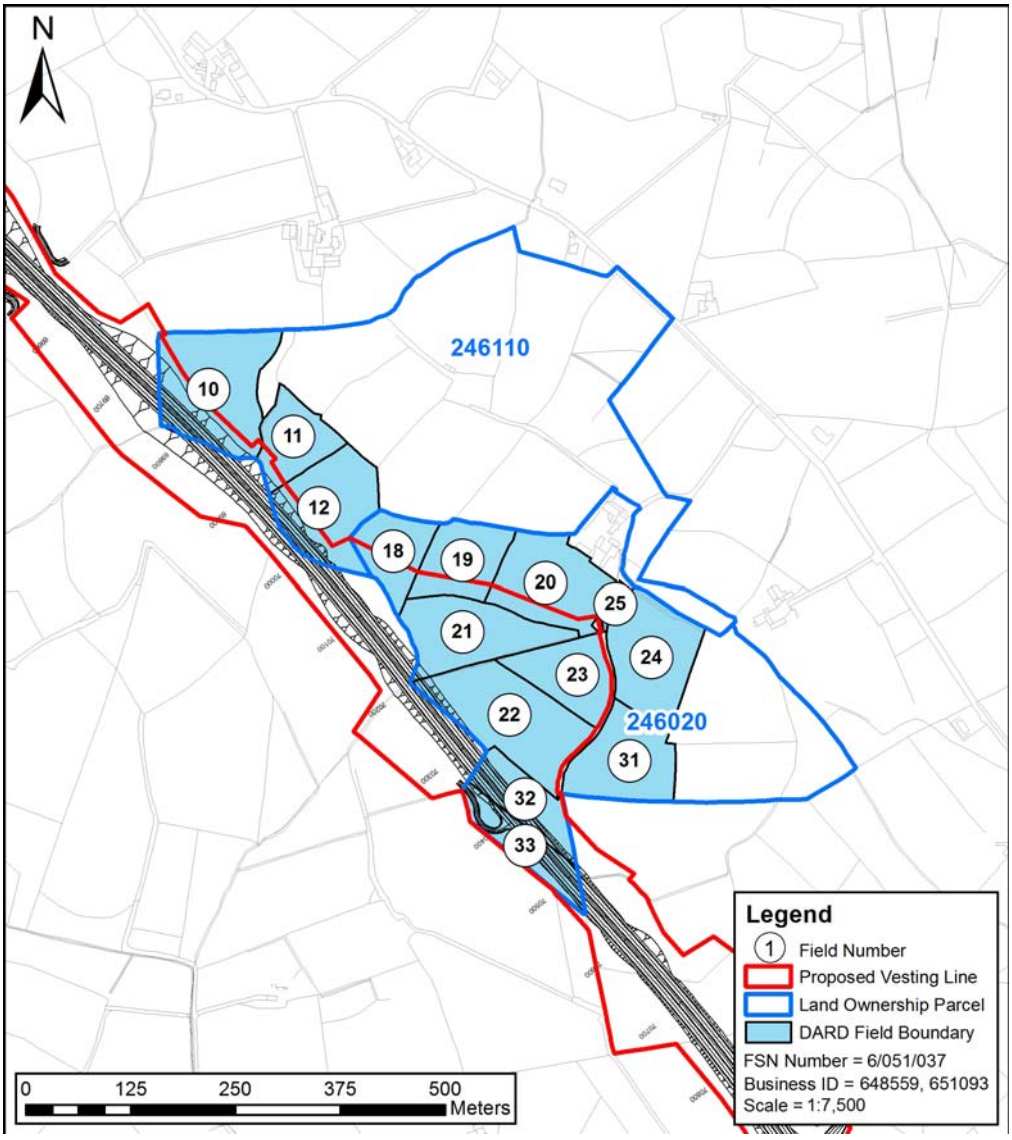
Land Parcel Ref	246020, 246110	**DARD Business Ref**	622238
		Data sources	September 2010 meeting. No response to 2013 AIA letter or landowner confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Fields from 246110 rented in conacre by 246020		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 30.49ha of owned land, which is split 50/50 between two landowners The land is all in grass.	
Type of Enterprise and Husbandry	
The farm runs a suckler herd and a bull. However, no information was provided by the Landowner with regard to either the numbers of cows or what happens to the progeny. In addition, the farm runs a sheep flock, but no information was provided by the Landowner regarding number of ewes and number of lambs produced.	
Conacre Arrangement	Conacre rented from 246110 by parcel 246020 farm.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Lowland (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
Total loss of 6.94 hectares of the 30.49 hectare farm equating to 22.76% of the productive land. This would include land for a deposition area. The landtake impact would be substantial. There would be no severance as a result of the Proposed Scheme.

© Mouchel 2016

Proposed Mitigation No mitigation would be required.	
Predicted Effects	The loss of 22.76% of the available land would have a substantial impact on the farms potential output and constitute a substantial adverse effect.

© Mouchel 2016

Land Parcel Ref	246040, 246120	**DARD Business Ref**	Not applicable

© Mouchel 2016

Size and Quality of Farm

The farm extends to approximately 34ha of owned land, which is all in grass. The landowner has purchasing an additional 40ha.

Land parcel 246040 is shown on Figure 15.16 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

This land had been purchased with a view to establishing a dairy herd on the farm. It had been intended to invest capitol in buildings and infrastructure in the farmyard to accommodate a dairy herd.

In the meantime, it is intended that beef cattle will be purchased and carried through to finish grazing grass and utilizing silage produced on the farm.

Conacre Arrangement	N/a
Single Farm Payment	There are no entitlements attached to the land, therefore no Single Farm Payment is collected.
Nitrates Directive	There are no implications for the farm, at present, under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	There are no stock on the land and it is therefore not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 3.48ha out of 34ha farm equating to 10% of the productive land. This would include land for the proposed road and a flood alleviation feature. The landtake impacts would be slight.

There would be no severance as a result of the Proposed Scheme.

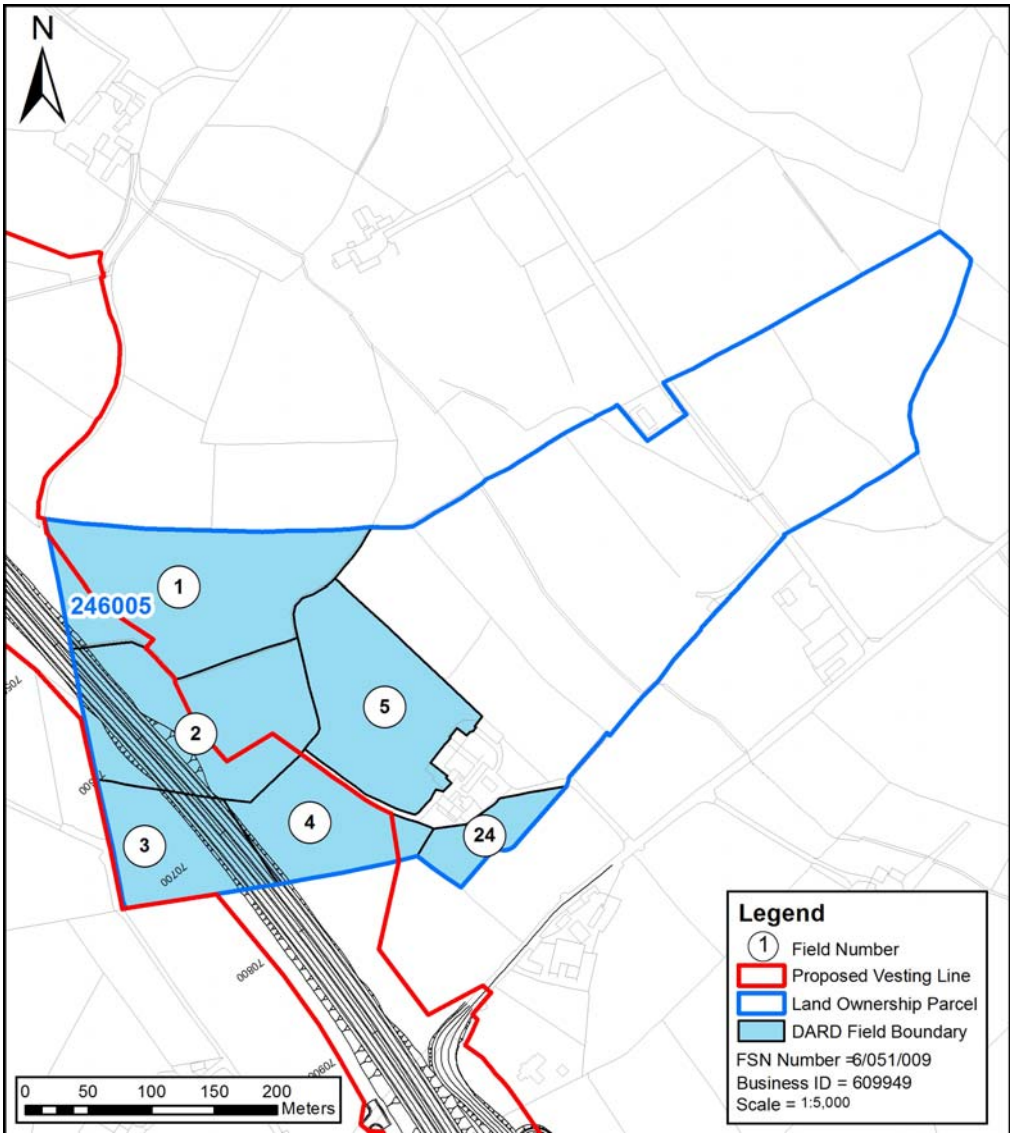
© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse.**

© Mouchel 2016

Land Parcel Ref	246005	**DARD Business Ref**	609949
		Data sources	March 2010 meeting. 2013 AIA letters not returned, no landowner confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 10.08ha of owned land. Land parcel 246005 is shown on Figure 15.16 Environmental Statement Land Ownership Boundaries. All fields are in grass.	
Type of Enterprise and Husbandry	
The farm runs a dairy herd of approximately 30 cows and one bull, with a herd average of 6,000 litres. There are approximately 12 -15 young stock on the farm. Bull calves are all reared and sold as store cattle (300-400 kg live weight).	
Conacre Arrangement	In 2010, 2ha of conacre were rented from parcel 247150. Parcel has changed ownership and no confirmation of conacre arrangements have been received from either landowner. No assessment of conacre could be undertaken.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, but not on conacre land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is classified Low Land (LL) and is not eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

Predicted Impacts
The proposed scheme will result in a total loss of 3.2ha out of 10.08ha farm equating to 32% of the productive land. The landtake would be from the dairy herds grazing platform. Under the Nitrates Directive,

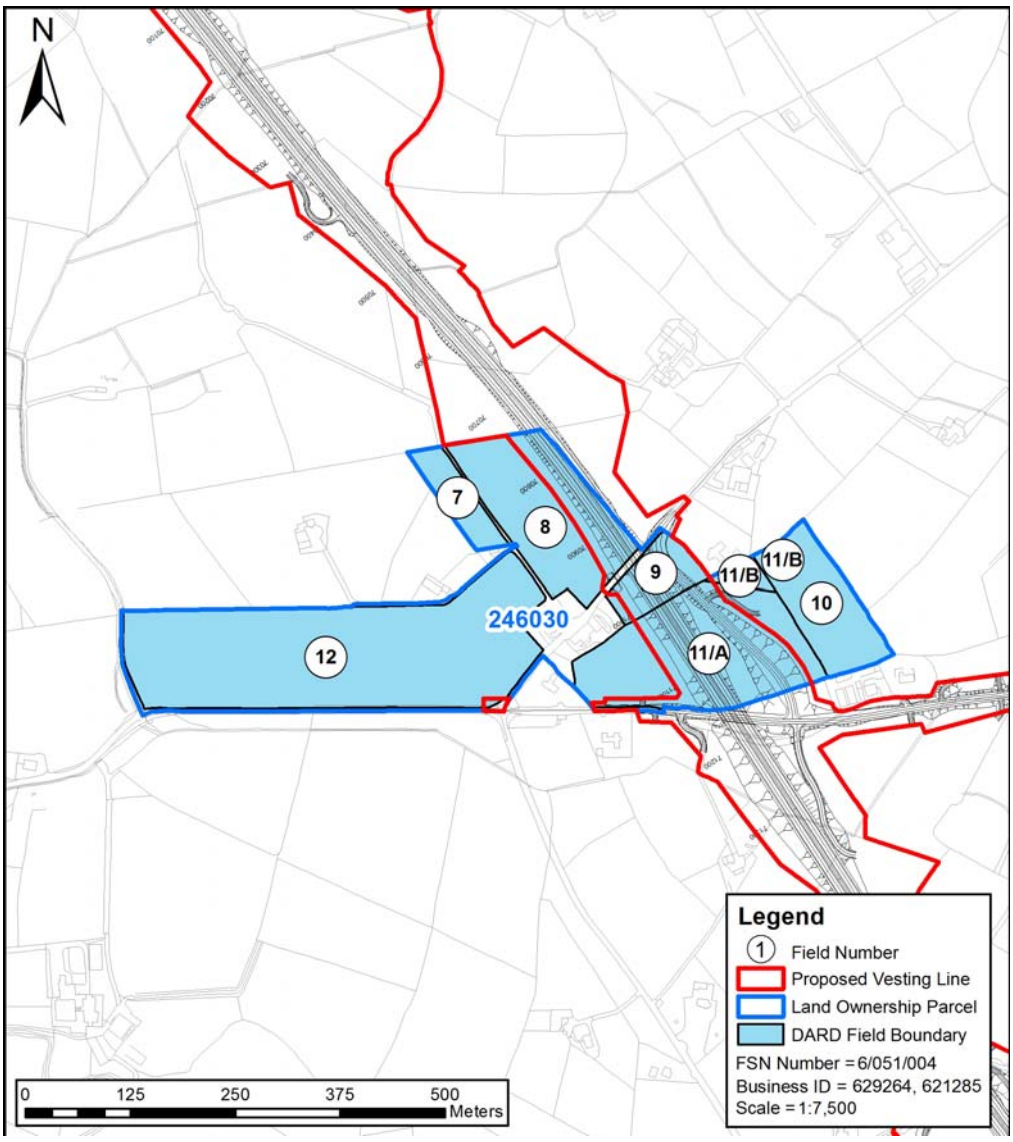
© Mouchel 2016

based on the existing stocking rate, the landtake may have implications for this farm. New severance would also impact upon the farm. Access to the severed land would be provided by a farm lane. The severance would be a moderate adverse impact to the farm due to the severed land being too small to be agriculturally useful.	
Proposed Mitigation During the construction phase access to severed land would to be maintained.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	246030	**DARD Business Ref**	629264
		Data sources	September 2010 meeting. Landowner confirmation meeting feedback stated no change to farm and minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Let in conacre to Parcel 246070 landowner, Datasheet 021-131		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 14.58ha of owned land, which is all in grass. Land parcel 246030 is shown on Figure 15.16 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The land is all rented out in conacre.	
Conacre Arrangement	Let in conacre to Parcel 246070 landowner. The impacts on the coancre tenant are outlined in datasheet 021-131
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Lowland (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The proposed scheme will result in a total loss of 3.6ha out of 14.58ha farm equating to 25% of the productive land. This would include land for the realigned Greenmount Road. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight. New severance would affect the farm. Access would be provided to all severed land via the realigned Greenmount Road. As the land is currently out in conacre and not farmed by the landowner directly, the severance impacts on the landowner would be slight.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	

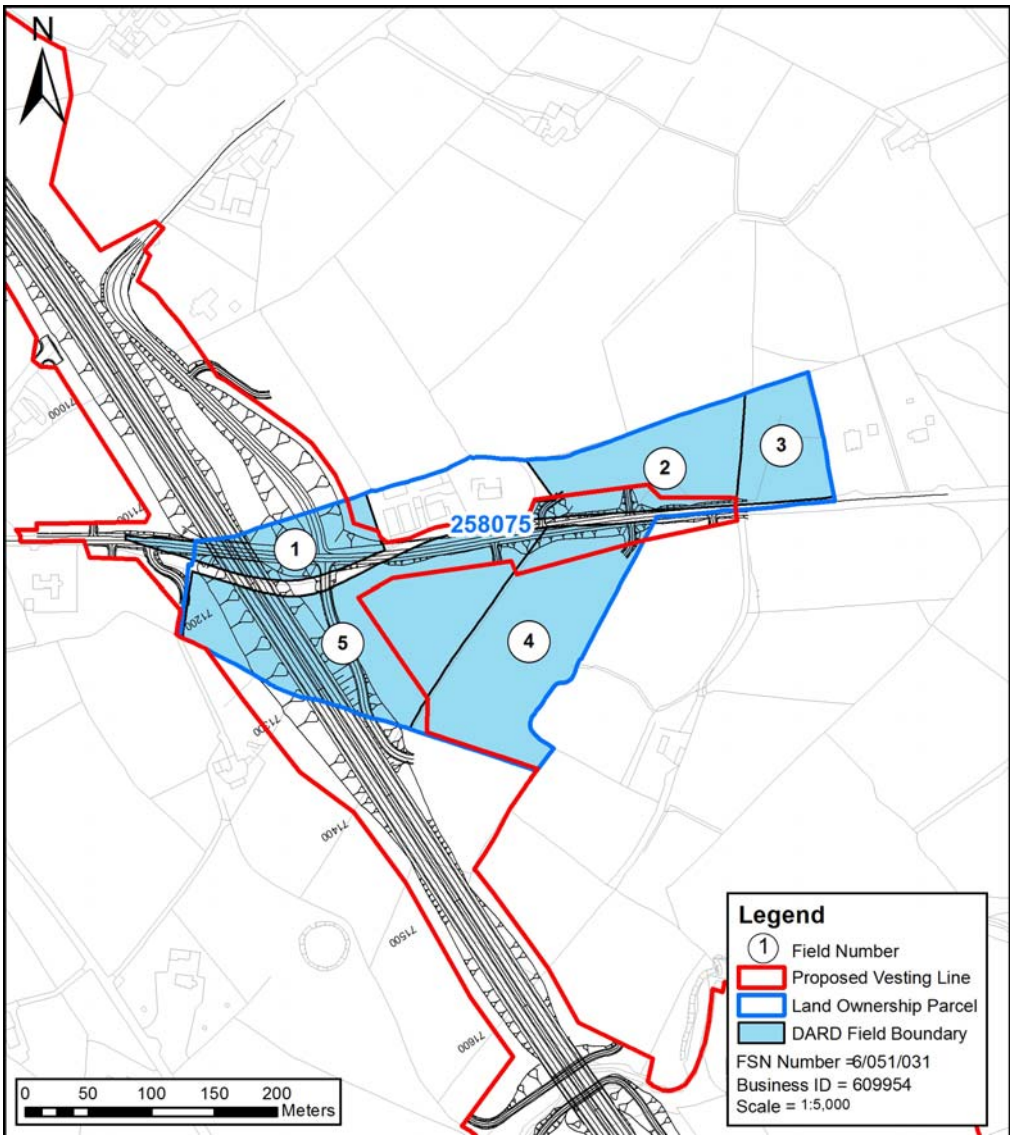
© Mouchel 2016

Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse.**

© Mouchel 2016

Land Parcel Ref	258075	**DARD Business Ref**	609954
		Data sources	October 2014 meeting
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 27.82ha of owned land, which is all in grass. Land parcel 258075 is shown on Figure 15.16 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The farm runs a flock of 130 ewes and 5 rams, producing approximately 200 lambs, which are carried through to finish. Field Nos 6, 10, 12, have been in conacre up until 2014, but will be farmed again by the landowner in 2015. Interruption of the water supply from the well in Field No 5 (photograph No 1), which supplies both the farmyard and the dwelling house, will have cost implications.	
Conacre Arrangement N/a	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	Field Nos 4 & 5 are classified Disadvantaged Area (DA) and are eligible for payments under LFACAS. The remainder of the land is classified Lowland (LL) and is not eligible for payments.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

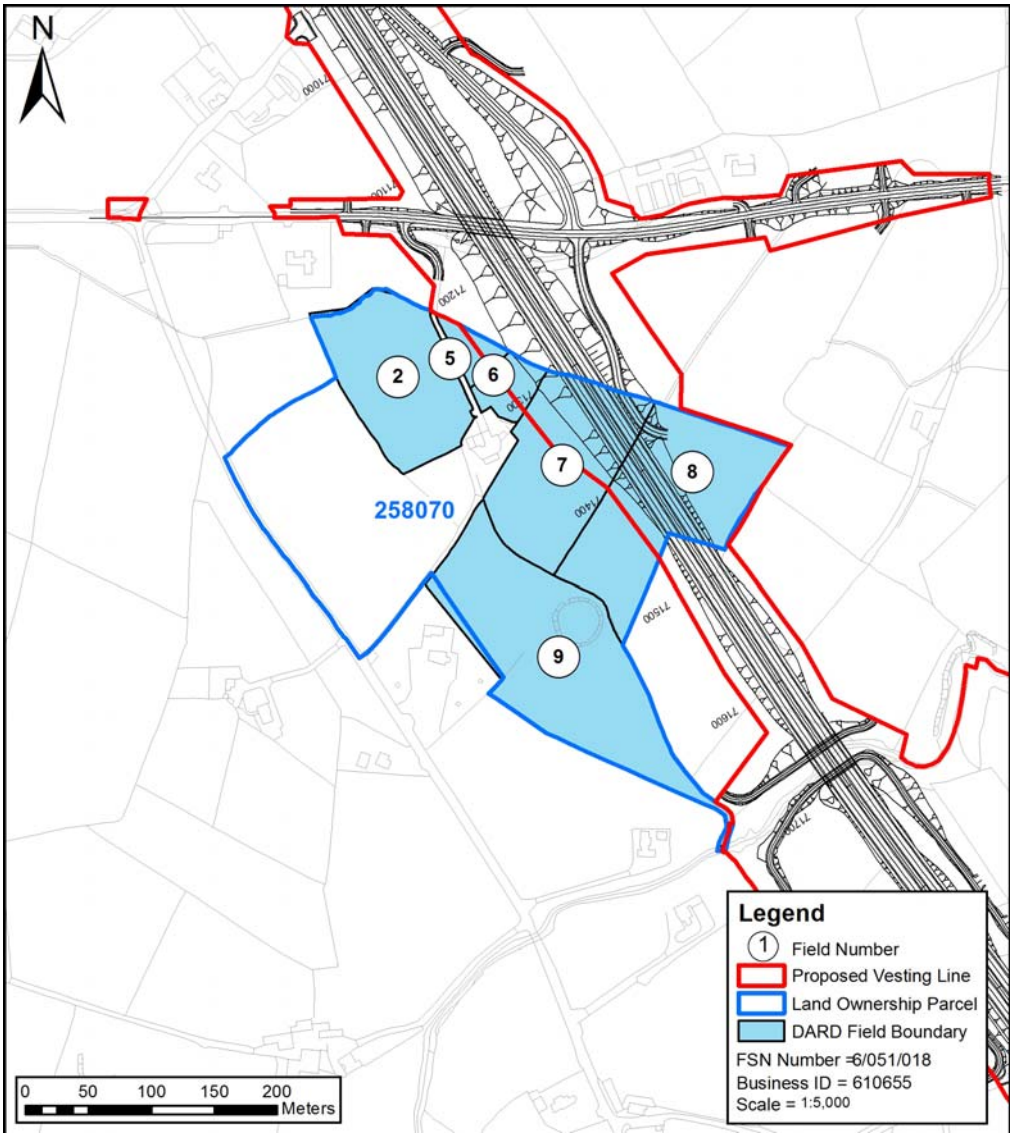
© Mouchel 2016

Predicted Impacts The proposed scheme will result in a total loss of 3.11ha out of 27.82ha farm equating to 11% of the productive land. There will be no severance as a result of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land will be required.	
Predicted Effects	The overall impact of the proposed A5WTC on the farm is a **moderate adverse** impact.

© Mouchel 2016

Land Parcel Ref	258070	**DARD Business Ref**	137470 (Applicant Ref)
		Data sources	September 2010 AIA meeting. Landowner confirmation meeting held. Agricultural land unaffected. Minor changes to the scheme only.
Conacre Parcel Ref	Parcel let out in conacre for leisure horses.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 9.96ha of owned land, which is all in grass. Land parcel 258070 is shown on Figure 15.16 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry	
Field No 4 is rented out in conacre for agriculture. The remainder of the farm is rented out in conacre to neighbours, for horse grazing.	
Conacre Arrangement	Field 4 is rented in conacre for agriculture and is unaffected by the Proposed Scheme. Remaining parcel is in conacre for grazing leisure horses
Single Farm Payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Since the land is rented out in conacre, the landowner is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
The proposed scheme will result in a total loss of 1.49ha out of 9.96ha farm equating to 15% of the productive land. This would include land for the proposed alignment and two farm lanes. The landtake impacts would be slight. New severance would also impact on the farm. Access would be provided to all severed land via two farm lanes off the realigned Greenmount Road. The severance impacts would be slight.

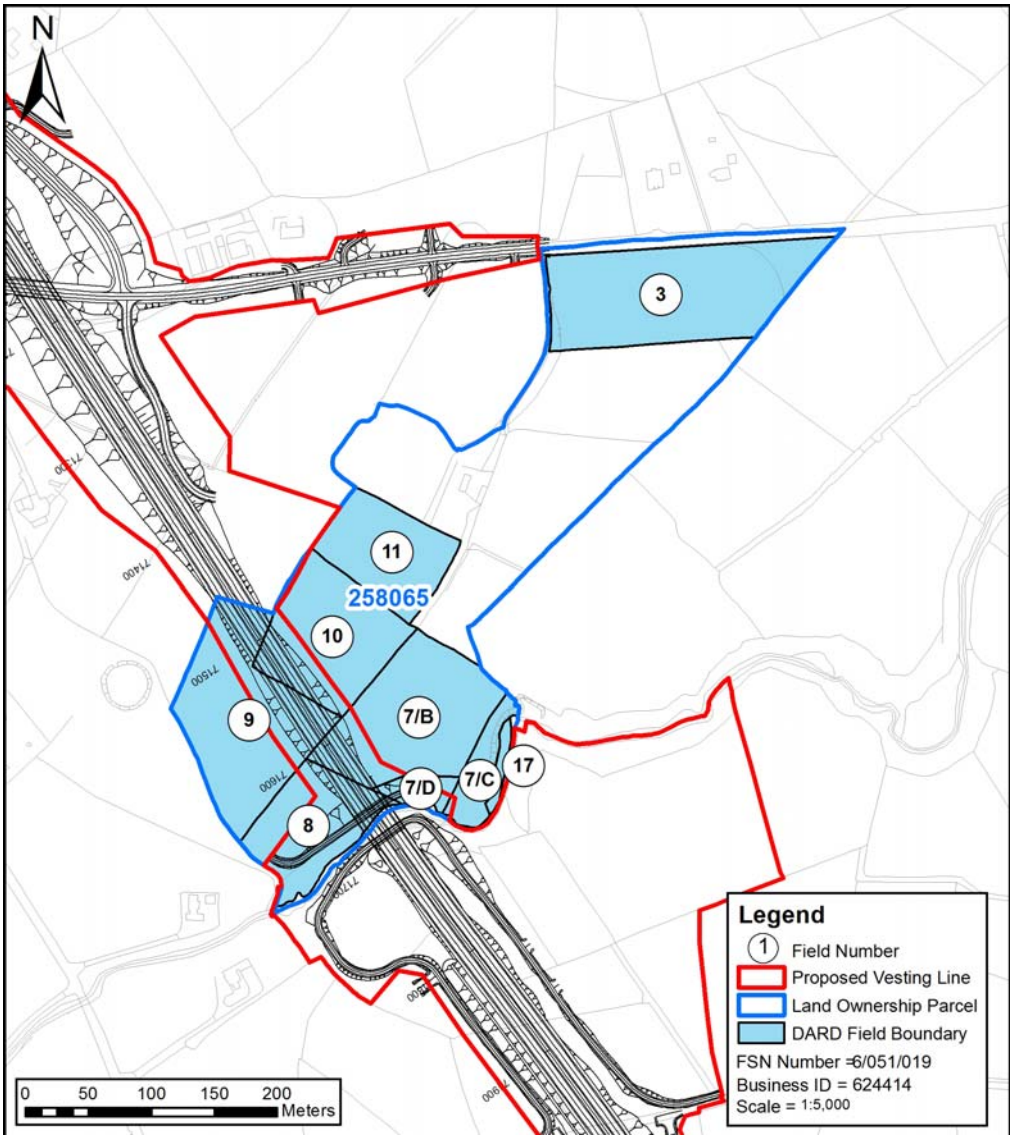
© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Residual Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse.**

© Mouchel 2016

Land Parcel Ref	258065	**DARD Business Ref**	63617
		Data sources	September 2010 meeting. 2013 AIA letters not returned and minor changes to the scheme only, therefore no 2014 revisit
Conacre Parcel Ref	Let in conacre to offline tenant and the landowner of parcel 203010.		

Land parcel reference, farm map filed surveys and the proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 37.6ha of owned land, in 3 parcels. The farm is all in grass.

Land parcel 258065 is shown on Figure 15.16 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

Parcel is let in conacre.

Conacre Arrangement	Parcel is let in conacre to offline tenant unaffected by the Proposed Scheme. Some land is rented in conacre by the landowner from parcel 203010. The assessment of impact on the conacre tenant are outlined in Datasheet 116.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Since most of the land is rented out in conacre, it is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 1.63ha out of 37.6ha farm equating to 4% of the productive land.

This would include land that is currently rented out in conacre. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

New severance would also impact on the farm. Access would be provided via an underbridge adjacent to the river. The severance impacts would be slight.

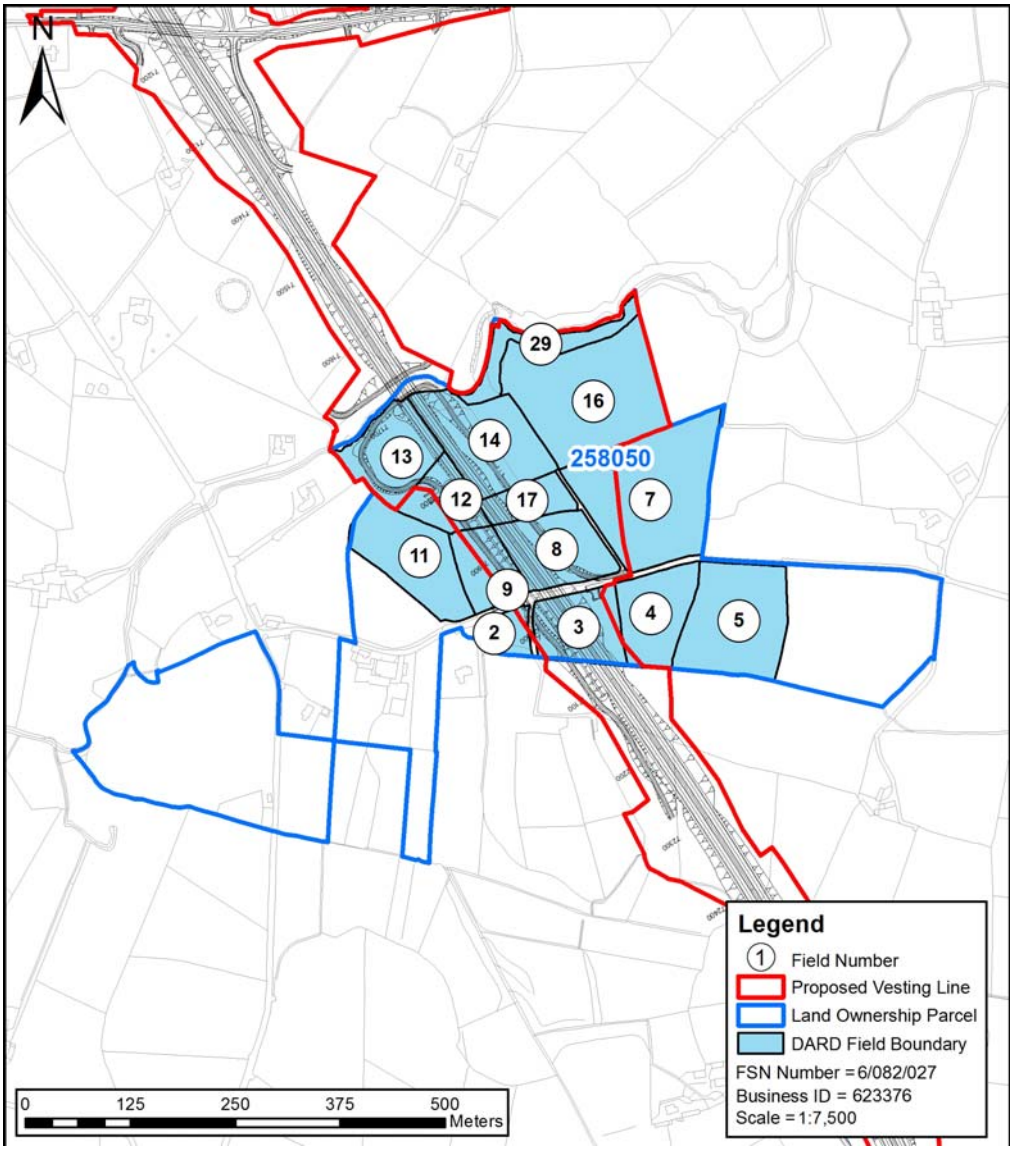
© Mouchel 2016

Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse.**

© Mouchel 2016

Land Parcel Ref	258050	**DARD Business Ref**	623376
		Data sources	September 2010 AIA meeting. Land confirmation pack sent and 2013 AIA letters not returned. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 35.44ha, which includes a small area of conacre. The farm is all in grass.

Land parcel 258050 is shown on Figure 15.16 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a herd of 50 dairy cows, with a herd average of approximately 6,000 litres. In addition, there are approximately 40 young stock being reared as herd replacements. Bull calves are normally sold. In 2010 the herd was closed with Tuberculosis and had to be retained on the farm.

There are approximately 120 cattle on the herd list.

In addition the farm buys in approximately 100 store lambs in the autumn, and these are carried through to finish.

The grazing platform for the dairy herd comprises all the land to the north of the cow-lane which runs from the farmyard along-side the Routingburn Road, along the southern field boundary of Field Nos 10, 11, 9 & 8, before turning and running between Field Nos 8 & 17 and Field No 7.

The land to the south of the Routingburn Road (Field Nos 2 – 6 and Field No 28) maybe accessed from the end of the cow-lane in the corner of Field No 8 by opening a gate and allowing the cows directly across the Routingburn Road into Field No 4, from where they have access to all the land south of the Routingburn Road.

Field Nos 6 & 7 are normally cut for first cut silage, before being returned for grazing the dairy herd.

The water supply to the dairy cow grazing platform is all supplied via a mains supply from the farmyard. Similarly, the power for the electric fencing on the cow grazing platform is supplied by a mains cable laid from the farmyard.

The farm also runs a broiler house with a capacity of 9,600 free-range broilers.

Conacre Arrangement	Conacre unaffected
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.

© Mouchel 2016

Nitrates Directive	Given the current stocking rate and the contribution from broiler litter, land-take may have implications under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	As this is a dairy farm, the land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 8.71ha out of 35.44ha farm equating to 25% of the productive land.
Under the Nitrates Directive there may be implications for the farm. The landtake would be from the dairy herds grazing platform. The landtake impacts would be substantial adverse.

New severance would impact upon the farm. Routingburn Road would be closed as a result of the Proposed Scheme and access would be provided via an underpass adjacent to the river to the north of the land parcel. The severance impacts would be substantial adverse.

Proposed Mitigation

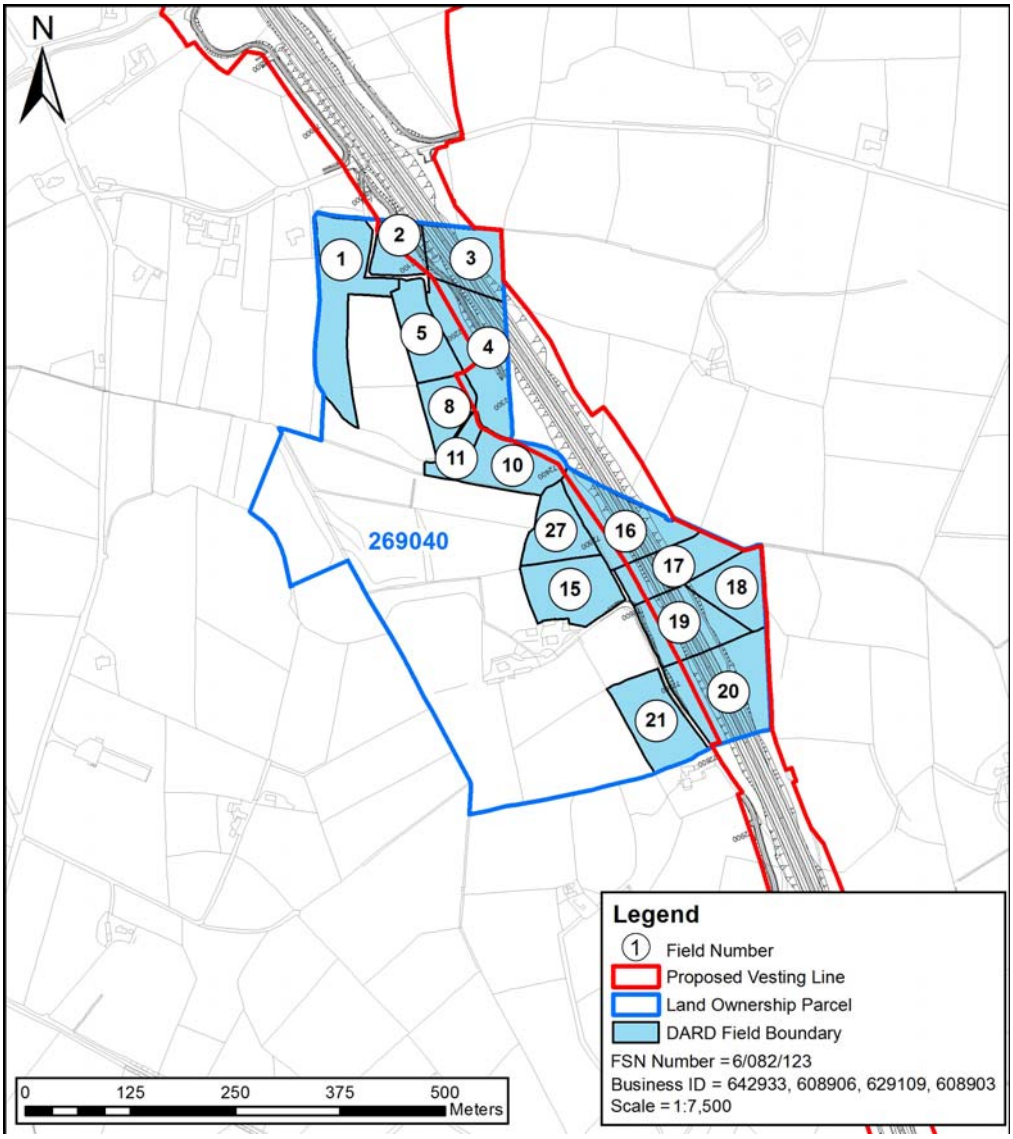
No mitigation would be proposed.

Predicted Effects	The overall impact of the Proposed Scheme on the landowner's farm would be **substantial adverse** to the extent that the farm may no longer be viable.

© Mouchel 2016

Land Parcel Ref	269040	**DARD Business Ref**	133446 (Applicant ref)
		Data sources	2010 AIA meeting. Landowner confirmation meeting held. October 2014 AIA meeting
Conacre Parcel Ref	Let in conacre		

Land parcel reference, farm map field surveys and the proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 18.71ha of owned land, which is all in grass, with the exception of Field Nos 28, 29 & 30, which are wooded.

Land parcel 269040 is shown on Figure 15.16 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm is all let out in conacre to two other landowners.

Conacre Arrangement	Land is let out in conacre to two different landowners, both of whom are unaffected by the proposed scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Since the land is in conacre, it is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 5.14ha out of 18.71ha farm equating to 27% of the productive land.

The proposed Scheme would run along the east of the farm. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

There would be no severance as a result of the Proposed Scheme.

Proposed Mitigation

During the construction phase access to severed land would be required

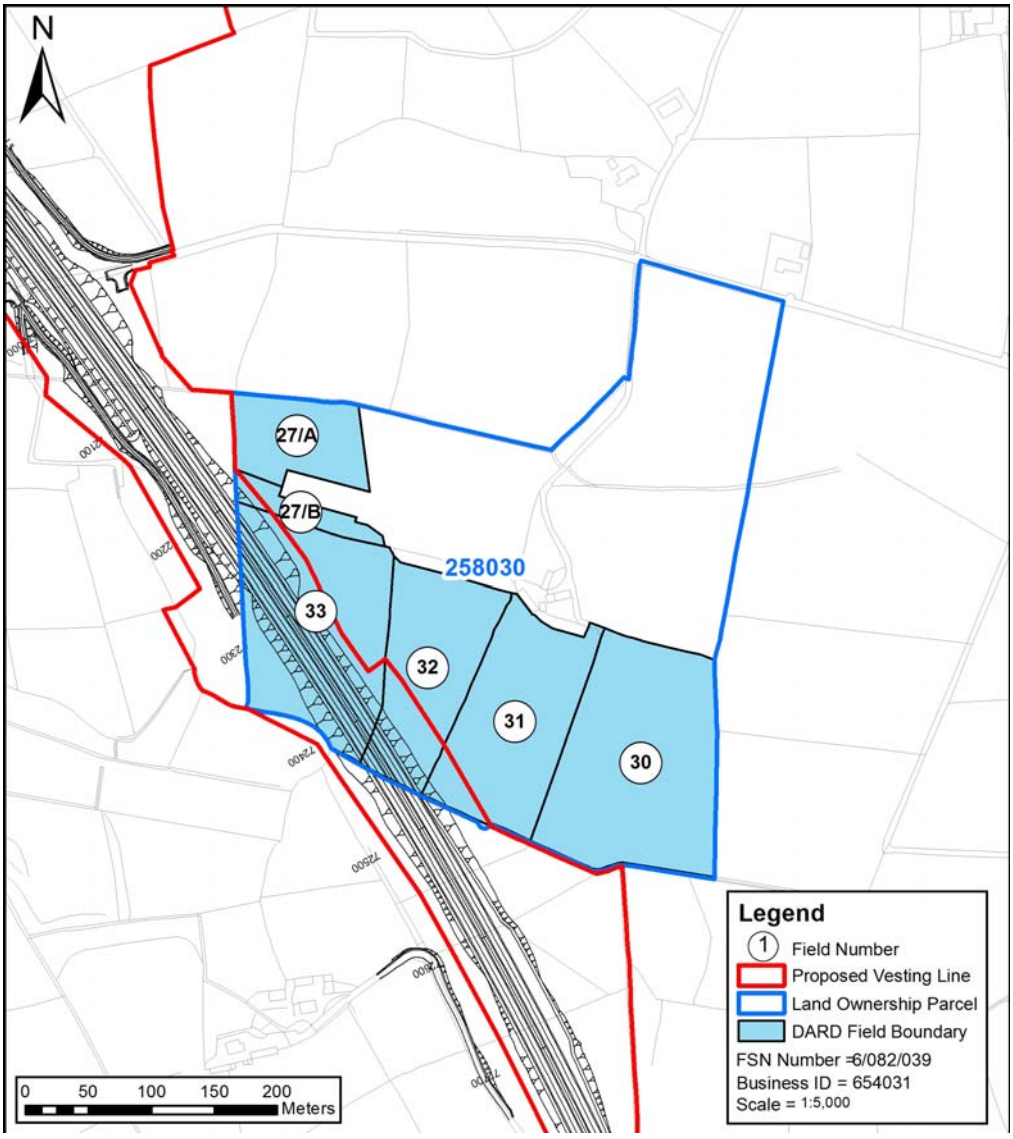
© Mouchel 2016

Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	258030	**DARD Business Ref**	227872 (Applicant Ref)
		Data sources	September 2010 meeting. No response to 2013 AIA letters or land confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Let in conacre to offline tenants		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 13.09ha of owned land, which is all in grass. Land parcel 258030 is shown on Figure 15.16 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry	
The land is all rented out in conacre.	
Conacre Arrangement	Let in conacre to offline tenants, whose land unaffected by the Proposed Scheme. Not enough information to conclude the impact on the conacre tenant's farms.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all rented in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
The proposed scheme will result in a total loss of 1.86ha out of 13.09ha farm equating to 14% of the productive land. This would include land for a proposed deposition area. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight. There would be no severance as a result of the Proposed Scheme

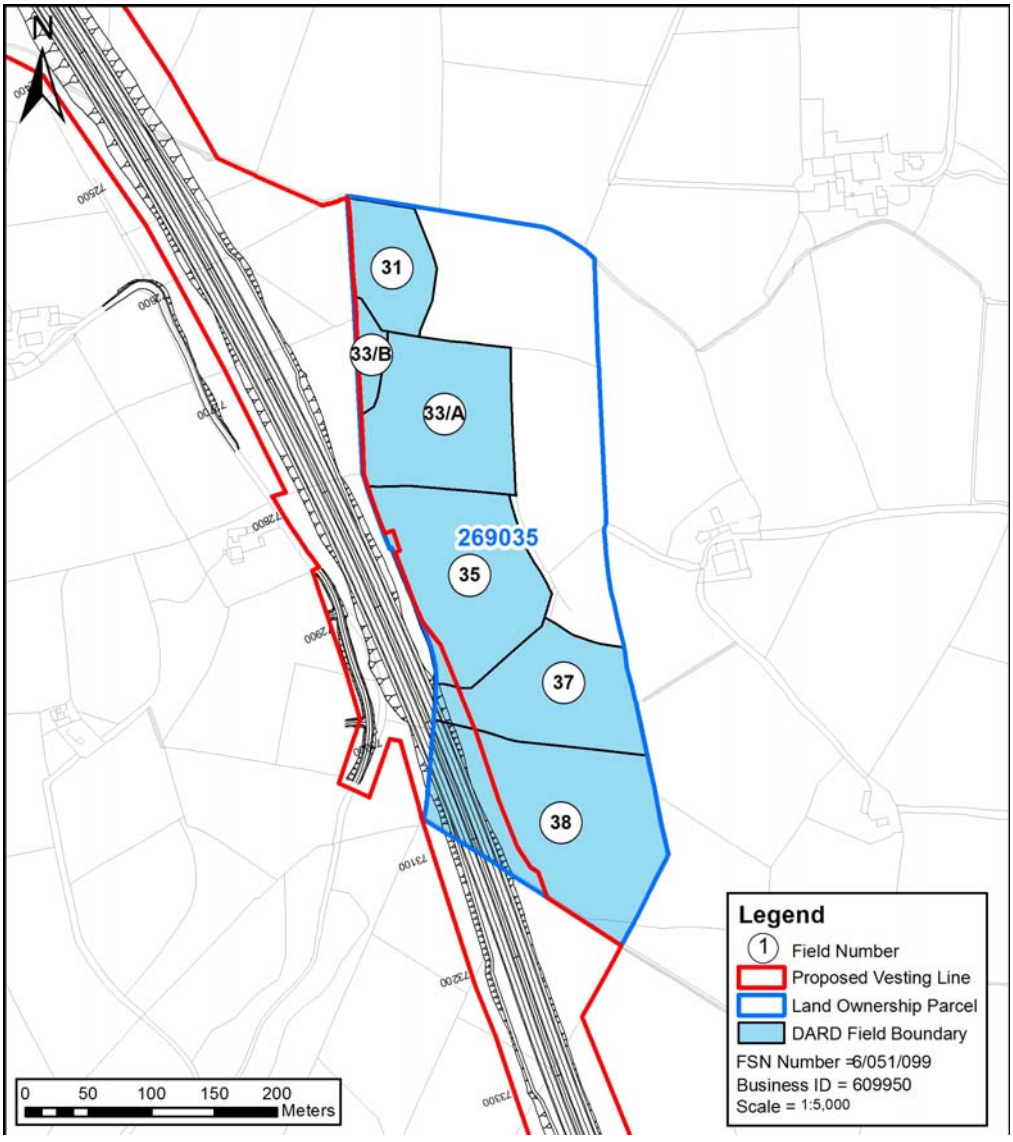
© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	269035	**DARD Business Ref**	Not available
		Data sources	September 2010 AIA meeting. 2013 feedback identified no change to farm and minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Farmed by family member, Datasheet 021-237.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 8.90 ha of owned land, which is all in grass. Parcel is farmed by landowner's nephew (Parcel 269035). Parcels are farmed as one unit. Land parcel 269035 is shown on Figure 15.16 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The land is all rented out in conacre as above.	
Conacre Arrangement	Let in conacre. Impacts on the conacre tenant are outlined in datasheet 021-237.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is rented out in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The proposed scheme will result in a total loss of 0.73ha out of 8.9ha farm equating to 8% of the productive land. . This would include land for the proposed road. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight. There would be no severance as a result of the Proposed Scheme. The overall impact of the Proposed Scheme on the farm would be **slight adverse.**	

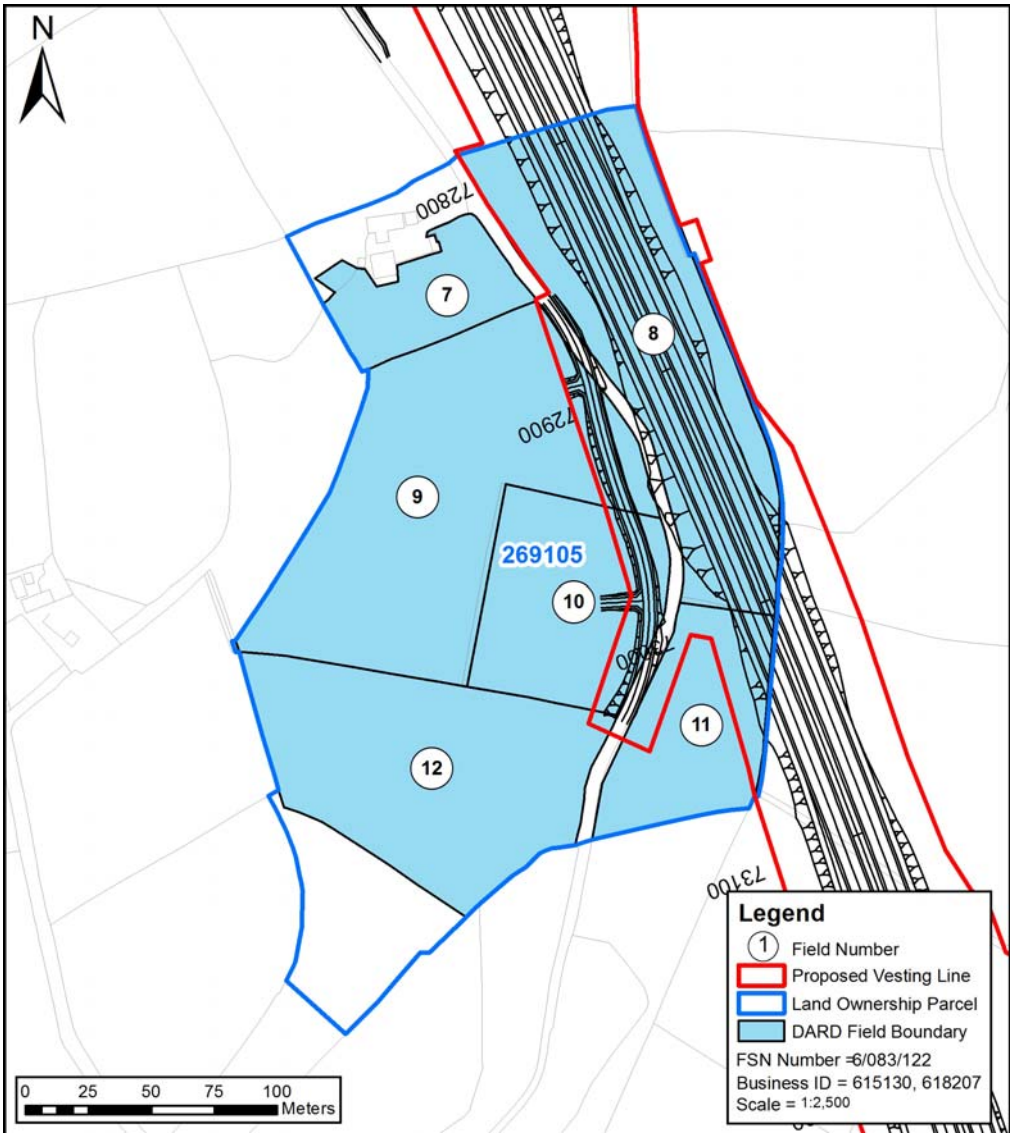
© Mouchel 2016

Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	269105	**DARD Business Ref**	615130
		Data sources	September 2010 meeting. No feedback to 2013 AIA letters or landowner confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Let in conacre to offline tenant, Datasheet 021-239		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 16.17ha, spread across 4 parcels of land, which is all in grass.

Land parcel 269105 is shown on Figure 15.16 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The land is all rented out in conacre.

Conacre Arrangement	Let in conacre to offline tenant unaffected by the Proposed Scheme. Impacts on the conacre tenant are outlined in Datasheet 021-239
Single Farm Payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is rented in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 1.61ha out of 16.17ha farm equating to 10% of the productive land.
This would include land that is currently rented out in conacre. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

There would be no severance as a result of the Proposed Scheme.

Proposed Mitigation

No mitigation would be proposed.

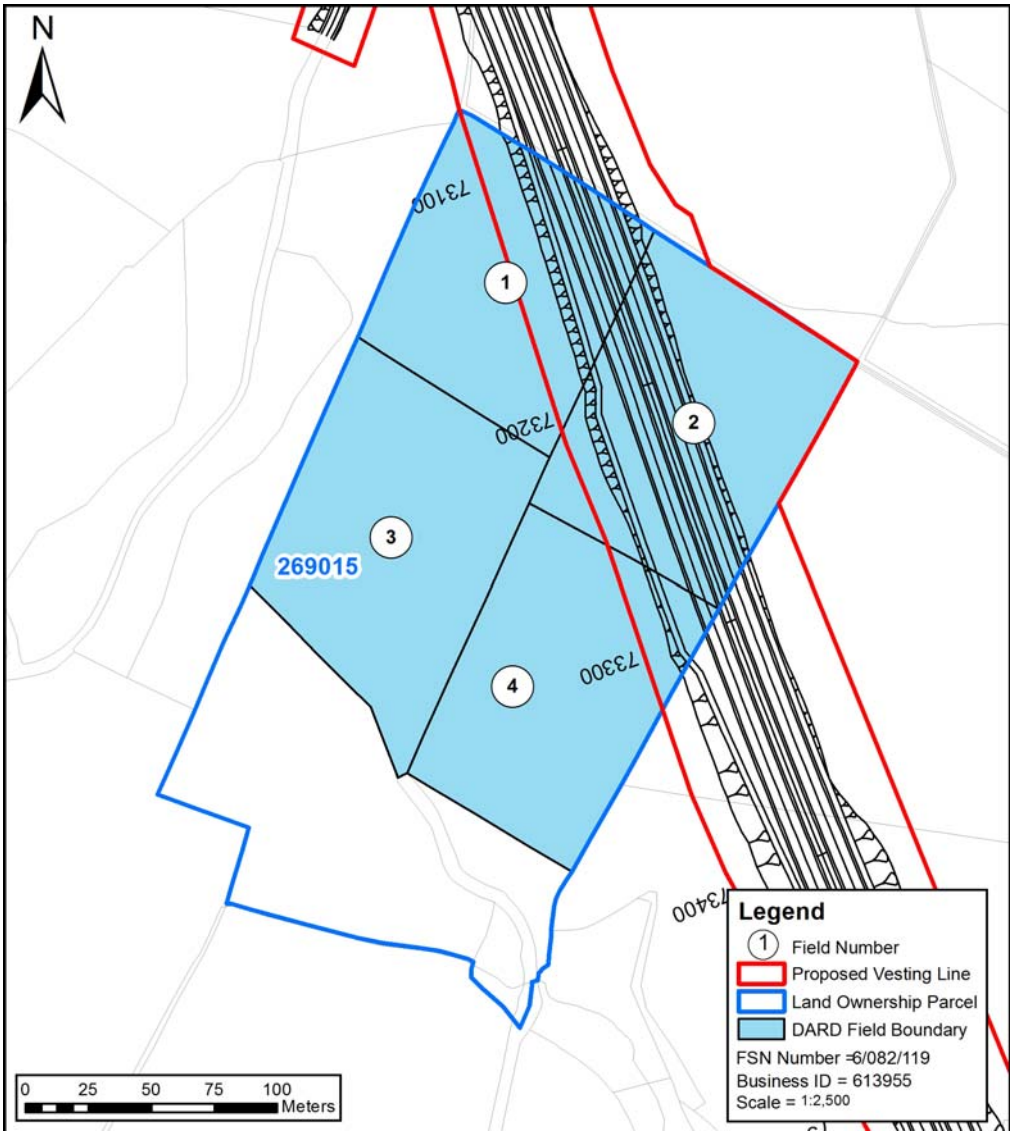
© Mouchel 2016

Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	269015	**DARD Business Ref**	133430 (Applicant Reference)
		Data sources	September 2010 AIA meeting. Land confirmation meeting identified no change in the farm and minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Let in conacre to offline tenant, Datasheet 021-240		

Land parcel reference, farm map filed surveys and the proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 5.43ha of owned land, which is all in grass. Land parcel 269015 is shown on Figure 15.16 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The land is all let out in conacre. Water for stock on the land is available from the stream that flows along the march ditch, at the end of Field Nos 1 & 2.	
Conacre Arrangement	Let in conacre to offline tenant unaffected by the Proposed Scheme. Impacts on the conacre tenant are outlined in Datasheet 021-240.
Single Farm Payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all rented in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The proposed scheme will result in a total loss of 1.53ha out of 5.43ha farm equating to 28% of the productive land. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight. There would be no severance as a result of the Proposed Scheme.	

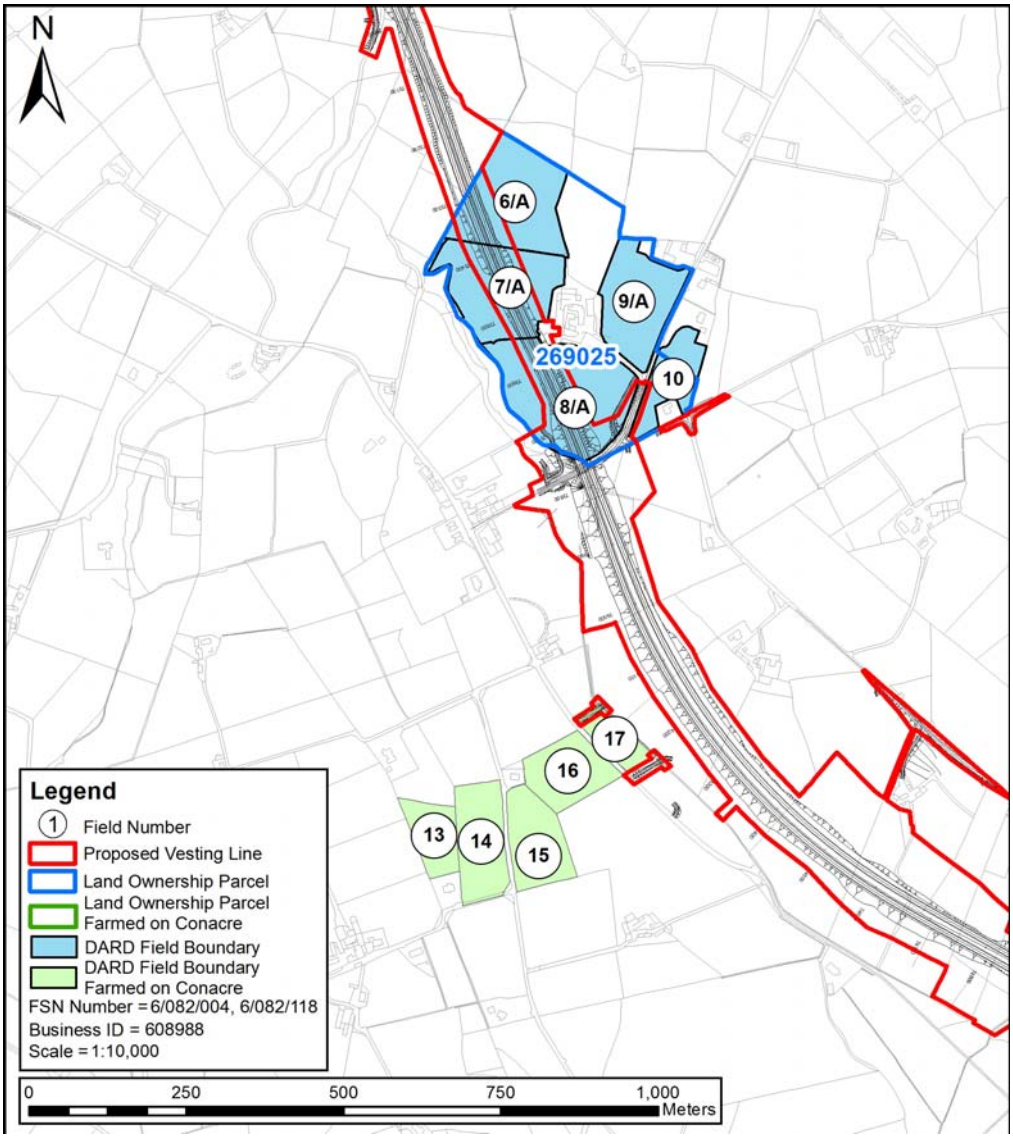
© Mouchel 2016

Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse.**

© Mouchel 2016

Land Parcel Ref	269025	**DARD Business Ref**	608988
		Data sources	March 2010 meeting. No feedback from 2013 AIA letters or land confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Conacre affected at FSN 6/082/118		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 70.75ha, of which 34.41ha is owned land, with the remainder being rented in conacre (including FSN 6/082/118).

The farm is all in grass.

Land parcel 269025 is shown on Figure 15.16 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a herd of 120 dairy cows with a herd average of approximately 7,000 litres. In addition there are approximately 80 young stock retained as herd replacements. There are approximately 200 cattle on the herd list.

Store lambs purchased in the autumn are grazed and finished during the winter.

The home farm, field Nos 6-10, is 12.65ha and provides the grazing platform for the dairy herd, with access to a further 16.2ha of conacre land (including FSN 6/082/118).

Conacre Arrangement	Additional land is rented in conacre. The majority of the coancre is unaffected by the proposed scheme. A negligible are will be taken from FSN 6/082/118 by the proposed scheme as outlined in the above plan.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, and also on some conacre land.
Nitrates Directive	The landowner is not sure regarding implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Most of the farm is registered Disadvantaged Area (DA), and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

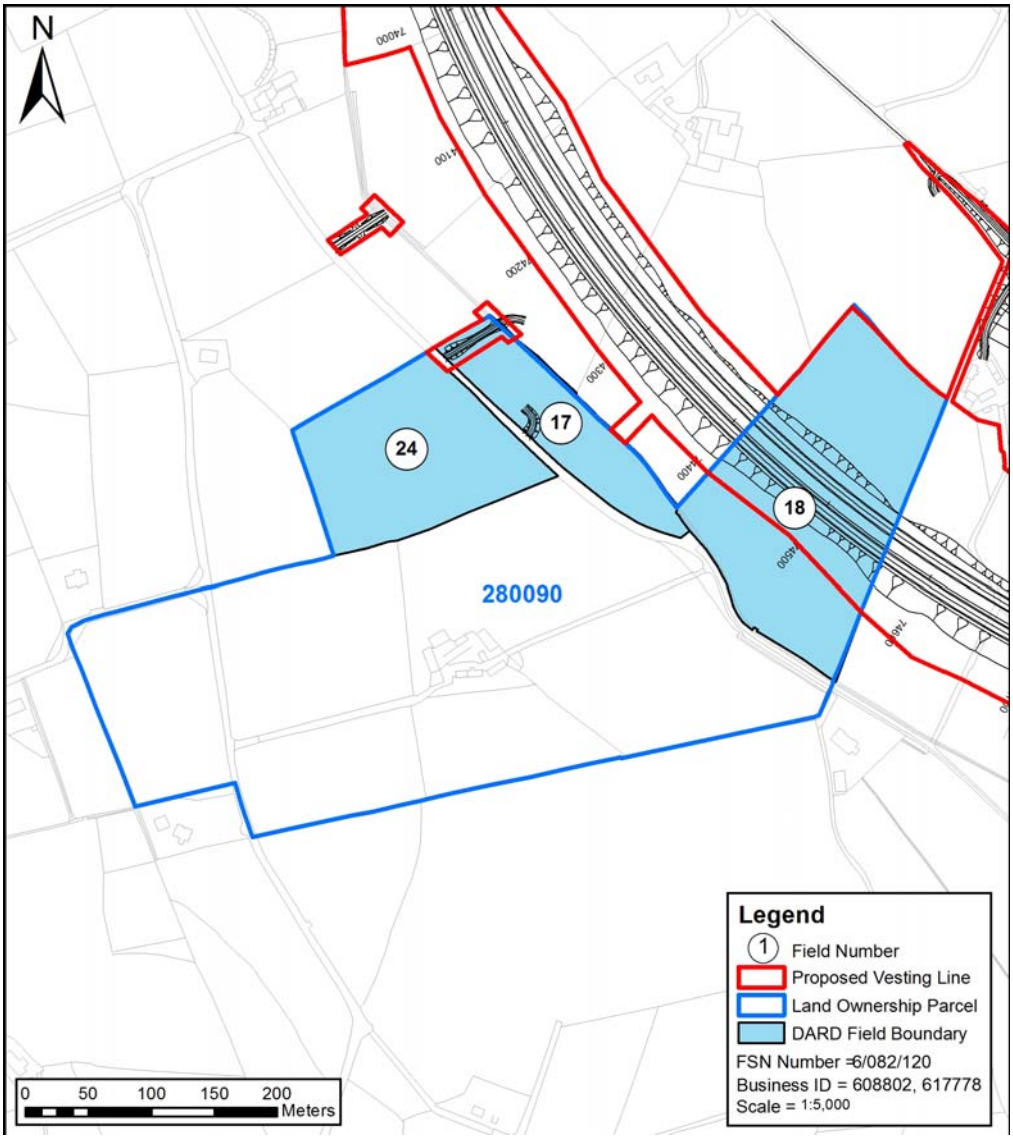
Predicted Impacts The proposed scheme will result in a total loss of 3.62ha out of 70.75ha farm equating to 5% of the owned land (fields 6, 7, 8) and conacre land (shown on the map). The landtake would include a section of land utilised as the grazing platform for the dairy herd. Under the Nitrates Directive there may be implications for the farm. The landtake impacts would be substantial. New severance would impact on the farm. Access would be provided via the realigned Rockmore Road adjoining fields 8 and 18 to enable movement of the dairy herd onto the grazing platform. The severance impacts would be moderate. As a result of the proposed scheme a slurry pit would be demolished. The demolition of this slurry pit would be a moderate impact. There would be temporary impacts during the construction phase of the Proposed Scheme.
Proposed Mitigation During the construction phase access to land would be maintained.

Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **substantial adverse** to the extent that the farms may no longer be viable.

© Mouchel 2016

Land Parcel Ref	280090	**DARD Business Ref**	608904
		Data sources	September 2010 meeting. 2013 AIA letters not returned and minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Let in conacre.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm business. These maps do not convey legal ownership.***



© Mouchel 2016

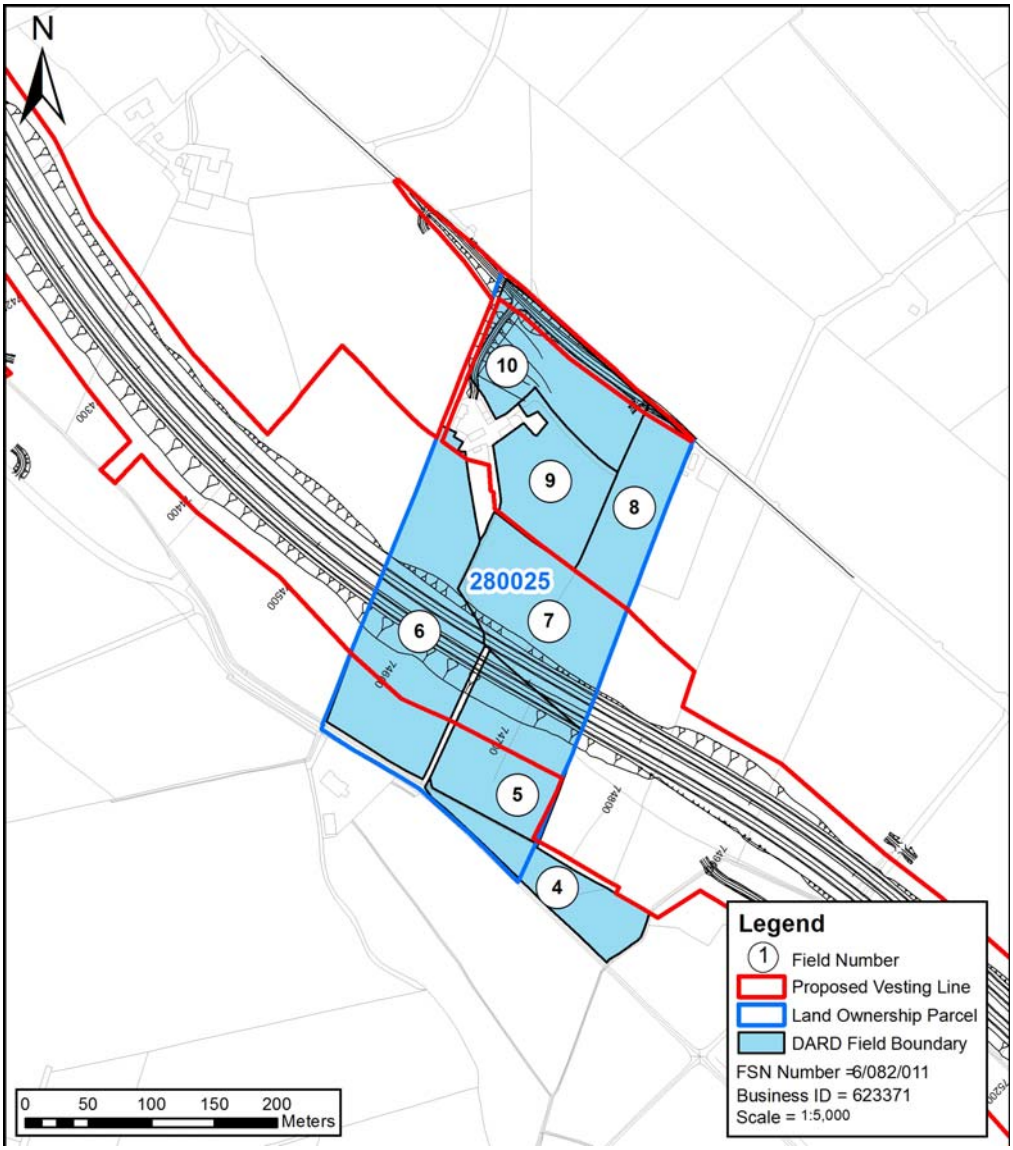
Size and Quality of Farm	
The farm extends to 46.76 ha of owned land, which is all in grass. Land parcel 280090 is shown on Figure 15.16 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry	
The land is all rented out in conacre.	
Conacre Arrangement	All let out in conacre, Datasheet 228.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Since the land is all rented out in conacre, the land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts	
The proposed scheme will result in a total loss of 2.37ha out of 46.76ha farm equating to 5% of the productive land. This would include land from the east of the parcel. As the land is currently rented out in conacre, the landtake impacts would be slight. There would be no severance as a result of the Proposed Scheme.	
Proposed Mitigation	
No mitigation measures would be proposed.	
Residual Effects	The overall impact of the Proposed Scheme on the farm business would be **slight adverse.**

© Mouchel 2016

Land Parcel Ref	280025	**DARD Business Ref**	616948
		Data sources	July 2010 AIA meeting. No feedback from 2013 AIA letters or Landowner confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 23.91ha, which is all in grass.

Land parcel 280025 is shown on Figure 15.17 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a herd of 14 suckler cows, which are all carried through to finish. There are 31 cattle on the herd list.

A well near the corner of Field No 5 supplies water, which is transported to provide water to stock on the out farm, since there is no mains water supply to the out farm.

Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	While the land is classified Disadvantaged Area (DA) the landowner does not collect payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 3.49ha out of 23.91ha farm equating to 15% of the productive land.
. The landtake would be from Fields 5, 6 and 7. The landtake impacts would be moderate.

New severance would also impact on the farm. The farmyard would be connected to Newtownsaville Road by a farm lane and underpass. Access to the severed land would also

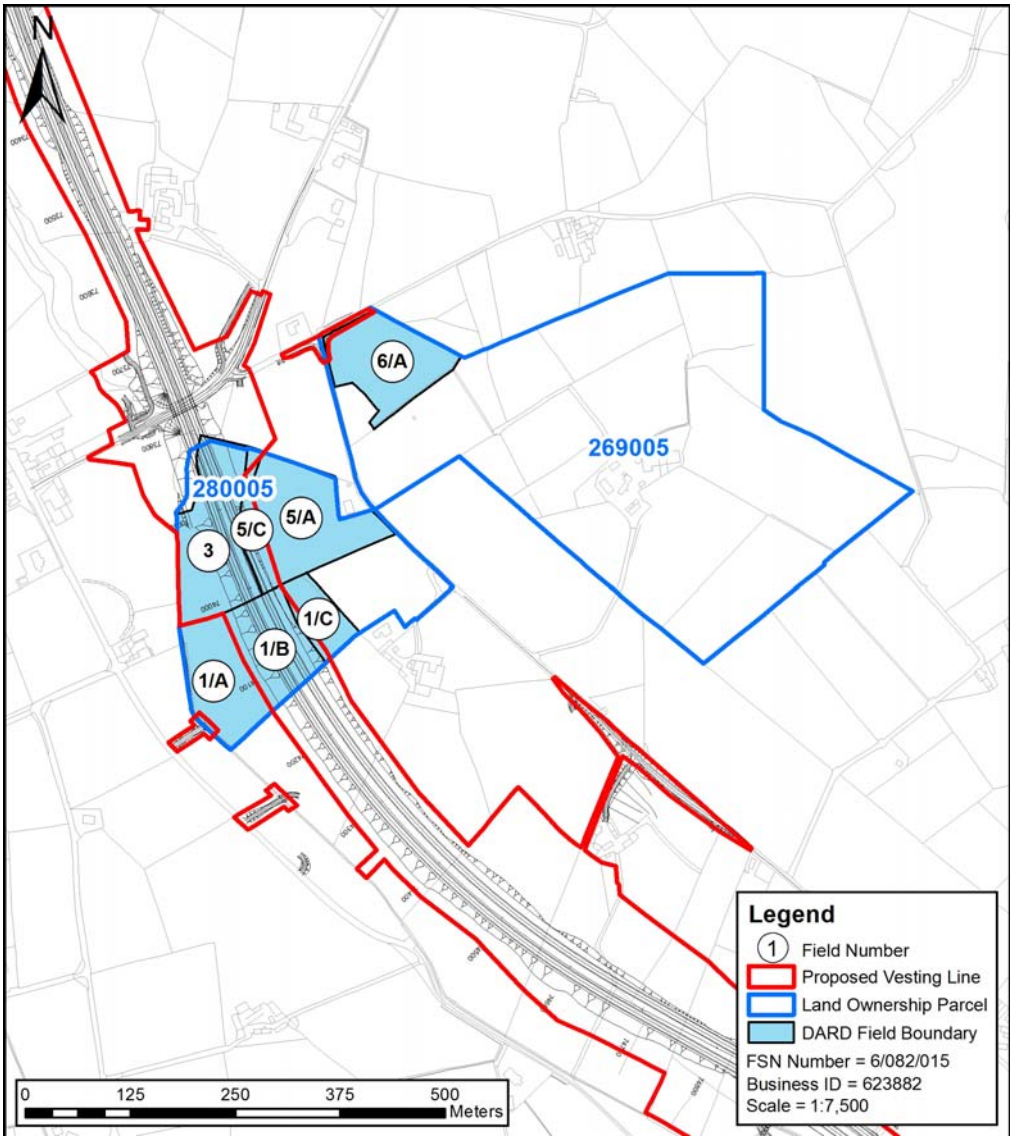
© Mouchel 2016

be provided via the underpass and Newtownsaville Road. Severance impacts would be moderate. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would need to be maintained.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	280005, 269005	**DARD Business Ref**	623882
		Data sources	2010 AIA meeting. Land confirmation meeting held. October 2014 meeting
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 40.59ha, of which 27.17ha is owned land, which is all in grass with the exception of Field No 6A, which is planted out under the DARD Farm Woodland Scheme. Land parcel 280005 is shown on Figure 15.16 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The farm runs a herd of approximately 50 suckler cows and 2 bulls, with all the progeny being either reared and sold as strong stores or finished as beef. There are approximately 100 cattle on the herd list. In addition, approximately 40 -50 store lambs are bought in each autumn and carried through to finish.	
Conacre Arrangement Approximately 13.42ha of land is rented in coancre from two landowners. This land is unaffected by the Proposed Scheme.	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

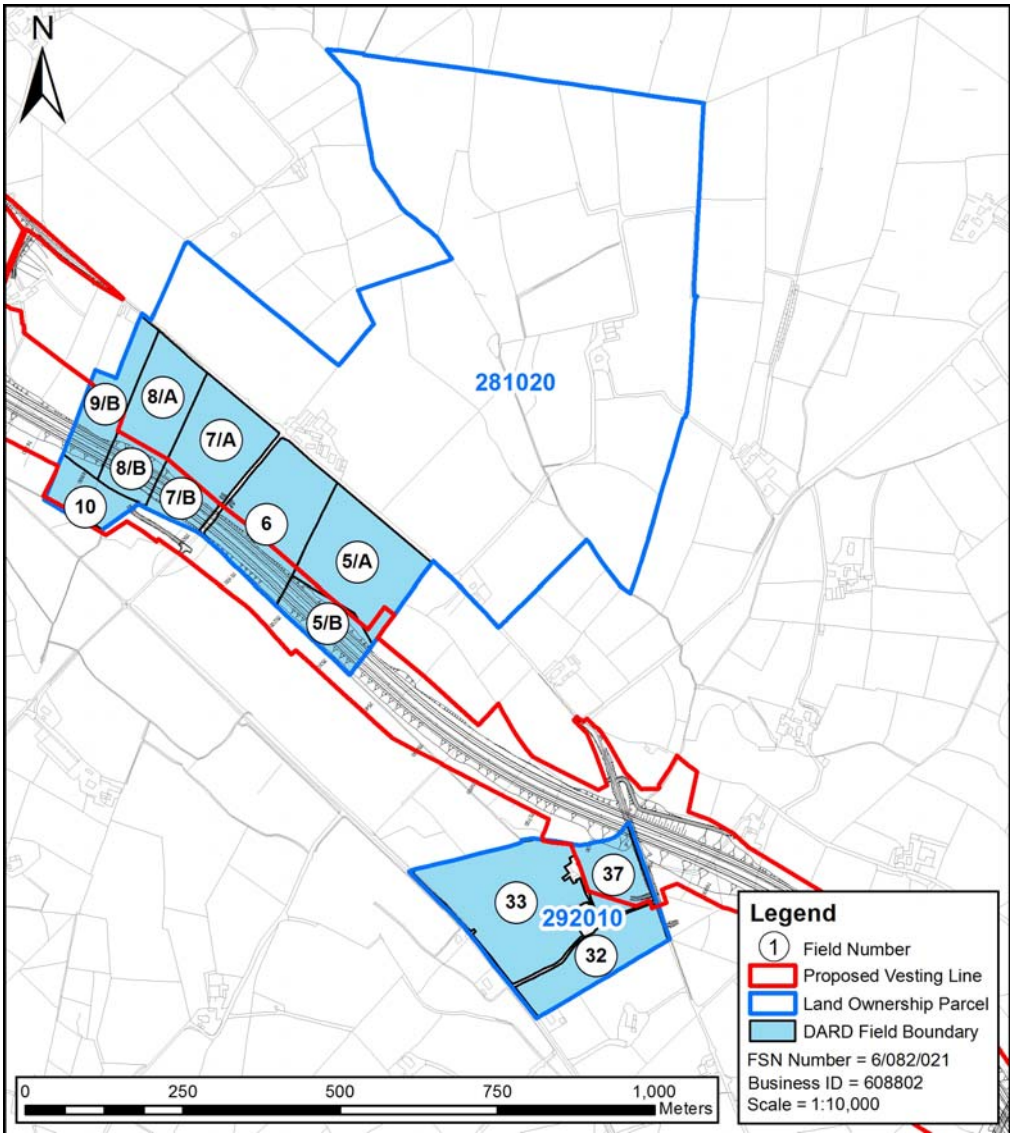
© Mouchel 2016

Predicted Impacts The main impacts on this farm will be severance and land-take. The proposed scheme will result in a total loss of 2.49ha out of 27.17ha farm equating to 9% of the productive land.	
Proposed Mitigation During the construction phase access to land would be maintained.	
Residual Effects	The overall impact of the Proposed Scheme on the farm is a **slight adverse**.

© Mouchel 2016

Land Parcel Ref	281020, 292010	**DARD Business Ref**	608802
		Data sources	April 2010 AIA meeting. 2013 AIA letter not returned and minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 125.3ha, of which 86.80ha is owned land. Conacre extends to 38.5ha and is taken from three landowners. Land parcel 281020 is shown on Figure 15.17 Environmental Statement Land Ownership Boundaries. Land parcel 292010 is shown on Figure 15.17 Environmental Statement Land Ownership Boundaries. The farm is run as a partnership.	
Type of Enterprise and Husbandry The farm runs a large dairy herd of 170 cows plus 2 bulls, with a herd average of 7,500 litres. All the calves are reared either as heifer replacements or as bulls for beef. There are approximately 400 cattle on the herd list. The farm also runs a pig unit containing 60 sows on a birth-to-bacon system. There is a farmyard on the out-farm (adjacent to field No 37) and stock are wintered here, with a requirement for access on a daily basis.	
Conacre Arrangement	Approx. 38.5ha of land is rented in conacre which is unaffected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land and also on some conacre land.
Nitrates Directive	Given the high cattle stocking rate, in association with the pig unit, the farm is already on the limit of 170kg of organic nitrogen per ha. Consequently, any loss of land may have implications for stocking rates, finding replacement land or exporting slurry in order to ensure compliance with the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Some of the land is classified Disadvantaged/Severely Disadvantaged Area (DA/SDA) and is eligible for payments under LFACAS.

© Mouchel 2016

Biosecurity	There are no issues of biosecurity that are not already being addressed.

Predicted Impacts

The proposed scheme will result in a total loss of 6.77ha out of 86.8ha farm equating to 8% of the productive land.
This would include land from parcel 281020 and 292010. Under the Nitrates Directive, land-take may impact on future compliance. The landtake would be a moderate impact to the farm.

Access to the out farm (parcel 292010) may be compromised. Due to Coremore Road being stopped up large vehicles would need to be diverted up Tullanafoile Road which is currently unsuitable for such vehicles. Severance would be a substantial adverse impact to the farm.

Proposed Mitigation

During the construction phase access to severed land would be maintained.

Predicted Effects	The overall impact of the proposed scheme on the farm would be a **substantial adverse** impact.

© Mouchel 2016

Land Parcel Ref	281035	**DARD Business Ref**	629096
		Date of Visit	September 2010. No response to 2013 AIA letters or land confirmation meeting. Minor changes to the scheme only.

© Mouchel 2016

Size and Quality of Farm The farm extends to 8.6ha of owned land which is all in grass. Land parcel 281035 is shown on Figure 15.17 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The landowner retains Field Nos 3, 5 & 6 (not shown on the map) for grazing leisure horses, while the remainder is rented out in conacre.	
Conacre Arrangement	Affected fields 11, 12, 21, 22 are let in conacre.
Single Farm Payment	The landowner collects the Single Farm Payment on Field Nos 1-3 & 5 & 6 only.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is not eligible under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The proposed scheme will result in a total loss of 1.67ha out of 8.6ha farm equating to 19% of the productive land. . Land would be taken from Field Nos 11, 12, 21 and 22. The landtake impacts would be slight. There would be no severance as a result of the Proposed Scheme.	
Proposed Mitigation No mitigation would be required.	

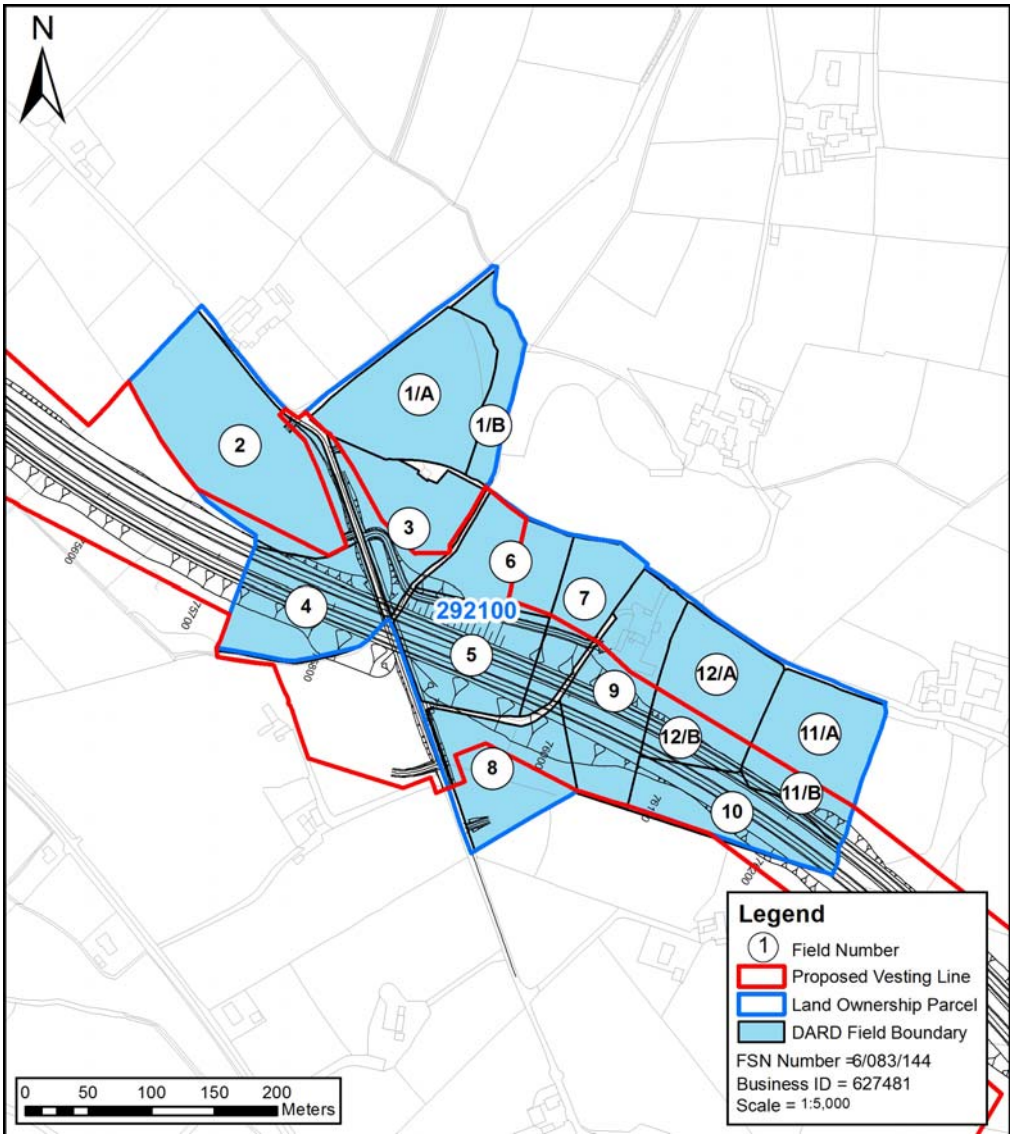
© Mouchel 2016

Residual Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	292100	**DARD Business Ref**	627481
		Data sources	2010 AIA meeting. Responded to 2013 AIA letters and land confirmation meeting. October 2014 AIA meeting
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 11.57ha of owned land, with all the agricultural land in grass. Land parcel 292100 is shown on Figure 15.17 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry	
The landowner runs a flock of 15 ewes producing approximately 22 lambs which are finished for slaughter.	
Conacre Arrangement	N/A
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme. Field Nos 1B and 8 are wooded.
Less Favoured Area Compensatory Allowances Scheme	As the farm is classified as Disadvantaged Area (DA) it is eligible for payment under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

Predicted Impacts

The proposed scheme will result in a total loss of 5.62ha out of 11.57ha farm equating to 49% of the productive land. This would include land for the Proposed Scheme and shared farm lanes connecting Tullanafoile Road.

Severance would impact on the farm house, new access would be provided via the Tullanafoile Road. The severance impacts would be slight.

As a result of the Proposed Scheme a slurry pit will be demolished. The demolition of the slurry pit would be a slight impact. The main impacts on this farm are severance and land take.

© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be provided.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	292080	**DARD Business Ref**	617778
		Data sources	June 2010 AIA meeting. No response to 2013 AIA letters or land confirmation meeting. Minor changes to the scheme only.

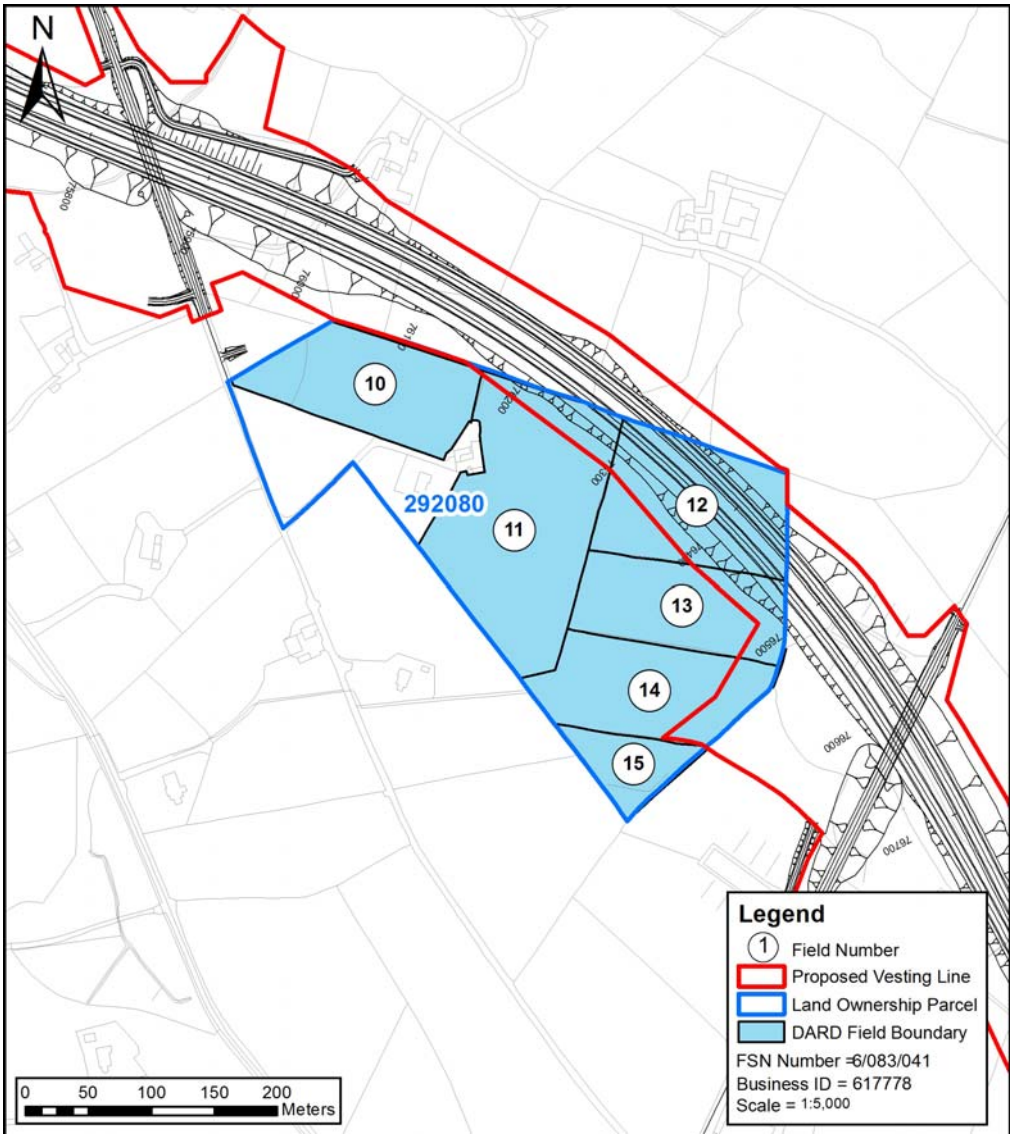
Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The land is split into two parcels, and farmed as two separate farms.

The farm extends to 16.53 ha which is all in grass.

Land parcel 292080 is shown on Figure 15.17 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a herd of 10 suckler cows plus a bull, with calves being sold as suckled calves in the autumn.

Part of the farm (Field Nos 11, 12 & 13) is rented out in conacre.

Conacre Arrangement	Part of the farm (Field Nos 11, 12 & 13) is rented out in conacre to the landowners brother, who's owned land is unaffected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and, with the exception of Field Nos 11, 12 & 13, which are rented out in conacre, the land is eligible for payments under LFACAS, which are paid to James Allen.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 1.94ha out of 16.53ha farm equating to 12% of the productive land.

As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

© Mouchel 2016

There would be no severance as a result of the Proposed Scheme. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

© Mouchel 2016

Size and Quality of Farm

The farm extends to 15.81 ha of owned land, which is all in grass.

Land parcel 292050 and 292065 are shown on Figure 15.17 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm buys in approximately 12 store cattle at 350 kg liveweight, carrying them through for sale as strong stores.

During the late autumn/winter, sheep are grazed on a “bed and breakfast” basis.

The landowner farms Field Nos 2, 5B, 6 (not shown on the map). Field Nos 9, 11B and part of Field No 2 are planted under the DARD Farm Woodland Scheme.

Conacre Arrangement	Land affected by the Proposed scheme is farmed by the landowner. Part of the land parcel outside the Proposed Scheme corridor is rented out in conacre to three landowners.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Since most of the land is rented in conacre, the land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 3.97ha out of 15.81ha farm equating to 25% of the productive land. This would include land from both parcel 292050 and 292065. The landtake impact would be **slight adverse**.

There would be no severance as a result of the Proposed Scheme.

© Mouchel 2016

There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**.

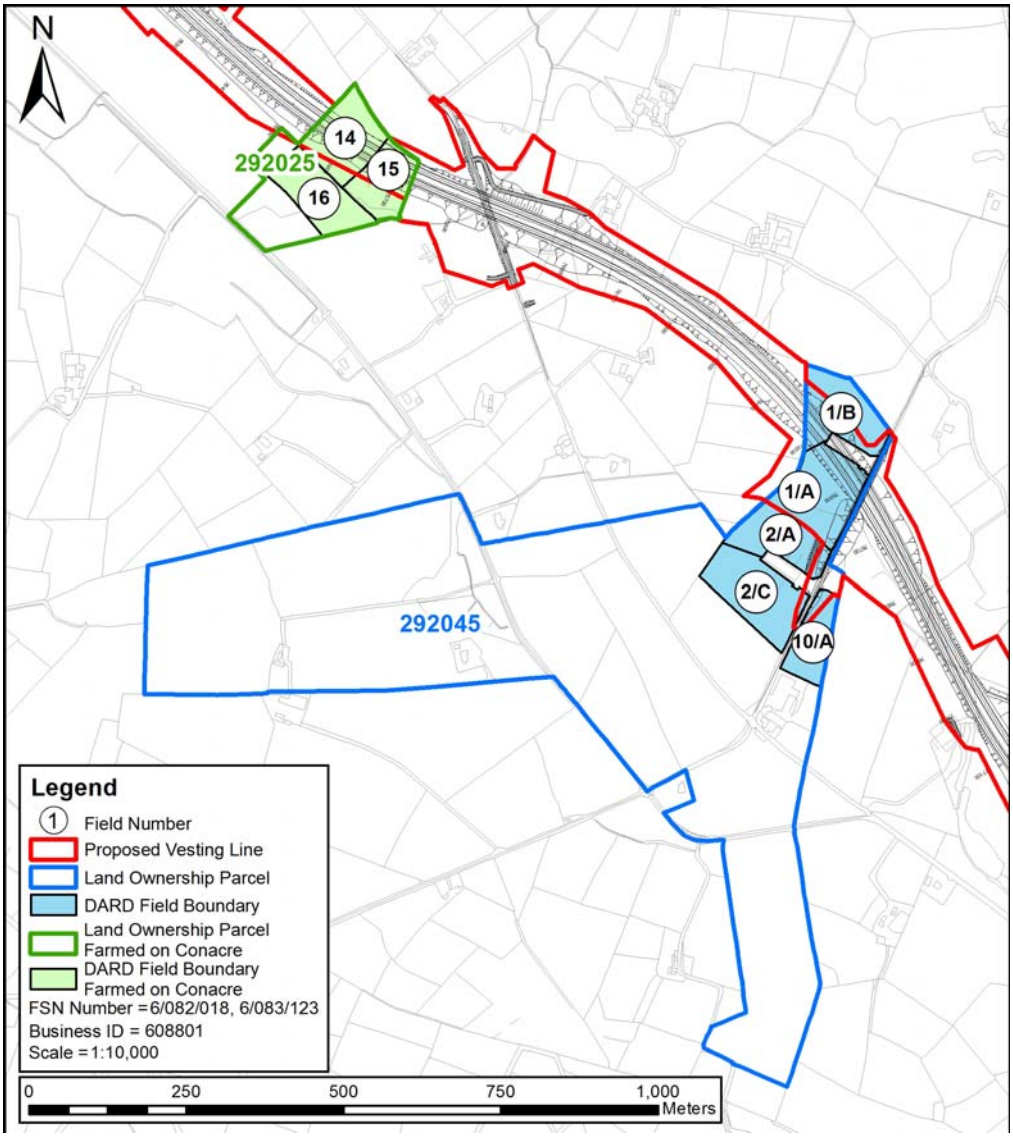
Land Parcel Ref	292045	**DARD Business Ref**	608801
		Data sources	September 2010 AIA meeting. 2013 AIA letter feedback stated no change to the farm and minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Conacre let from Parcel 292025 landowner, Datasheet 021-154		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends 77.95ha which includes 10.01ha of conacre some of which is affected by the Proposed Scheme. The land is all in grass. Land parcel 292045 and conacre land parcel 292025 are shown on Figure 15.17 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The farm runs a dairy herd of 100 cows with a herd average of approximately 7,000 litres per cow. Approximately 50 young stock are reared as herd replacements. Approximately 20 bull calves are reared and finished for beef. There are approximately 170 cattle on the herd list. The farm also runs 3 broiler houses, each containing 7,400 free-range organic broilers, with 6 – 7 crops per annum.	
Conacre Arrangement	10.01ha of land is rented in conacre from parcel 292025, (datasheet 021-154). This conacre is affected by the proposed scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land and also on conacre land.
Nitrates Directive	Based on the contribution of organic nitrogen from the 3 broiler houses, together with the cattle on the farm, land-take for the Road Scheme may have implications under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	This is a dairy farm, and the land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been addressed.

© Mouchel 2016

Predicted Impacts

The proposed scheme will result in a total loss of 2.87ha of owned land and 1.56ha of land taken in conacre. This equates to 5.68% of the productive land. This would include land from the north east of the land parcel.

New severance would impact upon the farm. Access to the severed land would be provided along Tycanny Road underbridge. The severed land areas are too small to be agriculturally viable.

One of the three broiler houses would be demolished as a result of the Proposed Scheme.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

No mitigation would be proposed.

Predicted Effects	The loss of 5.68% of the available productive land would have a slight impact on the farm's potential output and constitute a slight effect on the farm. The field severance constitutes a moderate effect on the farm. The demolition of the broiler house is considered to constitute a substantial effect on the farm. The overall impact of the Proposed Scheme on the farm would be **substantial adverse**.

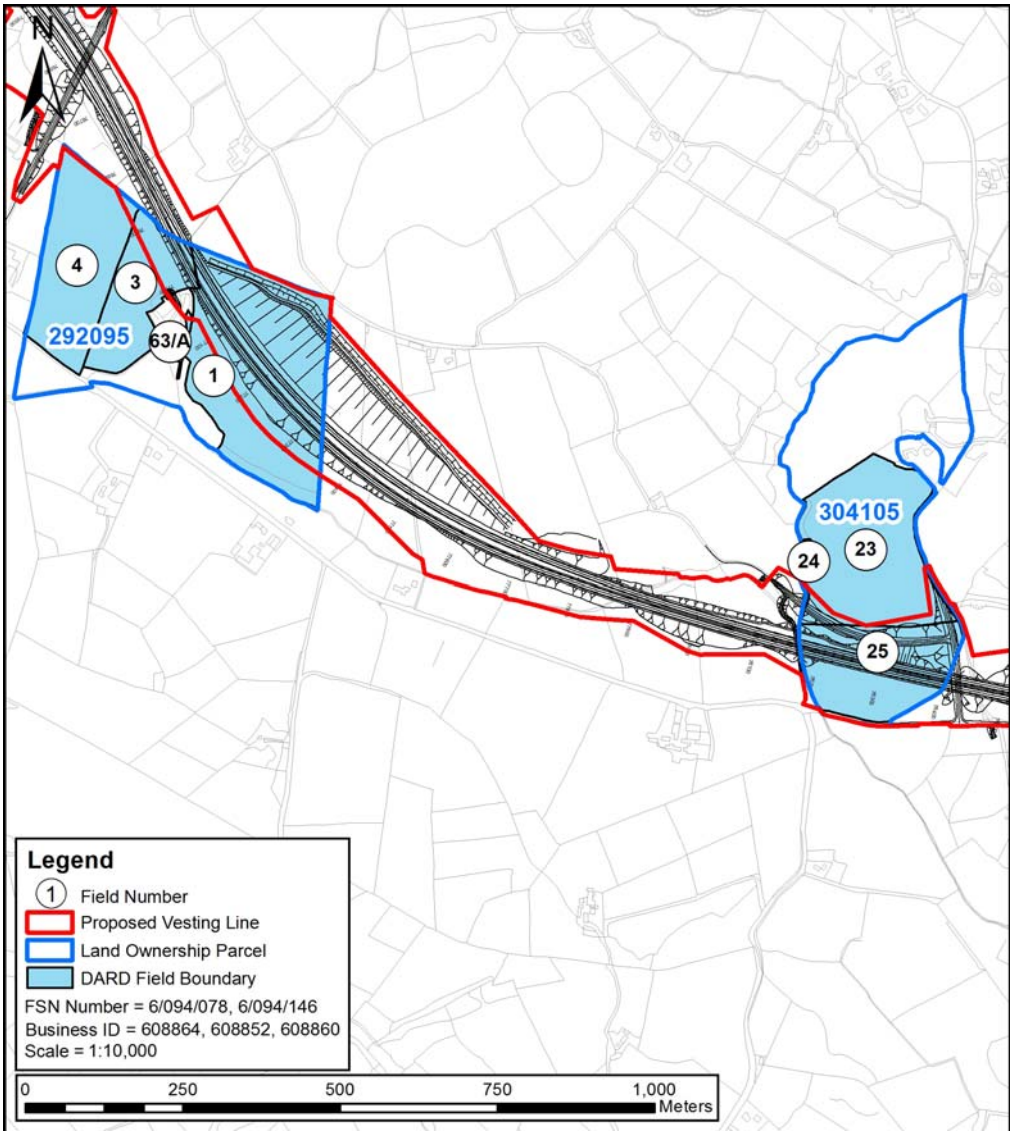
Land Parcel Ref	292095, 304105	**DARD Business Ref**	608852
		Data sources	March 2010 AIA meeting. Landowner confirmation meeting identified no change to farm and minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The partnership farms a total of 173.82ha, with 69.27ha currently being farmed by the landowner.

The land is divided up in several parcels, which are several miles apart, separate from the home farm.

Land parcel 292095 and 304105 are shown on Figure 15.17 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a dairy herd, consisting of 30 cows and one bull, with a herd average of 8,000 litres. In addition, the farm runs approximately 40 dairy herd replacements. The bull calves are all finished as beef, along with any heifers not required for replacements.

Grazing for the dairy herd is all on the home farm.

Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on land currently registered to him (69.27ha).
Nitrates Directive	Under the Nitrates Directive there may be implications to the farm
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area / Severely Disadvantaged Area (DA/SDA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 9.74ha out of 173.82ha farm equating to 6% of the productive land.

Under the Nitrates Directive there may be implications to the farm. The landtake impacts would be substantial.
There would be no severance as a result of the Proposed Scheme.

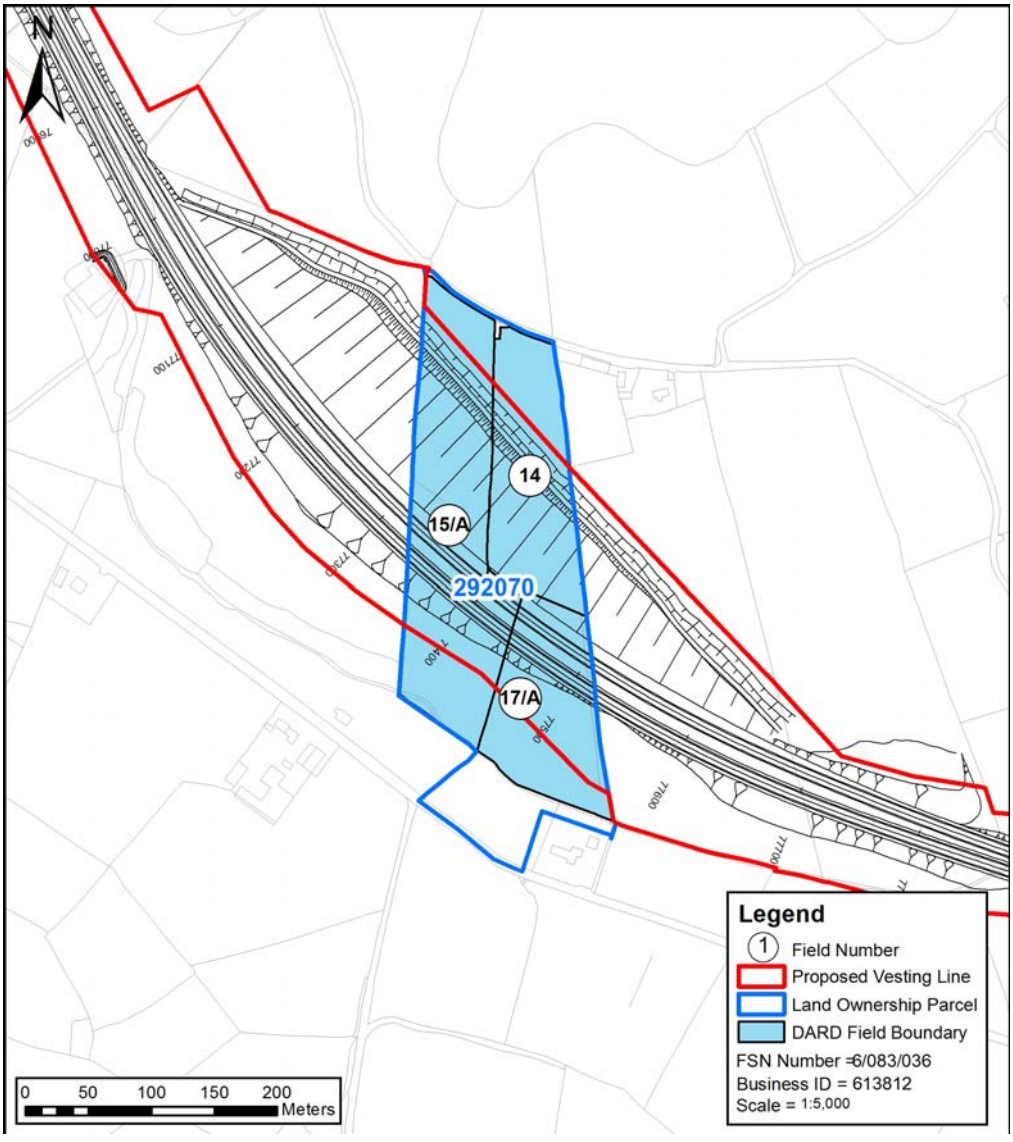
© Mouchel 2016

There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 6% of the available productive land would have a substantial impact on the farm's potential output. The overall impact of the Proposed Scheme on the farm would be a **substantial adverse**.

© Mouchel 2016

Land Parcel Ref	292070	**DARD Business Ref**	613812
		Data sources	June 2010 meeting. No response to the 2013 AIA letters or landowner confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 32.21ha, of which 20.14ha is owned land. The remaining land is taken in conacre from 2 other landowners, however this land is unaffected by the proposed scheme.

Land parcel 292070 is shown on Figure 15.17 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a dairy herd of 40 cows with a herd average of 6,500 litres. There are approximately 30 herd replacements on the farm.

The farm also runs a suckler herd of 8 cows and 1 bull, with all the progeny being sold as store cattle. There are approximately 90 cattle on the herd list.

The farm is grazed by sheep during the winter.

A pig unit on the farm has accommodation for approximately 400 finishing pigs, with store pigs being bought in and carried through to finish. With a 4 month turn-around, approximately 1,200 pigs are finished per annum.

A broiler unit houses 9,000 free-range broilers, although this may change to rearing turkeys. On the basis of 5 crops per annum, 45,000 birds are finished.

Since the land is being severed, there may be an issue regarding water supply to severed land. Field Nos 14, 15 & 17 are normally cut one or twice for silage, with after-grass being grazed. There may also be a requirement for handling facilities on the severed land.

Given the steep inclination of the land, normal procedure would be for machinery to work downhill, exciting via the gate in the corner of Field No 17 onto the public road.

There is also a potential problem with regard to the width of the public roadway along the northern field boundary, which would not be wide enough for 3m mowers.

Conacre Arrangement	12.07 ha of land rented in conacre. Unaffected by the proposed works.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land and also on conacre land.
Nitrates Directive	Given the intensive pig and poultry enterprises on the farm, land take may have implications for the landowner under the Nitrates Directive.

© Mouchel 2016

Countryside Management Scheme	The land is not currently registered under the Countryside Management Scheme, but application has been made to join the New Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified either Disadvantaged Area (DA) or Severely Disadvantaged Area (SDA), and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 3.4ha out of 32.21ha farm equating to 11% of the productive land. Under the Nitrates Directive, landtake may have implications on the farm. Land would be taken which is currently used for silage. The landtake impacts would be substantial.

New severance would also impact on the farm. Access to the severed land would be provided via the realigned Tycanny Road, Severance impacts would be moderate as the severed land parcels would be too small to be agriculturally viable.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

During the construction phase access to severed land would be maintained.

Predicted Effects	The loss of 11% of the available productive land would have a substantial impact on the farm's potential output and constitute a substantial effect on the farm. The field severance constitutes a moderate effect on the farm. The overall impact of the Proposed Scheme on the farm would be **substantial adverse**.

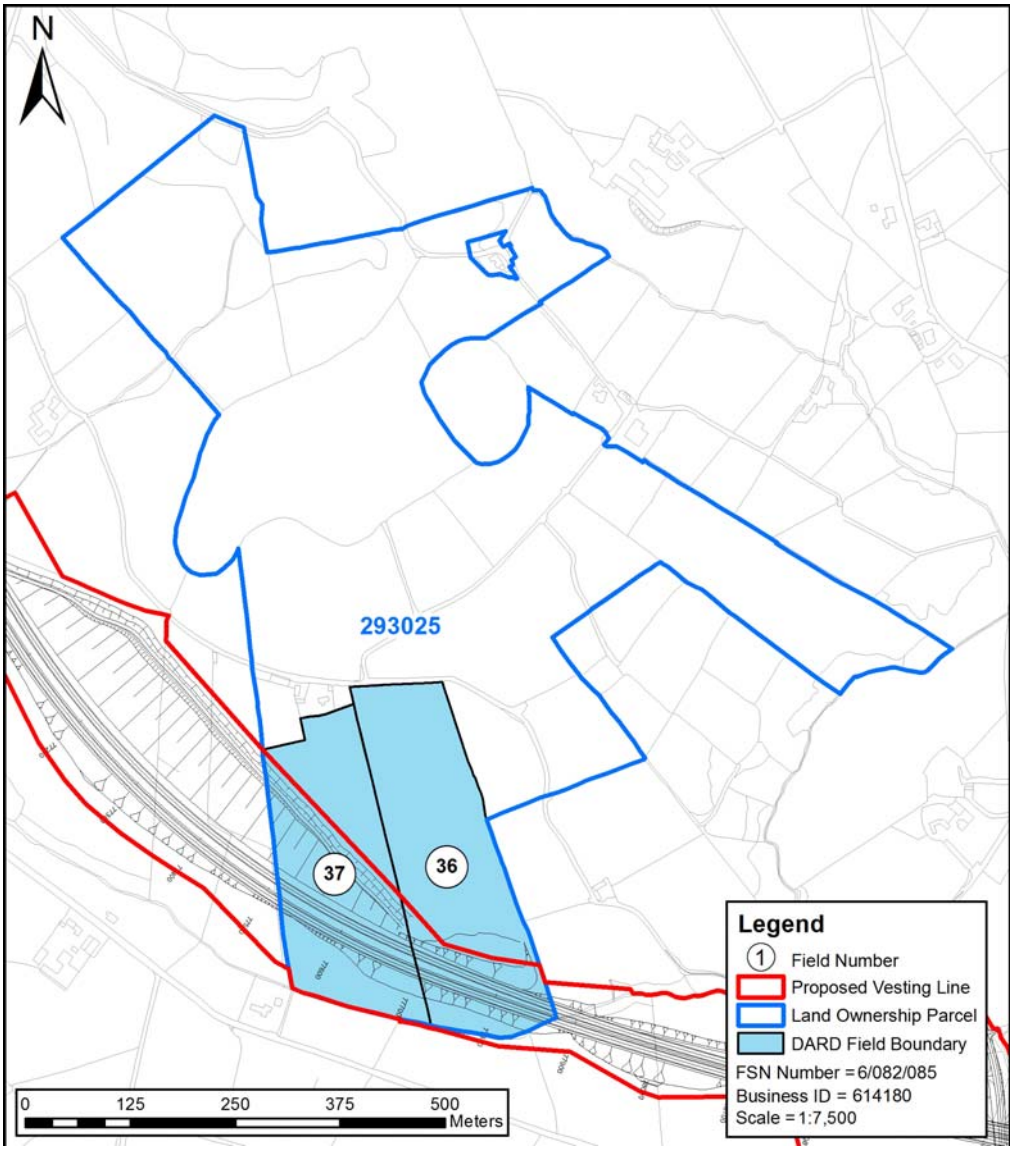
Land Parcel Ref	293025	**DARD Business Ref**	614180
		Data sources	June 2010 AIA meeting. 2013 AIA feedback stated no change to farm and minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 92.6ha of owned land, which is all in grass.

Land parcel 292025 is shown on Figure 15.17 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a herd of 100 suckler cows and 2 bulls, with all the progeny being finished for beef. There are approximately 300 cattle on the herd list.

In addition, the farm runs a flock of 70 ewes and 2 rams, producing approximately 110 lambs, which are carried through to finish. Approximately 100 store lambs are also purchased in the autumn and carried through to finish.

Field Nos 36 & 37 are utilized as grazing for beef cattle.

Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme but application has been made to join.
Less Favoured Area Compensatory Allowances Scheme	Some of the land is classified either Disadvantaged or Severely Disadvantaged Area (DA/SDA), and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 4.75ha out of 92.6ha farm equating to 5% of the productive land.

© Mouchel 2016

Landtake would be from Field No's 36 and 37. The landtake impacts would be slight. There would be no severance as a result of the Proposed Scheme.	
Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The loss of 5% of the available productive land would have a slight impact on the farm's potential output and constitute a slight effect on the farm. The overall impact of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

© Mouchel 2016

Size and Quality of Farm

The farm extends to 44.35ha of owned land, which is farmed in partnership. Land rented in conacre extends to 16.19ha.

Land parcel 304020 and 304025 are shown on Figure 15.17 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a dairy herd of 60 cows and 1 bull, with approximately 20 herd replacements. All the bull calves and heifers not retained for breeding are reared and sold as store cattle. There are approximately 130 cattle on the herd list.

In addition, the farm runs a flock of 50 ewes and 4 rams, producing approximately 85 lambs which are carried through to finish. Ewe numbers can fluctuate up to 130, as ewes are bought and sold, depending on the market.

Conacre Arrangement	16.19ha of land rented in conacre, unaffected by the proposed works.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	This being a diary farm, the land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 4.78ha out of 44.35ha farm equating to 11% of the productive land. This would include land which is currently used as the grazing platform for the dairy herd. The landtake impacts would be substantial.

New severance of land parcel 304025 would also impact on the farm. Access to the severed land would be provided by an underpass and farm lane. Severance would be moderate.

© Mouchel 2016

There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would to be maintained. Access to the severed land would be provided by an underpass and farm lane.	
Predicted Effects	The overall impact of the proposed A5WTC on the farm would be a **substantial adverse** impact.

© Mouchel 2016

Size and Quality of Farm The farm extends to 24.91ha, which is all in grass. Land parcel 304095 is shown on Figure 15.17 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The farm runs a suckler herd of 27 cows and 2 bulls, plus a further 7 heifers due to be served. Heifers are finished for beef, while bull calves are sold in the autumn as suckled calves. There are approximately 65 cattle in the herd list. The farm also runs a flock of 15 ewes and 2 rams, producing approximately 28 lambs, which are carried through to finish. A further 13 ewe lambs are being reared for replacements, taking the flock to a total of 28 ewes.	
Conacre Arrangement N/a	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all classified either Disadvantaged Area (DA) or Severely Disadvantaged Area (SDA) and is eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

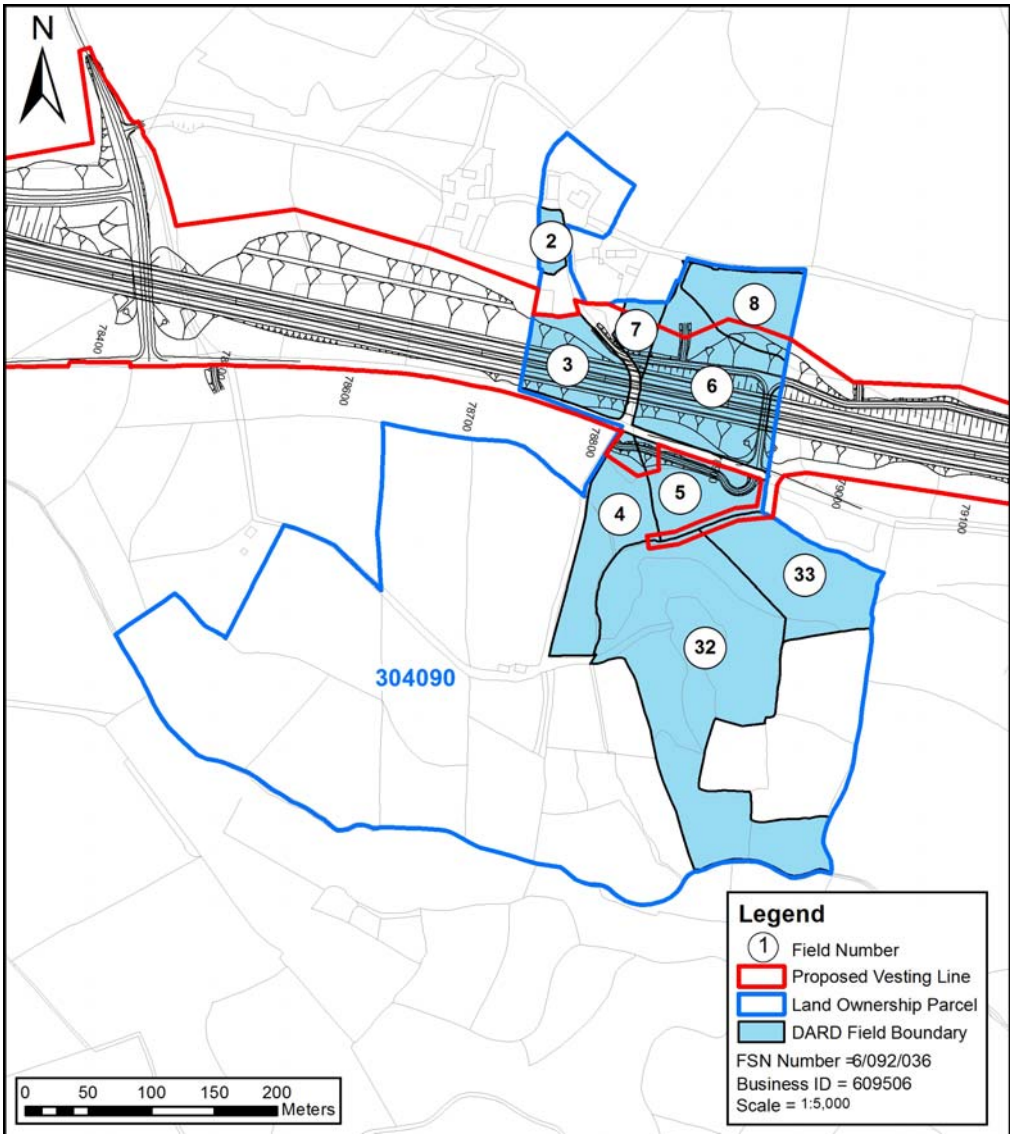
© Mouchel 2016

Predicted Impacts The main impacts on this farm are severance and land take. The proposed scheme will result in a total loss of 4.73ha out of 24.91ha farm equating to 19% of the productive land. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm is a **substantial adverse**.

© Mouchel 2016

Land Parcel Ref	304090	**DARD Business Ref**	609506
		Data sources	July 2010 AIA meeting. 2013 AIA letter feedback stated no change to farm and minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 57.58ha, of which 35.35ha is owned land. The remaining land is taken in conacre from 5 landowners who are not affected by the Proposed Scheme.

The farm is all in grass.

Land parcel 304090 is shown on Figure 15.17 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a suckler herd of 30 cows and 2 bulls, with all the progeny being finished for beef. The farm normally carries a herd of 60 cows, but stock numbers have been reduced as a result of culling.

The farm also carries a flock of 20 ewes plus a ram, producing approximately 35 lambs, which are carried through to finish. Ewe numbers are normally double this number.

Approximately 50 store heifers (300kg live-weight) are bought in for finishing for beef.

Silage (one or two cuts) is normally cut and baled on Field Nos 3, 6, 8, 17-20 & 22 (all fields are not shown on the plan above) with the remainder of the farm being grazed.

Access from the farmyard to a major portion of the farm will present the biggest challenge to this landowner.

Conacre Arrangement	22.23ha of land is rented in conacre from 5 landowners unaffected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, and also on conacre land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) or Severely Disadvantaged Area (SDA) and is eligible for payments under LFACAS.

© Mouchel 2016

Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 2.12ha out of 57.58ha farm equating to 4% of the productive land.
New severance would impact on the farm. Access to the severed land would be provided by an overpass over the proposed scheme. Severance impacts would be slight.

As a result of the Proposed Scheme a farm building would be demolished. The demolition of the building would be a moderate impact to the farm.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

During the construction phase access to severed land would be maintained.

Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Size and Quality of Farm

The farm extends to approximately 43.23ha, with 26ha being owned land and a further 14.13ha taken in conacre. With the exception of 1ha, which is planted under the DARD Farm Woodland Scheme and land under the Countryside Management Scheme, which is not farmed, the farm is in grass. Approximately 1ha of potatoes is grown in rotation on the farm.

Conacre land is rented from two landowners, both of which are unaffected by the Proposed Scheme.

An area of Field No 9 (approximately 0.5ha, from the sheugh across to the hedgerow) is now owned by another landowner.

Land parcel 305025 is shown on Figure 15.17 and 15.18 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a suckler herd of 20 cows, with the progeny all being finished for beef.

Conacre Arrangement	Conacre land is rented from two landowners, both of which are unaffected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land and one of the conacre parcels
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA), and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 10.69ha out of 43.23ha farm equating to 25% of the productive land. The landtake impacts would be **substantial adverse.**
There would be no severance as a result of the Proposed Scheme.

© Mouchel 2016

There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 25% of the available productive land would have a substantial impact on the farm's potential output and constitute a substantial effect on the farm. The overall impact of the Proposed Scheme on the farm would be **substantial adverse**.

Size and Quality of Farm	
The farm extends to 8.81ha of owned land, which is all in grass. Land parcel 305085 is shown on Figure 15.18 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry	
The farm runs a flock of 80 ewes and 2 rams, producing approximately 120 lambs, which are all carried through to finish.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified either Disadvantaged and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 1.9ha out of 8.81ha farm equating to 22% of the productive land.
Land would be required from Field Nos 1, 2, 3, 4 and 5. The landtake impacts would be substantial.

New severance would impact upon the farm. Access would be provided to the severed land via a new farm lane of the realigned Glenhoy Road. Severance impacts would be slight.

There would be temporary impacts during the construction phase of the Proposed Scheme.

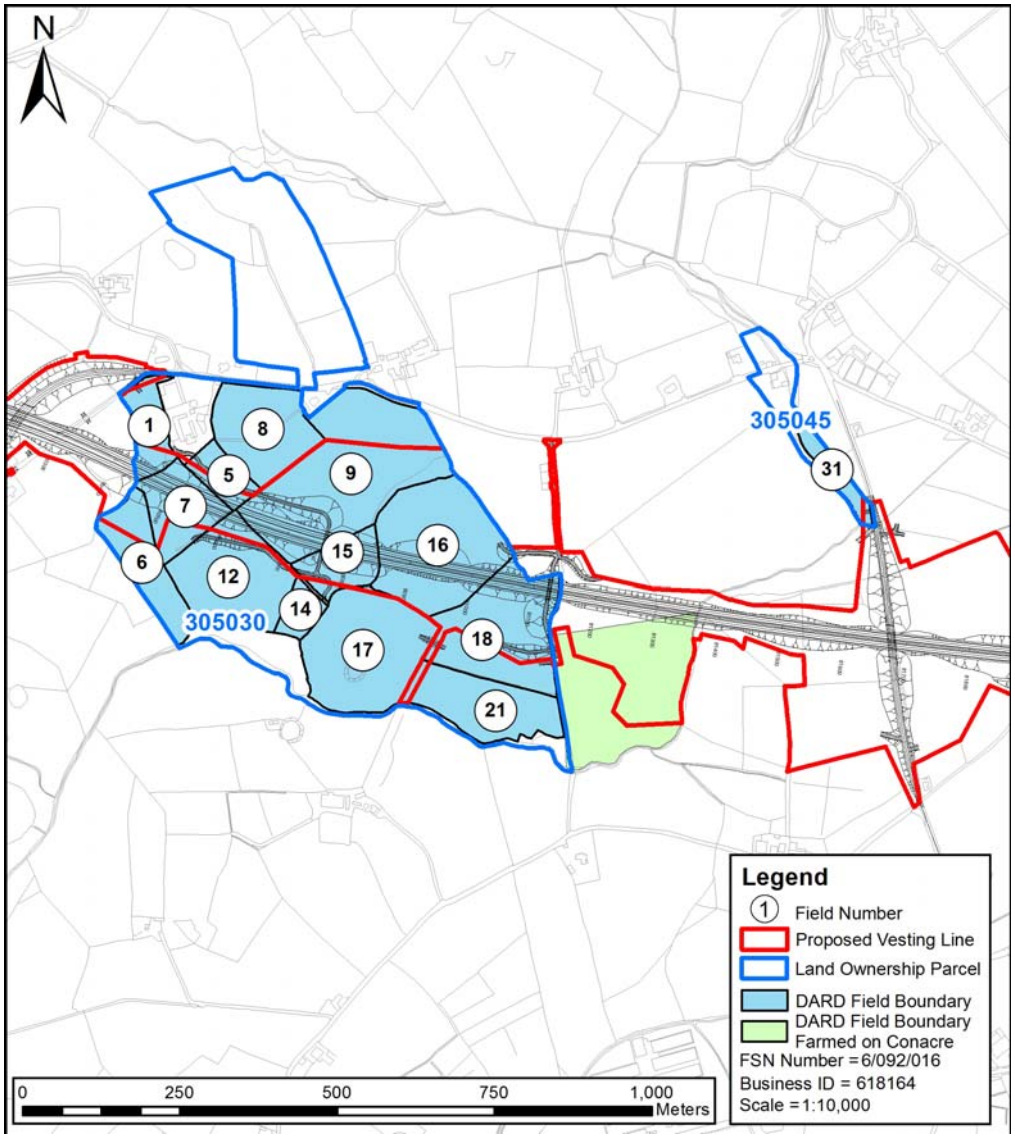
© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 22% of the available productive land would have a substantial impact on the farm's potential output and constitute a substantial effect on the farm. Severance constitutes a slight effect on the farm. The overall impact of the Proposed Scheme on the farm would be **substantial adverse**.

© Mouchel 2016

Land Parcel Ref	305030, 305045	**DARD Business Ref**	618164
		Data sources	2010 AIA meeting. Landowner confirm meeting held. October 2014 AIA meeting
Conacre Parcel Ref	Field rented in conacre from Parcel 305055 owner		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 45.19ha of owned land and is all in grass. In addition, a field from parcel 305055 (affected by the road scheme), is rented in conacre for 1 cut of silage in 2014. Land parcel 305030, 305045 and 305055 are shown on Figure 15.18 Environmental Statement Land Ownership Boundaries.
Type of Enterprise and Husbandry The farm runs a dairy herd of 60 cows and 1 bull. Holstein bull-calves are all sold at birth, with all the other calves being either reared as heifer replacements or sold as store cattle. There are approximately 100 cattle on the herd list. The cow grazing platform is centred around the farmyard and includes field Nos 1, 7 & 8, 12 & 17. Silage is normally cut off field Nos 13, 18, 21, 25 & 30, with access to field Nos 18 & 21 being off the Council lane which links the Sess Road and the Glenhoy Road. No all fields are shown in the plan above. The grazing area will be severed and access to the silage area affected by the scheme.

Conacre Arrangement	A field from parcel 305055 (affected by the road scheme), is rented in conacre for 1 cut of silage in 2014 (datasheet 021-165)
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.

© Mouchel 2016

Biosecurity	There are no issues of biosecurity that are not already being addressed

Predicted Impacts

The proposed scheme will result in a total loss of 12.2ha out of 45.19ha farm equating to 27% of the productive land. This includes land for a deposition area. Under the Nitrates Directive there may be implications for the farm. The land take is considered to be a substantial adverse impact to the farm.

New severance will also impact upon the farm. Access to the severed land will be provided via an overpass to the east of the land parcel. The severance is considered to a substantial adverse impact to the farm.

There would be temporary impacts during the construction phase of the Proposed Scheme. During the construction phase, access to severed land may be compromised.

Proposed Mitigation

Access to the severed land will be provided via a private underpass at Ch.80750 and Ch.81100.

During the construction phase access to severed land will need to be maintained.

Predicted Effects	The loss of 27% of the available productive land would have a substantial impact on the farm's potential output and constitute a substantial effect on the farm. The land take may make the farm no longer viable. Severance constitutes a substantial effect on the farm. The overall impact of the Proposed Scheme on the farm is a **substantial adverse** impact.

© Mouchel 2016

Land Parcel Ref	305055	**DARD Business Ref**	609008
		Data sources	2010 AIA letters. Landowner confirmation meeting held. October 2014 meeting
Conacre Parcel Ref	Field let in conacre to Parcel 305030 landowner

© Mouchel 2016

Size and Quality of Farm The farm extends to 17.57ha of owned land, which is all in grass. Land parcel 305055 is shown on Figure 15.18 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry This is a beef farm which buys in approximately 30 store cattle (250kg + liveweight) which are grazed during the summer, in-wintered and sold the following autumn as strong stores. There are approximately 40 cattle on the herd list. The farm also runs a flock of 30 ewes and 2 rams, producing approximately 45 lambs, which are carried through to finish.	
Conacre Arrangement	Field 8 let in conacre to Parcel 305030 landowner. Impacts on the coancre tenant are outlined in datasheet 021-164
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is not eligible under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts

The proposed scheme will result in a total loss of 4.4ha out of 17.57ha farm equating to 25% of the productive land, of which field 8 is let out in conacre.. This would include land for a flood storage area. The landtake impacts would be substantial.

New severance would also impact on the farm. Access would be provided via a shared overbridge connecting fields 6 and 7. Severance impacts would be moderate as some of the severed land will be too small to be agriculturally useful.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

During the construction phase, access to severed land will need to be maintained.

Predicted Effects	The loss of 25% of the available productive land would have a substantial impact on the farm's potential output and constitute a substantial effect on the farm. As some of the severed land will be too small to be agriculturally viable, severance constitutes a moderate effect on the farm. The overall impact of the Proposed Scheme on the farm would be **substantial adverse**.

Size and Quality of Farm The farm extends to 32.63ha of owned land, which is all in grass. Land parcel 305050 is shown on Figure 15.18 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The farm runs a dairy herd of 40 cows, with approximately 30 heifers being reared as herd replacements. In addition the farm runs a herd of 10 suckler cows, with the progeny being sold as strong stores, after being in-wintered. A pullet rearing enterprise rears 8,000 pullets to 16 weeks, producing approximately 24,000 pullets per annum. The landowner expressed concern regarding drainage from the outfall from Field No 11, since the field in liable to flood during wet weather.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

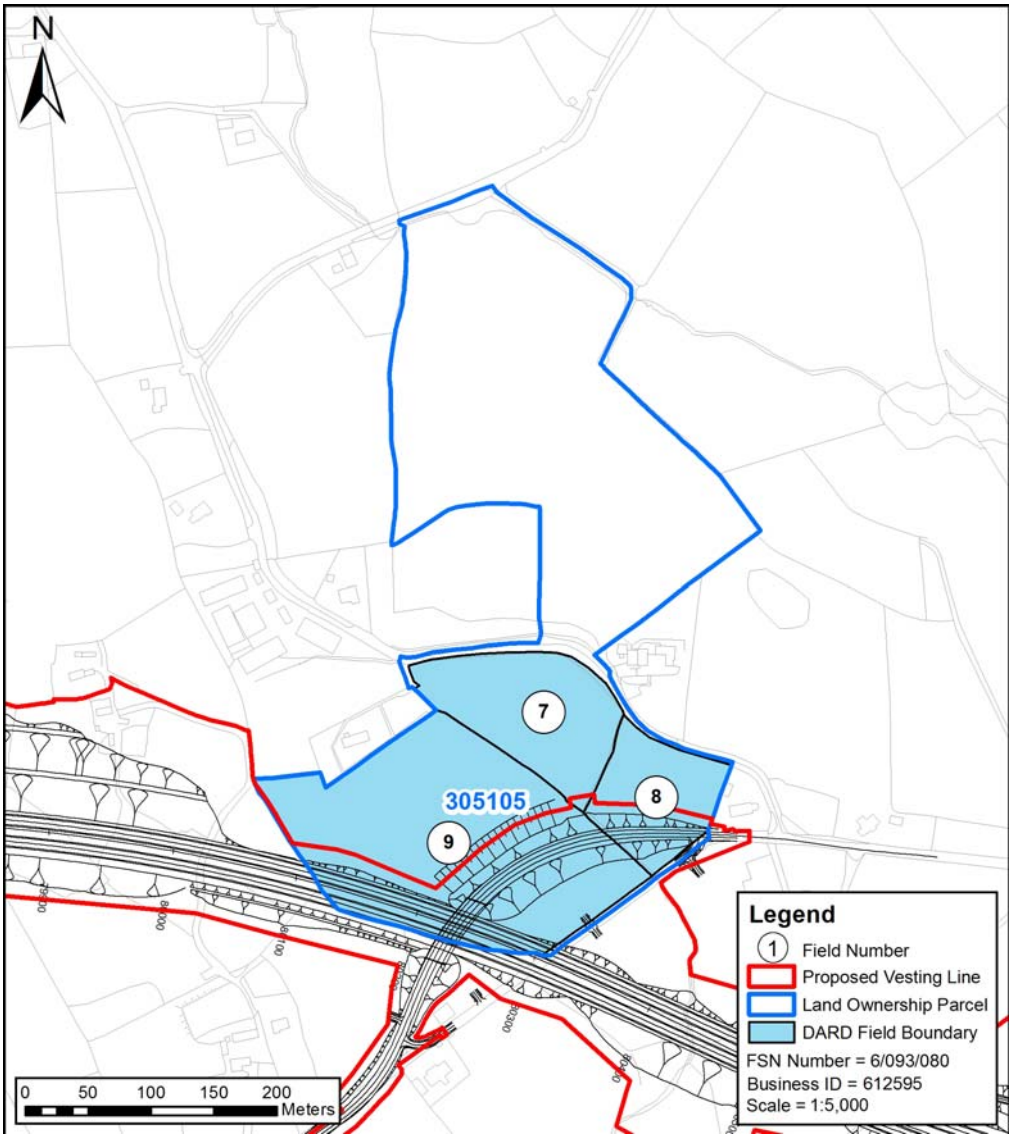
© Mouchel 2016

Predicted Impacts The proposed scheme will result in a total loss of 0.46ha out of 32.63ha farm equating to 1% of the productive land. This would include land from the south of the land parcel. The landtake impacts would be slight. There would be no severance as a result of the Proposed Scheme. The overall impact of the Proposed Scheme on the farm would be **slight adverse**.
Proposed Mitigation No mitigation would be proposed.
Predicted Effects The overall impact of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	305105	**DARD Business Ref**	612595
		Data sources	2010 AIA meeting. Landowner confirmation meeting held. October 2014 AIA meeting
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 54.01ha of owned land, with a further 6.48ha being taken in conacre, which is not affected by the Road Scheme.

The farm is all in grass.

Land parcel 305105 is shown on Figure 15.18 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a herd of approximately 40 suckler cows and 1 bull, with all the progeny being finished as beef. Approximately 250-300 store cattle (400+kg liveweight), are purchased annually for finishing as beef.

The farm also runs a flock of 200 ewes and 3 rams producing approximately 340 lambs which are carried through to finish. In the autumn approximately 400-500 store lambs are purchased in for finishing.

Conacre Arrangement	6.48ha of land rented in conacre, which is unaffected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, and also on the conacre land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme but the scheme is now finished.
Less Favoured Area Compensatory Allowances Scheme	Some of the land is classified Disadvantage Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 2.12ha out of 54.01ha farm equating to 4% of the productive land.

The main impact to this farm is land-take.

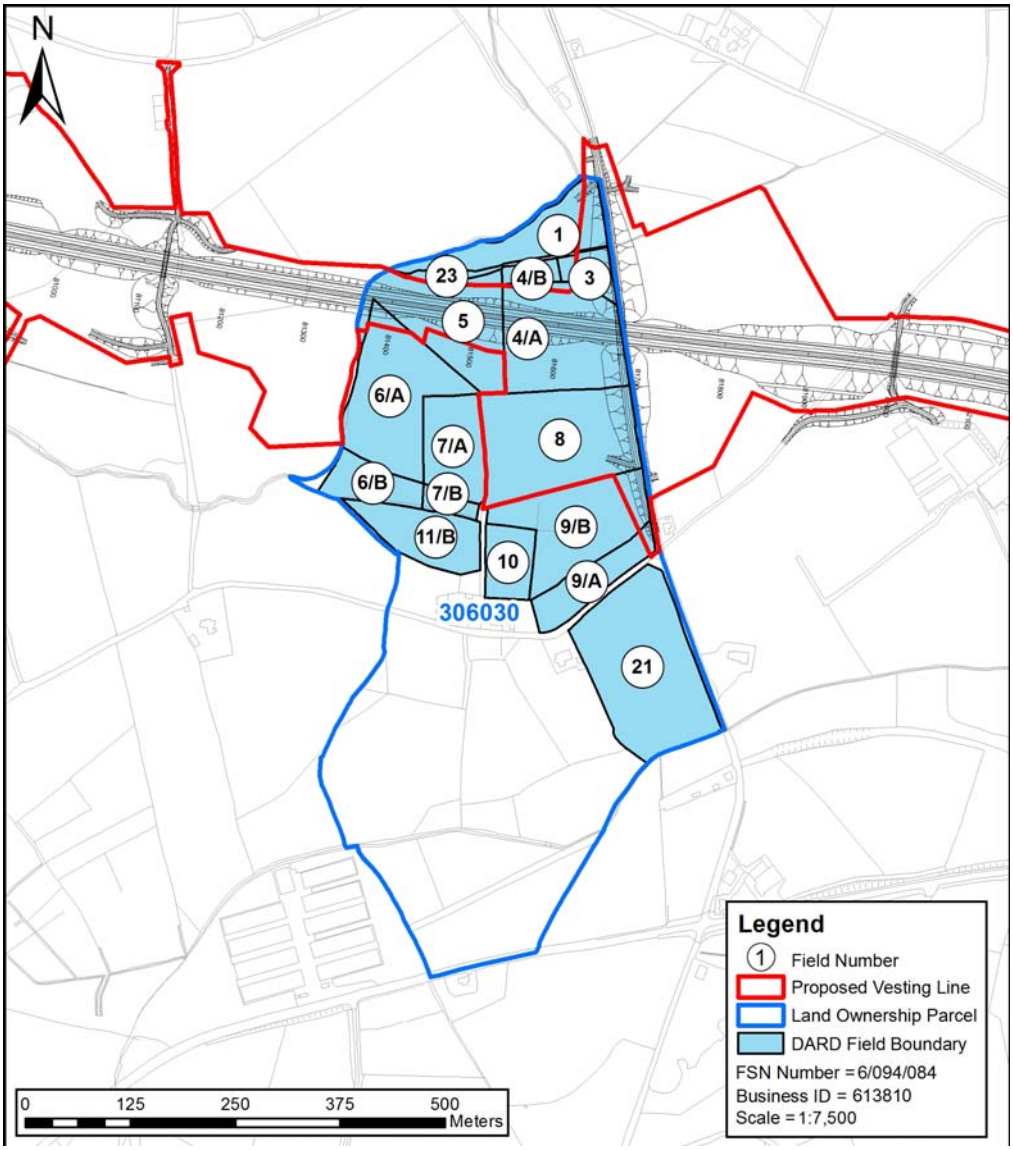
© Mouchel 2016

There is not severance as a result of the Proposed scheme. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	306030	**DARD Business Ref**	613810
		Data sources	April 2010 AIA meeting. 2013 AIA letters stated no changes to the farm and minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Land let out in conacre unaffected by Proposed Scheme		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends 46.03ha of owned land, which is mostly in grass, with some small areas of wooded land.

The farm rents out owned land (19.5ha) at Ballygawley in conacre.

Land parcel 306030 is shown on Figure 15.18 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a herd of 20 suckler cows which are either pedigree Aberdeen Angus or Limousin, producing pedigree bulls and heifers for breeding. There are approximately 60 cattle on the herd list.

Conacre Arrangement	The farm lets out owned land (19.5ha) at Ballygawley in conacre, which is unaffected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme, with some of the woodland in the DARD Woodland Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 5.72ha out of 46.03ha farm equating to 12% of the productive land.
The landtake impacts would be moderate.

New severance would impact on the farm. Access would be provided to severed land on

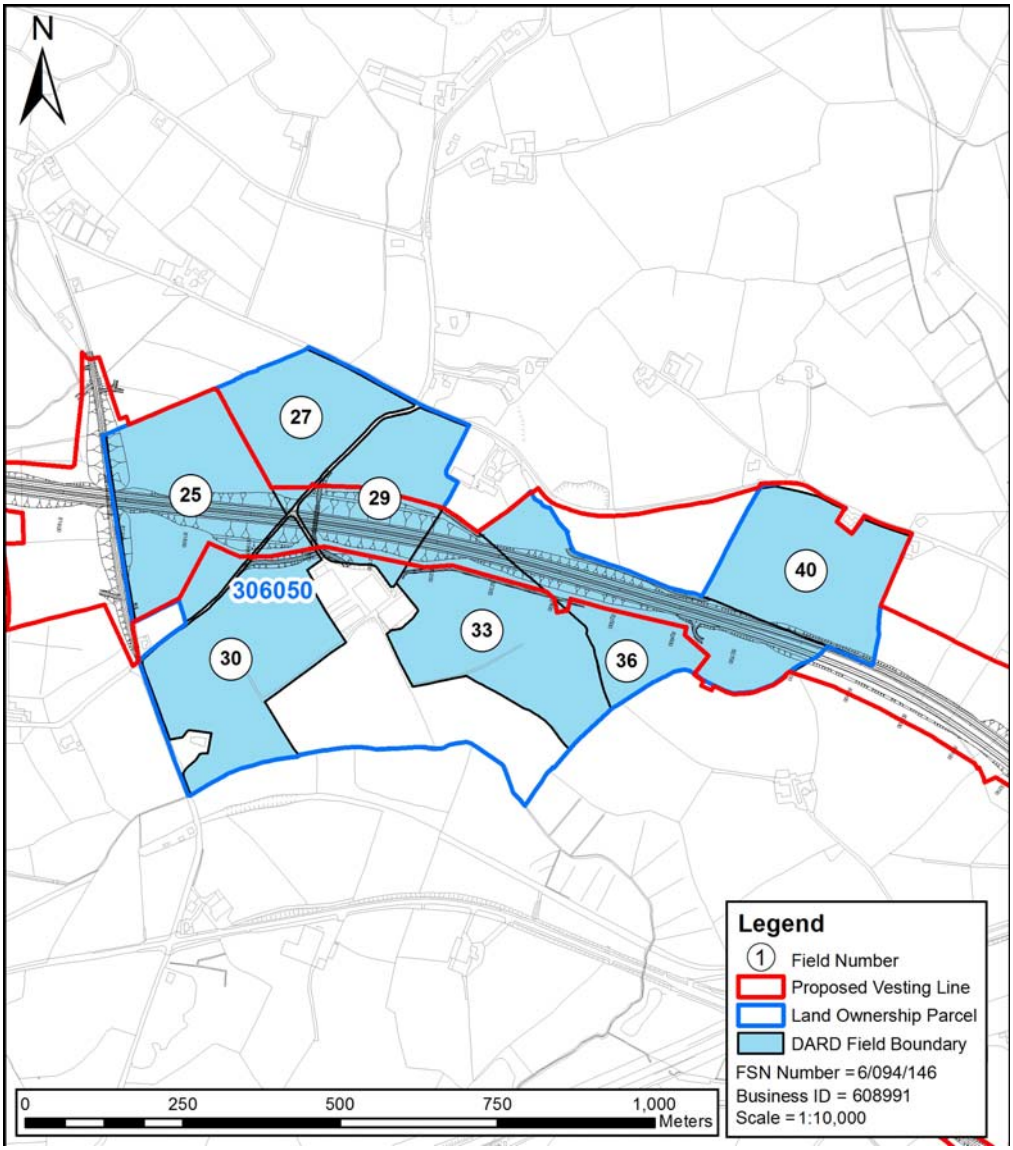
© Mouchel 2016

Ballynasaggart Road. Severance impacts would be slight. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	306050	**DARD Business Ref**	608991
		Data sources	June 2010 AIA meeting. 2013 AIA letters not returned, No Landowner confirmation meeting feedback. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

This farm extends over 300ha of which 204.99ha is owned land. The remaining land is rented in conacre and is not affected by the road scheme.

Land parcel 306050 is shown on Figure 15.18 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a large dairy herd of 380 cows with a herd average of approximately 9,000 litres. In addition there are approximately 320 young stock being reared as herd replacements. All bull calves are sold as dropped calves.

Field Nos 25, 27 & 36 are all in grass and would normally be cut 3 times for silage, with the after-grass being grazed by young stock. Field No 33 is normally in forage maize.

Conacre Arrangement	Approx. 95ha of land is taken in conacre. This land is not affected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	The farm is currently on the limit of organic nitrogen and any land-take will have implications under the Nitrates Directive. At present, in order to comply with the Nitrates Directive, the farm exports approximately 1m gallons of slurry per annum.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	As this is a dairy farm, the land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 19.98ha out of 204.99ha farm equating to 10% of the productive land.
Under the Nitrates Directive, the farm currently exports approximately 1m gallons of slurry per annum. Given the extensive landtake, the volume of slurry exported would have to increase

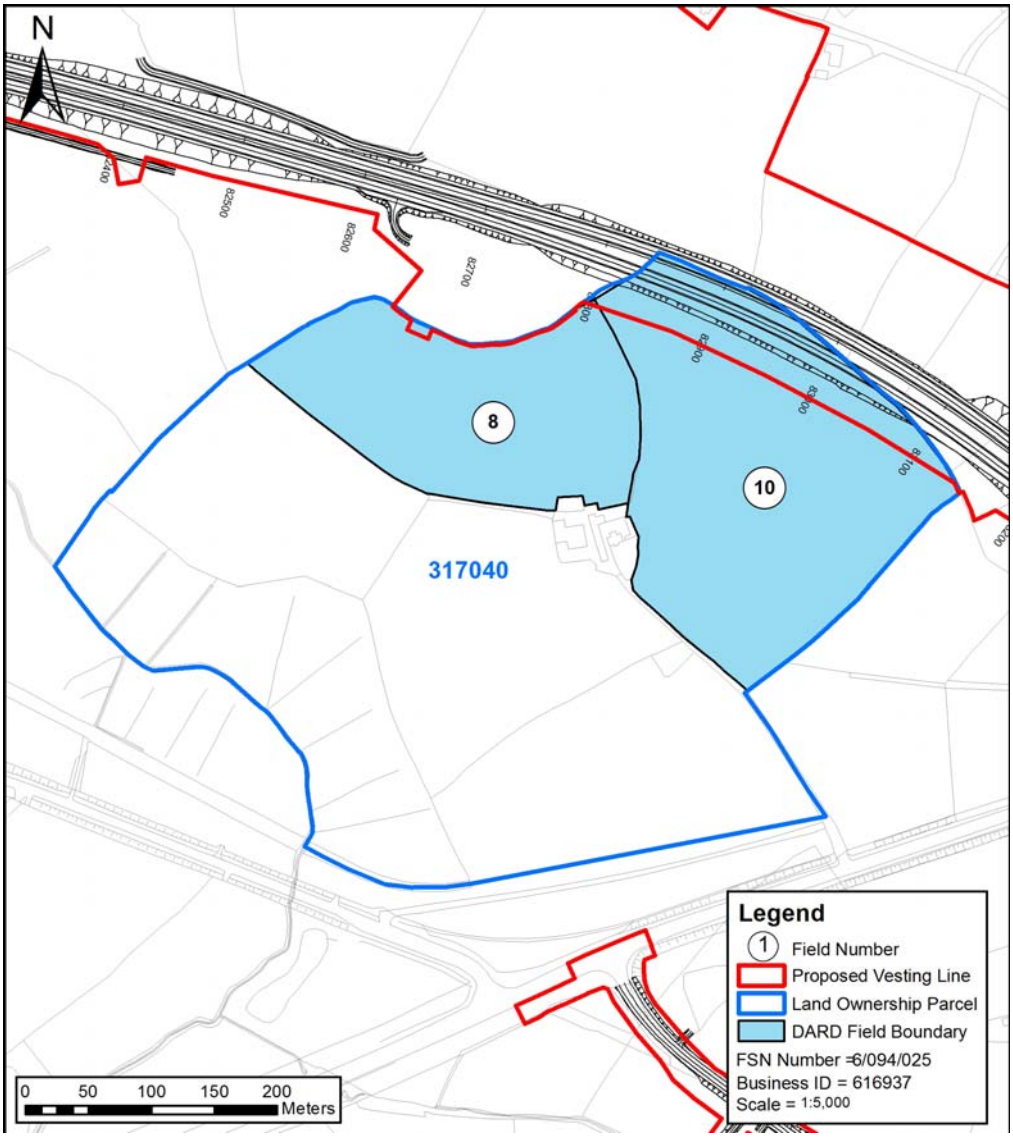
© Mouchel 2016

to ensure continued compliance. The landtake impacts would be substantial. New severance would impact on the farm. Access would be provided to the severed land via the realigned Crew Road and new farm lanes. Severance impacts would be slight. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **substantial adverse**.

© Mouchel 2016

Land Parcel Ref	317040	**DARD Business Ref**	631512
		Data sources	June 2010 AIA meeting. AIA letters not returned. Declined landowner confirmation meeting. Minor changes to the scheme only, no 2014 revisit.
Conacre Parcel Ref	Affected fields let in conacre Field 10 let to Parcel 318060 landowner, Datasheet 013-173.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 40.05ha of owned land. The farm is all in grass. Land parcel 317040 is shown on Figure 15.18 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry Some of the farm is rented out in conacre, with the remainder being farmed by the landowner. Field Nos 1, 7, 8, 10, 16A & 16B are let in conacre. Not all fields are shown on the plan above. The farm runs approximately 20 store cattle, which are bought in at 350-450kg liveweight and carried through to beef.	
Conacre Arrangement	Field No's 1, 7, 8, 10, 16A & 16B are let in conacre to Parcel 318060 landowner. Impacts on the coancre tenant are outlined in datasheet 021-173. Field 10 is affected by the proposed scheme.
Single Farm Payment	The land owner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land utilised by the landowner and not in conacre is classified Severely Disadvantaged Area (SDA) and qualifies for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The proposed scheme will result in a total loss of 1.33ha out of 40.05ha farm equating to 3% of the productive land. As the affected land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.	

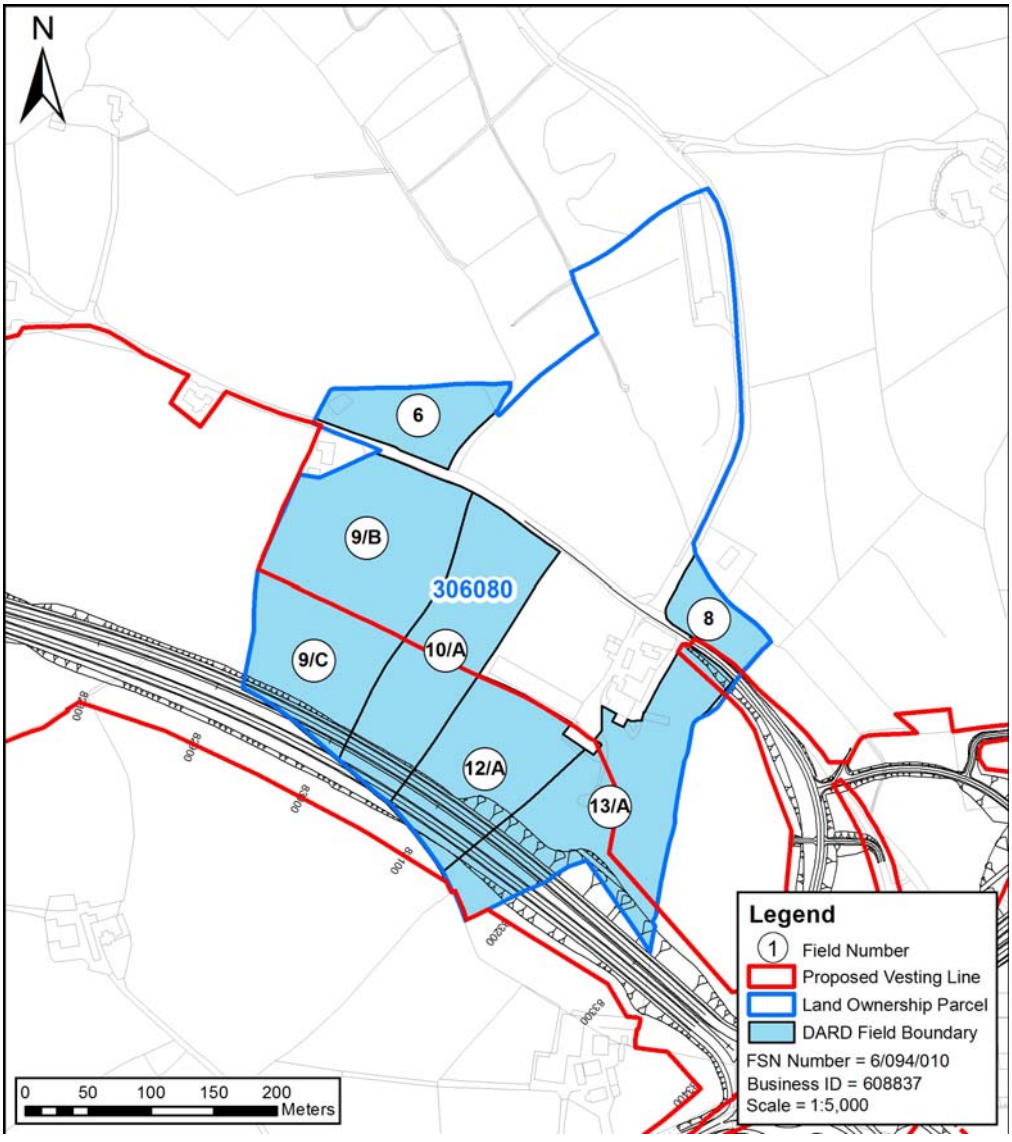
© Mouchel 2016

There would be no severance as a result of the Proposed Scheme. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	306080	**DARD Business Ref**	608837
		Data sources	2010 AIA meeting. Landowner confirmation meeting held. Requested revisit. October 2014 AIA meeting.
Conacre Parcel Ref	Lets conacre land from parcel 306010 landowner.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends 26.79ha of owned land, which is in two distinct parcels. In addition, a further 2ha of land is rented in conacre which is affected by the road scheme. Land parcel 306080 is shown on Figure 15.18 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The farm is all in grass. Approximately 80 store cattle (approximately 400kg liveweight) are bought in per annum for finishing as beef cattle. At any one time there could be up to 160 cattle on the herd list. Store lambs (approximately 80 per year) are purchased in the autumn for finishing. The farm runs two, free range, layer houses with approximately 8,000 birds in each. Given the location of the out-farm, cattle are moved by trailer to-and-from the out-farm. Silage is transported from the out-farm to the home-farm, with slurry and chicken litter being transported from the home-farm to the out-farm.	
Conacre Arrangement 2ha of land (parcel ref 306010) is rented in conacre which is affected by the road scheme. Parcel 306010 is considered in Appendix A.	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	Depending on the extent of land take, there may be implications for the farm under the Nitrates Directive, unless the Rose Energy Project receives approval to allow broiler litter to be exported off the farm for incineration.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

© Mouchel 2016

Predicted Impacts

The proposed scheme will result in a total loss of 4.14ha out of 26.79ha farm equating to 15% of the productive land. 2 ha of land taken in conacre from parcel 306010 will also be affected.

The main impact on this farm is land-take. The land take to the rear of the layer house at the back of the farmyard, will also have implications for the future of the free-range layers in the shed, since there is an area requirement per bird for access to grassland.

Under the Nitrates Directive, land-take may have implications for future compliance.

There will be no severance as a result of the proposed scheme.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

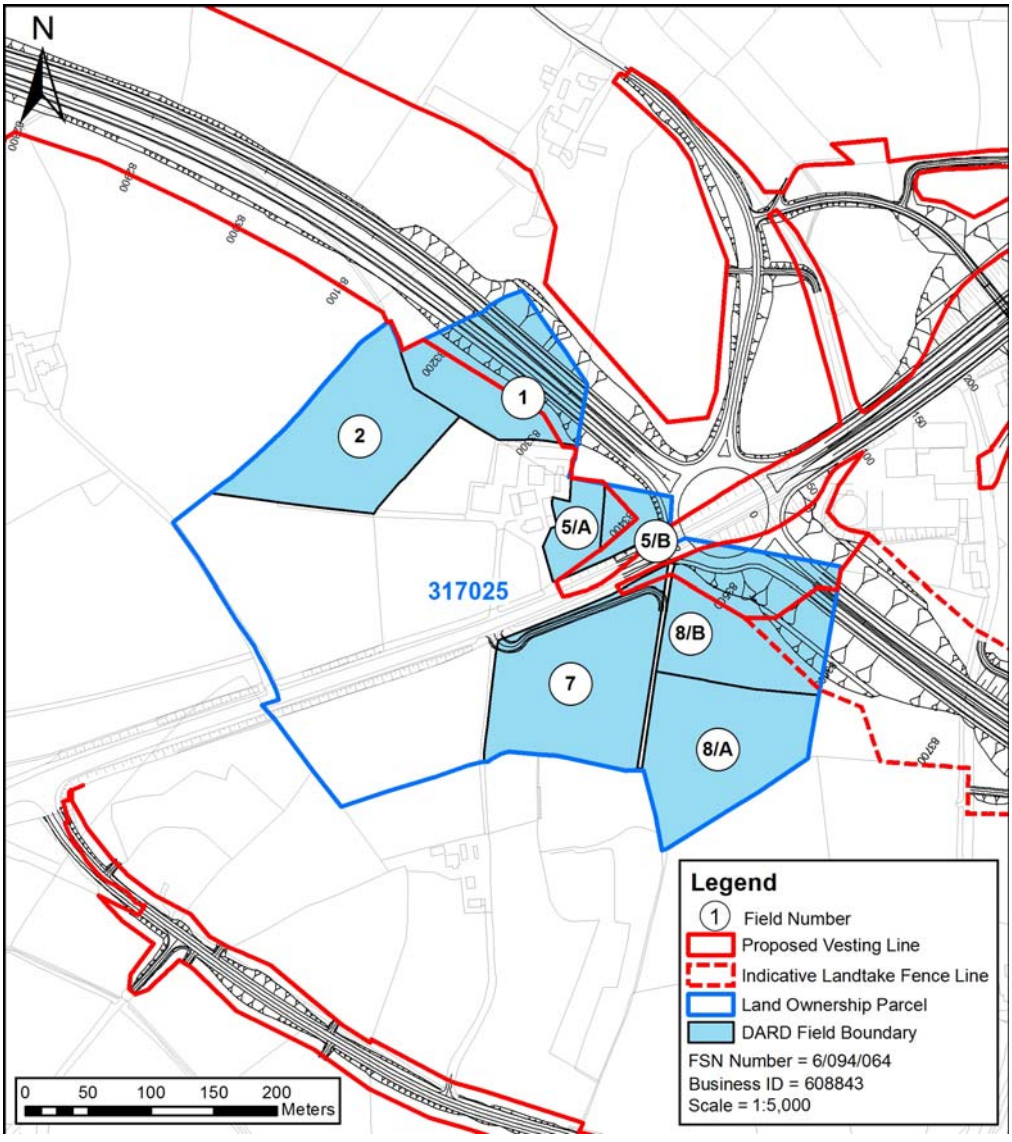
No mitigation is proposed

Predicted Effects	The overall impact of the proposed A5WTC on the farm is a **moderate adverse** impact.

© Mouchel 2016

Land Parcel Ref	317025	**DARD Business Ref**	608843
		Date of Visit	June 2010 AIA meeting. AIA letters not returned and declined landowner confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 105.32ha, with 85.02ha of owned land. The remaining land is taken in conacre from 3 different landowners. Land parcel 317025 is shown on Figure 15.18 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The farm runs a dairy herd of 63 cows with a herd average of 8,000 litres. In addition, there are approximately 40 herd replacements. All bull calves and heifer calves surplus to herd replacements are finished for beef. The farm also runs a suckler herd of 20 cows and 1 bull, with all the progeny being finished for beef. There are approximately 180 cattle on the herd list. The grazing platform is currently severed by the A4, with cows crossing the A4 to graze land to the south during the day, remaining on land north of the A4 at night. The grazing platform also includes conacre land.	
Conacre Arrangement	20.3ha of land rented in conacre from three different landowners. This land is unaffected by the proposed scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, and also on conacre land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	This is a diary farm and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

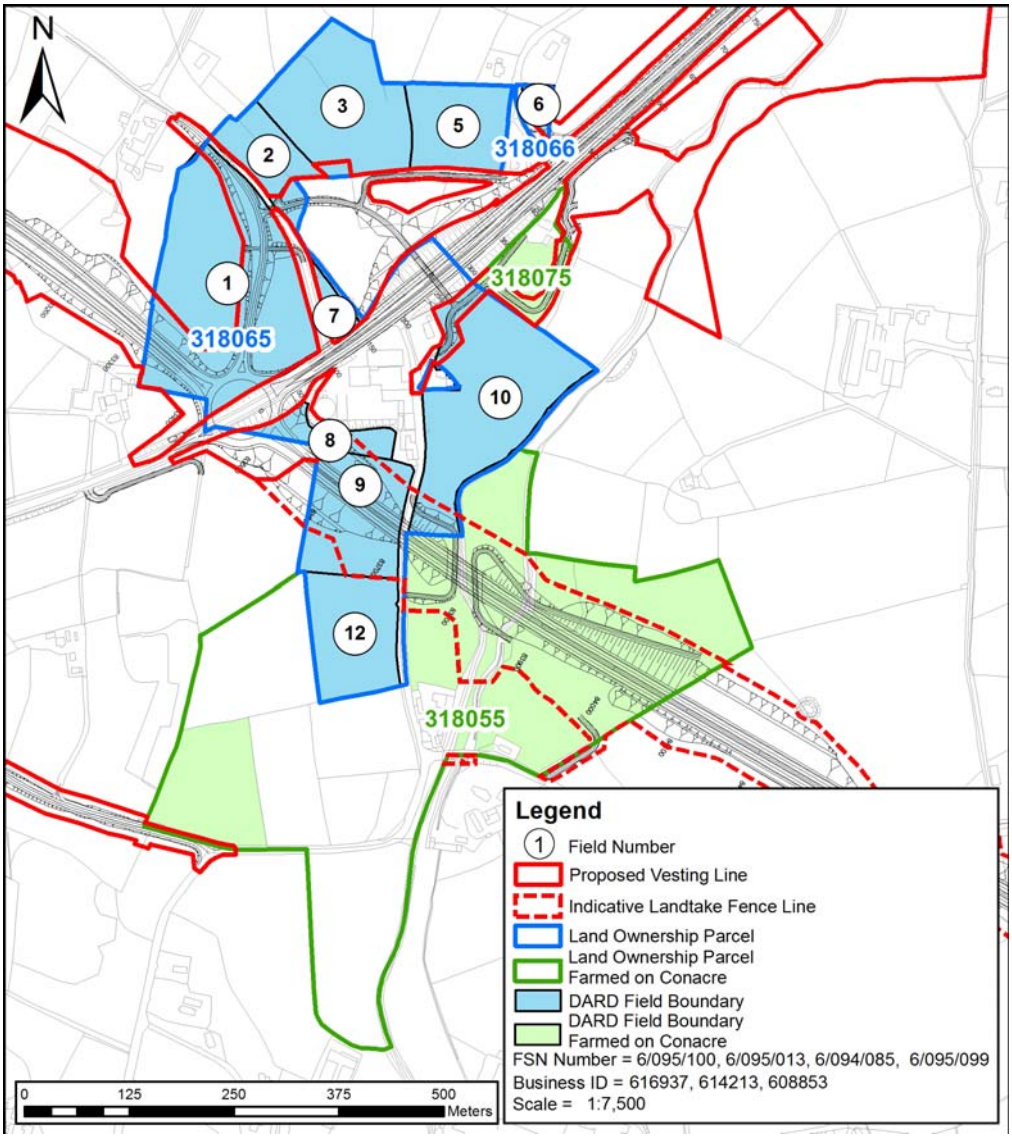
© Mouchel 2016

Predicted Impacts The proposed scheme will result in a total loss of 1.8ha out of 105.32ha farm equating to 2% of the productive land. Under the Nitrates Directive, landtake may impact on future compliance. The landtake impacts would be moderate. There will be no severance as a result of the Proposed Scheme. There would be temporary impacts during the construction phase of the Proposed Scheme.
Proposed Mitigation No mitigation would be proposed.
Residual Effects The overall impact of the Proposed Scheme on the farm would be **moderate adverse**.

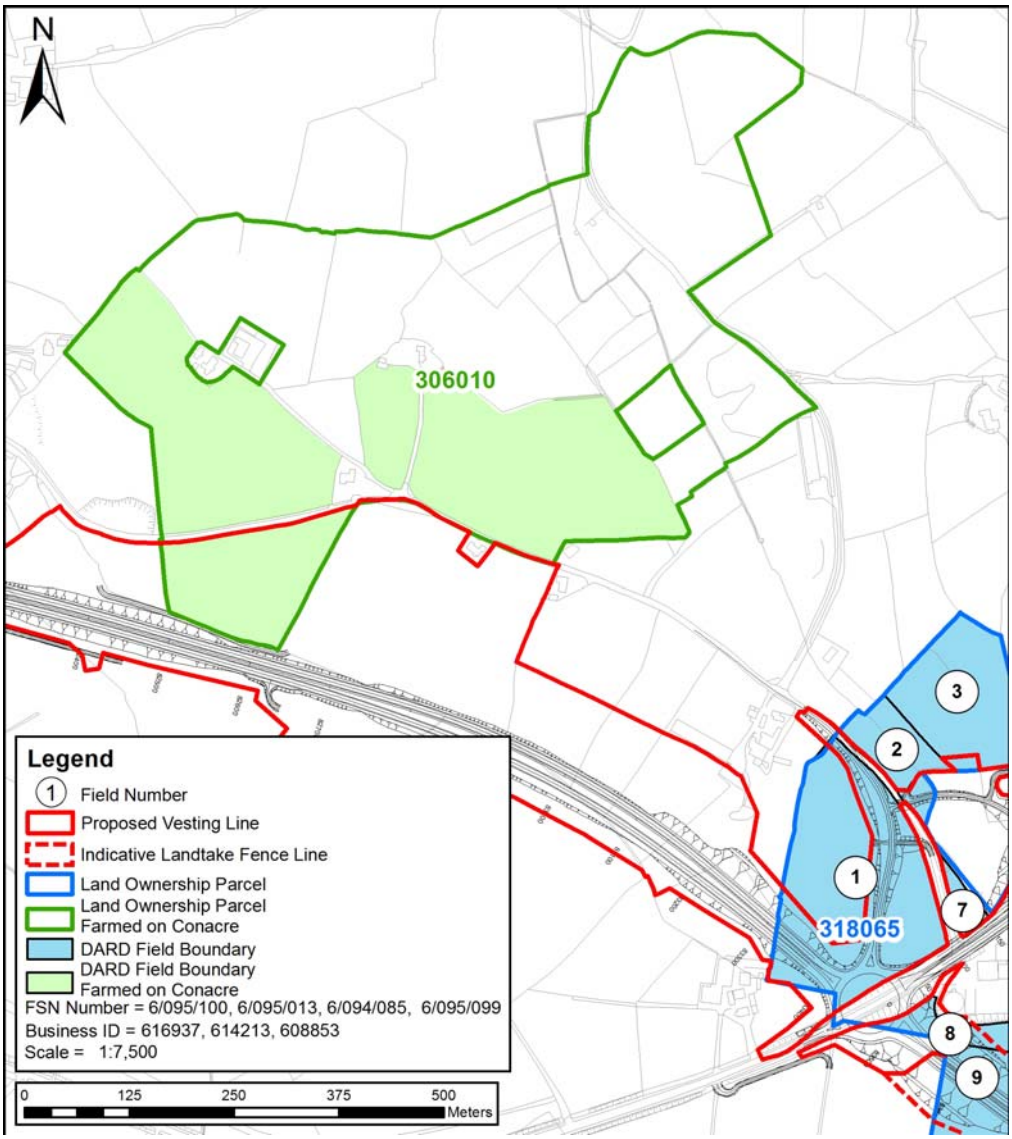
© Mouchel 2016

Land Parcel Ref	318066, 318065	**DARD Business Ref**	616937
		Data sources	2010 AIA meeting. Landowner confirmation meeting held. October 2014 meeting
Conacre Parcel Ref	Rents conacre from 3 affected landowners (parcels 318075, 318055, 306010)		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016



© Mouchel 2016

Size and Quality of Farm The farm extends to 150.99ha, of which 27.3ha is owned land. The farm is all in grass. The remaining 123.69ha is taken in conacre from 11 landowners. Land parcel 318066, 318065 and conacre land parcel 306010, 318055 and 318075 are shown on Figure 15.18 Environmental Statement Land Ownership Boundaries.
Type of Enterprise and Husbandry The farm runs a large dairy herd of 280 cows, with a herd average of 8,500 litres. There are approximately 200 young stock being reared as herd replacements. Due to the extent of severance by the A4, the dairy herd is housed all year round (at present). Only the dry cows and the young stock are grazed during the grazing season, mainly on conacre land away from the farmyard.

Conacre Arrangement	123.69ha of land is taken in conacre from 11 landowners, parts of which are affected by the Proposed Scheme. (part of parcels 318075, 318055, 306010)
Single Farm Payment	The landowner collects the Single Farm Payment on owned land and conacre land, with the exception of one.
Nitrates Directive	Given the high stocking rate on the farm, in order to ensure compliance with the Nitrates Directive, slurry is exported. Land take will have further implications under the Nitrates Directive.
Countryside Management Scheme	Owned land is all registered under the Countryside Management Scheme. However, the scheme has now expired.
Less Favoured Area Compensatory Allowances Scheme	Given that this is a dairy farm, the land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts

The proposed scheme will result in a total loss of 3.35ha out of 150.99ha farm equating to 2% of the productive land.
Under the Nitrates Directive, landtake may impact on future compliance. The landtake impacts would be substantial.

Given the citing of the proposed junction/intersection to the west of the farmyard and associated link-roads, the existing farm business will be further severed, with extensive land-take.

During the construction phase access to severed land will need to be maintained. There would be temporary impacts during the construction phase of the Proposed Scheme.

Under the Nitrates Directive, land-take may impact on future compliance.

The mitigation measures propose avoiding the existing farmyard. In the post scheme scenario, the farm may no longer be viable as a dairy farm and provision to include the farmyard within the area vested may have to be considered.

Proposed Mitigation

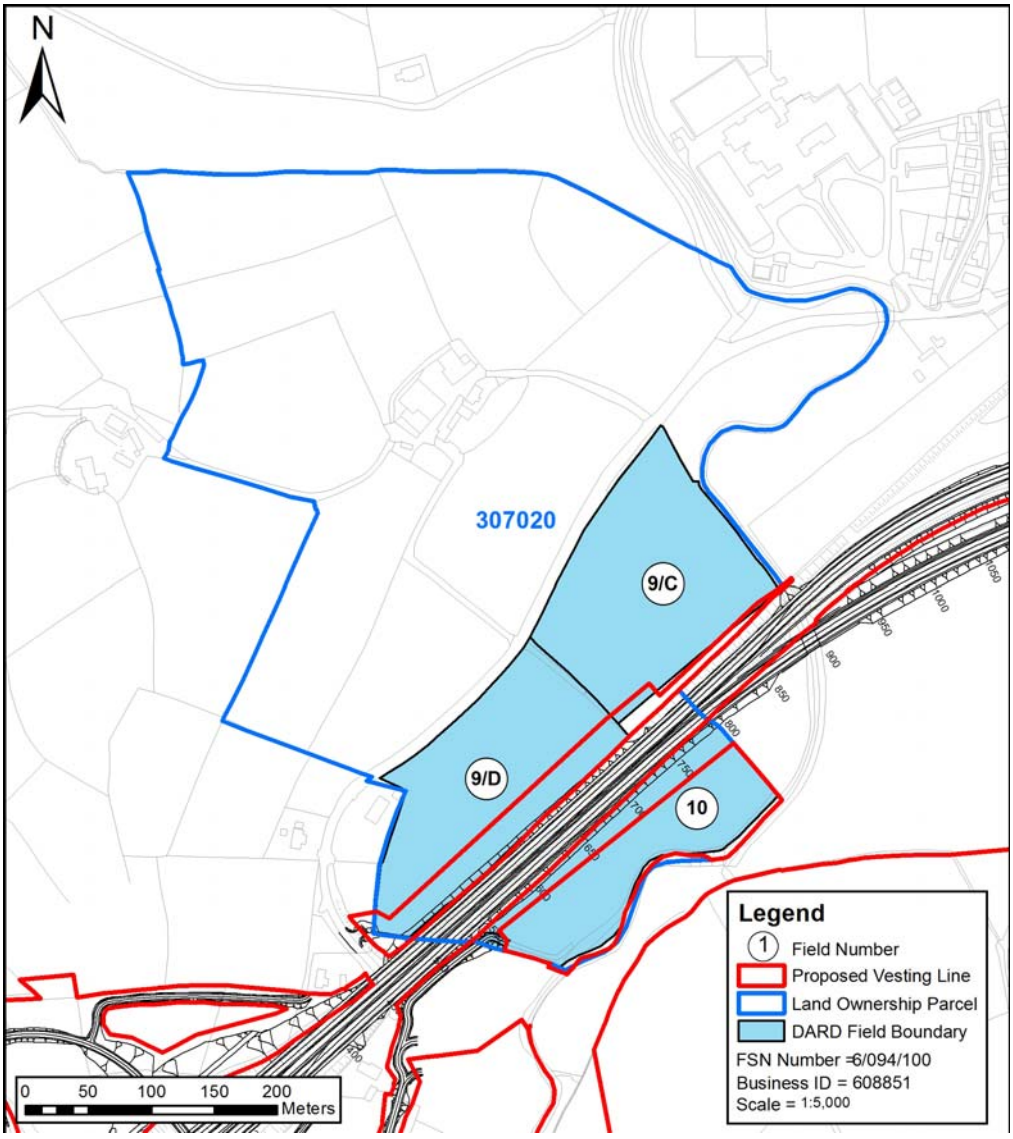
The farmyard is not being vested. With the land take, the remaining farm may not be sustainable as a dairy farm and therefore in this event there will be the provision to vest the farm buildings, if required.

Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **substantial adverse**.

© Mouchel 2016

Land Parcel Ref	307020	**DARD Business Ref**	608851
		Data sources	2010 AIA meeting. Landowner confirmation meeting held. October 2014 meeting
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 44.73ha of owned land, which is all in grass. The farm is in 3 distinct parcels, one of which is approximately a mile away, while the other is 3 miles away. Land parcel 307020 is shown on Figure 15.18 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The farm runs a dairy herd of approximately 70 cows, with a herd average of 7,900 litres. In addition, there are approximately 50 dairy herd replacements. Bull calves are all reared and either sold as stores or finished for beef. There are approximately 150 cattle on the herd list.	
Conacre Arrangement Conacre unaffected by the Proposed Scheme.	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	The farm currently exceeds the 170kg/ha of organic nitrogen threshold, and as a result, the farm exports slurry to ensure compliance. Land take will have further implications under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all registered Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

© Mouchel 2016

Predicted Impacts The proposed scheme will result in a total loss of 1.28ha out of 44.73ha farm equating to 3% of the productive land. Under the Nitrates Directive, land-take will impact on compliance. There would be temporary impacts during the construction phase of the Proposed Scheme. During the construction phase, access to severed land will need to be maintained. The main impacts on this farm are severance and land take.
Proposed Mitigation During the construction phase access to severed land will be required.
Predicted Effects The overall impact of the Proposed Scheme on the farm is a **substantial adverse** impact.

© Mouchel 2016

Size and Quality of Farm The farm extends to 40.92ha, of which 32.85ha is owned land, with the remaining 8ha being taken in conacre from 2 land parcels which are not affected by the Proposed Scheme. The farm is all in grass. Land parcel 307015 is shown on Figure 15.18 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The farm runs a suckler cow herd of 30 cows and 1 bull. All the progeny are carried through and finished as beef. In addition, approximately 30-40 store cattle are bought in annually at approximately 350-400kg liveweight and finished as beef. The number of cattle on the herd list is approximately 100 -120. The farm also runs a broiler breeder house, containing 6,800 broiler breeders and a sheep flock consisting of 120 ewes and 4 rams, producing approximately 180 lambs which are finished for slaughter.	
Conacre Arrangement The farms takes approximately 8ha of land in conacre from two separate landowner who are not affected by the Proposed Scheme.	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	Depending on the extent of land-take, there may be implications under the Nitrates Directive.
Countryside Management Scheme	The land is registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all registered Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity

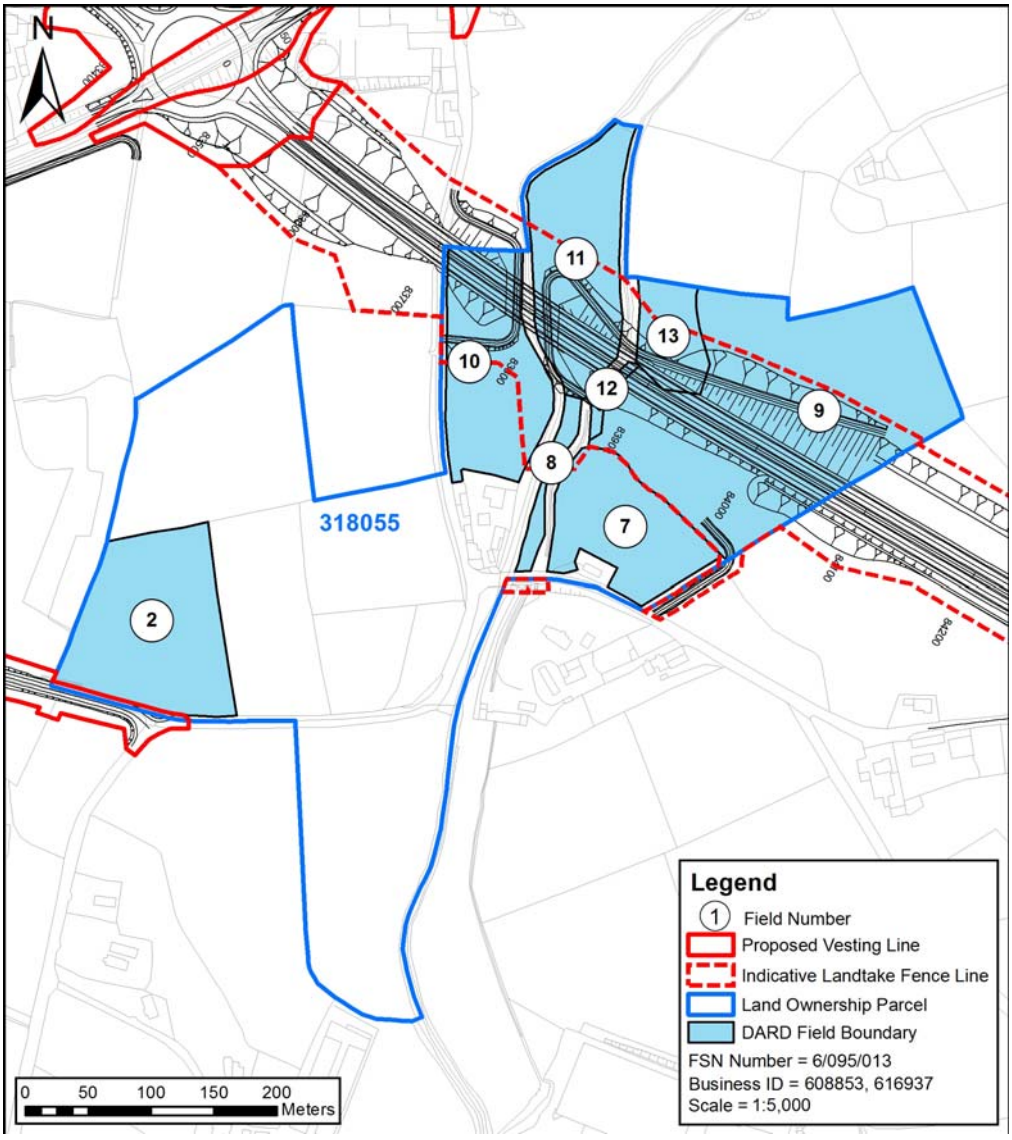
© Mouchel 2016

Predicted Impacts The proposed scheme will result in a total loss of 9.9ha out of 40.92ha farm equating to 24% of the productive land. Under the Nitrates Directive, land-take may impact on future compliance. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land will need to be maintained. Access will be provided to the severed land off the Annaghilla Road and an underpass.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm is a **moderate adverse** impact.

© Mouchel 2016

Land Parcel Ref	318055	**DARD Business Ref**	627476
		Data sources	June 2010 AIA meeting. 2013 AIA letters not returned. Landowner confirmation meeting held. Minor changes the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Let in conacre to Parcel 318065 landowner, Datasheet 021-173		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 16.73ha of owned land, which is all in grass, with the exception of Field No 13, which is planted out under the DARD Woodland Scheme.

Land parcel 318055 is shown on Figure 15.18 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm is all rented out in conacre.

Conacre Arrangement	Let in conacre to Parcel 318065 landowner. Impacts on the conacre tenant are outlined in datasheet 021-173
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all rented out in conacre, and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 4.68ha out of 16.73ha farm equating to 28% of the productive land.
This would include an area to the north of the land parcel. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

New severance would impact the farm, however, access would be provided from field no 11 to 10 and 11 to 12 by two underpasses. During the construction phase, access to severed land would be maintained. Severance impacts would be slight.

There would be temporary impacts during the construction phase of the Proposed Scheme.

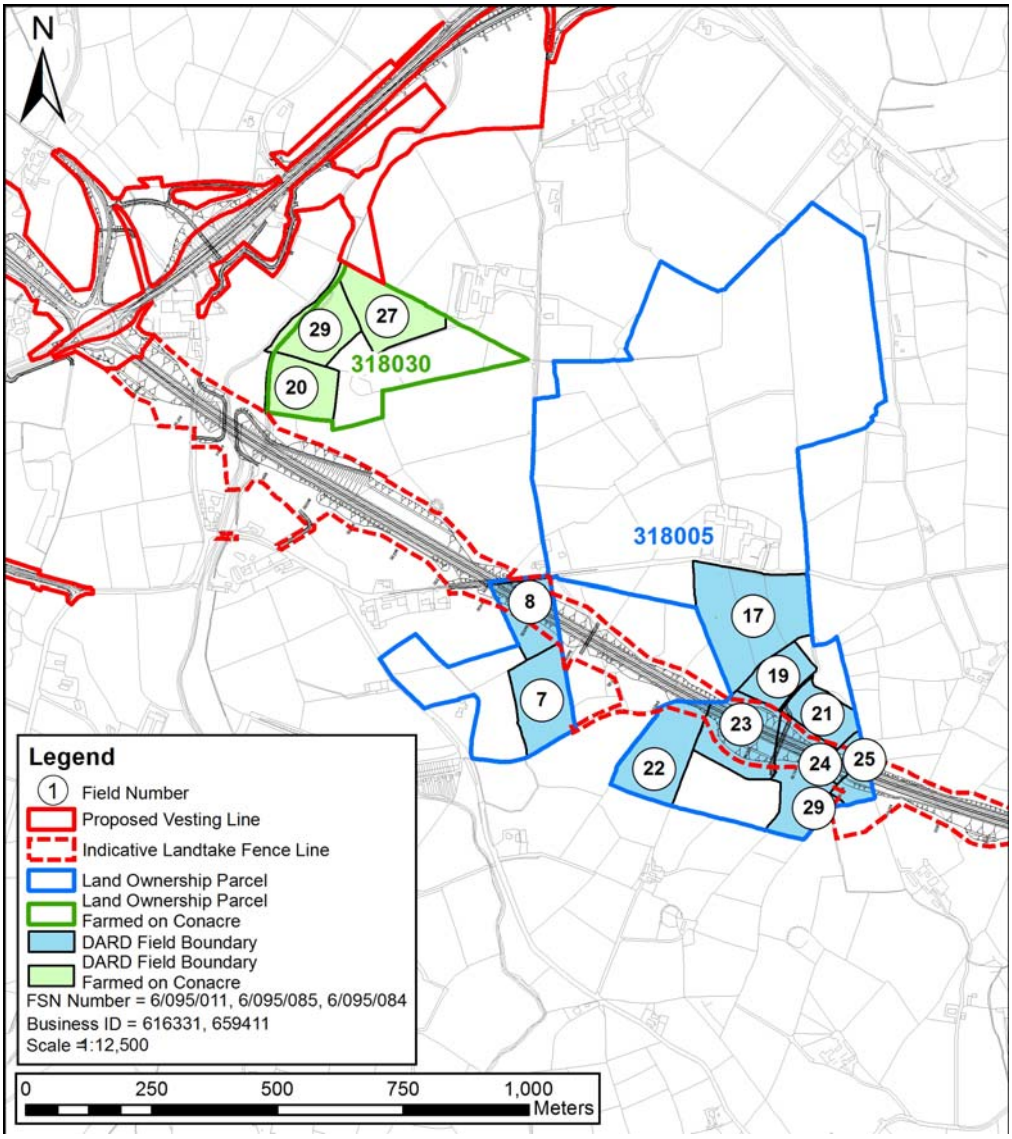
© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	318005	**DARD Business Ref**	616331
		Data sources	March 2010 AIA meeting. 2013 AIA letters not returned. No land confirmation meeting feedback. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Rents Parcel 318030 in conacre.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 83.12ha of which 56ha is owned land, with the remainder being taken in conacre.

The land is mainly in grass, with one or two fields being utilized for whole crop silage.

Land parcel 318005 and conacre land parcel 318030 are shown on Figure 15.18 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a large dairy herd, containing 190 cows with a herd average of approximately 8,700 litres. In addition there are 2 bulls on the farm, and approximately 100 dairy herd replacements. Bull calves are all sold at birth, while the heifers, not required for replacements, are reared and finished for beef.

The farm runs 3 broiler houses containing approximately 76,000 birds.

Conacre Arrangement	27.12ha of land is rented in conacre including parcel 318030.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, but not on conacre land.
Nitrates Directive	The farm must comply with IPPC regulations in relation to the broiler houses, and given the high stocking rate, the Nitrates Directive has serious implications for the farm, due to stock numbers and the disposal of chicken litter.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all registered Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 4.45ha of land out of 83.12ha farm equating to 5% of the productive land.

Under the Nitrates Directive and the IPPC Regulations, landtake would have implications for

© Mouchel 2016

future compliance. New severance would impact on the farm. Access to the severed land would be provided via an overbridge and off Lisdoart Road. Severance impacts would be moderate. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 5% of the available productive land, severance, and implications under the Nitrates Directive would constitute a substantial effect on the farm.

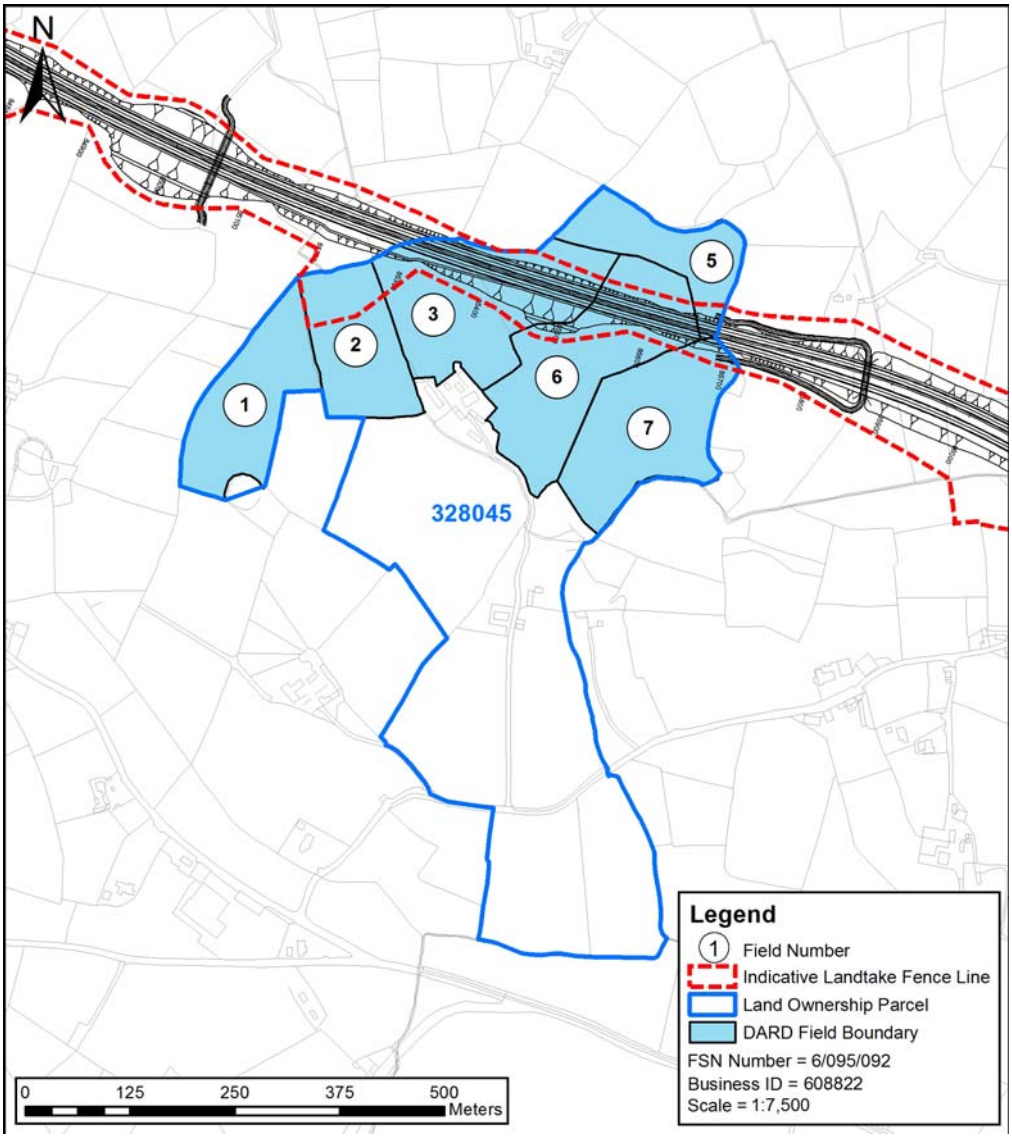
Land Parcel Ref	328045	**DARD Business Ref**	608822
		Data sources	2010 AIA meeting. Land confirmation meeting feedback. Did not accept 2014 meeting invitation.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only sows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 41.74ha of owned land, which is all in grass.

Land parcel 328045 is shown on Figure 15.18 and 15.19 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a herd of 90 suckler cows and 2 bulls, with the calves all being over-wintered and offered for sale in the spring as strong store cattle. In addition, the farm buys in approximately 200 store lambs each autumn for finishing.

Field No 5, which will be severed, is normally grazed. Field Nos 2, 3, 6 & 7 are normally grazed.

Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 3.28ha out of 41.74ha farm equating to 8% of the productive land.
This would include land for the Proposed Scheme alignment. The landtake impacts would be moderate.

New severance would impact on the farm. Access would be provided to all severed land via a shared access lane to the east of the land parcel. Severance impacts would be slight.

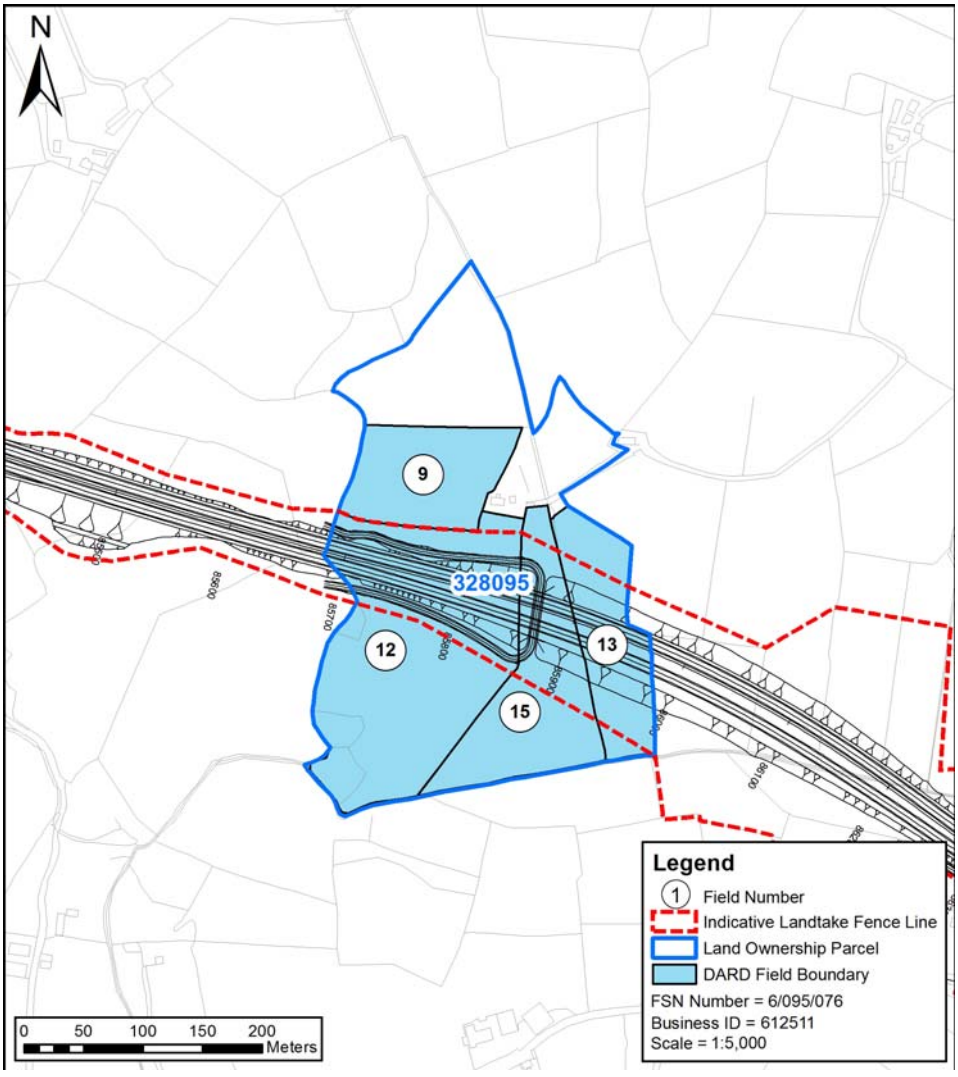
© Mouchel 2016

There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	328095	**DARD Farm Map Ref**	612511
		Data sources	September 2010 meeting. 2013 AIA letters not returned, no landowner confirmation meeting feedback. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 47.03ha, of which 43.09ha is owned land, plus a further 3.94ha which is taken in conacre. The farm is all in grass. Land parcel 328095 is shown on Figure 15.19 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry	
The farm runs a dairy herd of 70 cows plus approximately 60 young stock as herd replacements. There are approximately 130 cattle on the herd list.	
Conacre Arrangement	3.94ha of land is rented in conacre, which is unaffected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land, and also on conacre land.
Nitrates Directive	Given the current stocking rate, the farm is very close to the upper limit of 170kg of organic nitrogen per ha. Consequently, any loss of land to the road scheme will have implications under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	As this is a dairy farm, the land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
The proposed scheme will result in a total loss of 2.72ha out of 47.03ha farm equating to 6% of the productive land. This would include land for the proposed road and a shared farm lane. Under the Nitrates Directive the landtake may have implications for the farm. The landtake impacts would be

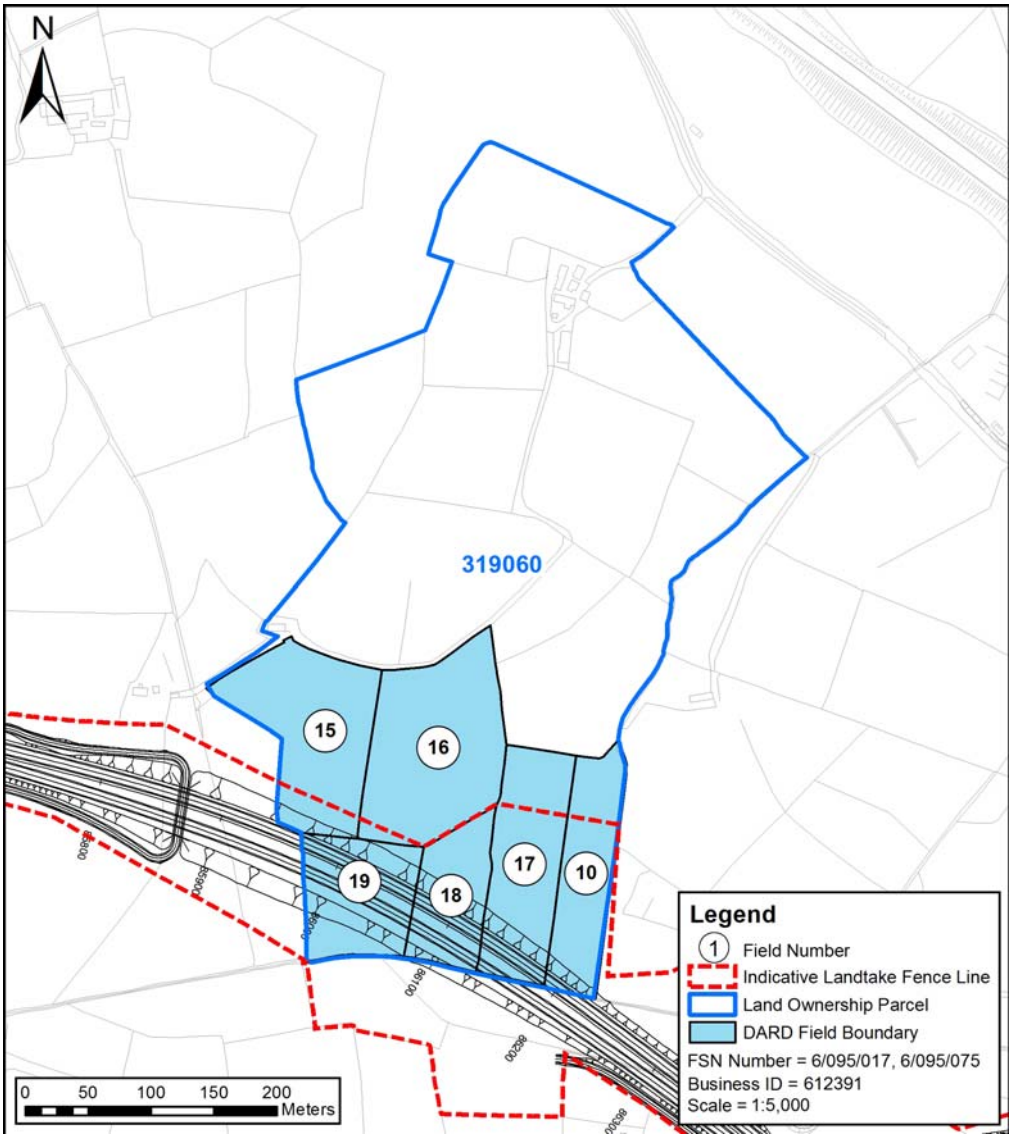
© Mouchel 2016

moderate. New severance would affect the farm. Access to severed land would be provided via an underbridge. Severance impacts would be slight. There would be temporary impacts during the construction phase of the Proposed Scheme.
Proposed Mitigation During the construction phase access to severed land would be maintained.
Proposed Effects The overall impact of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	319060	**DARD Business Ref**	612391
		Data sources	2010 AIA meeting. Landowner confirmation meeting held. October 2014 AIA meeting
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 39.01ha, of which 36.99ha is owned land, with the remaining 2.02ha being taken in conacre which is unaffected by the Proposed Scheme. The farm is all in grass. Land parcel 319060 is shown on Figure 15.19 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry This is a beef farm with up to 30 strong stores or suckler calves being bought in each autumn for over-wintering and carried through to finish. There are approximately 60 cattle on the herd list. Field No 10 is normally utilised for one cut of silage, with the after-grass being grazed. Field Nos 17-19 are cut for 1 or 2 cuts of silage, with the aftergrass being grazed.	
Conacre Arrangement	2.02ha of land rented in conacre which is unaffected by the Proposed Scheme.
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

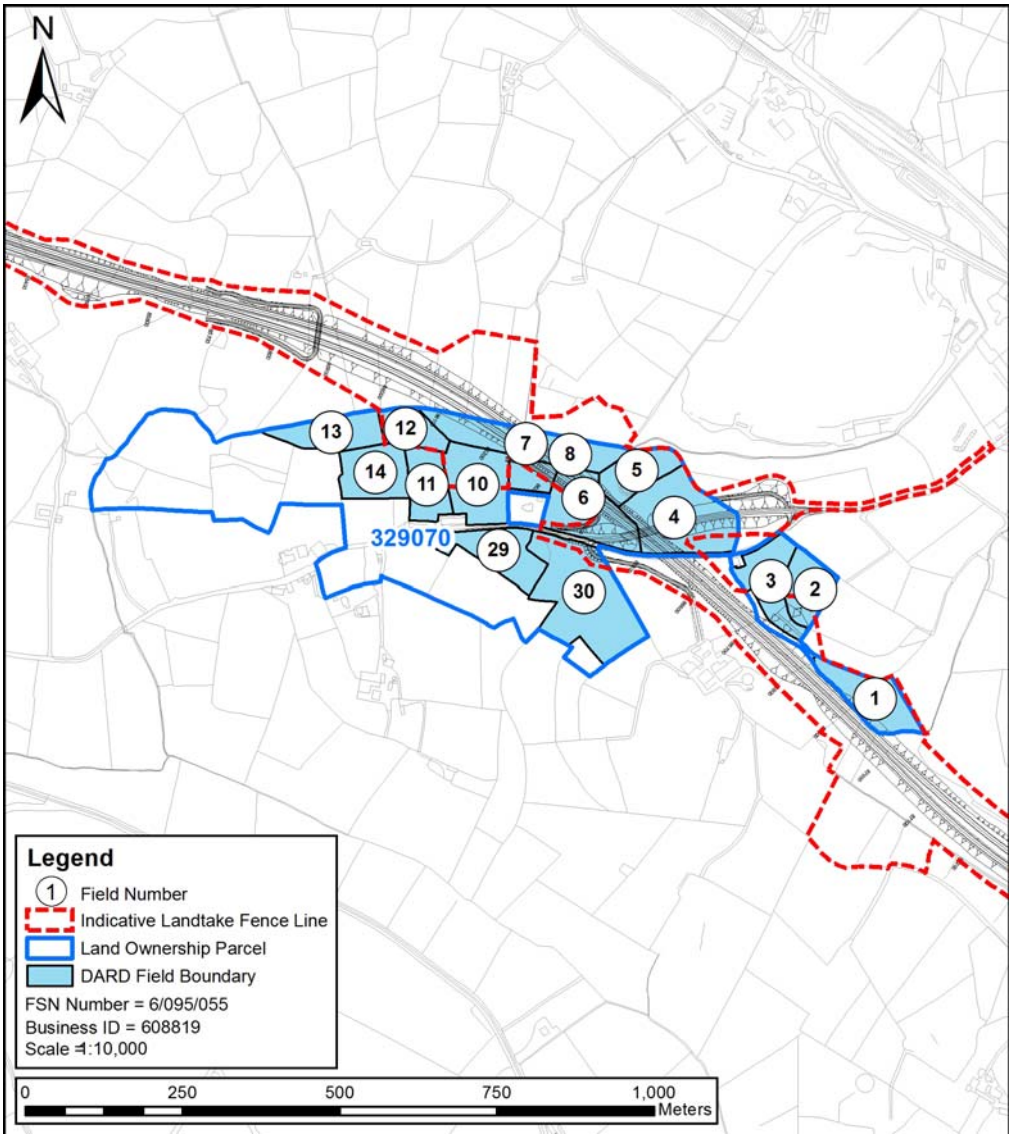
© Mouchel 2016

Predicted Impacts The proposed scheme will result in a total loss of 3.00ha out of 39.01ha farm equating to 8% of the productive land. The main impact on this Landowner will be land-take of flat land that is available for cutting silage, since much of the farm is too steep to even drive a tractor over. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land will be required.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm is a **slight adverse** impact.

© Mouchel 2016

Land Parcel Ref	329070	**DARD Business Ref**	Not available
		Data sources	June 2010 AIA meeting. AIA letters not returned, No landowner confirmation meeting feedback. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to approximately 34ha of owned land, which is all in grass. Land parcel 329070 is shown on Figure 15.19 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The farm buys in approximately 50 continental crossbred dropped calves, which are reared and carried through to finish. There are approximately 100 cattle on the herd list.	
Conacre Arrangement	Conacre unaffected
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Only one parcel of land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	As there are no DARD maps available, it is not know if the land is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The proposed scheme will result in a total loss of 7.66ha out of 34ha farm equating to 23% of the productive land. Land would be required from the east side of the parcel. The landtake impacts would be substantial. New severance would impact on the farm. Access to severed land would be provided via the realigned Lisginny Road Severance impacts would be slight. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation No mitigation would be proposed.	

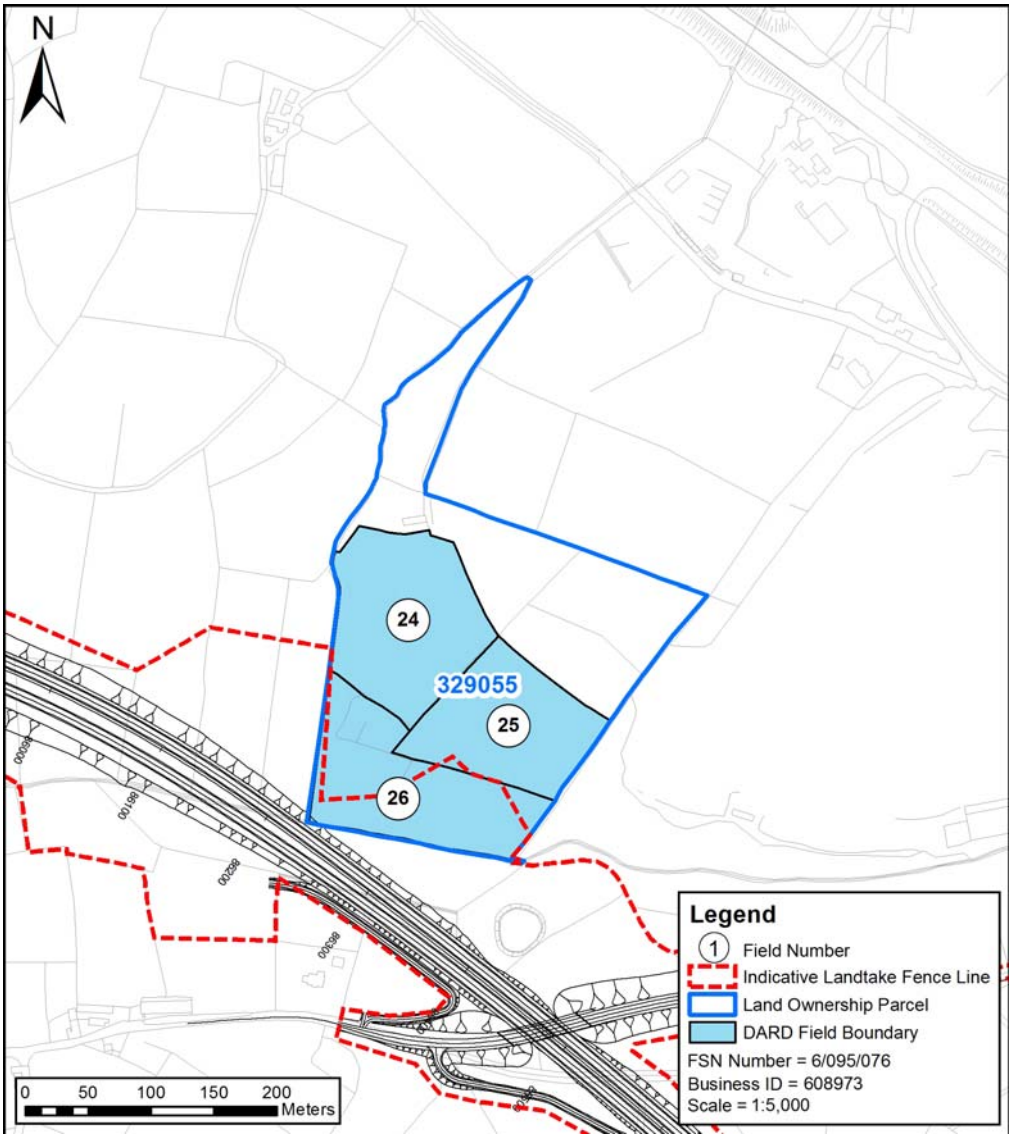
© Mouchel 2016

Predicted Effects	The loss of 23% of the available productive land would have a substantial impact on the farm's potential output and constitute a substantial effect on the farm. Severance constitutes a slight effect on the farm. The overall impact of the Proposed Scheme on the farm would be **substantial adverse**.

© Mouchel 2016

Land Parcel Ref	329055	**DARD Business Ref**	197476 (Applicant Ref)
		Data sources	September 2010 AIA meeting. AIA letters not returned and minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Let in conacre		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 6.47ha of owned land, which is all in grass.

Land parcel 329055 is shown on Figure 15.19 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The land is all rented in conacre.

Conacre Arrangement	Let in conacre to offline landowner, not affected by the Proposed Scheme. No conclusion can be made on the impacts of the conacre tenant as there is not sufficient information on conacre tenant's farm.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all rented in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 0.82ha out of 6.47ha farm equating to 13% of the productive land.

This would include land for a proposed deposition area. As the land is currently rented out in conacre, the landtake impacts would be slight.

There would be no severance as a result of the Proposed Scheme.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

No mitigation would be proposed.

© Mouchel 2016

Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**

© Mouchel 2016

Land Parcel Ref	329025	**DARD Business Ref**	608817
		Data sources	September 2010 AIA meeting. 2013 AIA letters not returned, no landowner confirmation meeting feedback. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	N/a

© Mouchel 2016

Information based on 2010 assessment. At time of assessment parcel was in the process of being sold, therefore, information likely to be subject to change.

Size and Quality of Farm

The farm extends to approximately 6.1ha of owned land, which is all in grass.

Land parcel 329025 is shown on Figure 15.19 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs an equine enterprise with 5 brood mares, with 4 of the mares being half-breds and one thorough-bred. Foals produced are reared and broken, before being sold.

Conacre Arrangement	N/a
Single Farm Payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land does not qualify for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 1.34ha out of 6.1ha farm equating to 22% of the productive land. This would include land for the realigned Lisginny Road. The landtake impacts would be slight.

There would be no severance as a result of the Proposed Scheme.

There would be temporary impacts during the construction phase of the Proposed Scheme.

© Mouchel 2016

Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**

© Mouchel 2016

Land Parcel Ref	329065	**DARD Business Ref**	608817

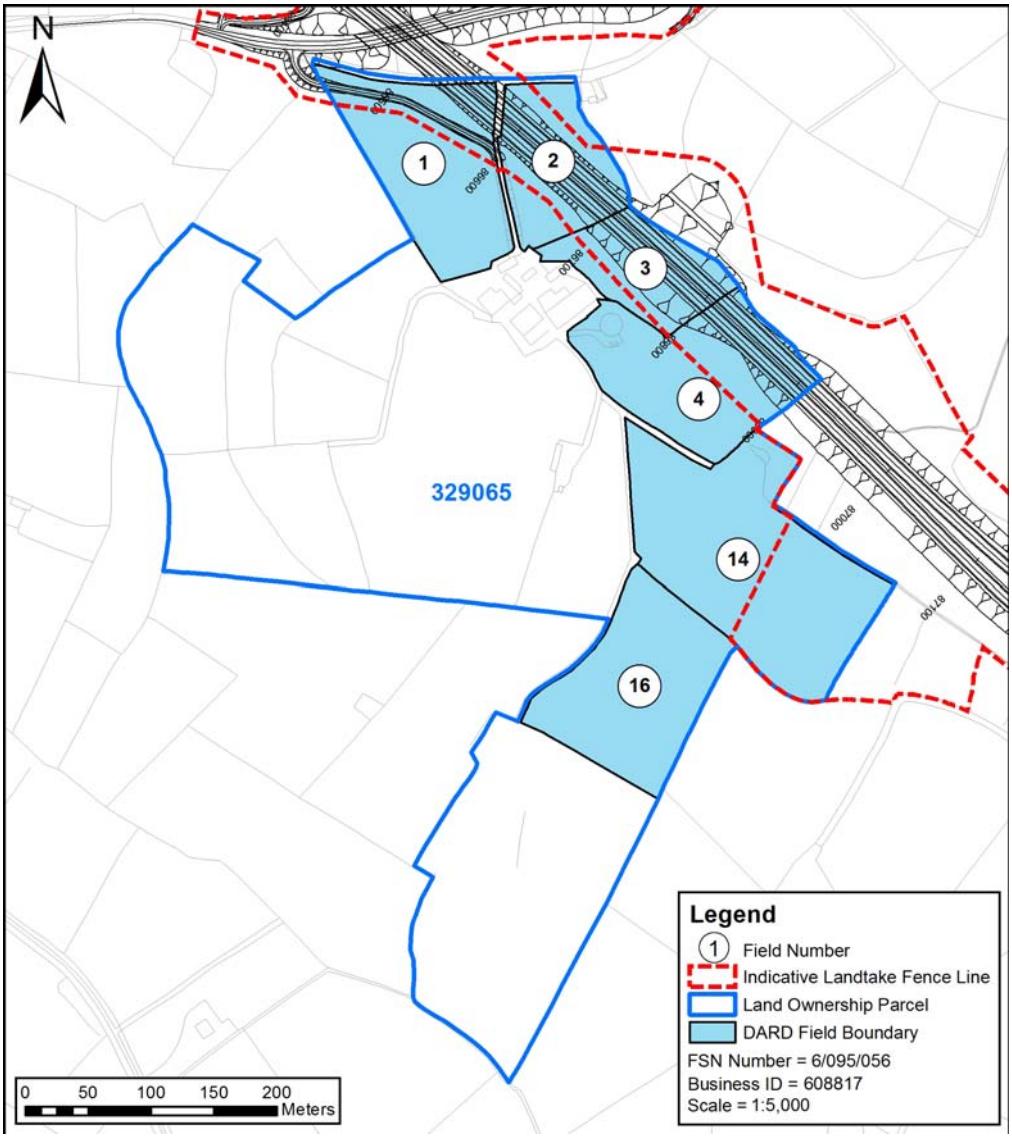
Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 49.56ha of owned land.

The land is all in grass.

Land parcel 329065 is shown on Figure 15.19 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a herd 40 dairy cows plus 2 bulls, with all the calves being reared either for herd replacements or for beef.

In addition, the farm runs a herd of 15-20 suckler cows, which are served and then sold after calving with the calves at foot.

Field Nos 1, 2, 3 and 12 are utilised as part of the cow-grazing platform and are affected by the scheme.

Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 3.63ha out of 49.56ha farm equating to 7% of the productive land.

Landtake would be from the dairy herds grazing platform. The landtake impacts would be substantial.

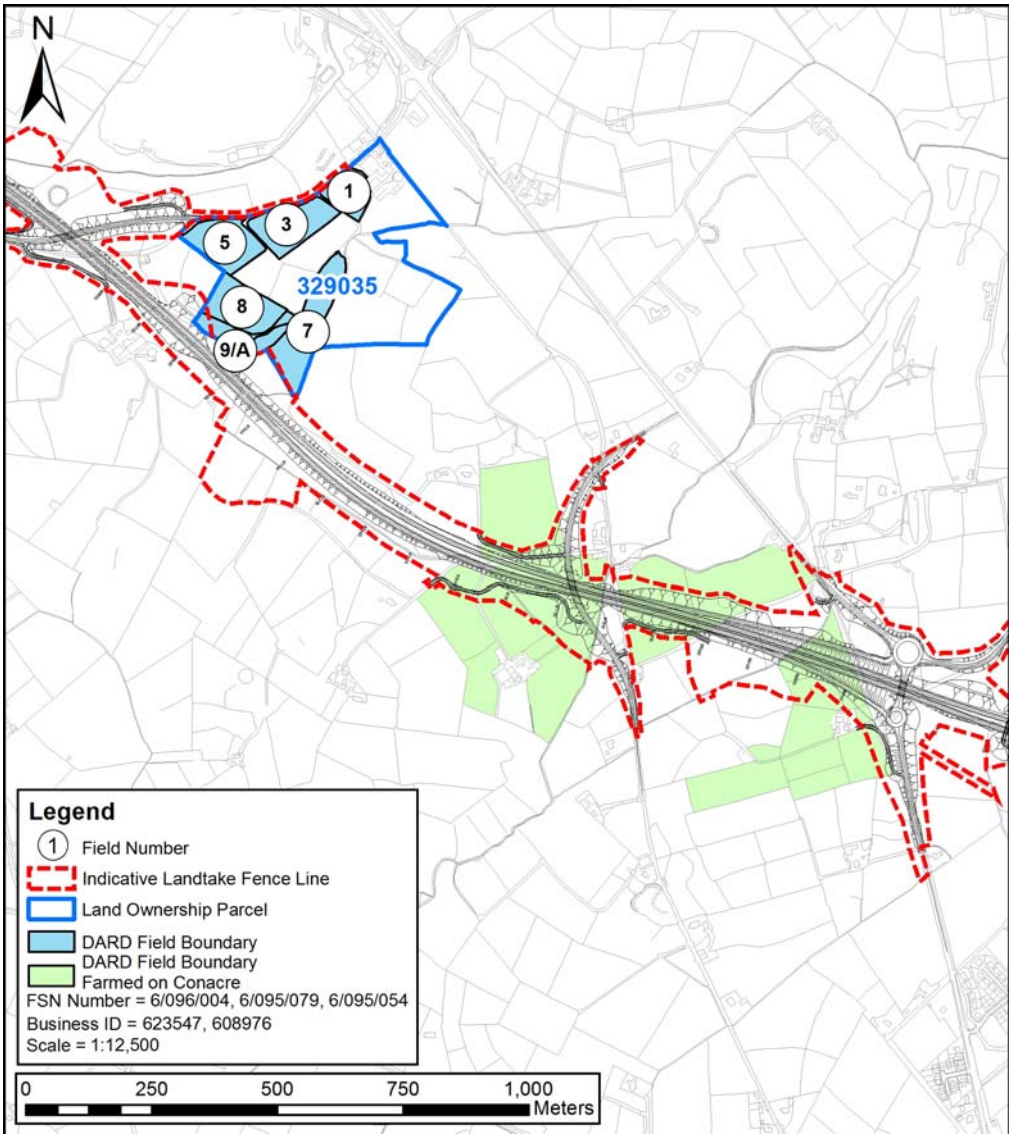
© Mouchel 2016

There would be no severance as a result of the Proposed Scheme. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **substantial adverse**.

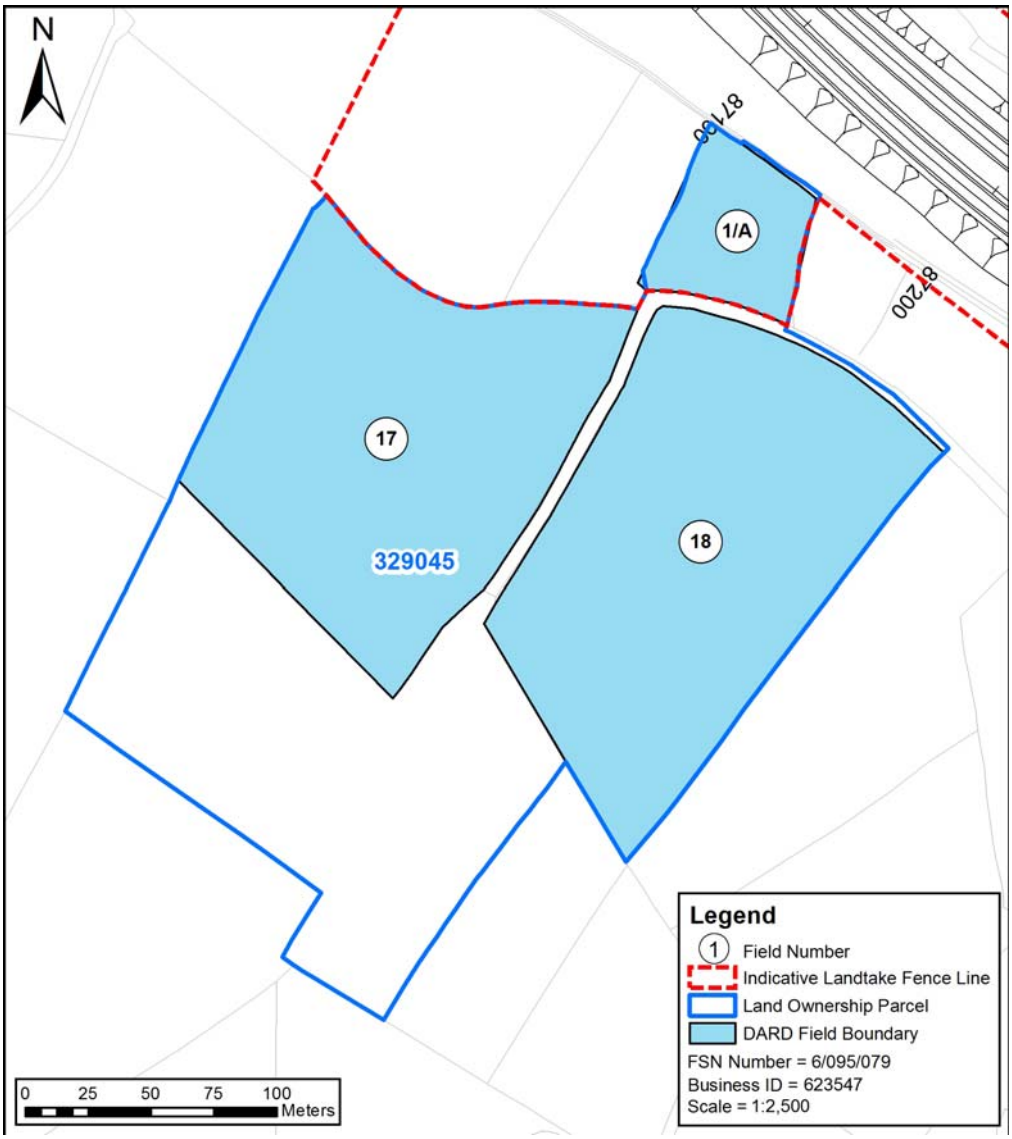
© Mouchel 2016

Land Parcel Ref	329035, 329045	**DARD Business Ref**	623547
		Data sources	2010 AIA meeting. Landowner confirmation meeting held. October 2014 AIA meeting
Conacre Parcel Ref	Affected conacre is rented from parcels 329110,340085,340015.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016



© Mouchel 2016

Size and Quality of Farm The farm extends to 68ha of which 24.66ha is owned land. The farm is all in grass. Land parcel 329035 and 329045 are shown on Figure 15.19 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The farm runs a dairy herd of 120 cows, with a herd average of 8,500 litres, plus approximately 80/90 young stock, which are reared as heifer replacements. Heifers not retained for breeding and all bull calves are sold as dropped calves. There are approximately 20 cattle on the herd list.	
Conacre Arrangement	Conacre is rented from eight landowners, three of which are affected by the proposed scheme (Parcels 329110, 340085, 340015)
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	Depending on the land-take from conacre land, there may be implications for the farm under the Nitrates Directive. As present, the farm produces 154kg of organic nitrogen per ha, which is below the maximum of 170kg of organic nitrogen per ha.
Countryside Management Scheme	Owned land is registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	Since this is dairy farm, the land is not eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

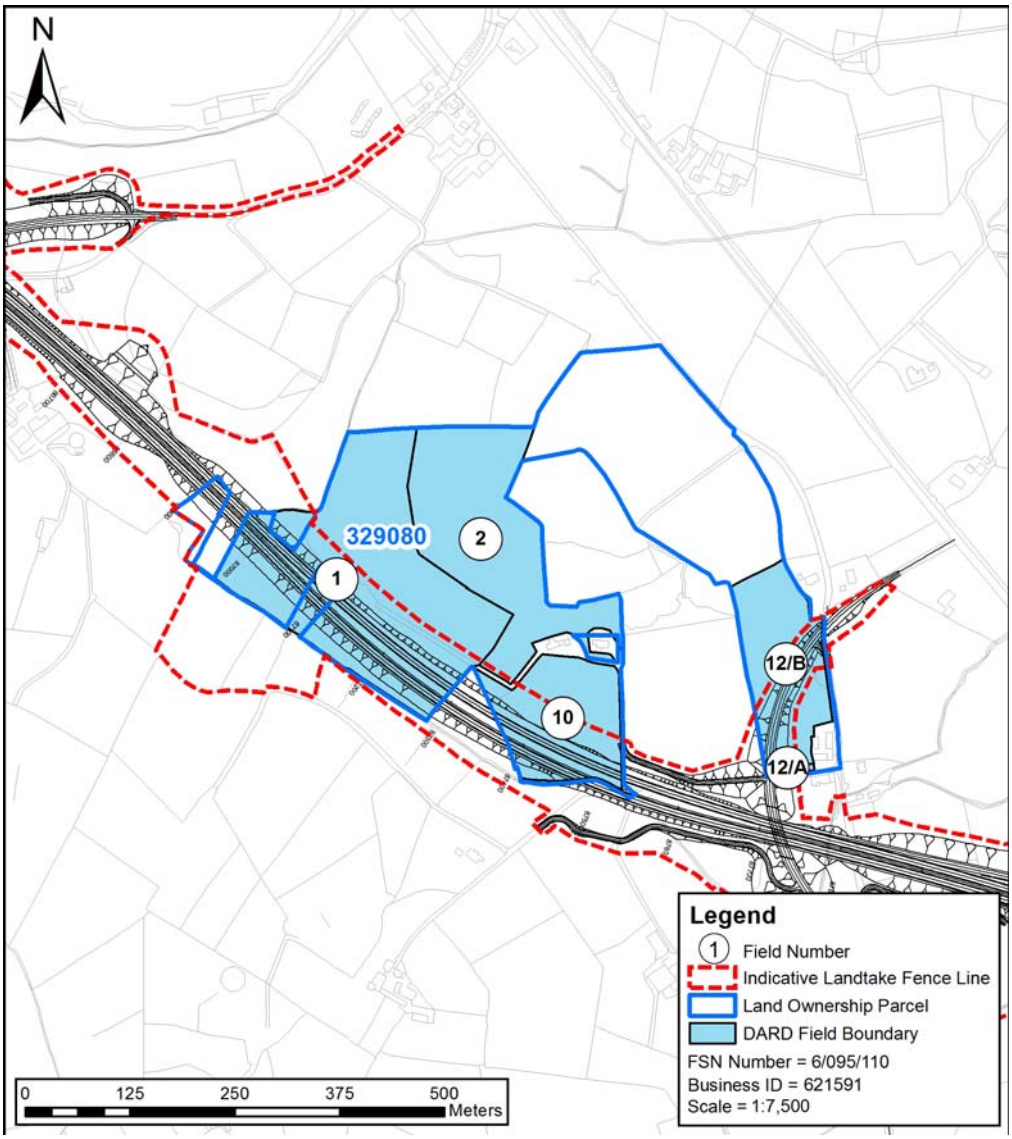
© Mouchel 2016

Predicted Impacts The proposed scheme will result in a total loss of 0.15ha of owned land out of 68ha farm equating to <1% of the productive land. Additional areas taken in conacre are affected. There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	329080	**DARD Business Ref**	621591
		Data sources	April 2010 AIA meeting. 2013 AIA letters not returned, no landowner confirmation meeting feedback. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 17.8ha of owned land which is all in grass.

Land parcel 329080 is shown on Figure 15.19 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a herd of 30 suckler cows plus 1 bull, with all the calves being sold as suckled calves. At present there are also 7 heifers retained as herd replacements.

In winter, the farm grazes sheep on a "Bed and breakfast" basis.

Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 5.31ha out of 17.8ha farm equating to 30% of the productive land.

New severance would impact upon the farm. Access would be provided to the severed land via the realigned Old Chapel Road. Severance impacts would be moderate.

There would be temporary impacts during the construction phase of the Proposed Scheme.

© Mouchel 2016

Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	329082, 329105, 329110, 340085	**DARD Business Ref**	608976

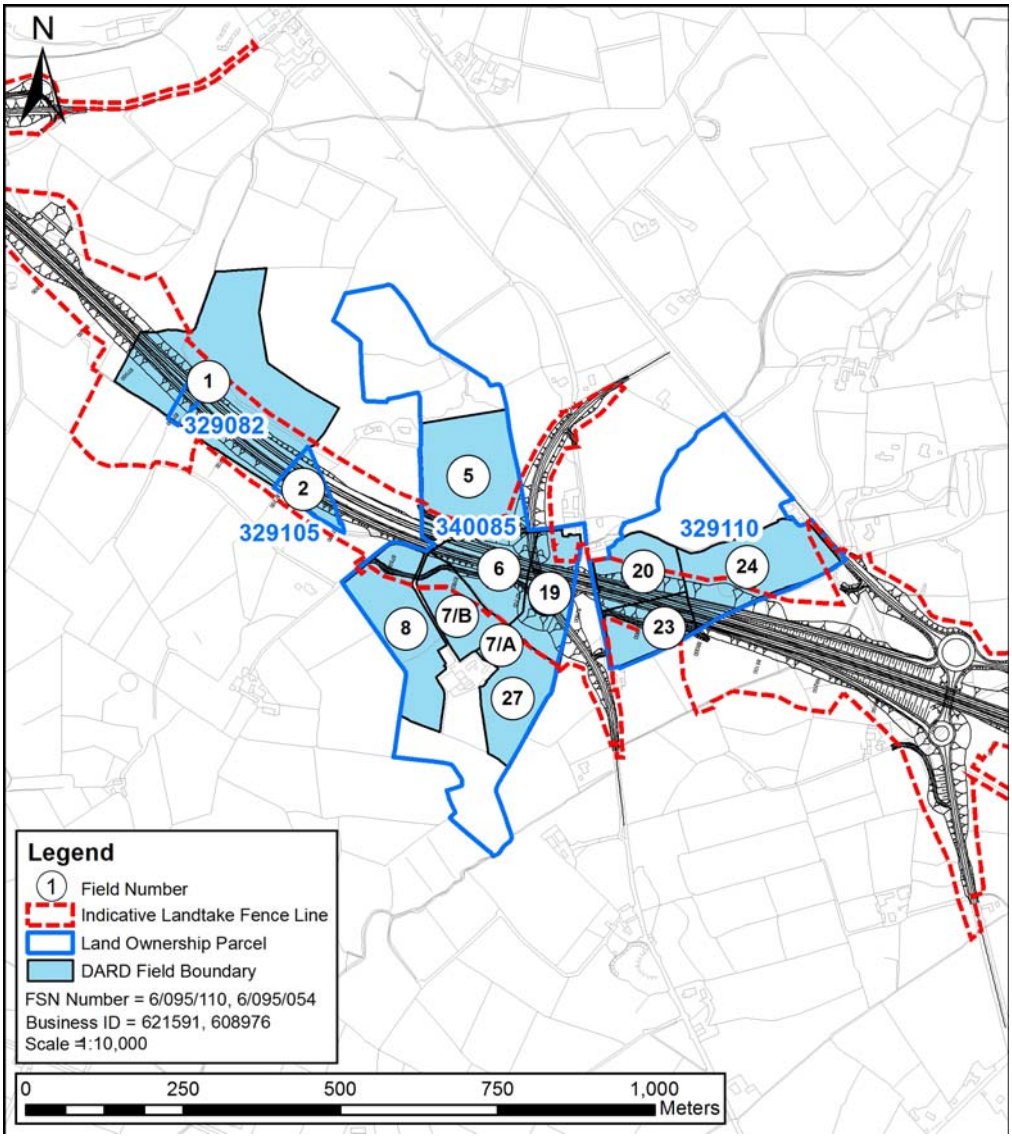
Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 51.29ha of owned land, which is all in grass, with the exception of an area of woodland/scrub.

Land parcel 329082 and 329105 are shown on Figure 15.19 Environmental Statement Land Ownership Boundaries.

Land parcel 329110 is shown on Figure 15.20 Environmental Statement Land Ownership Boundaries.

Land parcel 340085 is shown on Figure 15.19 and 15.20 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a herd of 23 suckler cows, with all the progeny being finished as beef. In addition, approximately 80 store cattle are bought in and finished for beef.

Note: the 80 store cattle are not owned.

Silage grown on the farm is used to feed approximately 150 cattle housed and fed on the farm on a bed and breakfast basis.

Approximately 50 store lambs are bought in the autumn and carried through to finish. During the winter the farm is grazed with sheep.

Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	As this used to be a dairy farm, the land is not eligible for payments under LFACAS.

© Mouchel 2016

Biosecurity	No biosecurity have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 7.33ha out of 51.29ha farm equating to 14% of the productive land.

Land would be required from four land parcels. The landtake impacts would be substantial.

New severance would impact the farm. Access would be provided off the realigned Old Chapel Road and Tullyvar Road.

There would be temporary impacts during the construction phase of the Proposed Scheme.

Proposed Mitigation

During the construction phase access to severed land would be maintained.

Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **substantial adverse**

© Mouchel 2016

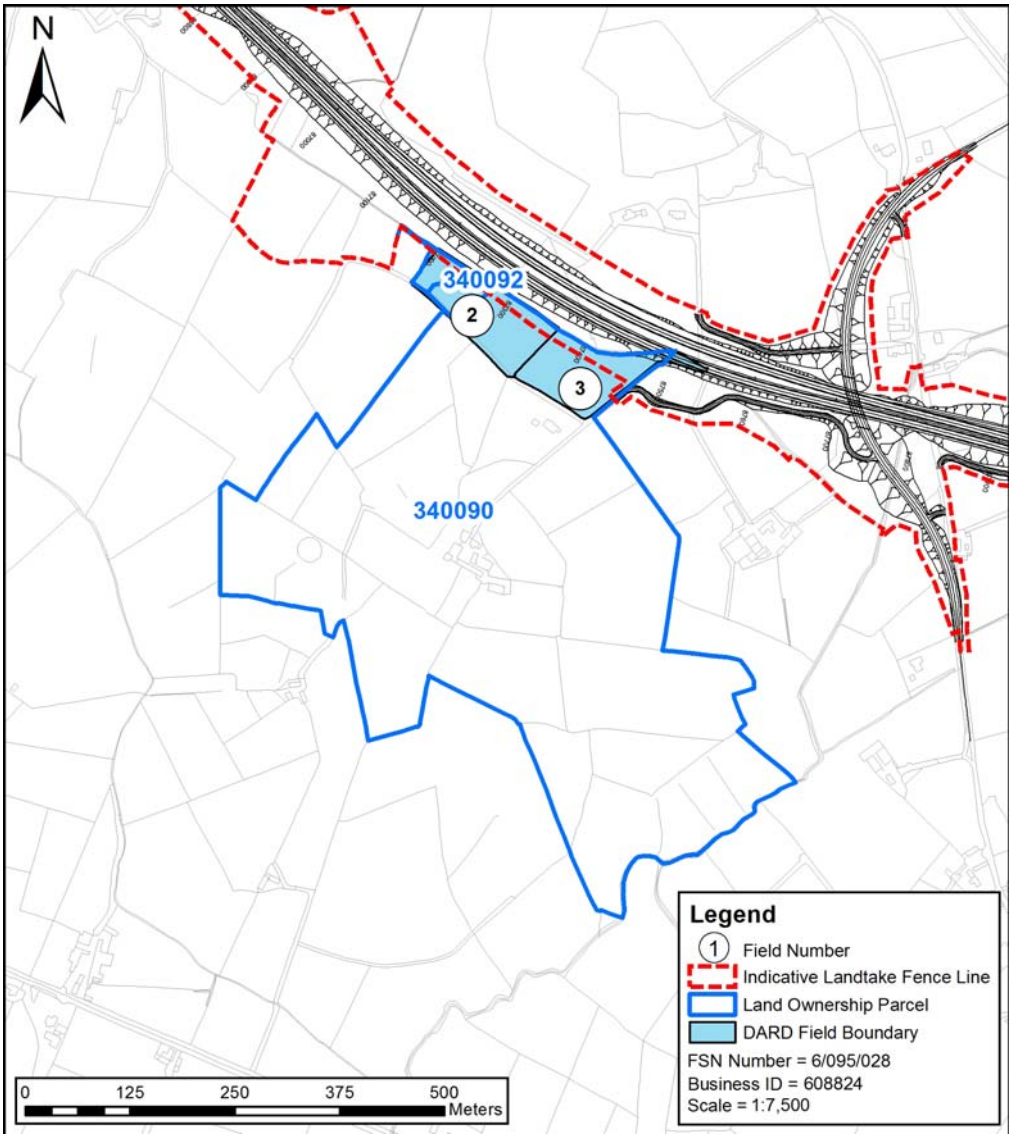
Land parcel reference, farm map filed surveys and the proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 29.69ha, of which 23.82ha is owned land, with a further 5.87ha being taken in conacre. Land parcel 340090 is shown on Figure 15.19 and 15.20 Environmental Statement Land Ownership Boundaries. The farm is all in grass.	
Type of Enterprise and Husbandry	
The farm runs a herd of approximately 35 suckler cows, with calves being over-wintered and sold as strong stores in the spring. In addition, a flock of 50 ewes and 2 rams produce approximately 80 lambs, which are carried through to finish.	
Conacre Arrangement	Rents 5.87ha in conacre which is unaffected by the Proposed Scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
The proposed scheme will result in a total loss of 0.5ha out of 29.69ha farm equating to 2% of the productive land.

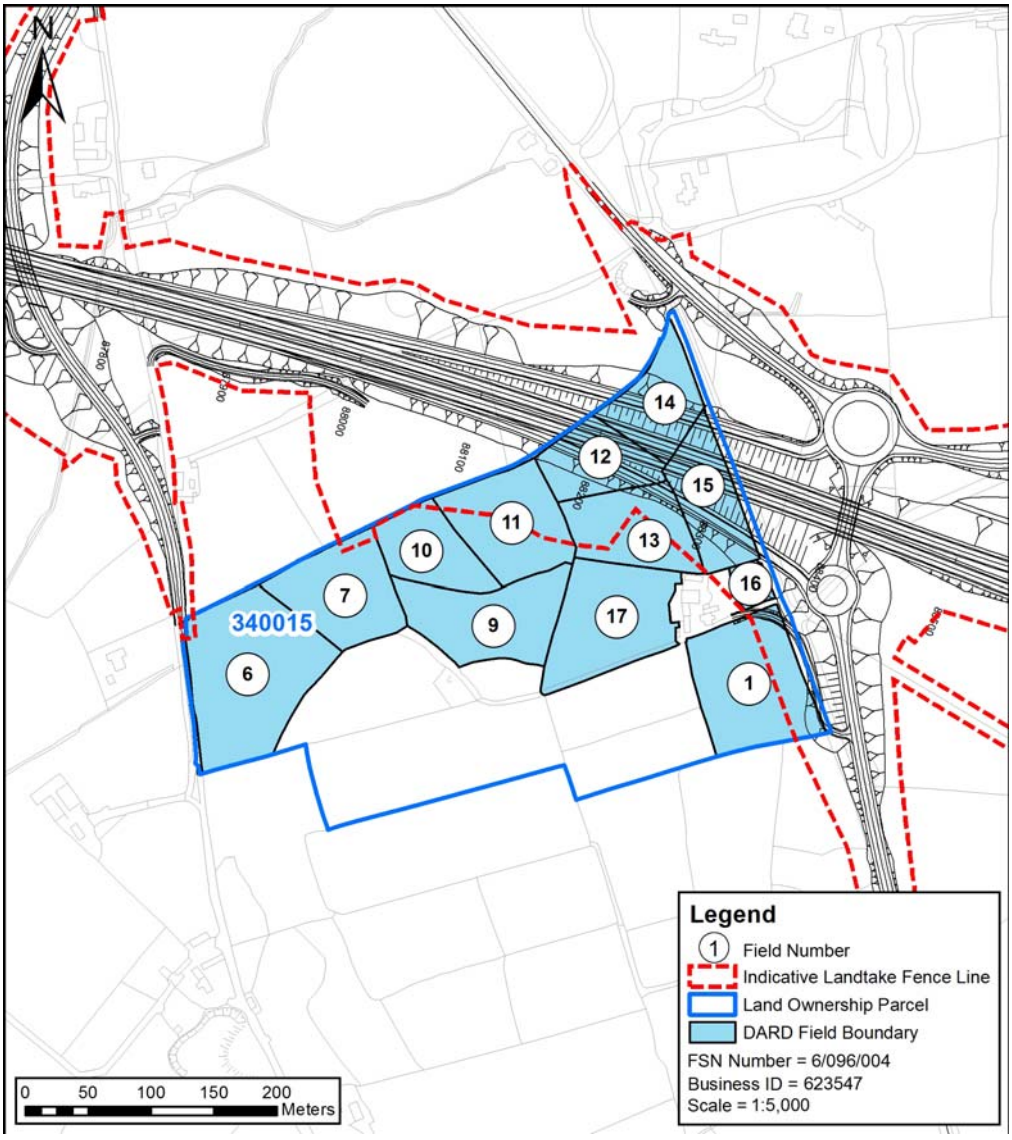
© Mouchel 2016

. This would include land for a proposed attenuation feature. The landtake impacts would be slight. There will be no severance as a result of the Proposed Scheme.	
Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	340015	**DARD Farm Map Ref**	Not available
		Data sources	October 2010 AIA meeting. 2013 AIA letters stated no change to the farm and minor changes to scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Land let in conacre to Parcel 329035, Datasheet 021-186.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to approximately 10.5ha of owned land, which is all in grass.

Land parcel 340015 is shown on Figure 15.20 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The land is all rented out in conacre.

Conacre Arrangement	Land let in conacre to Parcel 329035. The impacts on the conacre tenant are outlined in the datasheet 021-186
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all rented in conacre, and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 2.75ha out of 10.5ha farm equating to 26% of the productive land.
This would include land for a proposed junction. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

There would be no severance as a result of the Proposed Scheme.

Proposed Mitigation

No mitigation would be proposed.

© Mouchel 2016

Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	340005	**DARD Business Ref**	608990
		Date of Visit	September 2010 AIA meeting. 2013 AIA letters not returned. Landowner confirmation phone call identified no change. Minor changes to the scheme only.

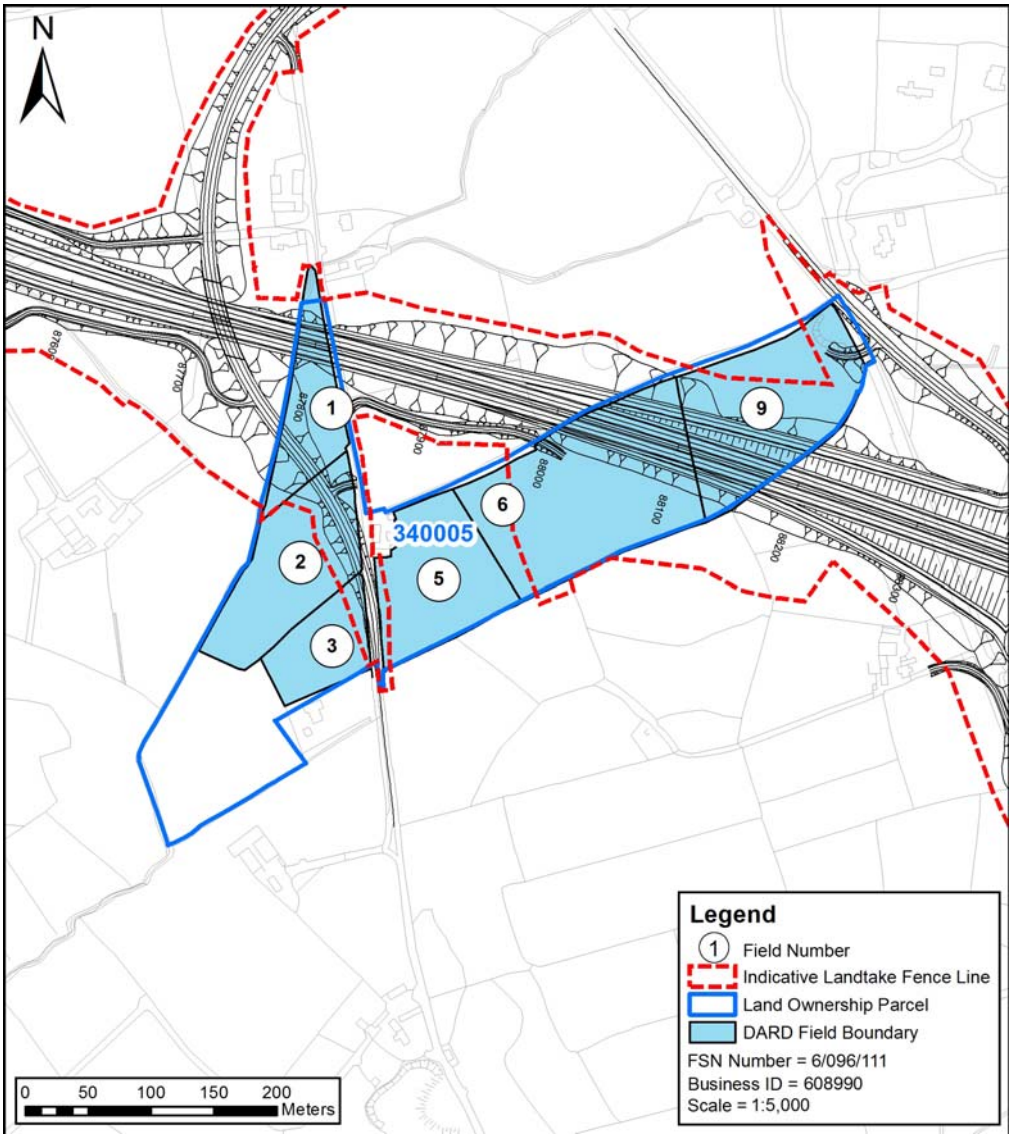
Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to approximately 7.83ha, which is all in grass. Land parcel 340005 is shown on Figure 15.20 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry	
The farm runs a flock of 9 ewes and 1 ram, producing approximately 14 lambs, which are carried through to finish.	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme, although application has been made to join the 2009 scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
The proposed scheme will result in a total loss of 4.21ha out of 7.83ha farm equating to 54% of the productive land. This would include land for the realigned Old Chapel Road overbridge. The landtake impacts would be moderate. New severance would impact on the farm. Access is provided to all severed land via the realigned Old Chapel Road and Tullyvar Road. Severance impacts would be moderate.

© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would to be maintained.	
Predicted Effects	The loss of 54% of the available productive land would have a substantial impact on the farm's potential output and constitute a moderate effect on the farm. Severance constitutes a **moderate** effect on the farm. The overall impact of the Proposed Scheme on the farm would be **moderate adverse.**

© Mouchel 2016

Land Parcel Ref	330005	**DARD Business Ref**	608835
		Data sources	June 2010 meeting. AIA letters not returned. No landowner confirmation feedback. Minor changes to the scheme only, therefore not 2014 revisit.

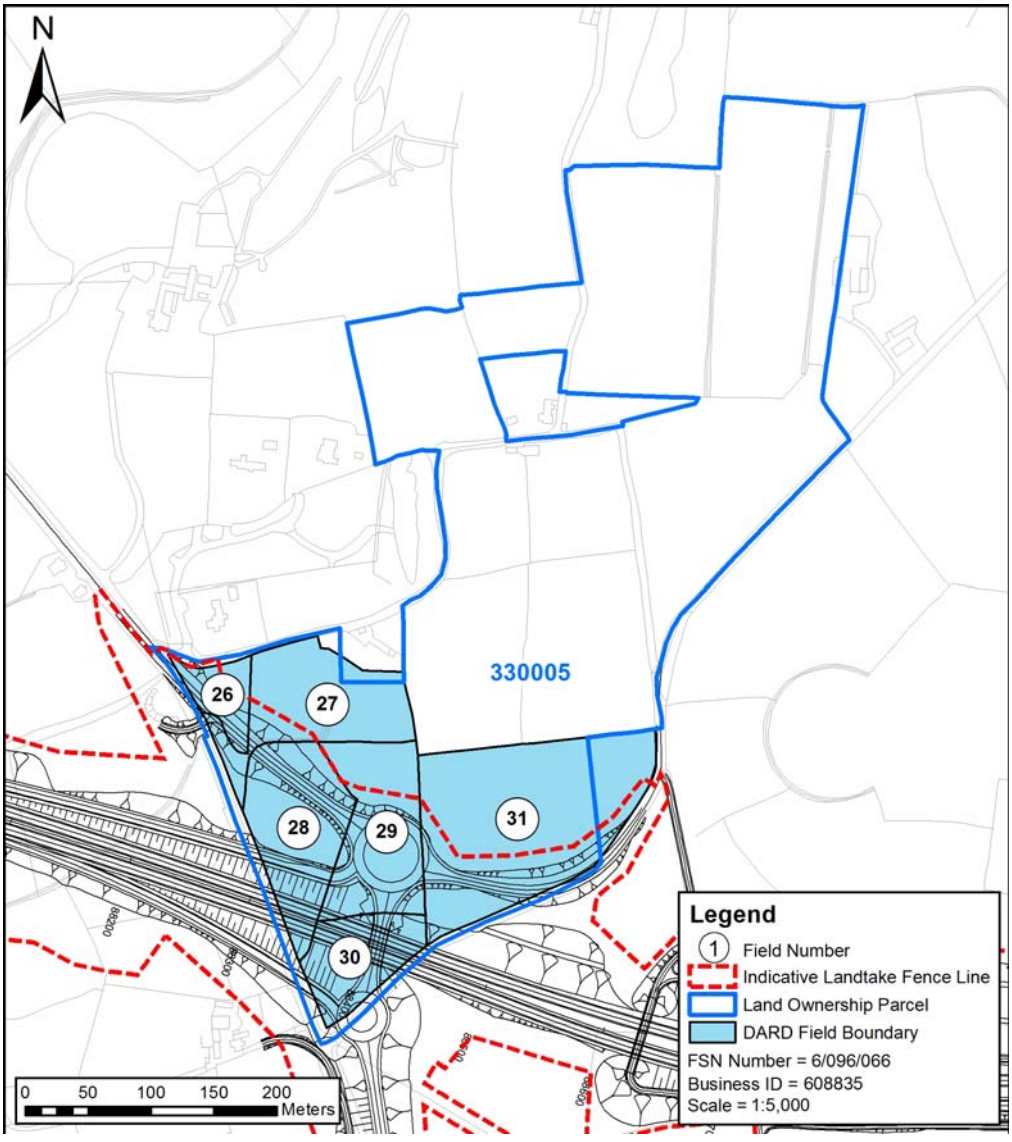
Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 56.17ha of owned land, which is all in grass.

Land parcel 330005 is shown on Figure 15.20 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a dairy herd of 50 British Friesian cows with a herd average of 6,500 litres. In addition, there are 25 herd replacements, with animals not suitable for replacements and bull calves being finished for beef. There are approximately 140 cattle on the herd list.

Field Nos 28-31 are generally regarded as silage ground, with two cuts being taken and after-grass grazed.

Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Since this is a dairy farm, the land is not eligible for LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 3.61ha out of 56.17ha farm equating to 6% of the productive land.

. Under the Nitrates Directive, landtake may impact on future compliance. The landtake impacts would be moderate adverse.

There would be no severance as a result of the Proposed Scheme.

Proposed Mitigation

No mitigation would be proposed.

© Mouchel 2016

Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **moderate adverse**

Conacre Arrangement	The land all taken in conacre.
Single farm payment	No Information
Nitrates Directive	No Information
Countryside Management Scheme	No Information
Less Favoured area Compensatory Allowance Scheme	The land is in conacre and is therefore not eligible for payments under LFACAS.
Biosecurity	No Information

Predicted Impacts The proposed scheme will result in a total loss of 4.79ha out of 23.07ha farm equating to 21% of the productive land. The main impacts of the proposed scheme is land take and severance. The impact of the Proposed Scheme is considered **moderate adverse**.	
Proposed Mitigation During the construction phase access to severed land will be required.	
Predicted Effects	The overall impact of the proposed A5WTC on the farm is **moderate adverse.**

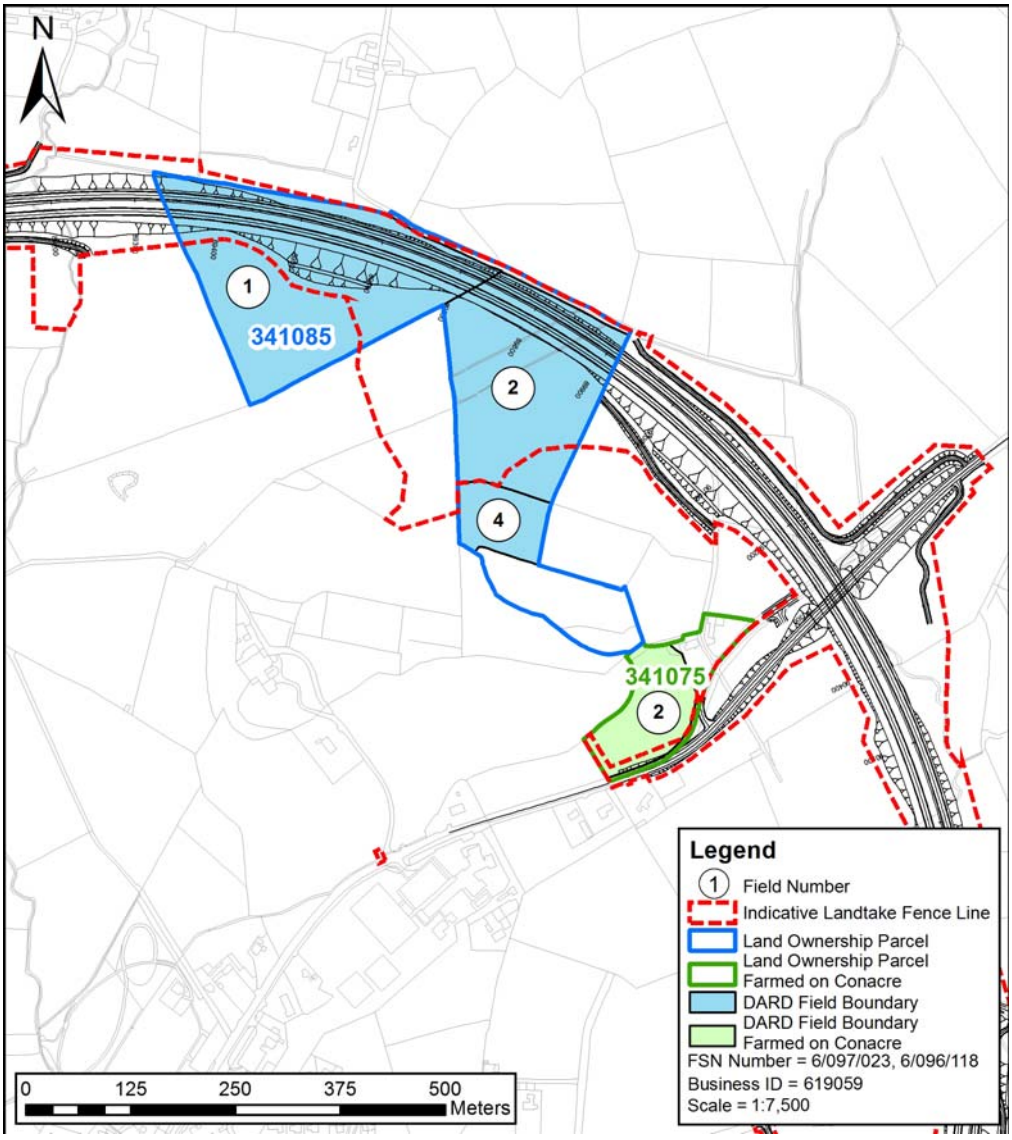
Land Parcel Ref	341085	**DARD Business Ref**	619059
		Data sources	September 2010 AIA meeting. Landowner confirmation meeting held. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Rents land in conacre Parcel 341075		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to approximately 21ha, of which 15.85ha is owned land. The remainder is taken in conacre.

The farm is all in grass.

Land parcel 341085 is shown on Figure 15.20 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm runs a herd of 15 suckler cows, plus 1 bull, with all the progeny being over-wintered and sold as strong stores.

Conacre Arrangement	5.15ha of land rented in conacre from two landowners. Land associated with parcel 341075 is affected by the proposed scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on both owned and conacre land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 7.39ha of owned land and 0.22ha of land taken in conacre, equating to 36% of the productive land.
This would include land that is proposed to be used as a deposition area. The landtake impacts would be substantial.

New severance would impact on the farm. Severed land would be accessed via a shared farm lane through the proposed deposition area. Severance impacts would be substantial.

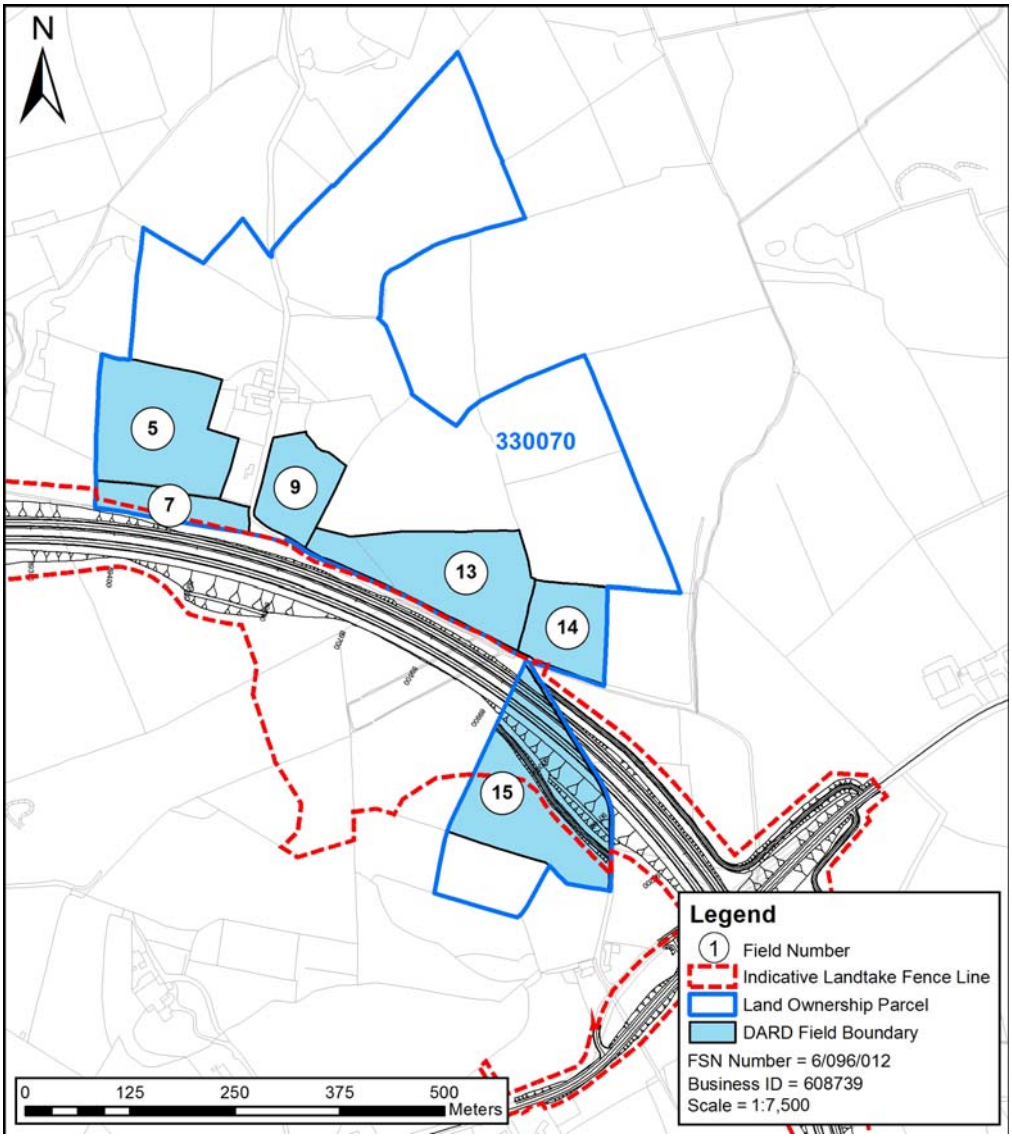
© Mouchel 2016

The overall impact of the Proposed Scheme on the farm would be **substantial adverse** to the extent that this farm may no longer be viable.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The loss of 36% of the available productive land and severance would result in a **substantial adverse** impact.

© Mouchel 2016

Land Parcel Ref	330070	**DARD Business Ref**	133141
		Data sources	July 2010 AIA meeting. No response to 2013 AIA letters or land confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Affected Field 15 let to Parcel 235045 owner.		

Land parcel reference, farm map field surveys and the proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 26.52ha, which is all in grass. Land parcel 330070 is shown on Figure 15.20 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry	
In the past the farm ran a suckler cow herd with 30 cows, with the progeny being sold as suck calves.	
Conacre Arrangement	Field Nos 2, 3, 5, 7, 15 & 16 (no all fields marked on plan above) are rented out in conacre to two landowners. Affected Field 15 let to Parcel 235045 owner. Impacts on this conacre tenant are outlined in datasheet 021-127.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) or Severely Disadvantaged Area (SDA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
The proposed scheme will result in a total loss of 1.79ha out of 26.52ha farm equating to 7% of the productive land. This would include land for the Proposed Scheme and two farm lanes. As the ffected land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight. New severance would impact on the farm. Access would be provided to all severed land via a shared farm lane off Carnteel Road. Severance impacts would be slight.

© Mouchel 2016

There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse.**

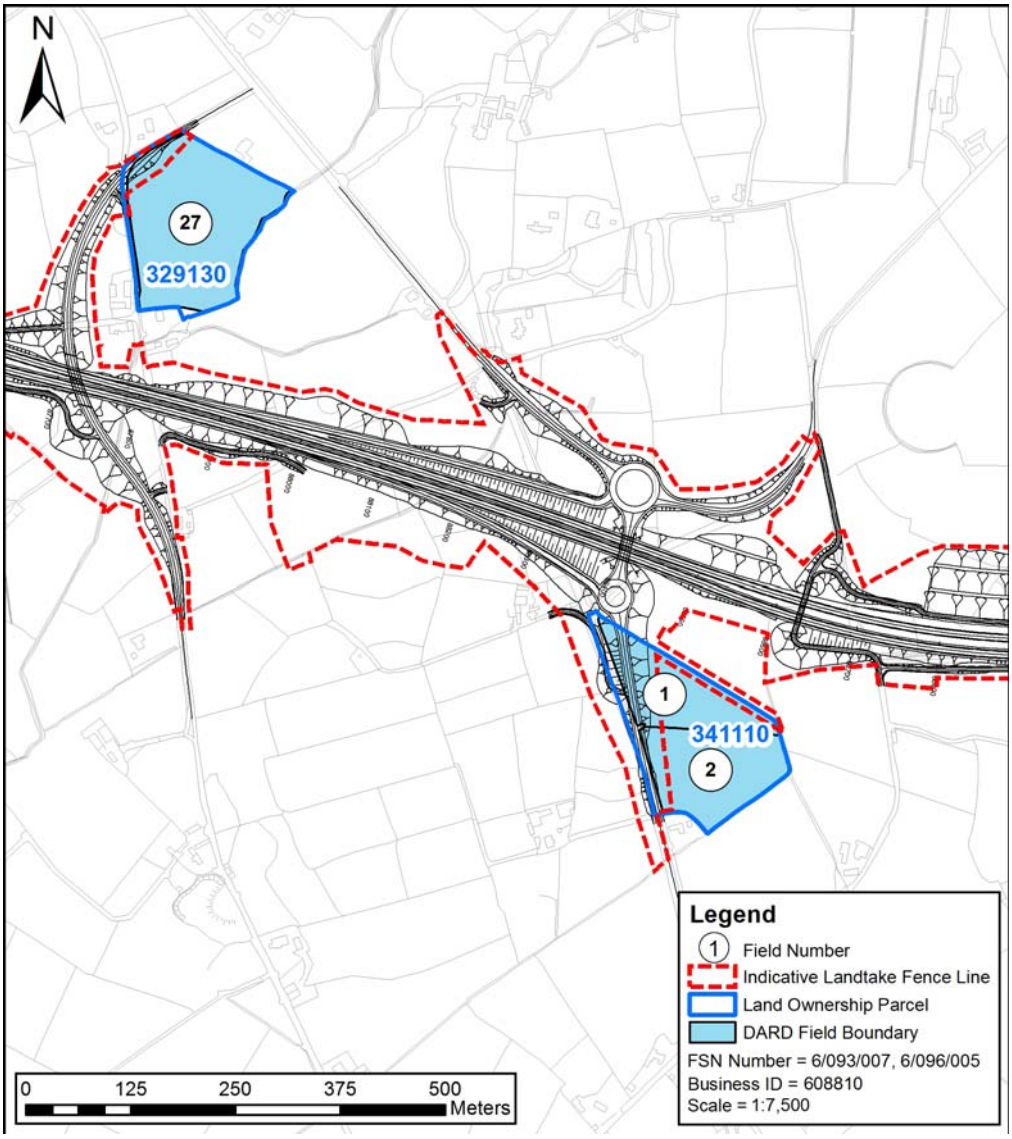
Land Parcel Ref	329130, 341110	**DARD Business Ref**	608810
		Data sources	2010 AIA meeting. Landowner confirmation meeting held. October 2014 AIA meeting
Conacre Parcel Ref	No maps available		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to approximately 25.76ha, of which 13ha is owned land, with the remainder being taken in conacre. Land parcel 329130 is shown on Figure 15.19 and 15.20 Environmental Statement Land Ownership Boundaries. Land parcel 341110 is shown on Figure 15.20 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The farm runs a herd of 30 suckler cows and 1 bull, with some of the progeny being sold as suckled calves, while the remainder are over-wintered and grazed during the following season. There are approximately 60 - 70 cattle on the herd list. In addition, approximately 30 store lambs are bought in each autumn and carried through to finish.	
Conacre Arrangement Approximately 12.76ha of land is rented in conacre from four different landowners. No maps available.	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all classified Disadvantaged Area, and is eligible for payments under Less Favoured Area Compensatory Allowance Scheme.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

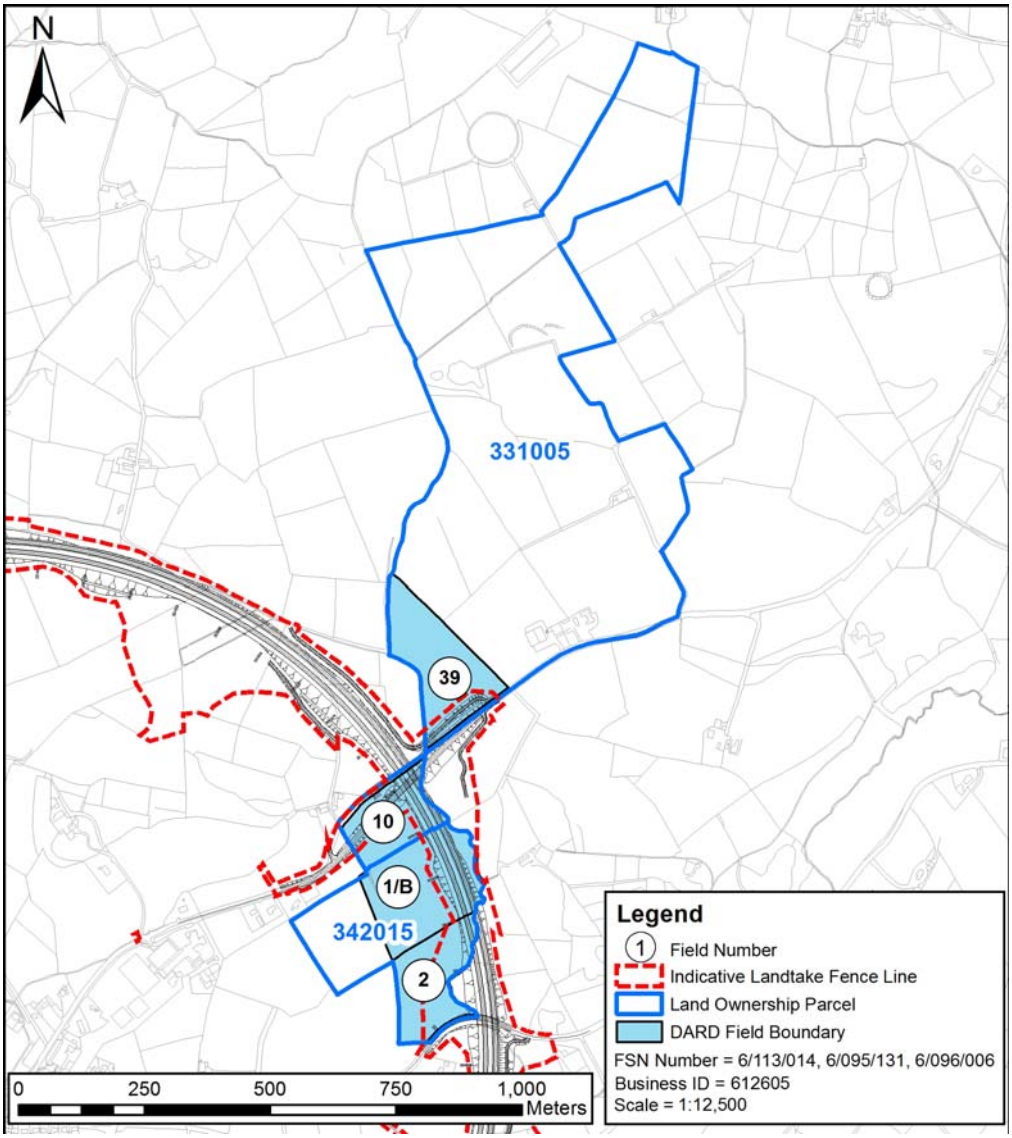
© Mouchel 2016

Predicted Impacts The main impact on this farm will be land-take. The proposed scheme will result in a total loss of 1.34ha owned land out of 25.76ha farm equating to 5% of the productive land.	
Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	331005, 342015	**DARD Business Ref**	612605
		Data sources	September 2010 meeting. No response to 2013 AIA letters or landowner confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to 114.5ha of owned land, which includes 1.5ha of conacre land. Land parcel 331005 is shown on Figure 15.20 Environmental Statement Land Ownership Boundaries. Land parcel 342015 is shown on Figure 15.2 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry	
The farm runs a herd of 100 suckler cows and 5 bulls, with all the progeny being finished as beef. In addition, the farm buys in store cattle for finishing. There are approximately 350 cattle on the herd list. The farm also buys in 200-250 store lambs in the autumn, and carries them through to finish.	
Conacre Arrangement	1.5ha of land is rented in conacre, which in unaffected by the proposed scheme.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land and also on conacre land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Field Nos 1 – 19 (FSN6/113/014) are registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all classified Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
The proposed scheme will result in a total loss of 5.4ha out of 114.5ha farm equating to 5% of the productive land. This would include land for the realigned Carnteel Road. The landtake impacts would be moderate. There would be no severance as a result of the Proposed Scheme.

© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **moderate adverse.**

© Mouchel 2016

Land Parcel Ref	352070	**DARD Business Ref**	608837
		Data sources	2010 AIA meeting. Landowner confirmation pack sent. October 2014 AIA meeting

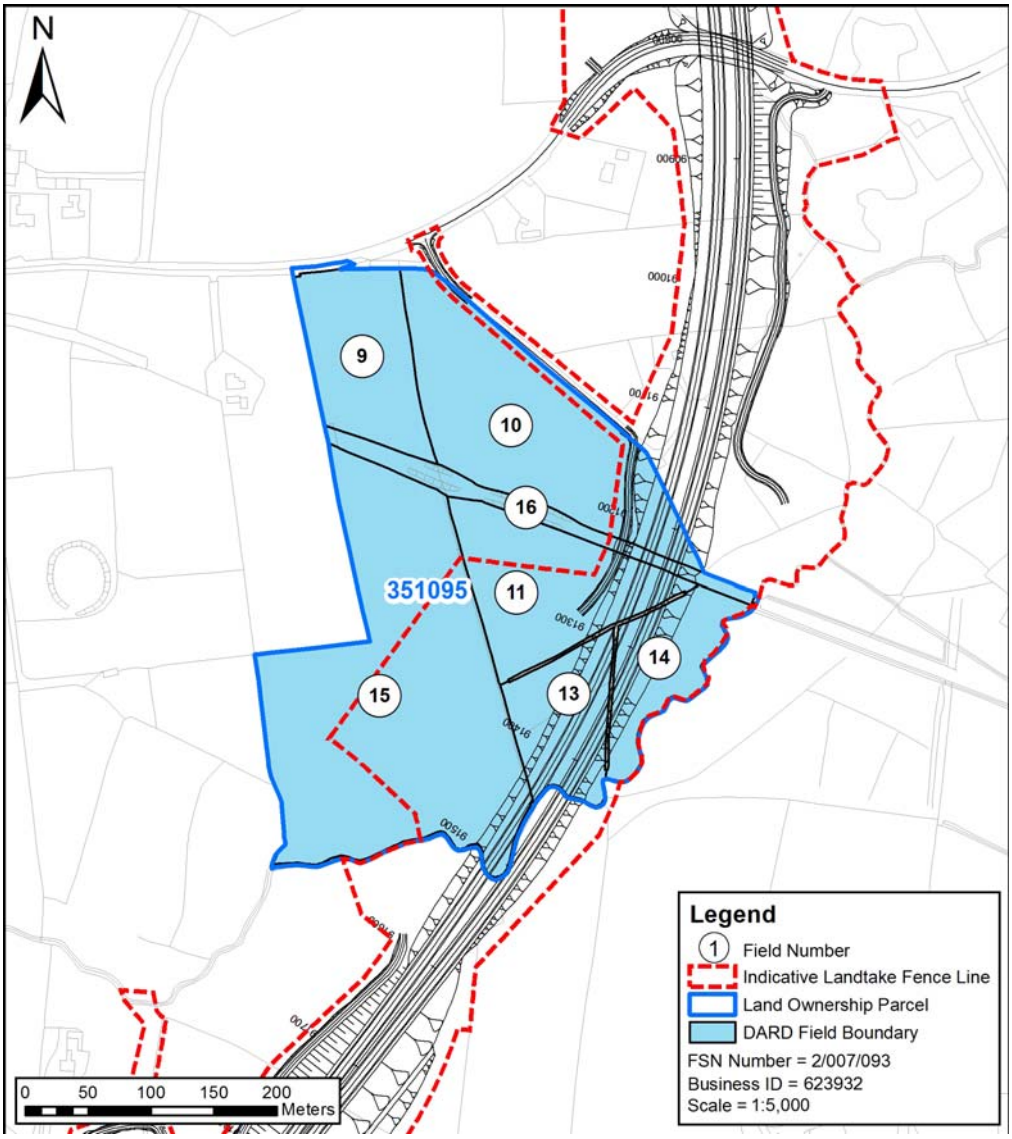
Size and Quality of Farm The farm extends to 4.74ha, which is all in grass. Land parcel 352070 is shown on Figure 15.20 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry The farm runs a herd of 24 suckler cows, 2 bulls plus young stock. All calves are either finished or wintered and sold as strong stores. There are approximately 80 cattle on the herd list. .	
Conacre Arrangement	N/a
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	This is an intensive dairy farm and there may be implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Approximately 9.7ha of owned land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is registered as Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The proposed scheme will result in a total loss of 2.65ha out of 4.74ha farm equating to 56% of the productive land. The main impact on this Landowner is land take and severance.	
Proposed Mitigation No mitigation would be proposed.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse.**

© Mouchel 2016

Land Parcel Ref	351095	**DARD Business Ref**	623932
		Data sources	2010 AIA meeting. Landowner confirmation meeting held. October 2014 AIA meeting.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to approximately 33ha of owned land, in two parcels, including 11.44ha which is affected. The farm is all in grass.

Land parcel 351095 is shown on Figure 15.20 Environmental Statement Land Ownership Boundaries.

Type of Enterprise and Husbandry

The farm buys approximately 25 store cattle which are grazed during the summer, before being sold as strong stores in the autumn.

Conacre Arrangement	N/a
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is all registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is not eligible for payments under LFACAS, since only store cattle are grazed.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

Predicted Impacts

The proposed scheme will result in a total loss of 5.43ha out of 33ha farm equating to 16% of the productive land.
This includes land for an attenuation feature.

There will be no severance as a result of the proposed scheme.

Proposed Mitigation

During the construction phase access to severed land will need to be maintained.

Predicted Effects	The overall impact of the Proposed Scheme on the farm is a **slight adverse** impact.

© Mouchel 2016

Size and Quality of Farm	
The farm extends to 7.46ha of owned land, which is all in grass. Land parcel 351055 is shown on Figure 15.20 Environmental Statement Land Ownership Boundaries.	
Type of Enterprise and Husbandry	
The land is all rented in conacre.	
Conacre Arrangement	The land is all rented in conacre.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all rented out in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The proposed scheme will result in a total loss of 4.49ha out of 7.46ha farm equating to 60% of the productive land.
This would include land for the proposed road and junction. As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

New severance would impact on the farm. Access to severed land would be provided via a farm lane off Caledon Road. As the land is currently out in conacre and not farmed by the landowner directly, the severance impacts on the landowner would be slight.

As a result of the Proposed Scheme a farm building would be demolished. The demolition of the building would be a moderate impact to the farm.

There would be temporary impacts during the construction phase of the Proposed Scheme.

© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would need to be maintained.	
Predicted Effects	The overall impact of the Proposed Scheme on the farm would be **slight adverse**

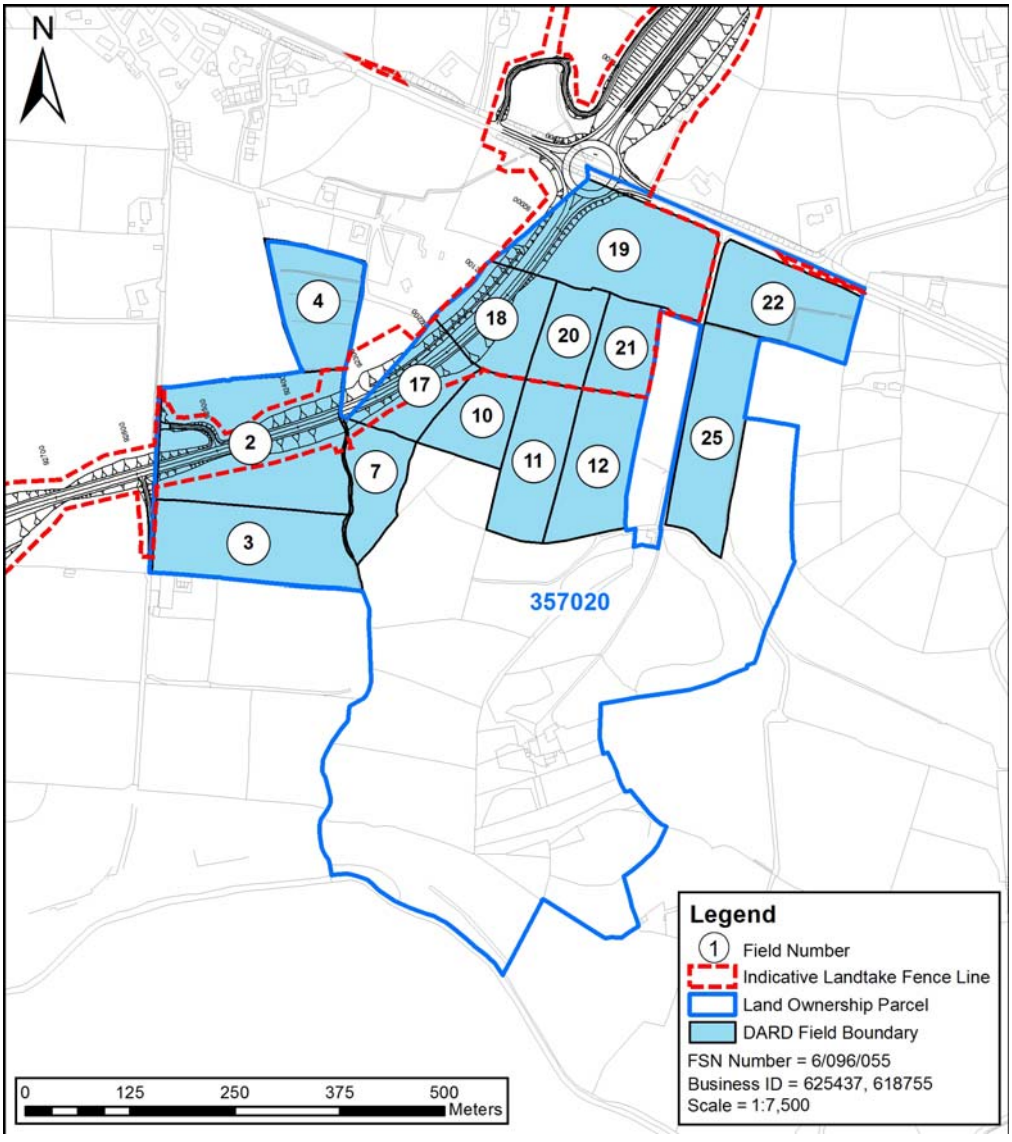
Land Parcel Ref	357020	**DARD Business Ref**	Not available
		Data sources	September 2010 meeting. No response to 2013 AIA letters and landowner confirmation meeting. Minor changes to the scheme only.
Conacre Parcel Ref	Land let in conacre (conacre tenant includes parcel 347030)		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
The landowner was not prepared to divulge information regarding the area covered by the farm, but it is estimated at 75ha, some of which is in grass, rough grazing or wooded.	
Type of Enterprise and Husbandry	
The land is all rented out in conacre to several landowners.	
Conacre Arrangement	The land is all rented out in conacre to several landowners, who are not otherwise affected by the Proposed Scheme. Fields 2 & 3 are let to Parcel 357030. Impacts on this conacre tenant are outlined in datasheet 021-202. No conacre tenant details for the remaining affected area. No conclusions can be made on the impact of the Proposed Scheme on these conacre tenants.
Single Farm Payment	The landowner was not prepared to provide details regarding the Single Farm Payment.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The landowner was not prepared to provide details regarding the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Since the land is rented out in conacre, the land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 7.94 hectares from fields 2, 3, 4, 7, 10, 11, 12, 17, 18, 19, 20, 21, 22 and 25 of the estimated 75 hectare farm equating to some 10.6% of the productive land

This would include land to be used as a deposition area.

The landtake impact would be slight adverse.

New severance would impact on the farm. Access to the severed land would be provided via an underpass. As the land is currently out in conacre and not farmed by the landowner

© Mouchel 2016

directly, the severance impacts on the landowner would be slight.	
Proposed Mitigation During the construction phase, access to land should be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**

© Mouchel 2016

Land Parcel Ref	357030	**DARD Business Ref**	No DARD Map Available
		Data sources	2010 AIA meeting. Landowner confirmation meeting held. October 2014 AIA meeting.

© Mouchel 2016

Size and Quality of Farm	
The farm extends to approximately 28.3ha, and is all in grass. In addition, approximately 12.5ha are rented in conacre from two landowners.	
Type of Enterprise and Husbandry	
The farm runs a suckler herd of 10 cows plus a bull, with all the progeny being reared and finished for beef. In addition, the farm buys in approximately 100 suckled calves, which are carried through to finish as beef. There are approximately 120 cattle on the herd list. In winter approximately 100 store lambs are purchased and carried through to finish.	
Conacre Arrangement	12.5ha of land is rented in conacre from parcel 357020 which is affected by the Proposed Scheme (Datasheet 021-201).
Single Farm Payment	The land is not registered for Single Farm Payment.
Nitrates Directive	There are no implications under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is not eligible for payments under LFACAS, as it is not registered.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 4.8 hectares from fields 1A, 1B, 1D, 1E, 2, 5, 9 and 17A of the 28.3 hectare farm equating to some 17.0% of the productive land. Land taken in conacre in parcel 357020 is also affected by the Proposed Scheme.

This would include land for the proposed alignment. The landtake impact would be substantial.

New severance would impact on the farm. Access would be provided via an underbridge. The severance impacts would be slight.

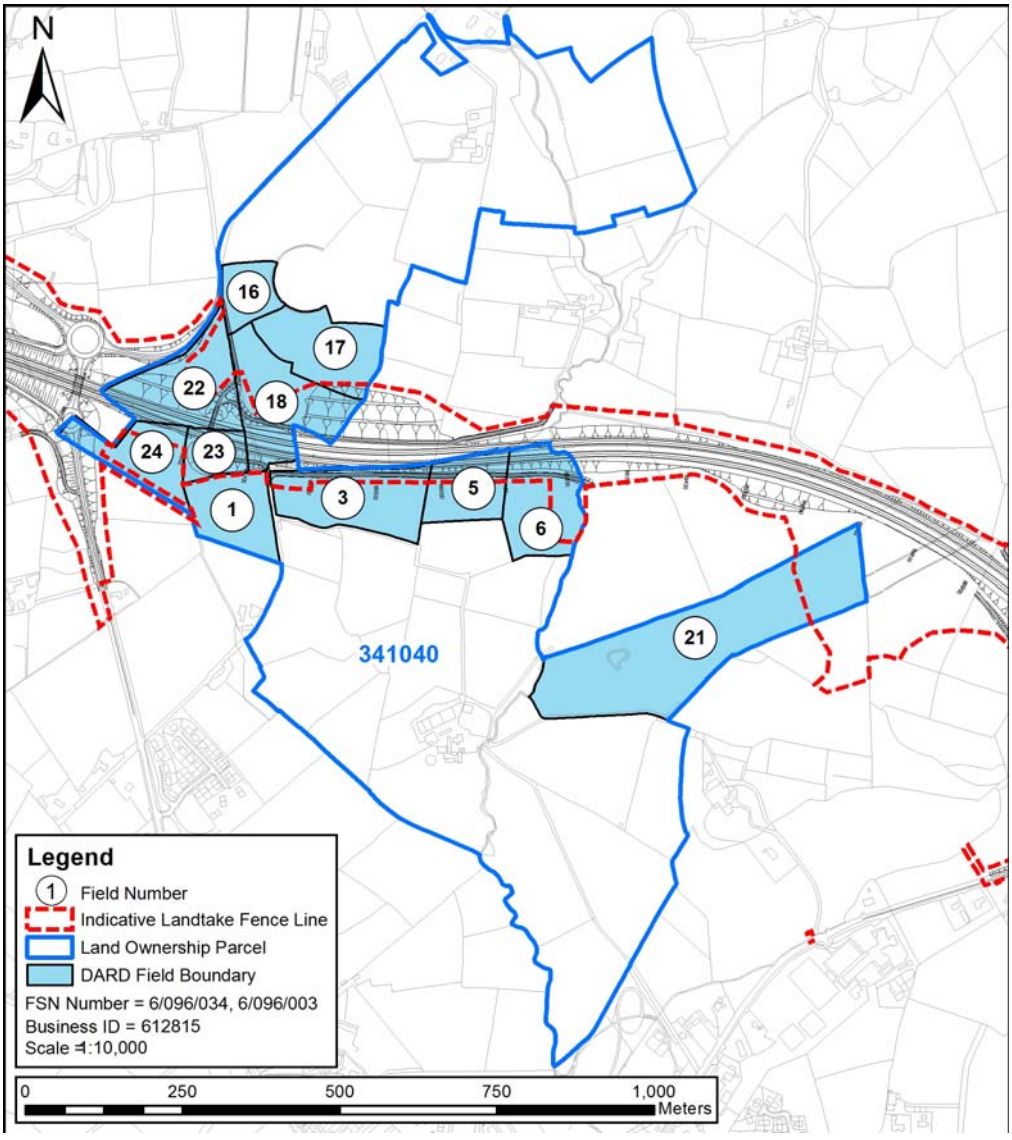
© Mouchel 2016

There would be temporary impacts during the construction phase of the Proposed Scheme.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **substantial adverse.**

© Mouchel 2016

Land Parcel Ref	341040	**DARD Business Ref**	612815
		Data sources	June 2010 meeting. No response to 2013 AIA letters and landowner confirmation meeting. Minor changes to the scheme only, therefore no 2014 revisit.
Conacre Parcel Ref	No information		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm	
Based on 2010 information, the farm extends to 89.78ha, of which 70.57ha is owned land and 19.21ha is rented in conacre. A further 10.33ha (FSN 6/095/002) is utilised for slurry export. The farm is all in grass.	
Type of Enterprise and Husbandry	
The farm runs a dairy herd of 80 cows, plus 12 herd replacements. Replacements required, over and above this number, are bought in as required. There are approximately 200-250 cattle on the herd list, with the remaining cattle being finished as beef. Store lambs may be purchased in the autumn to aid grass management.	
Conacre Arrangement	19.21ha of land was taken in conacre (2010)
Single Farm Payment	The landowner collects the Single Farm Payment on owned land but not on conacre land.
Nitrates Directive	The farm is currently borderline with regard to compliance under the Nitrates Directive. Hence the need for the export of slurry from the farm at present.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts
Total loss of 8.32 hectares from fields 1, 3, 5, 6, 16, 17, 18, 21, 22, 23 and 24 of the 89.78 hectare farm equating to 9.3% of the productive land. The farm would experience some severance as a result of the proposed scheme. There would be an impact during the construction phase of the Proposed Scheme.
Proposed Mitigation
Access for the dairy herd to grazing land situated across the Proposed Scheme is proposed

© Mouchel 2016

via a farm track.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

© Mouchel 2016

Land Parcel Ref	15005	**DARD Business Ref**	610897
		Data sources	No 2013 AIA letter feedback. Landowner confirmation meeting held. November 2014 AIA meeting.

© Mouchel 2016

Size and Quality of Farm The farm extends to 32.62ha and is all arable.	
Type of Enterprise and Husbandry The farm is all arable, with various crops being grown in rotation.	
Conacre Arrangement	The affected field (Field No 1) is let out in conacre. The remainder of the farm is rented to various, undisclosed landowners. The landowner indicated his intention to return to farming the land again during 2015.
Single farm payment	The landowner collects the Single Farm Payment on owned land and conacre.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is registered as Lowland (LL) and is therefore not eligible for payments.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts Total loss of 0.81 hectares from field 1 of the 32.62 hectare farm equating to some 2.5% of the productive land
Proposed Mitigation During the construction phase access to land will be required.

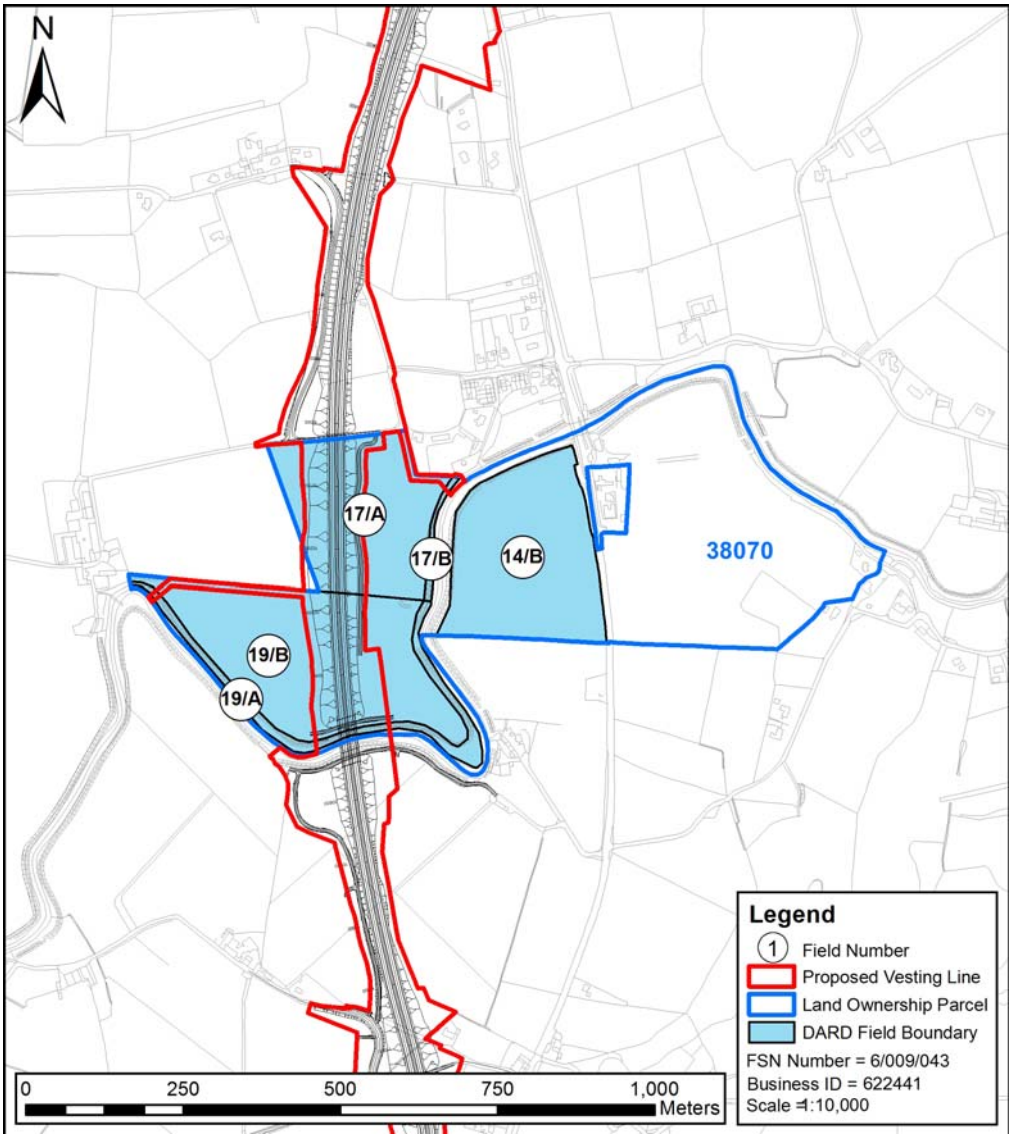
© Mouchel 2016

Predicted Effects	The residual effect of the proposed A5WTC on the farm is a **slight adverse** impact.

© Mouchel 2016

Land Parcel Ref	38070	**DARD Business Ref**	622441
		Data sources	No 2010 AIA assessment. No response to 2013 AIA letters. Landowner confirmation meeting held. September 2014 AIA meeting.
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 64.78ha of owned land. Additional land is rented in conacre.	
Type of Enterprise and Husbandry The farm runs a flock of approximately 100 ewes, producing approximately 150 lambs, which are taken through to slaughter.	
Conacre Arrangement	The land taken in conacre is unaffected by the Proposed Scheme.
Single farm payment	The landowner collects the Single Farm Payment on owned land and conacre.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	Some of the land is registered Disadvantaged Area (DA) and Severely Disadvantaged Area (SDA), and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

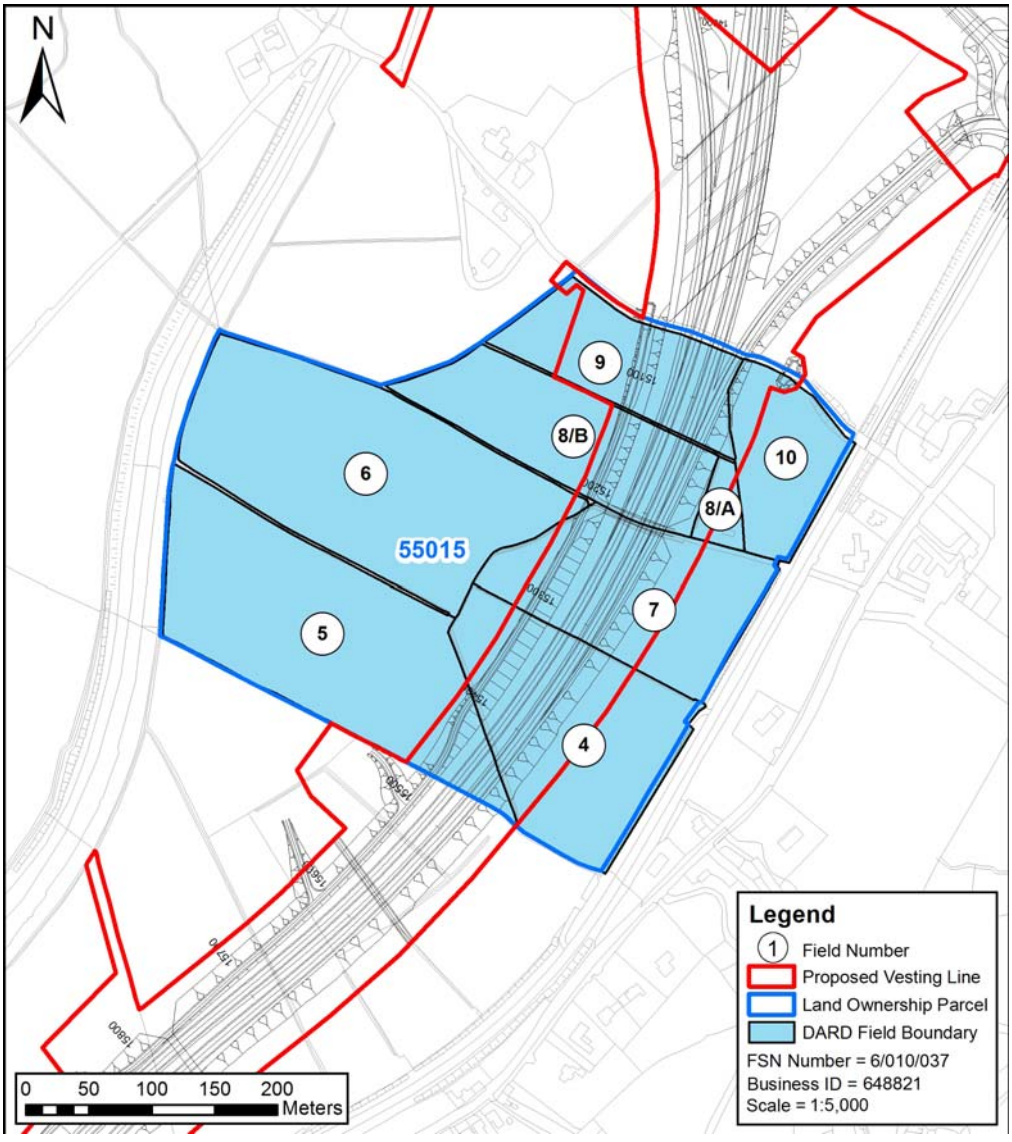
© Mouchel 2016

Predicted Impacts Total loss of 5.37 hectares from fields 14B, 17A, 17B, 19A and 19B of the 64.78 hectare farm equating to 8.3% of the productive land. The main impacts on this farm are severance and land take. The impact of the scheme on the overall farm is considered to be **moderate adverse.**
Proposed Mitigation During the construction phase access will need to be maintained along the Drumenny Road, as will access to the severed area in Field No 19.
Predicted Effects The residual effect of the proposed A5WTC on the farm is a **slight adverse** impact.

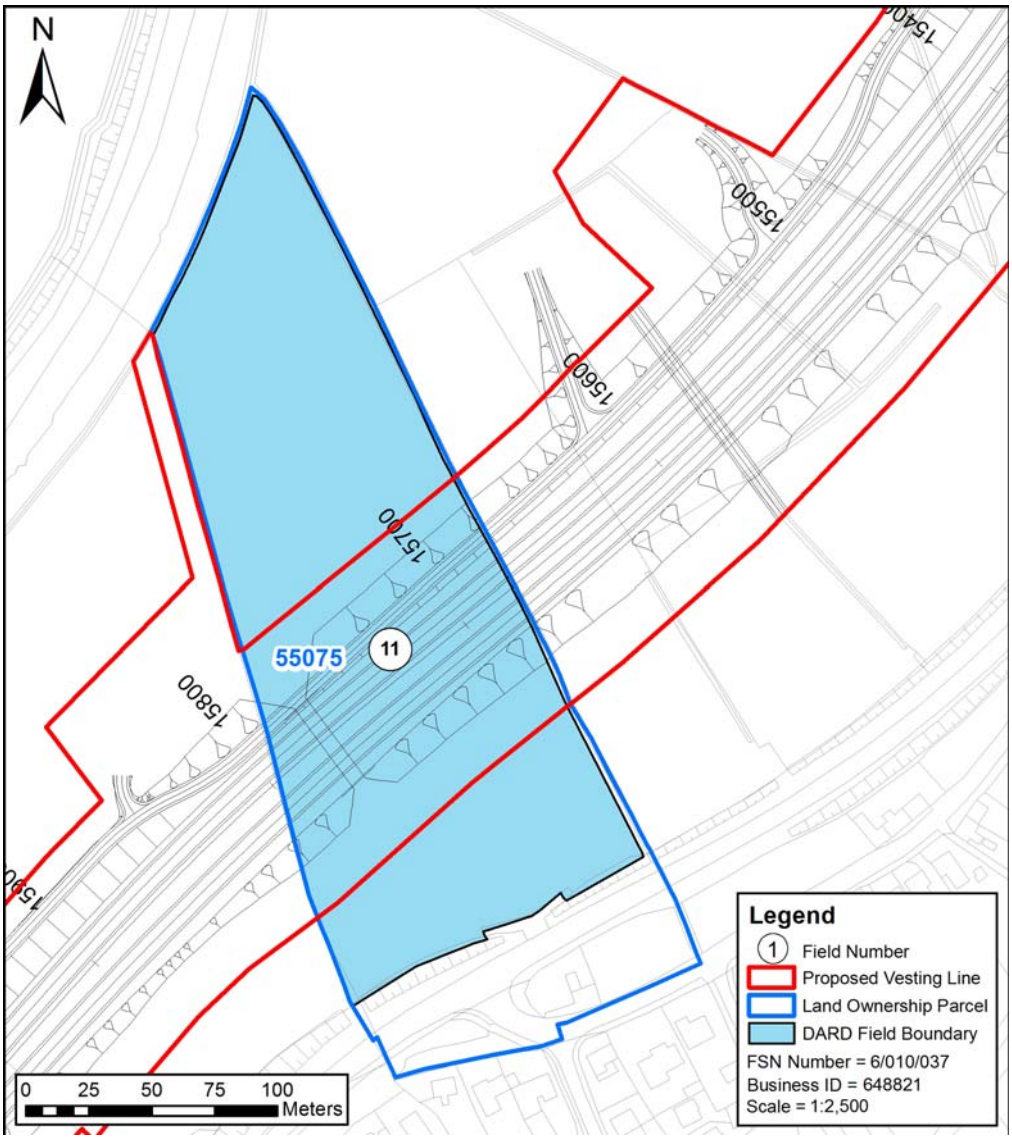
© Mouchel 2016

Land Parcel Ref	55015, 55075	**DARD Business Ref**	611077
		Data sources	2010 AIA meeting. Did not respond to 2013 AIA letters. Landowner confirmation meeting held. November 2014 meeting
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016



© Mouchel 2016

Size and Quality of Farm The farm extends to 55.56ha, of which 43.42ha is owned land with the remaining 12.14ha taken in conacre. The farm is managed by the Landowner's sons.	
Type of Enterprise and Husbandry The farm runs a dairy herd of approximately 200 cows, with a herd average of 7,500 litres. There are approximately 100 herd replacements. All the bull calves are sold. A well in the corner of Field No 10 supplies water to the farmyard for all the stock requirements. The grazing platform for the dairy herd includes land across the A5 in Field Nos 4, 7, 8, 9 & 10, while Field Nos 5 & 6 are normally cut for silage, with the aftergrass grazed.	
Conacre Arrangements 12.14ha taken in conacre which is not affected by the Proposed Scheme.	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Only land under FSN6/009/010 is registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all classified Low Land, and is not eligible for payments under Less Favoured Area Compensatory Allowance Scheme.
Biosecurity	There are no issues of biosecurity

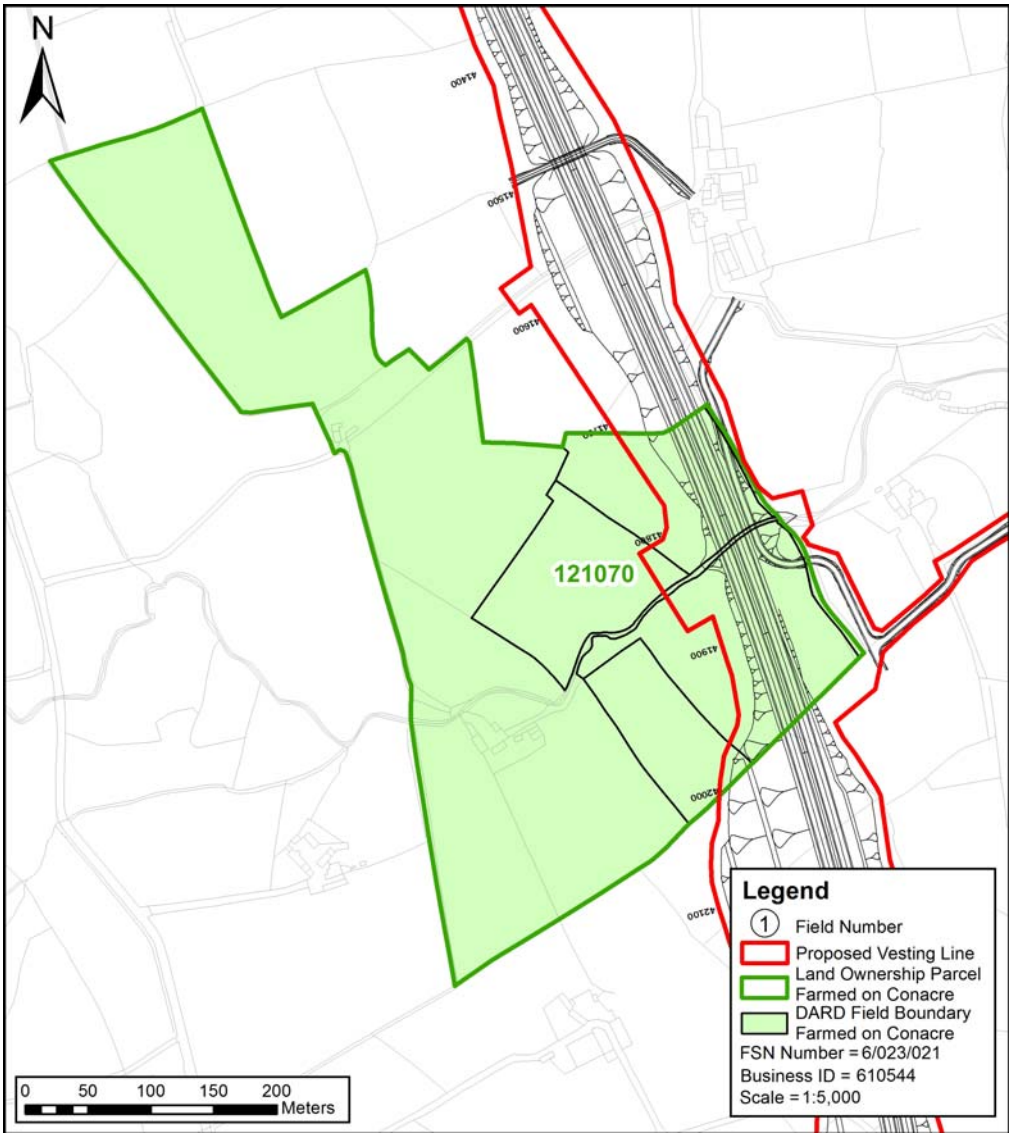
© Mouchel 2016

Predicted Impacts Total loss of 6.11 hectares from fields 4, 5, 6, 7, 8A, 8B, 9 and 10 in parcel 55015 and field 11 in parcel 55075 of the 55.56 hectare farm equating to 11.0% of the productive land. During the construction phase access to severed land will need to be maintained, to provide access to the grazing platform for the dairy herd. The loss of the water supply from the well in field 10 will have cost implications for the farm.
Proposed Mitigation Access for the dairy herd to the severed area of the grazing platform is provided by a connectivity culvert.
Predicted Effects The residual effect of the Proposed Scheme on the farm would be **substantial adverse.**

© Mouchel 2016

Land Parcel Ref	Offline	**DARD Farm Map Ref**	-
		Data sources	Phone call November 14
Conacre Parcel Ref	Rents conacre from Parcel 121070, Datasheet 021-081		

Land parcel reference, farm map field surveys and the proposed scheme vesting line. ***Note this figure only shows affected land, not necessarily the entire farm.***



© Mouchel 2016

Size and Quality of Farm The farm extends to approximately 115.4ha and is all in grass. Owned land extends to 20.2ha, with 14.17ha being rented in conacre off the parcel 121070 landowner, and a further 81ha being rented in conacre off other landowners.	
Type of Enterprise and Husbandry The farm runs a suckler herd of 25 cows and 1 bull, with the progeny being sold as strong stores. A few store cattle are bought in for grazing. In addition the farm runs a sheep flock extending to 400 ewes and 15 rams, producing approximately 600 lambs which are finished off the farm. Surplus grass is cut for silage in big bales, and sold as a cash crop.	
Conacre Arrangement	Rents conacre from Parcel 121070 (Datasheet 021-081)
Single Farm Payment	The tenant collects the Single Farm Payment on owned land and also on parcel 121070.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is registered as Disadvantaged land (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The main impact on this conacre tenant is land take. The loss of land will require that the tenant sources alternative conacre land, to avoid the loss of Single Farm Payment (or payments under the Basic Payment Scheme from 2015).	

© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Residual Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

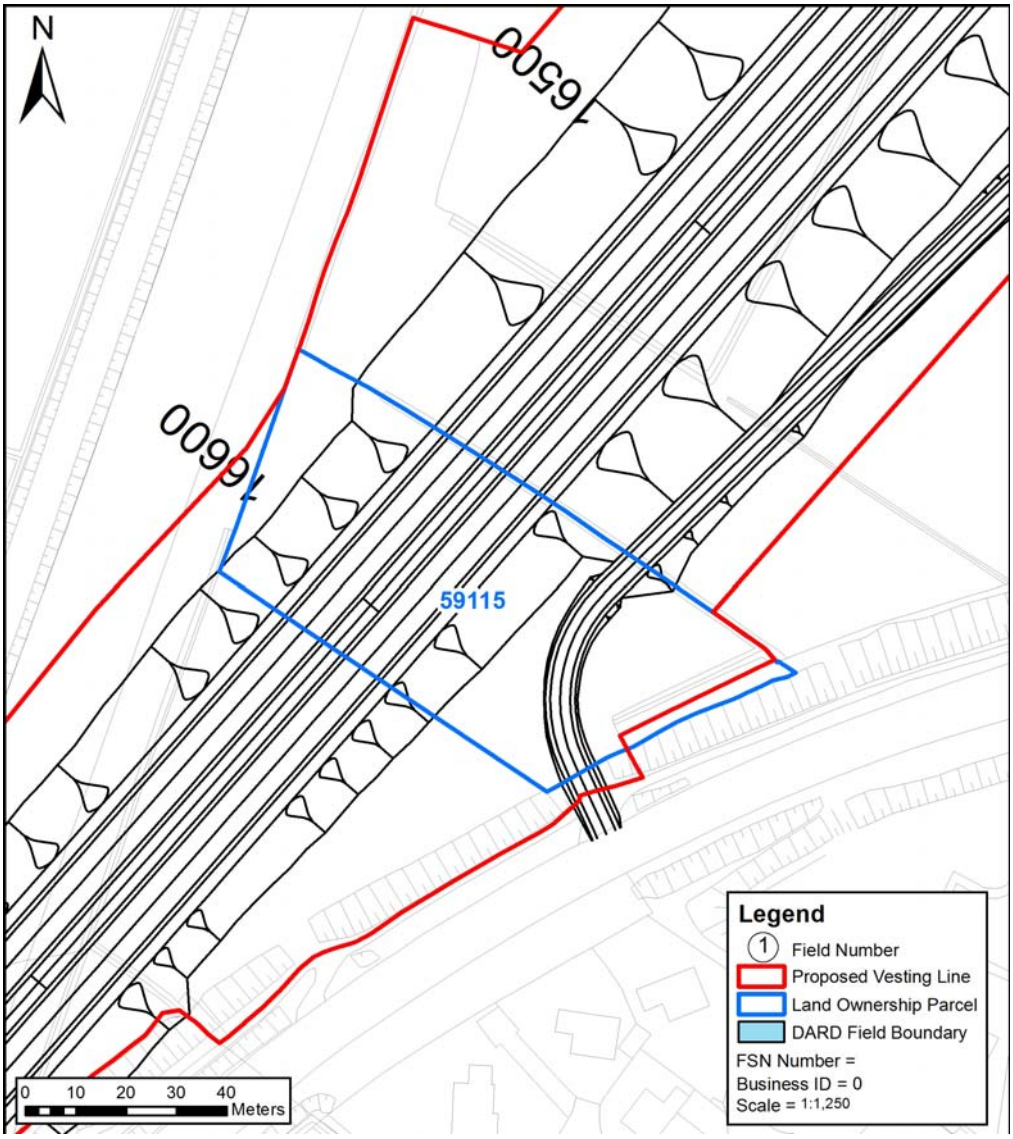
		Data sources	2010 AIA meeting. Landowner confirmation meeting held. October 2014 meeting
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extents are unknown.	
Type of Enterprise and Husbandry Some of the land is utilised by for grazing cattle and horses, while some of the land is in scrub.	
Conacre Arrangements N/a	
Single farm payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The Landowner's land is registered as Lowland (LL) and is therefore not eligible for payments.
Biosecurity	There are no issues of biosecurity

Predicted Impacts The main impact on this Landowner is land take. The impact of the scheme on the overall farm is considered to be **slight adverse**.	
Proposed Mitigation No mitigation required	
Predicted Effects	The residual effect of the proposed A5WTC on the farm is a **slight adverse** impact.

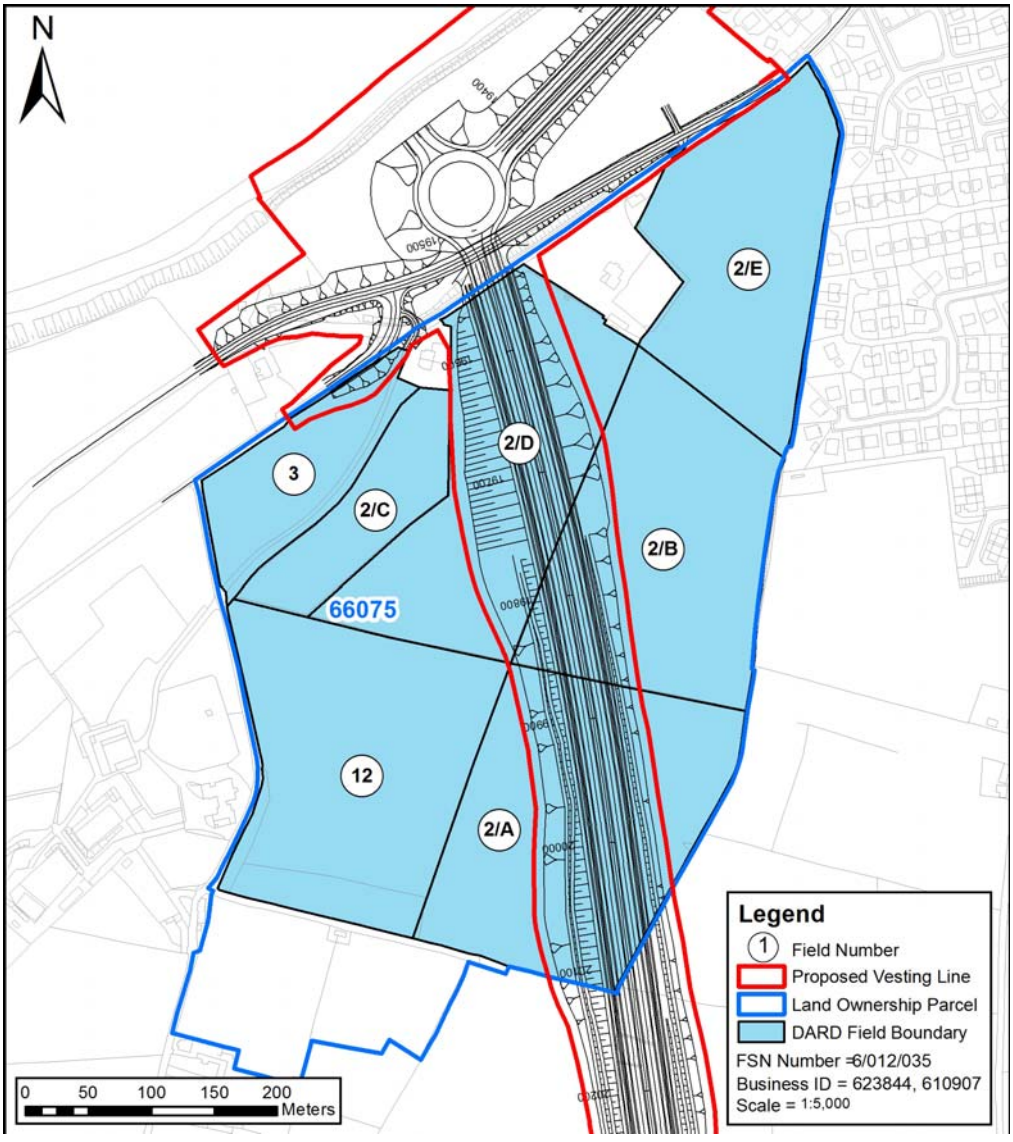
Land Parcel Ref	66075	**DARD Business Ref**	610907
		Data sources	No 2010 AIA meeting. No response to 2013 AIA letters. Landowner confirmation meeting held. September 2014 AIA meeting.
Conacre Parcel Ref	Let in conacre		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

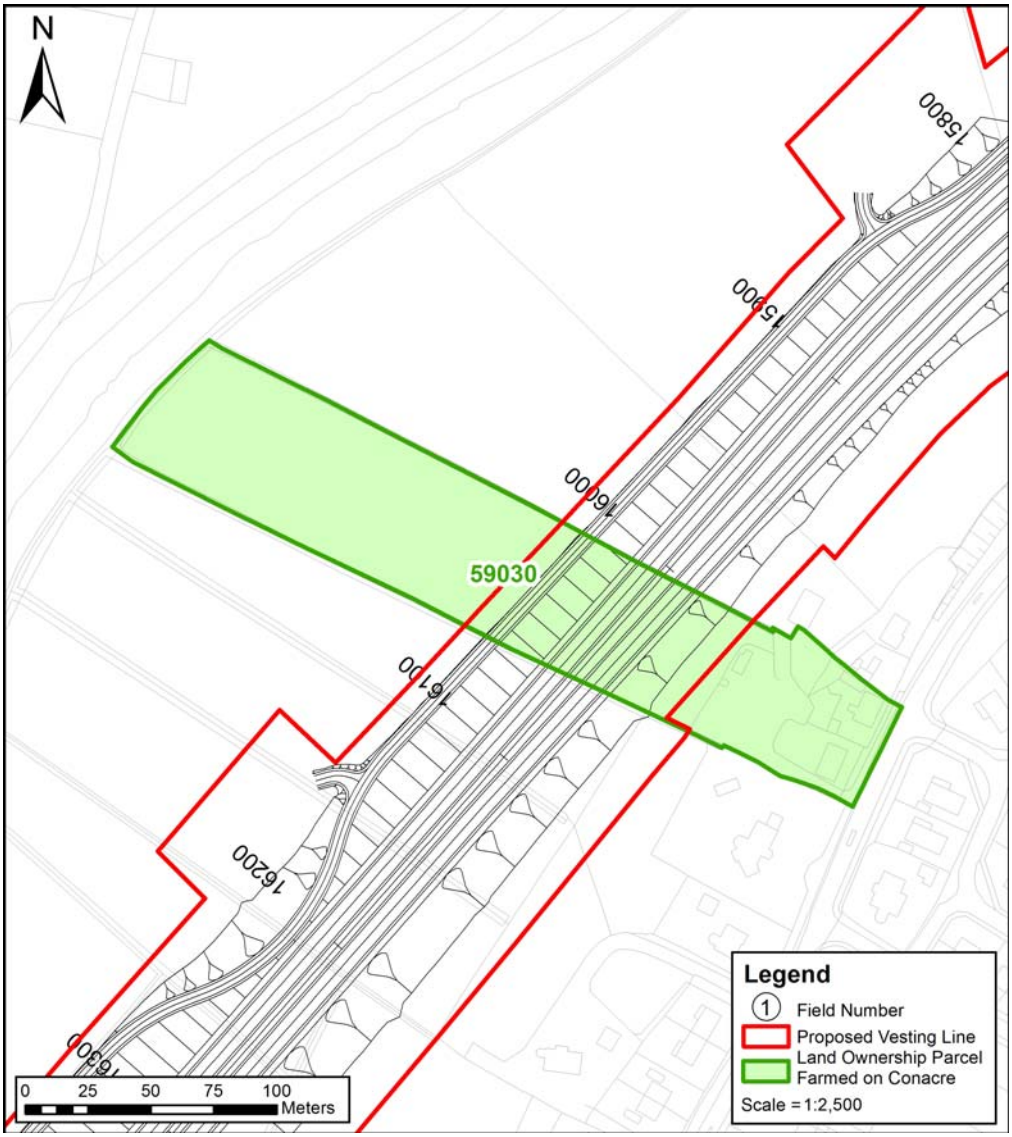
Size and Quality of Farm The farm extends to 22.6ha and is all in grass.	
Type of Enterprise and Husbandry No Information.	
Conacre Arrangement	Land is rented in conacre to a landowner not affected by the Proposed Scheme. No information of conacre tenant's farm, therefore no conclusion of the impact on the conacre tenant's farm can be determined.
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is in conacre and is therefore not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts Total loss of 6.18 hectares from fields 2A, 2B, 2C, 2D, 2E, 3 and 12 of the 22.6 hectare farm equating to 27.3% of the productive land.	
Proposed Mitigation During the construction phase access to severed land will be required.	
Predicted Effects	The residual effect of the proposed A5WTC on the farm is **slight adverse** impact.

© Mouchel 2016

Land Parcel Ref	Offline	**DARD Farm Map Ref**	-
		Data sources	Phone call November 14
Conacre Parcel Ref	Rents conacre from Parcel 59030.		

Land parcel reference, farm map field surveys and the proposed scheme vesting line. ***Note this figure only shows affected land, not necessarily the entire farm.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 1.62ha and is all in grass.	
Type of Enterprise and Husbandry The land is used to graze leisure horses as a hobby. There is no commercial or agricultural interest.	
Conacre Arrangement	Rents conacre from Parcel 59030.
Single Farm Payment	The tenant does not collect the Single Farm Payment on rented land.
Nitrates Directive	There are no implications under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The main impact on this conacre tenant is land take. There is no farm but the impact of the scheme on the tenant is considered to be slight.	
Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Size and Quality of Farm The farm extends to 40.5ha and is all in grass with the exception of 6.1ha which is managed by a quarrying company (Field No 15).	
Type of Enterprise and Husbandry The farm runs approximately 25 beef cattle that are bought in at 250kg liveweight in spring and sold as strong stores in either autumn or the following spring. In addition, the farm runs a B & B cattle enterprise for approximately 100 dry cows and sucklers.	
Conacre Arrangement	N/a
Single farm payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is registered as Lowland (LL) and is not eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity
Predicted Impacts Total loss of 1.7 hectares from fields 15A and 15B of the 40.5 hectare farm equating to 4.2% of the productive land.	
Proposed Mitigation During the construction phase access to land will be required.	
Predicted Effects	The residual effect of the proposed A5WTC on the farm is a **slight adverse** impact.

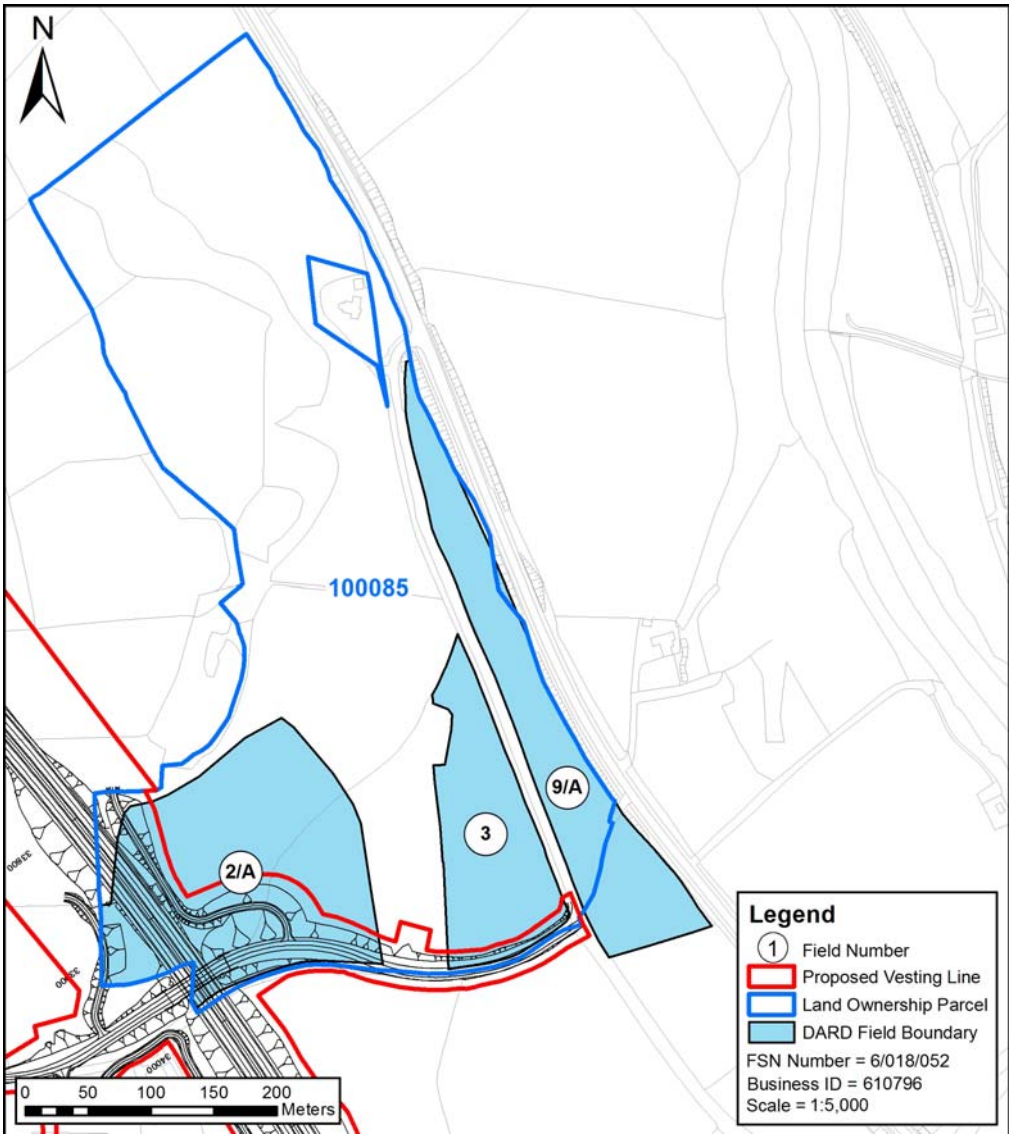
		Data sources	No 2010 AIA meeting. 2013 AIA letters not returned. Landowner confirmation meeting held. October 2014 AIA meeting
Conacre Parcel Ref	Field 4A let in conacre to parcel 100025 owner		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 54.53ha and is all in grass. The Landowner's son owns Field Nos 1, 9, 12, 13, 14, 15, 18, 20, 22, 23, and 30 while his other son owns Field Nos 4, 5, 6, 7 and 8. The remainder is owned by the Landowner. No all fields are shown on the above plan. Field No 4A is rented in conacre to parcel 100085 who is affected by the Proposed Scheme.
Type of Enterprise and Husbandry The farm runs sport horses and brood mares as follows: 7 brood mares, foals are all reared and sold. In addition, 20 store cattle are grazed and sold in the autumn.
Conacre Arrangements Field 4A let in conacre to parcel 100025 owner. This field is unaffected by the Proposed Scheme.

Single farm payment	The landowner collects the Single Farm Payment on all land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	Most of the land is registered as Disadvantaged Area (DA) and is eligible for payments under LFACAS, with the exception of the Landowner's land, which is registered as Lowland (LL) and is therefore not eligible for payments.
Biosecurity	There are no issues of biosecurity

© Mouchel 2016

Predicted Impacts Total loss of 2.24 hectares from fields 2A, 3 and 9/A of the 54.53 hectare farm equating to 4.1% of the productive land.	
Proposed Mitigation No mitigation measures	
Predicted Effects	The residual effect of the proposed A5WTC on the farm is a **slight adverse** impact.

© Mouchel 2016

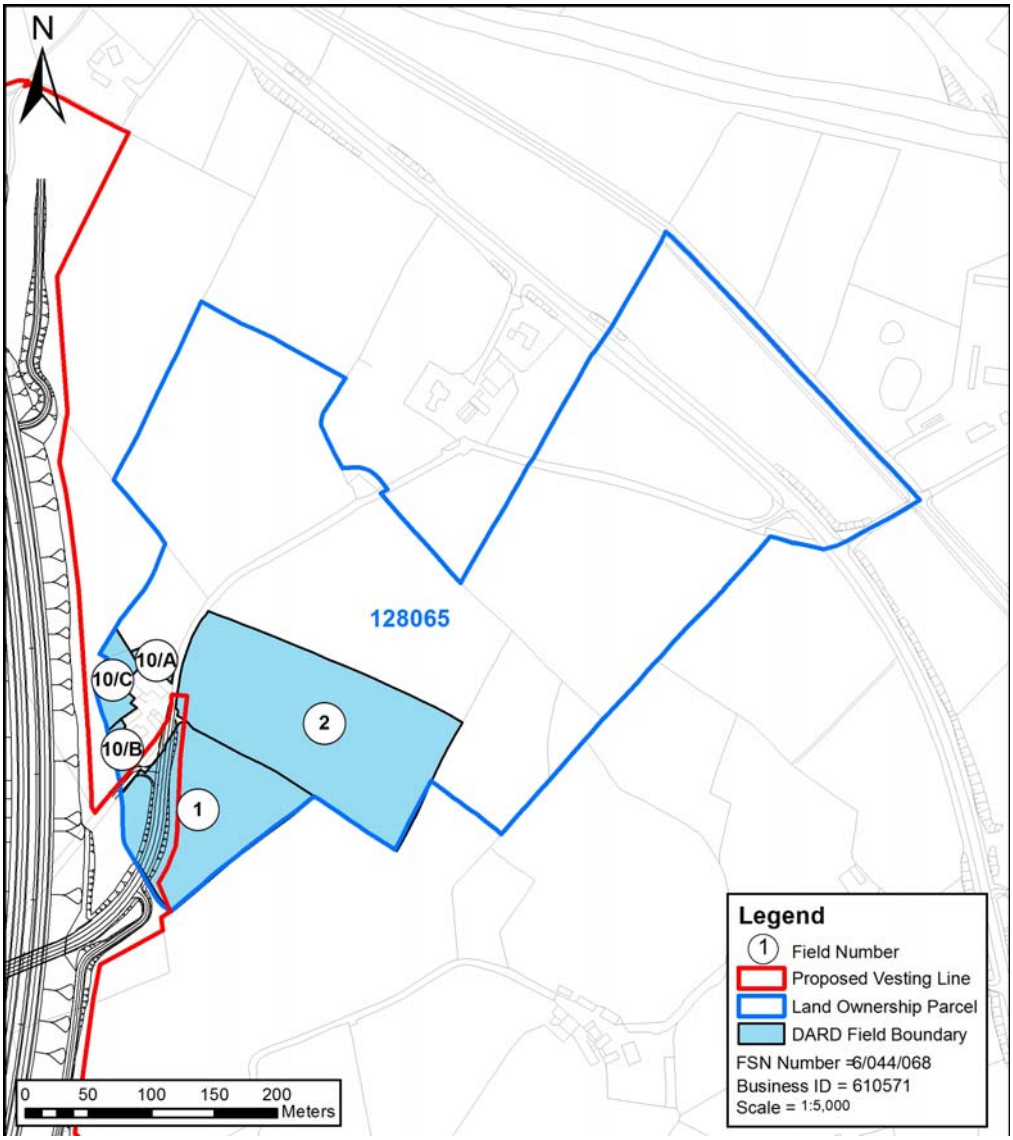
Size and Quality of Farm The farm extends to 8.2ha of which approx. 4.6ha is in grass.	
Type of Enterprise and Husbandry All the land is let in conacre	
Conacre Arrangements Parcel is let in conacre. The impacts on the conacre tenant are outlined in datasheet 021-087.	
Single farm payment	No information
Nitrates Directive	No implications under the Nitrates Directive as the land is let in conacre.
Countryside Management Scheme	No information
Less Favoured area Compensatory Allowance Scheme	The land is in conacre and is therefore not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts Total loss of 0.89 hectares from field 3 of the 8.2 hectare farm equating to some 10.9% of the productive land. The main impact on this landowner is land take and severance.	
Proposed Mitigation During the construction phase access to severed land will be required.	
Predicted Effects	The residual effect of the proposed A5WTC on the farm is **slight adverse** impact.

© Mouchel 2016

Land Parcel Ref	128065	**DARD Business Ref**	610571
		Data sources	No response to 2013 AIA letters. Land confirmation meeting held. September 2014 AIA meeting.
Conacre Parcel Ref	Conacre Unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 27.70ha, with 23.42ha as owned land and 4.28ha in conacre. The land is all in grass.	
Type of Enterprise and Husbandry The farm runs a herd of 7 suckler cows, with the progeny being sold as store cattle. In addition, the farm runs a sheep flock, extending to 60 ewes, producing approximately 100 lambs, which are finished for slaughter.	
Conacre Arrangement 4.28ha of conacre land rented, which is unaffected by the road scheme.	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all registered as Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity

Predicted Impacts

Total loss of 0.48 hectares of land in fields 1, 2, 10/A, 10/B and 10/C of the 22.6 hectare farm equating to some 2.1% of the productive land.

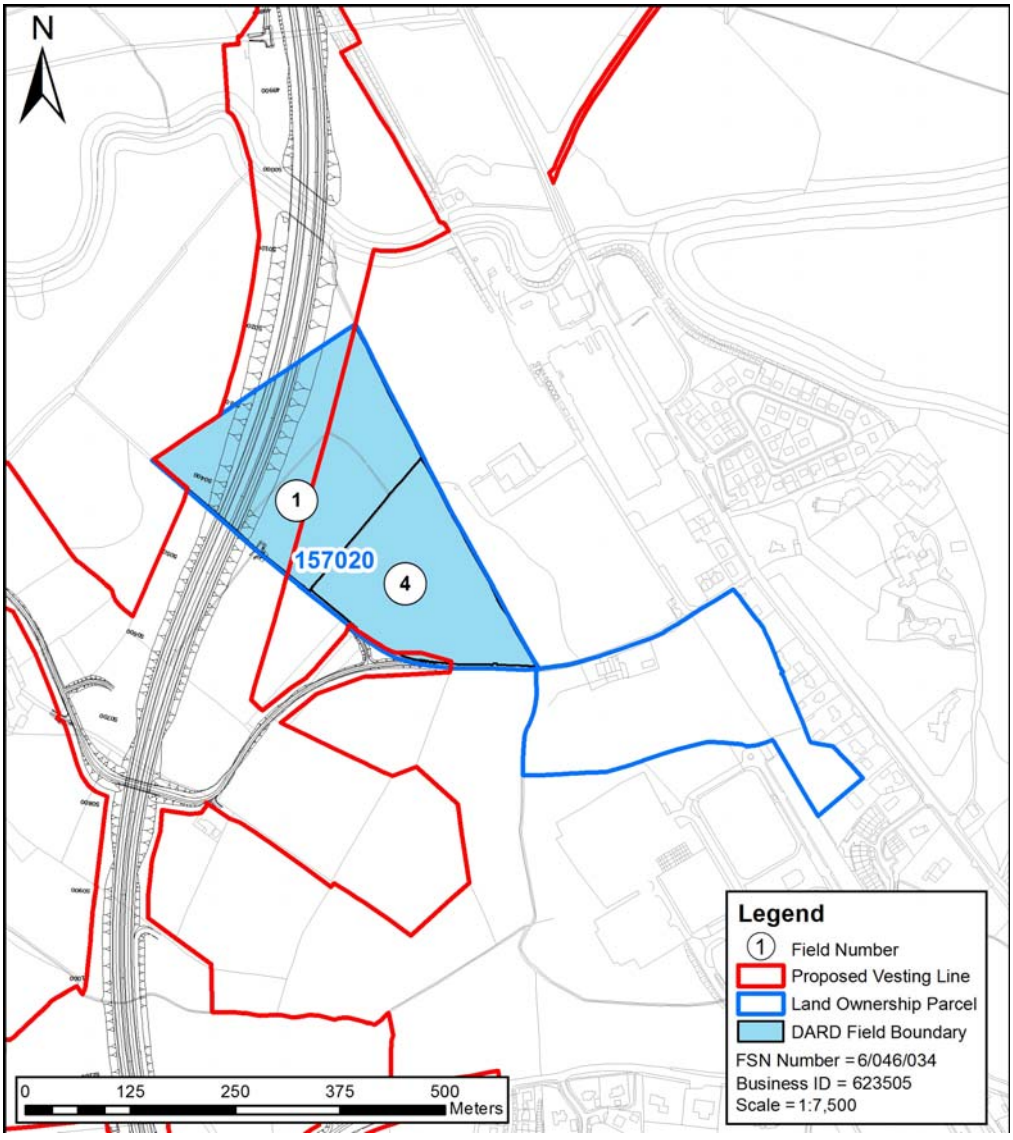
© Mouchel 2016

Proposed Mitigation Since there is land take from the end of 2 fields adjacent to the Killynure Road, no mitigation is considered necessary.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm is **slight adverse**.

© Mouchel 2016

157020	157020	**DARD Business Ref**	623505
		Data sources	No 2010 AIA meeting. Landowner confirmation meeting held. September 2014 AIA meeting.
Conacre Parcel Ref	N/a		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm, which is managed as a partnership, extends to 26.23ha.	
Type of Enterprise and Husbandry The farm buys in 30-60 store cattle and carries them through to finish. In addition, approximately 30-40 store lambs are purchased and carried through to finish.	
Conacre Arrangements N/a	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all registered as Lowland (LL) and is not eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity

© Mouchel 2016

Predicted Impacts Total loss of 3.10 hectares from fields 1 and 4 of the 26.23 hectare farm equating to some 11.8% of the productive land.	
Proposed Mitigation During the construction phase access to land will be required.	
Predicted Effects	The residual effect of the proposed A5WTC on the farm is a **slight adverse** impact.

© Mouchel 2016

Size and Quality of Farm The farm extends to 14.99ha, which is all in grass.	
Type of Enterprise and Husbandry The land is all rented out in conacre to a landowner who is not affected by the Proposed Scheme.	
Conacre Arrangement	The land is all rented out in conacre to a landowner who is not affected by the Proposed Scheme. No information provided on the conacre tenant's farm. No conclusions can therefore be made
Single farm payment	The landowner does not collect the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is not eligible for payments under LFACAS since it is rented as conacre.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The main impacts on this farm is land take. Total loss of 1.48 hectares from fields 1, 2, 5, 6, 11 and 12 of the 14.99 hectare farm equating to 9.9% of the productive land.	
Proposed Mitigation During the construction phase access to severed land will be required.	
Predicted Effects	The residual effect of the proposed A5WTC on the farm is a **slight adverse** impact.

© Mouchel 2016

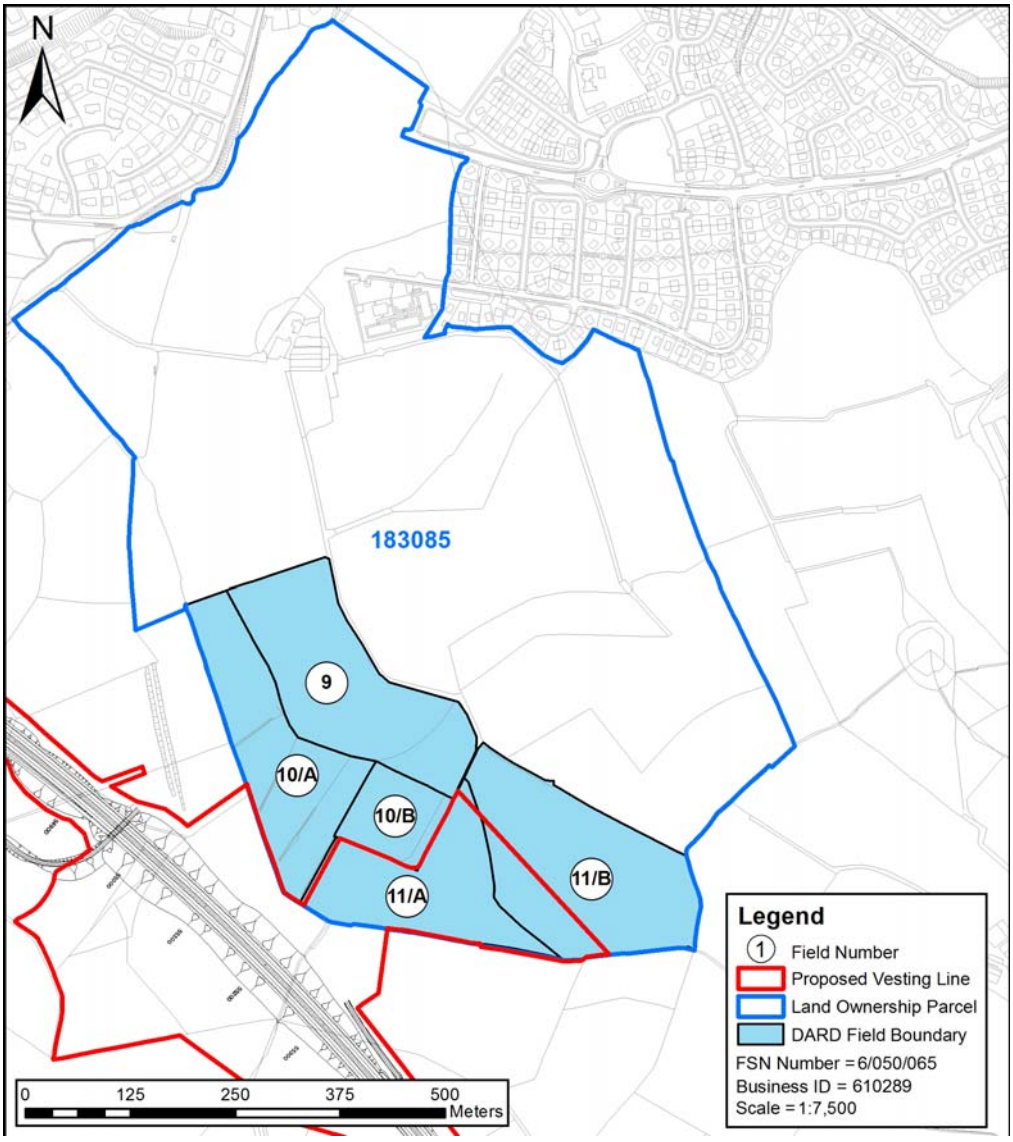
Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 62.63ha.	
Type of Enterprise and Husbandry The land is all rented out in conacre to two landowners.	
Conacre Arrangements The land is all rented out in conacre to two landowners whose owned land is not affected by the proposed scheme. No information on the conacre tenant's farms were provided. No conclusion of impacts on the conacre tenant's farms can be determined.	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is all registered Disadvantaged Land (DA), but is not eligible for payments under LFACAS, since the land is in conacre.
Biosecurity	There are no issues of biosecurity

© Mouchel 2016

Predicted Impacts The main impacts on this farm is land take. Total loss of 3.38 hectares from fields 9, 10/A, 10/B, 11/A and 11B of the 62.63 hectare farm equating to 5.4% of the productive land.
Proposed Mitigation The mitigation measures proposed are considered to be adequate.
Predicted Effects The residual effect of the Proposed Scheme on the farm is **slight adverse**.

© Mouchel 2016

Land Parcel Ref	193005	**DARD Business Ref**	616228
		Data sources	No 2010 AIA meeting. Landowner confirmation meeting held. October 2014 AIA meeting

© Mouchel 2016

Size and Quality of Farm The farm extends to 119.07ha and is all in grass.
Type of Enterprise and Husbandry The farm runs a flock of approximately 80 ewes and 3 rams, with the lambs being finished off the farm. Approximately 90 ewe lambs have been retained as ewe lamb replacements, which will ultimately be for sale. There are 4 store cattle which are being finished for slaughter. Field Nos 21B and 15 (not shown on plan) are wooded.
Conacre Arrangement Field Nos 16A, 17, 18, 19A, 20, and (not shown on plan) are let out in conacre but are not affected by the road scheme.

Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	Affected land is not eligible for payments under LFACAS since the land is under woodland.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

Predicted Impacts

Total loss of 1.09 hectares from fields 5/A, 5/C, 6, 12/A, 13, 25 and 26 of the 119.07 hectare farm equating to some 0.9% of the productive land.

© Mouchel 2016

Proposed Mitigation During the construction phase access to land will be required.
Predicted Effects The loss of 0.9% of the available productive land would have a slight impact of the farms potential output and constitute a slight adverse effect on the farm

		Data sources	2014 Landowner confirmation meeting. October 2014 AIA meeting
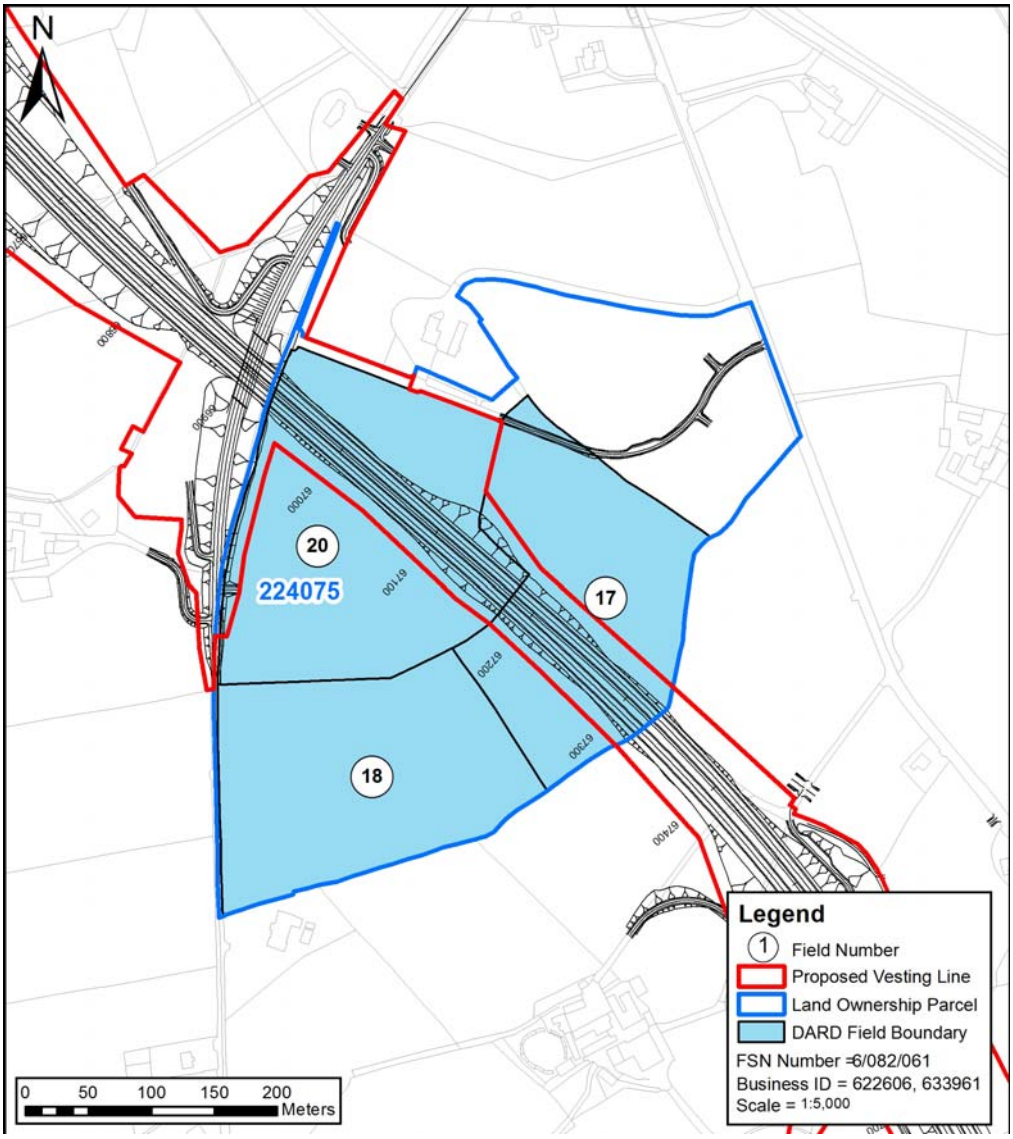
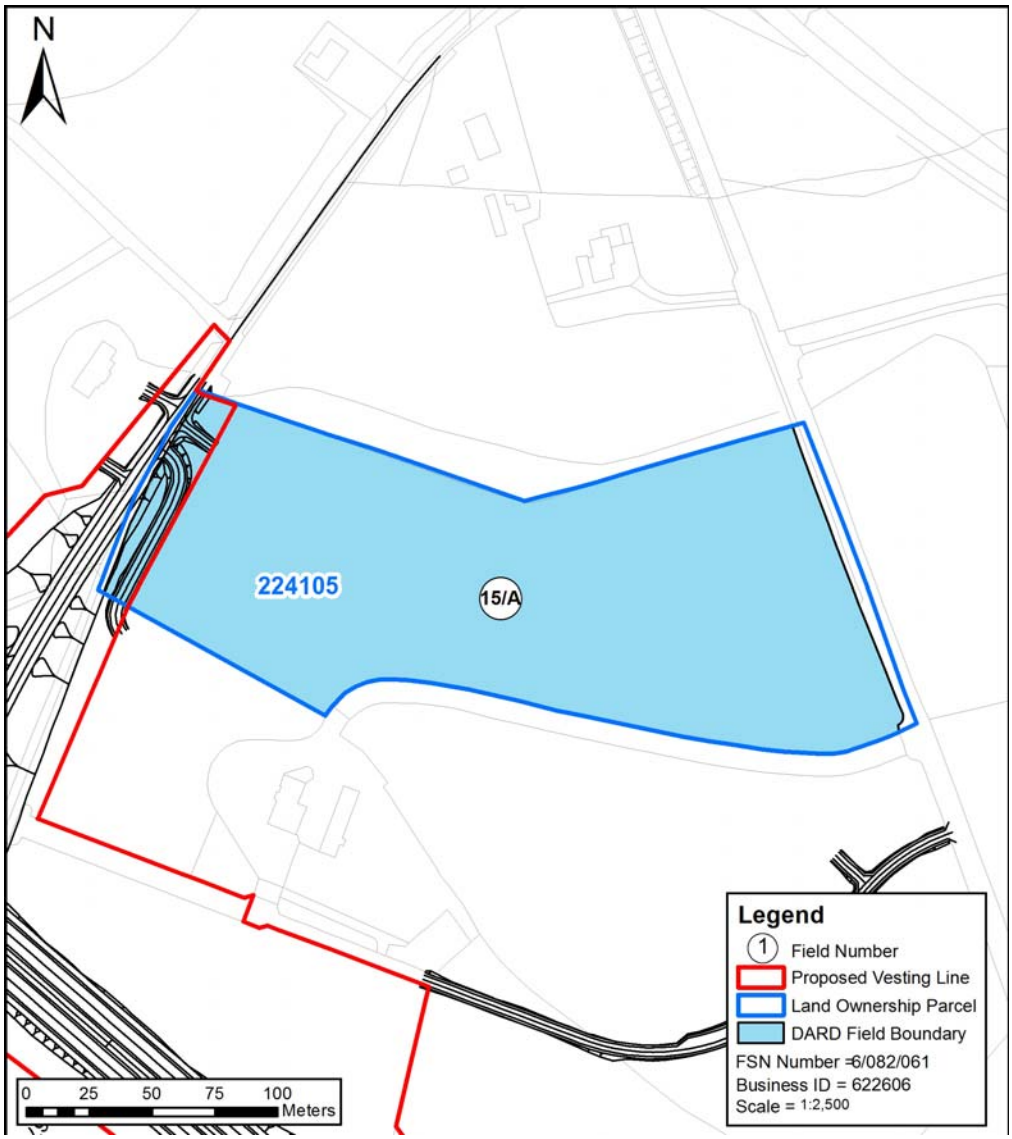
Conacre Parcel Ref	Part let out in conacre to parcel 224050 landowner.		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016



Size and Quality of Farm The farm extends to 41.25ha and is all in grass.
Type of Enterprise and Husbandry The farm runs several breeding mares and horses for competition. Horses are also kept on livery. The land is grazed by horses and cut for haylage. The remainder of the land is rented out in conacre to parcel 224050 owner.

© Mouchel 2016

Conacre Arrangement	Part of the land is rented out in conacre to parcel 224050 owner. The impacts on the conacre tenant are outlined in datasheet 021-125.
Single farm payment	The landowner does not collect the Single Farm Payment on owned land. this is claimed by the conacre tenant
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	Since the land is in conacre, it is not eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity that are not already being addressed.

Predicted Impacts

Total loss of 3.69 hectares from fields 17, 18 and 20 in parcel 224075 and field 15/A in parcel 224105 of the 41.25 hectare farm equating to 8.9% of the productive land.

Proposed Mitigation

During the construction phase access to severed land will be required.

Predicted Effects	The residual effect of the proposed A5WTC on the farm is a **slight adverse** impact.

Size and Quality of Farm The farm extends to 24.01ha, of which 8.95ha is rented as conacre. The farm is all in grass.	
Type of Enterprise and Husbandry The farm runs a herd of 25 suckler cows and 2 bulls. Suckler calves are either sold in the autumn or wintered and sold as strong stores in spring. There are approximately 55-60 cattle on the herd list.	
Conacre Arrangement Approximately 8.95ha of land is rented in conacre which is unaffected by the Proposed Scheme.	
Single farm payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	Most of the land is registered as Disadvantaged Area (DA), while some fields are Severely Disadvantaged Area (SDA) and are eligible for payments under LFACAS.
Biosecurity	There are no issues of biosecurity
Predicted Impacts Total loss of 0.4 hectares from field 12 of the 24.01 hectare farm equating to 1.67% of the productive land. The main impact on this Landowner is land take.	
Proposed Mitigation During the construction phase access to land should be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm is **slight adverse**.

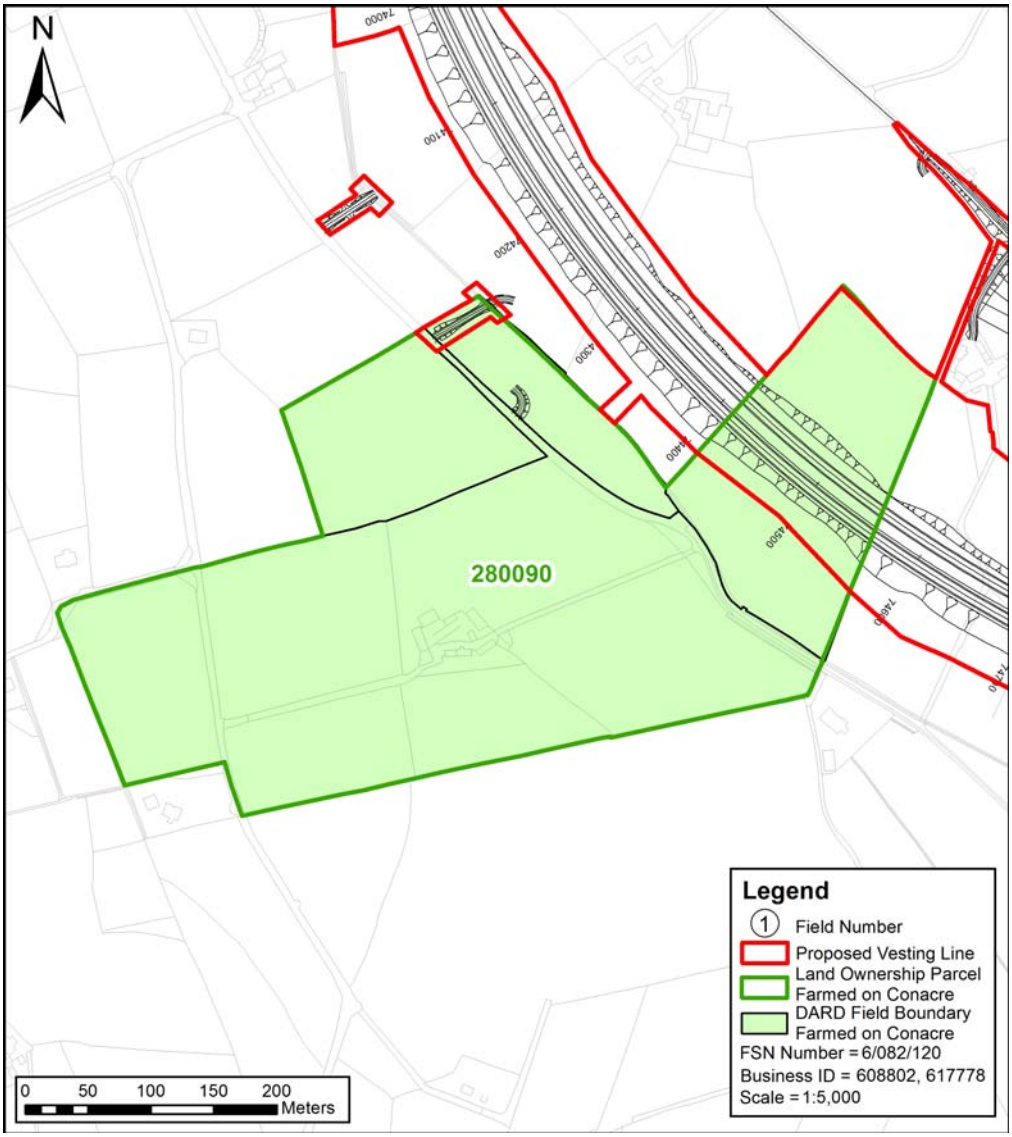
Land Parcel Ref	Offline	**DARD Farm Map Ref**	-
		Data sources	Phone call November 14
Conacre Parcel Ref	Rents conacre from Parcel 280090, Datasheet 021-146		

Land parcel reference, farm map field surveys and the proposed scheme vesting line. ***Note this figure only shows affected land, not necessarily the entire farm.***



© Mouchel 2016

Size and Quality of Farm The farm extends to approximately 40.5ha and is all in grass. Owned land, extends to 16.2ha, with a further 24.3ha being rented in conacre from 5 landowners.	
Type of Enterprise and Husbandry The farm runs a dairy herd consisting of 60 cows plus young stock. Cows are bred to a Hereford bull and calves are reared and sold as stores at approximately 350 – 400kg. There are approximately 110 cattle on the herd list.	
Conacre Arrangement	Rents conacre from Parcel 280090, Datasheet 021-146.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land and also on conacre land.
Nitrates Directive	There are no implications under the Nitrates Directive.
Countryside Management Scheme	The land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is registered Disadvantaged land (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts Total loss of 2.37 hectares from the farm equating to 5.8% of the productive land. The main impact on this conacre tenant is land take. The loss of land will require that the tenant sources alternative conacre land, to avoid the loss of Single Farm Payment (or payments under the Basic Payment Scheme from 2015). The impact of the scheme on the overall farm is considered to be **slight adverse.**	
Proposed Mitigation During the construction phase access to severed land would be maintained.	

© Mouchel 2016

Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

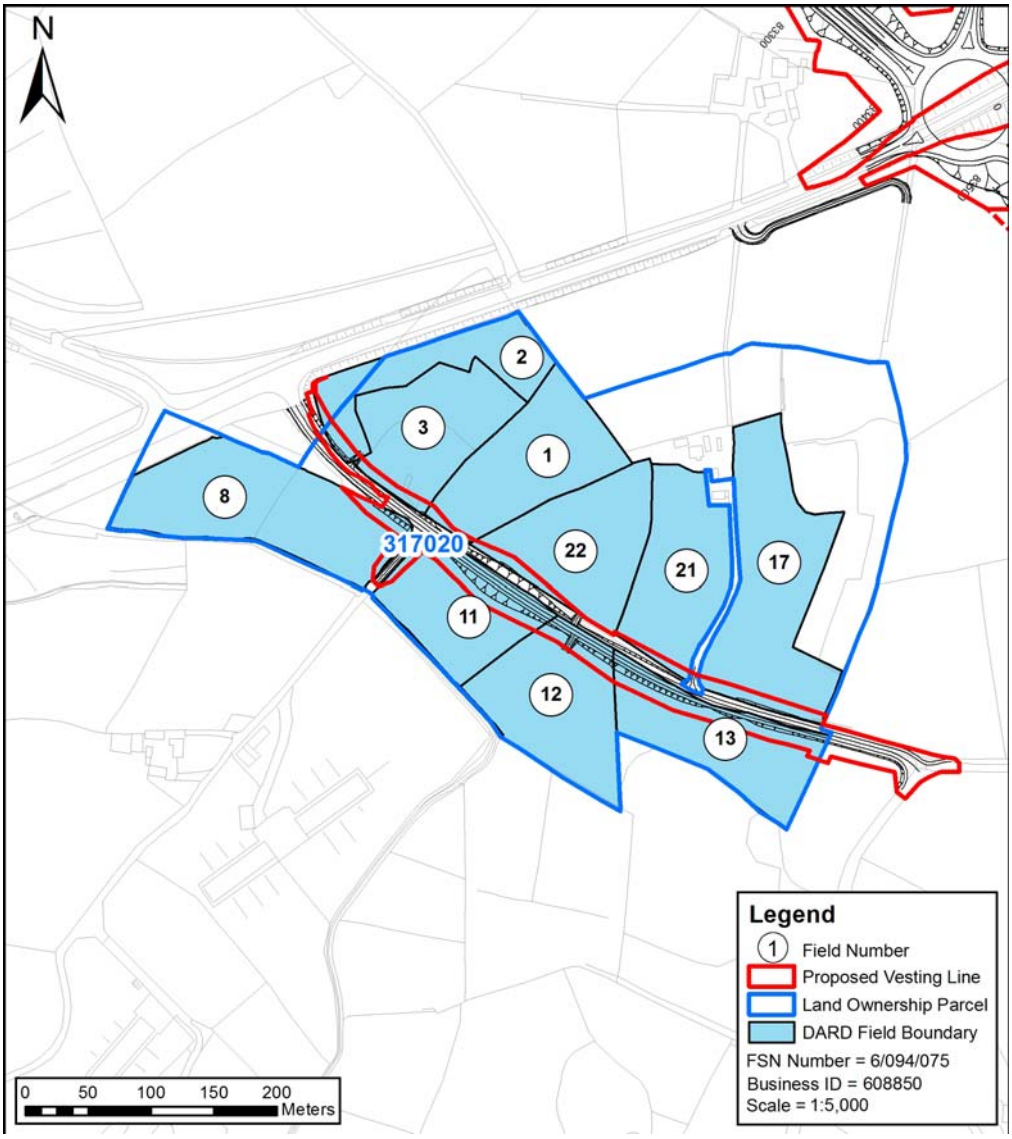
		Data sources	No 2010 AIA meeting. Landowner confirmation meeting held. October 2014 AI meeting
Conacre Parcel Ref	Conacre unaffected		

Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm extends to 33.46ha and is all in grass. Conacre is rented from 2 landowners unaffected by the Proposed Scheme.
Type of Enterprise and Husbandry The farm runs a herd of 30 suckler cows, a stock bull, plus young stock. The calves are as suckler calves. There is also a pedigree herd of 15 Charolais cows and 1 bull for breeding on the farm. There are approximately 65 cattle on the herd list. In addition, the farm runs a flock of 80 ewes and 4 rams, producing approximately 120 lambs which are all finished.
Conacre Arrangements Conacre is rented from 2 landowners unaffected by the Proposed Scheme.

Single farm payment	The landowner collects the Single Farm Payment on owned land and one conacre parcel
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is registered as Disadvantaged Area (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts Total loss of 1.55 hectares from of the 33.46 hectare farm equating to 4.6% of the productive land.

© Mouchel 2016

The main impact on this Landowner is land take.	
Proposed Mitigation During the construction phase access to severed land will be required.	
Potential Effects	The residual effect of the proposed A5WTC on the farm is a **slight adverse** impact.

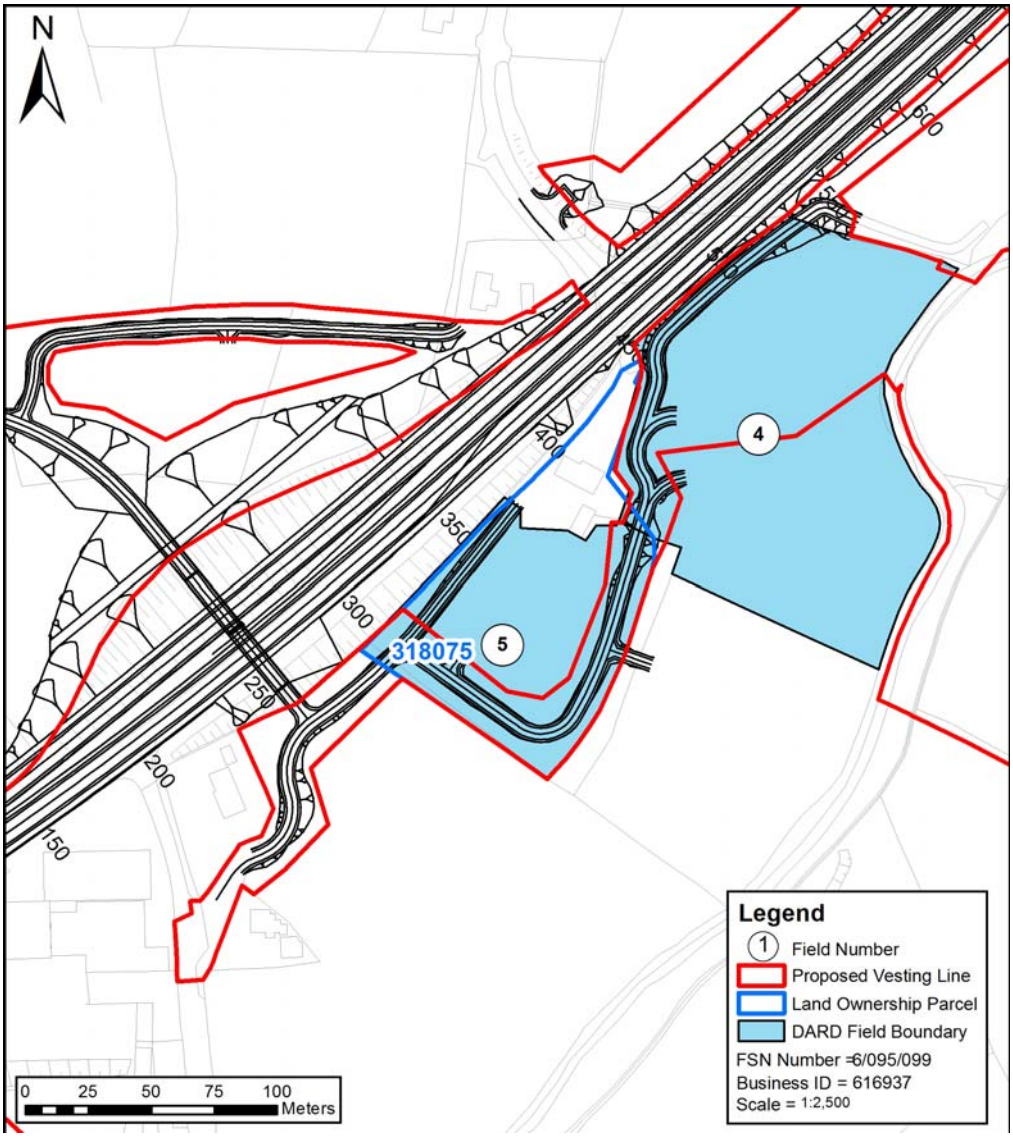
Land parcel reference, farm map field surveys and proposed scheme vesting line. ***Note this figure only shows land affected by the scheme, not necessarily the entire farm. These maps do not convey legal ownership.***



© Mouchel 2016

Size and Quality of Farm The farm is run as a partnership, with 3 partners. The farm extends to 145.12ha and is all in grass. The farm is all organic and is registered as such with the Soil Association. Land taken in conacre is unaffected by the Proposed Scheme.	
Type of Enterprise and Husbandry The farm runs an organic dairy herd of 165 dairy cows, with a herd average of approximately 6,900 litres, plus young stock. All bull calves are sold. There are approximately 300 cattle on the herd list. Heifer calves are reared and either retained as replacements or sold, if surplus to requirements. The home farm provides the grazing platform for the herd, which is strip grazed. The farm's organic milk supply is contracted to Emerald Organics, which in turn has contracts to supply organic milk to several multiples.	
Conacre Arrangement	Land is rented in conacre from Parcel 214010, which is affected by the Proposed Scheme (Datasheet 021-222).
Single farm payment	The landowner collects the Single Farm Payment on owned land and conacre.
Nitrates Directive	This is an intensive dairy farm with an output of approximately 160kg organic nitrogen/ha and, as a result of land-take, there may be implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured area Compensatory Allowance Scheme	The land is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

© Mouchel 2016

Predicted Impacts

The main impact on this Landowner is land take from the grazing platform for the dairy herd. 6.33ha will be taken by the Proposed Scheme. Being organic land, it is impossible to replace it with alternative organic land in close proximity to the farmyard. There is a compulsory, 3 year, switch-over from conventional to organic, and most landowner, with land to rent as conacre, are unwilling to commit to a long term contract, which is required in order to facilitate the changeover.

The impact of the scheme on the overall farm is considered to be **substantial adverse.**

Proposed Mitigation

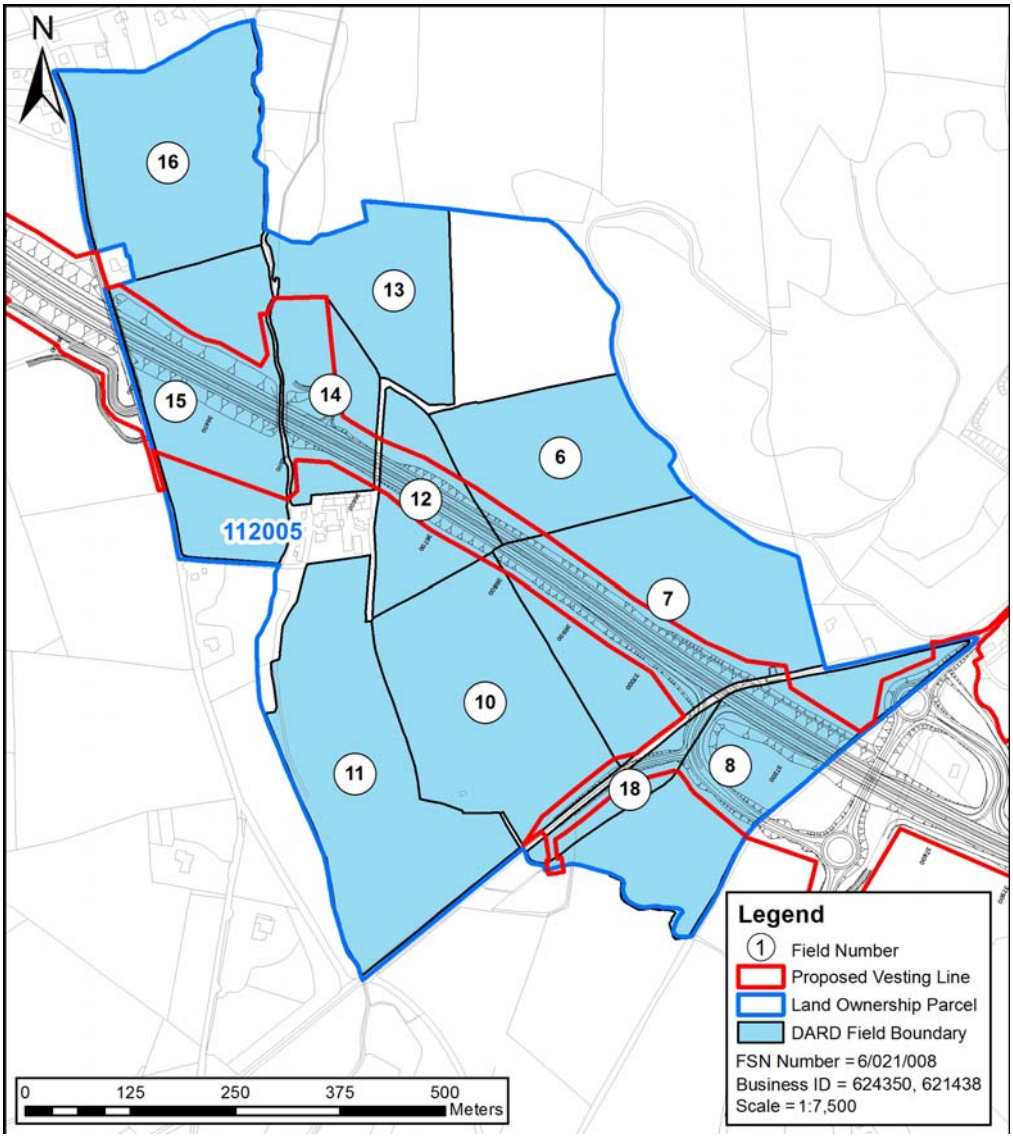
During the construction phase access to severed land will be required.

Predicted Effects	The residual effect of the proposed A5WTC on the farm is a **substantial adverse** impact.
Cumulative Effects	There may be cumulative effects affecting this Landowner by way of failure to meet the contracted supply of organic milk to an Organics Milk Supplier.

© Mouchel 2016

Land Parcel Ref	112005	**DARD Farm Map Ref**	140398
		Data sources	March 2010 ES data. No change identified in 2013 correspondence, therefore no 2014 revisit.
Conacre Parcel Ref	Let in conacre to parcel 121010 landowner, Datasheet 021-080.		

Land parcel reference, farm map field surveys and the proposed scheme vesting line. ***Note this figure only shows affected land, not necessarily the entire farm.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to 52.41ha which is all in grass.

Type of Enterprise and Husbandry

The land is rented out in conacre.

Conacre Arrangement

The farm is rented out in conacre to parcel 121010 landowner. Impact on conacre tenant is outlined in datasheet 021-080.

Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is all rented in conacre and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 11.62 hectares from the 52.41 hectare farm equating to 22.17% of the productive land.

As the land is currently out in conacre and not farmed by the landowner directly, the landtake impacts on the landowner would be slight.

New severance would impact the farm. Access would be provided to all severed land either off Magheracoltan Road or Drumleagh Road North, integrating into a farm track. The severance impacts would be slight.

There would be temporary impacts during the construction phase of the Proposed Scheme.

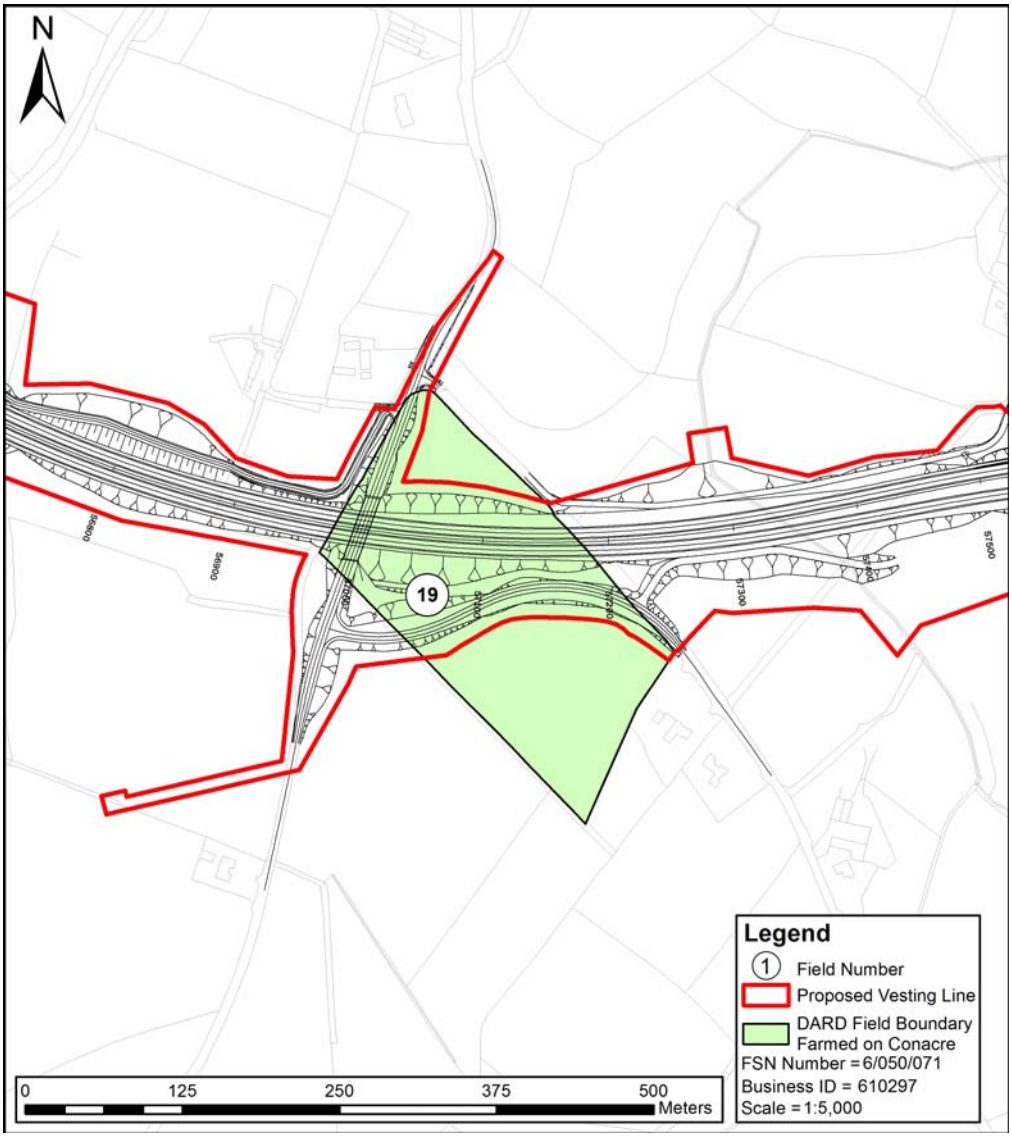
© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Land Parcel Ref	Offline	**DARD Farm Map Ref**	-
		Data sources	Phone call November 14
Conacre Parcel Ref	Rents conacre from Parcel 192005, Datasheet 021-112		

Land parcel reference, farm map field surveys and the proposed scheme vesting line. ***Note this figure only shows affected land, not necessarily the entire farm.***



© Mouchel 2016

Size and Quality of Farm The farm extends to approximately 48.6ha and is all in grass.	
Type of Enterprise and Husbandry The farm runs a dairy herd consisting of 70 cows plus young stock. There are approximately 110 cattle on the herd list. The affected field in normally cut for silage (2 – 3 cuts), and grazed as aftergrass.	
Conacre Arrangement	Owned land extends to 31.6ha, with 8.9ha being rented in conacre off the Parcel 192005 landowner (datasheet 021-112), and a further 8.1ha being rented in conacre off other landowners. One field (approximately 4.8ha), is affected by the road scheme. The land has been rented in conacre for 5 - 6 years.
Single Farm Payment	The tenant does not collect the Single Farm Payment on conacre land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The farm is not eligible for payments under LFACAS as it is a dairy farm.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts Total loss of 3.4 hectares from field 19 of the 31.6 hectare farm equating to 10.76% of the productive land. The main impact on this conacre tenant is land take which will be approximately 3.4ha. The loss of land will require that the tenant sources alternative conacre land, to avoid the loss of Single Farm Payment (or payments under the Basic Payment Scheme from 2015).	

© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

© Mouchel 2016

Size and Quality of Farm The farm extends to approximately 17ha and is the only land farmed. There is no owned land.	
Type of Enterprise and Husbandry The farm runs approximately 60 store cattle that are carried through to slaughter. There are approximately 60 cattle on the herd list.	
Conacre Arrangement	The tenant rents parcel 33030 (datasheet 021-017) as conacre. No other land is owned.
Single Farm Payment	The tenant does not collect the Single Farm Payment on conacre land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is registered Lowland (LL) and is not eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The landtake of conacre required by the Proposed Scheme would total 4.61ha, approximately 27% of the farm area. The main impact on this conacre tenant is land take. The loss of land will require that the tenant sources alternative conacre land, to avoid the loss of Single Farm Payment (or payments under the Basic Payment Scheme from 2015). The impact of the scheme on the overall farm is considered to be **substantial adverse.**	
Proposed Mitigation During the construction phase access to severed land would be maintained.

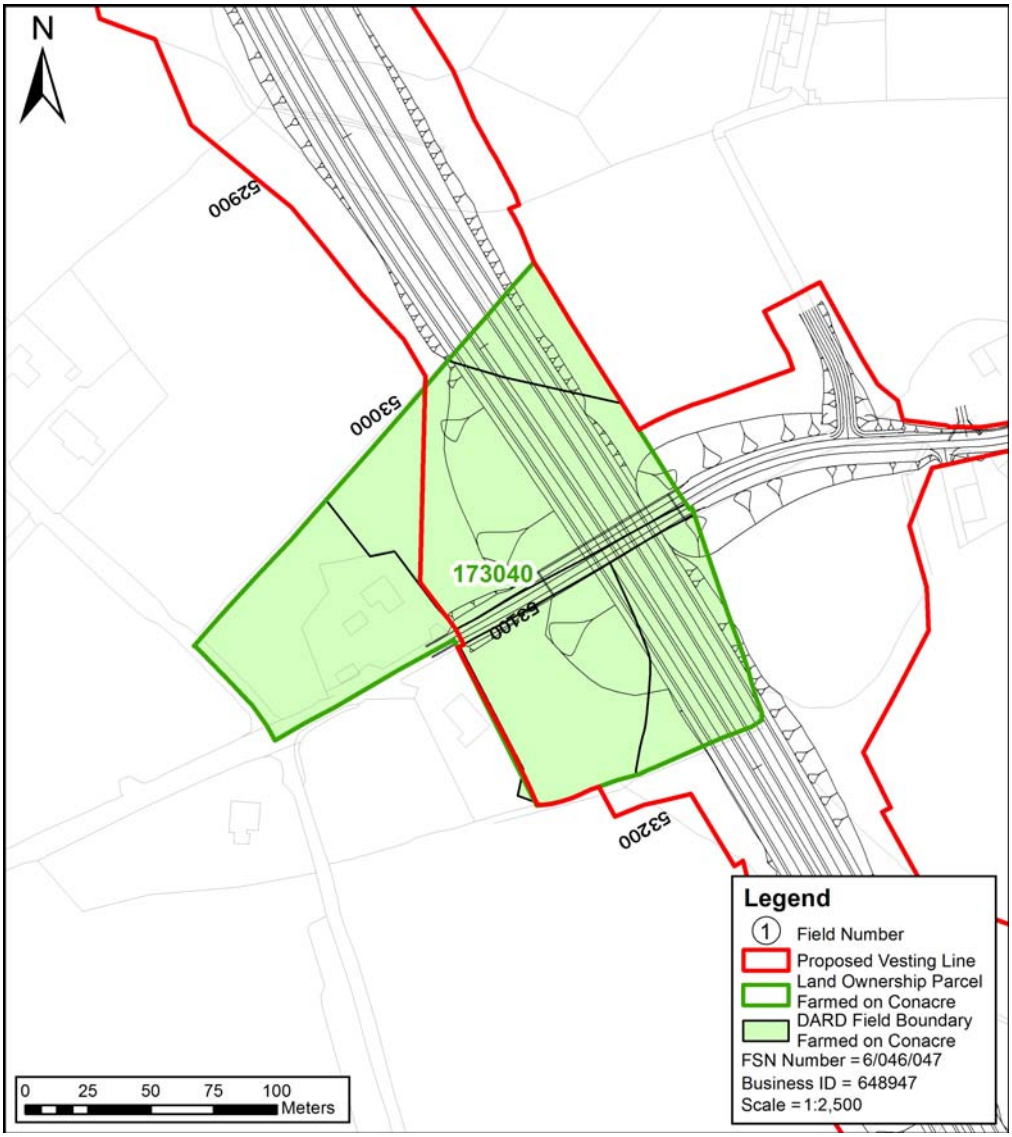
Land Parcel Ref	Offline	**DARD Farm Map Ref**	-
		Data sources	Phone call November 14
Conacre Parcel Ref	Rents conacre from Parcel 173040, Datasheet 021-102		

Land parcel reference, farm map field surveys and the proposed scheme vesting line. ***Note this figure only shows affected land, not necessarily the entire farm.***



© Mouchel 2016

Size and Quality of Farm	
The farm extends to approximately 6.1ha and is all in grass. Land taken from parcel 173040 extends to 2.4ha, while a further parcel of 3.6ha is also rented in conacre. There is no owned land. The land has been taken for 10 years	
Type of Enterprise and Husbandry	
The farm runs a suckler herd consisting of 1 cow and 3 in-calf heifers. Progeny are sold in the autumn as sickled calves. There are approximately 8-10 cattle on the herd list. In addition the farm runs a flock of 25 ewes and 1 ram, producing approximately 40 lambs, which are carried through to finish.	
Conacre Arrangement	All of the farm is conacre rented land extending to 6.1ha. affected conacre is rented from Parcel 173040 (Datasheet 021-102)
Single Farm Payment	The tenant collects the Single Farm Payment on affected conacres land but not on the other conacre land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is registered Disadvantaged land (DA) but is not eligible for payments under LFACAS as it is less than 3ha.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts	
The landtake of conacre required by the Proposed Scheme would total 1.76ha, 29% of the farm area. The main impact on this conacre tenant is land take. The loss of land will require that the tenant sources alternative conacre land, to avoid the loss of Single Farm Payment (or payments under the Basic Payment Scheme from 2015). The impact of the scheme on the overall farm is considered to be **substantial adverse.**

Size and Quality of Farm The farm extends to approximately 36.6ha and is all in grass. Owned land extends to 24.3ha, with 6.3ha being rented in conacre from Parcel 224060, and a further 6.1ha being rented in conacre off another landowner.	
Type of Enterprise and Husbandry The farm buys in store cattle for grazing/finishing out of the shed. There are approximately 50 cattle on the herd list. In addition, the farm runs a flock of 300 pure-bred Llynn ewes and 9 rams, producing approximately 450 lambs, which are either finished for slaughter or reared as breeding rams or replacement ewe lambs.	
Conacre Arrangement	Rents conacre from Parcel 224060, Datasheet 021-123
Single Farm Payment	The landowner collects the Single Farm Payment on owned land.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Approximately two thirds of the home farm and conacre land is registered as Disadvantaged land (DA) and is eligible for payments under LFACAS, with the remainder not being eligible, as it is registered as Lowland (LL).
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The main impact on this conacre tenant is land take. 2.79ha, 7.6%, will be taken by the Proposed Scheme. The loss of land will require that the tenant sources alternative conacre land, to avoid the loss of Single Farm Payment (or payments under the Basic Payment Scheme from 2015). The impact of the scheme on the overall farm business is considered to be **moderate adverse.**	

© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.

© Mouchel 2016

Size and Quality of Farm

The farm extends to approximately 32.4ha and is all in grass. Owned land extends to 13.4ha, and a further 19.1ha being rented in conacre off 3 other landowners.

Type of Enterprise and Husbandry

The farm buys in approximately 120 store cattle (400kg) in spring or autumn and grazes or winters them, for slaughter out of the house. There is also a herd of 10 suckler cows and a bull, with progeny being finished for slaughter. There are approximately 150 cattle on the herd list.

In addition, the farm runs a sheep flock of approximately 110 ewes and 4 rams, producing approximately 170 lambs, which are carried through to slaughter. Approximately 200 store lambs are purchased in the autumn for finishing off grass.

Conacre Arrangement	Rents conacre from Parcel 269105, Datasheet 021-144 and 2 other unaffected landowners.
Single Farm Payment	The landowner collects the Single Farm Payment on owned land and for parcel 269105.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	Owned land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is registered as Disadvantaged land (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

Total loss of 1.61 hectares from the 32.4 hectare farm equating to 5% of the productive land.

The main impact on this conacre tenant is land take. The loss of land will require that the tenant sources alternative conacre land, to avoid the loss of Single Farm Payment (or payments under the Basic Payment Scheme from 2015).

© Mouchel 2016

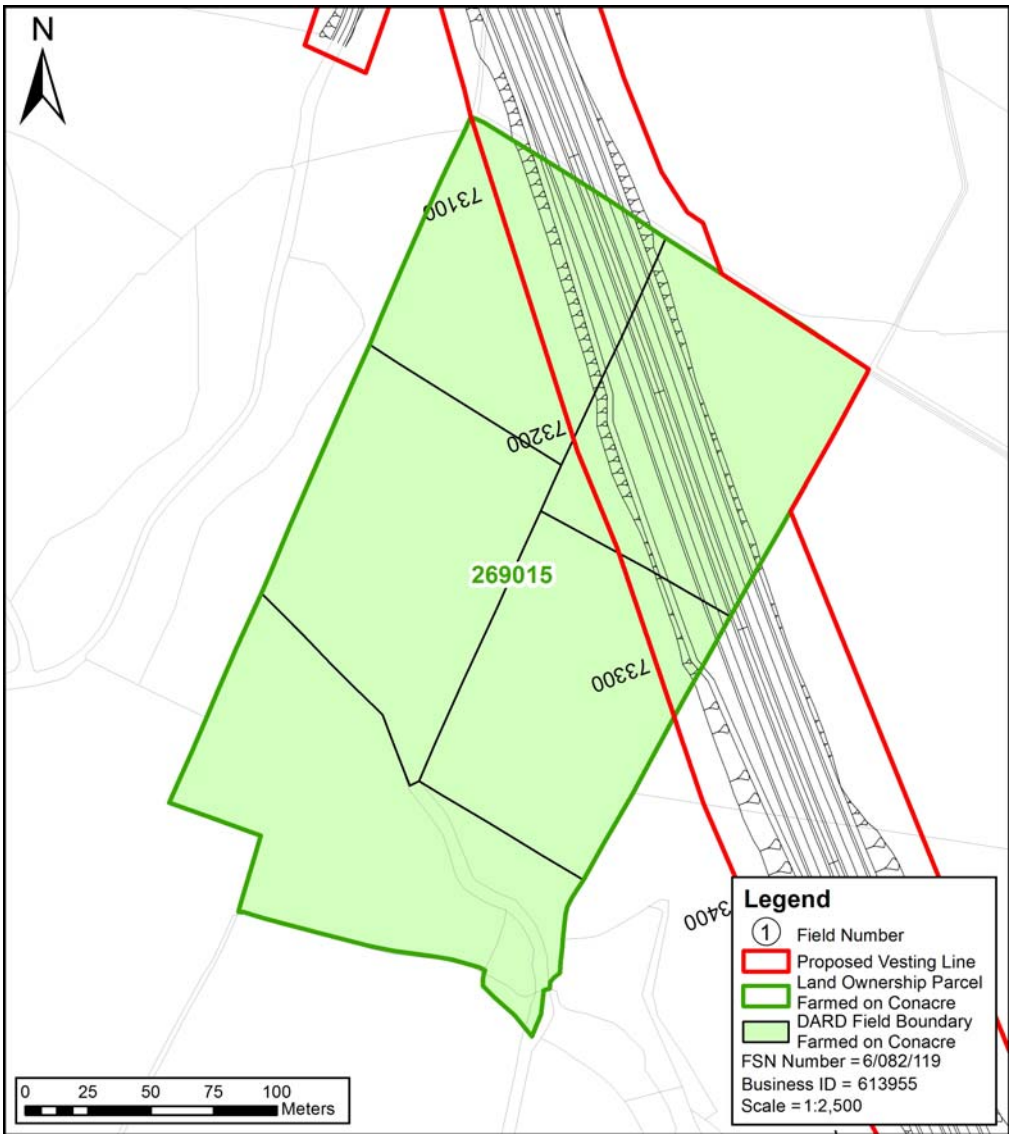
Conacre Parcel Ref	Rents conacre from Parcel 269015, Datasheet 021-144		

Land parcel reference, farm map field surveys and the proposed scheme vesting line. ***Note this figure only shows affected land, not necessarily the entire farm.***



© Mouchel 2016

Size and Quality of Farm

The farm extends to approximately 39.27ha and is all in grass. Owned land extends to 15.4ha, with 5.67ha being rented in conacre off 269015 landowner and a further 18.2ha being rented in conacre off other landowners. Under the Basic Payment Scheme (BPS), landowners renting out land as conacre from 2015 will not be regarded as 'active farmers' and will lose their payments under the current SFP scheme. This will result in the tenant losing the 18.2ha rented off another landowner. As a consequence of this, and also the land-take for the road scheme, the farm will have to be substantially downsized.

Type of Enterprise and Husbandry

The farm buys in store cattle in spring or autumn and grazes or winters them, for slaughter out of the house. There are approximately 80 cattle on the herd list.

Conacre Arrangement	Rents conacre from Parcel 269015, Datasheet 021-144 and a further 18.2ha from other landowners. The land has been rented in conacre for over 30 years.
Single Farm Payment	The tenant collects the Single Farm Payment on owned land and also on parcel 269015.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	The land is registered as Disadvantaged land (DA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The main impact on this conacre tenant is land take. The loss of land will require that the tenant sources alternative conacre land, to avoid the loss of Single Farm Payment (or payments under the Basic Payment Scheme from 2015).

© Mouchel 2016

© Mouchel 2016

Size and Quality of Farm The farm extends to approximately 90.48ha and is all in grass. Owned land extends to 29.2ha, with 19.8ha being rented in conacre off landowner 113075, and a further 10.1ha being rented in conacre off 113015 and a further 12.9ha being rented off 4 other landowners.	
Type of Enterprise and Husbandry The farm runs a dairy herd consisting of 100 cows plus young stock. There are approximately 300 cattle on the herd list. Bull calves are sold. The farm also runs a herd of 60 suckler cows and a bull, with all progeny being finished to slaughter. In addition, the farm runs a flock of 150 ewes and 4 rams, with approximately 250 lambs being carried through to slaughter.	
Conacre Arrangement	Rents conacre from Parcel 113015 and Parcel 113075, (Datasheet 021-082)
Single Farm Payment	The landowner collects the Single Farm Payment on owned land and also on all the conacre land, with the exception of one.
Nitrates Directive	Given the intensive stocking rate, there may be implications for the farm under the Nitrates Directive, due to the loss of conacre land.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Some 19 fields on the farm are registered Severely Disadvantaged Area (SDA) and is eligible for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The main impact on this conacre tenant is land take, 10.7ha. The loss of land will require that the tenant sources alternative conacre land, to avoid the loss of Single Farm Payment (or payments under the Basic Payment Scheme from 2015).	

© Mouchel 2016

Size and Quality of Farm The farm extends to approximately 118ha and is all in grass or arable (barley, in a rotation. Owned land extends to 46.2ha, with 16ha being rented in conacre off the landowner parcel 15025, and a further 56.7ha being rented in conacre off 2 unaffected landowners.	
Type of Enterprise and Husbandry The farm runs 60 suckler cows and 2 bulls, with all the progeny carried through to slaughter. Store cattle are bought in occasionally. There are approximately 180 cattle on the herd list. In addition, the farm runs a flock of 200 ewes and 7 rams, producing approximately 300 lambs, which are finished for slaughter.	
Conacre Arrangement	Rents conacre from Parcel 15025 (Datasheet 021-006)
Single Farm Payment	The tenant collects the Single Farm Payment on owned land and also on conacre land and a further 56.7ha being rented in conacre off 2 unaffected landowners.
Nitrates Directive	There are no implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The land is not registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	Approximately two thirds of the home farm and one conacre parcel is registered as Disadvantaged land (DA) and is eligible for payments under LFACAS, with the remainder not being eligible, as it is registered as Lowland (LL).
Biosecurity	No biosecurity issues have been identified.
Predicted Impacts The main impact on this conacre tenant is land take, 3.8ha of conacre. The loss of land will require that the tenant sources alternative conacre land, to avoid the loss of Single Farm Payment (or payments under the Basic Payment Scheme from 2015).	

© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **slight adverse**.

Size and Quality of Farm

The farm extends to approximately 72.9ha and is all in grass. Owned land extends to 50.6ha, with a further 22.2ha being rented in conacre Parcel 124055 landowner. Another area of conacre is taken off another landowner, but this may be lost in 2015, due to the 'active farmer' requirement to retain the Single Farm Payment.

Type of Enterprise and Husbandry

The farm runs a flock of 300 ewes and 5 rams, producing approximately 450 lambs, which are carried through to slaughter. In autumn, approximately 1000 store lambs are bought in for finishing.

In addition, there are approximately 6 store cattle on the farm.

A dairy herd extending to 100 cows plus 25 young stock are also carried. There are approximately 155 cattle on the herd list.

Conacre Arrangement	Rents conacre from Parcel 125055 (Datasheet 021-085)
Single Farm Payment	The tenant collects the Single Farm Payment on owned land and also on conacre land.
Nitrates Directive	The farm is running close to the upper limit of 170kg and currently exports slurry to maintain compliance. Any land loss is likely to have further implications for the farm under the Nitrates Directive.
Countryside Management Scheme	The owned land is registered under the Countryside Management Scheme.
Less Favoured Area Compensatory Allowances Scheme	There is no information regarding the eligibility for payments under LFACAS.
Biosecurity	No biosecurity issues have been identified.

Predicted Impacts

The main impact on this conacre tenant is land take, 5.7ha. The loss of land will require that the tenant sources alternative conacre land, to avoid the loss of Single Farm Payment (or payments under the Basic Payment Scheme from 2015).

© Mouchel 2016

Proposed Mitigation During the construction phase access to severed land would be maintained.	
Predicted Effects	The residual effect of the Proposed Scheme on the farm would be **moderate adverse**.

APPENDIX 15B - EXPLANATION OF THE AIMS AND OBJECTIVES OF A NUMBER OF GOVERNMENT INITIATIVES RELATING TO THE AGRICULTURAL INDUSTRY AND INDIVIDUAL BUSINESS

Single Farm Payment

Under the Single Farm Payment Scheme (SFP), eligible landowners are paid approximately £48 per ha, plus a further amount based on subsidy claims made during the reference years 2000, 2001 and 2002. The precise amount payable will depend on the final regional ceiling and the area of eligible land declared within the EU controlled Integrated Administration Control Scheme (IACS).

Nitrates Directive

The Nitrates Directive restricts the quantity of organic nitrogen (N) applied per ha of farmland to 170kg. Intensive dairy farms are most likely to be affected, since the organic N output per ha on most dairy farms is well above the 170kg limit. Given the calculated annual output of 91kg organic N per cow, affected farms will be required to either de-stock to reduce the overall organic N output for the farm, or, alternatively, either take more land in conacre or buy land to reduce the average organic N per ha to below the 170kg per ha ceiling. Intensive beef and poultry units are also likely to be affected, depending on area farmed and current stocking levels.

Countryside Management Scheme

The Countryside Management Scheme aims to improve the environment and the countryside through land management, by reversing the decline in farmland diversity, enhancing the landscape and by managing natural resources to improve the quality of water, air and soil. The scheme is voluntary and applies to all farmland outside Environmentally Sensitive Areas (ESA) but excludes farms with less than 3ha of eligible land. Conacre land is not eligible. However, conacre land that is entered on the IACS Single Application Form is eligible to be included. Annual management payments range from £20 - £1,110/ha, and are dependant on the land category, with additional payments available for approved capital enhancement work. A scheme normally has a lifespan of 7 years. A new CMS was launched in June 2008.

Less Favoured Area Compensatory Allowance Scheme (LFACAS)

The 'Less Favoured Area Compensatory Allowances Scheme' (LAFCAS) provides support for farmers by compensating for additional costs and income foregone related to maintaining agricultural production in Less Favoured Areas (LFA's).

© Mouchel 2016

The scheme has two parts:

1. An area based payment for eligible hectares of Severely Disadvantaged Land

   (SDA) and Disadvantaged Land (DA); and

2. A 'cattle bonus' which increases the area based payment for those producers

   having 25% or more of their eligible livestock units (LUs) as suckler cows or heifers.

To be eligible to claim under LFACAS, you must:

- have at least 3 ha of eligible forage land in the SDA and/or DA;
- keep enough eligible stock to meet the minimum 0.2 LUs per ha stocking density;
- have the land available and accessible to you and meet the stocking density requirement throughout the period of 1 April 2010 to 31 October 2010;
- adhere to the Cross-Compliance requirements;
- undertake to farm in the Less Favoured Area (LFA) for at least five years from the first payment of a compensatory allowance; and
- Payment rates for 2014 will be £47.62 per ha Severely Disadvantaged Area (SDA) and £23.81 per ha Disadvantaged Area (DA/Common Land).

Conacre

The conacre system is unique to Ireland. Approximately one third of all farmland in Northern Ireland is rented informally in this way. There is no documentation or signed lease between the landowner and the farmer renting the land.

Much of the land is on small farms, 10 - 20ha, which are too small to be commercially viable, or from landowners wishing to retire from active farming, while still retaining ownership of the land. Such landowners frequently decide to rent out their land in conacre to another farmer for an annual fee.

A landowner who rents land in conacre from another landowner has no tenure of the land beyond the season (generally March – November), for which he has rented it.
