APPENDIX 6B SIDE ROAD SCHEDULE

Table 6B.1 Side Road Schedule

Side Road	Approx. Mainline Chainage	Average Existing Cross-section (F denotes footway)			Traffic Movements (2 way, 12hr) from TCS		Over/Under the A5	Closure Option	Other Comments/details e.g. Bus Route, NMU issues, business considerations
		Nearside Verge (m)	Carriageway (m)	Offside Verge (m)	Vehicle	NMU		Permanently Stop Off	
Junction 1 Existing A5 (Victoria Road)	400	N/A	N/A	N/A	-	-	N/A	No	New roundabout on existing A5
Junction 2 Existing A5 (Victoria Road)	1770	N/A	N/A	N/A	-	-	N/A	No	New roundabout on existing A5
Junction 2 Link To A5 WTC	1770	N/A	N/A	N/A	-	-	N/A	N/A	New Link Provided From Existing A5 To Junction 2 Roundabout.
Dunnalong Road	3900	0.50	3.80	0.50	157	10	Over	No	
Meenagh Road	4900	N/A	2.80	N/A	56	0	Over	Yes	Meenagh Road Retained For Use By The Landowner.
Existing A5, Victoria Road	6400	1.00	6.00	1.00	-	-	Under	No	
Cloghboy Road	6400	0.50	4.70	0.50	485	8	N/A	No	School Bus Route.
Tamnabrady Road (U1813)	7100	0.60	3.00	1.20	-	-	N/A	Yes, but realigned	Connection to Victoria Road stopped up and realigned to connect to Tamnabrady Road
Donagheady Road	7800	0.50	4.40	0.50	216	0	Over	No	School Bus Route.
Existing A5, Victoria Road	9100	2.00	9.00	2.00	-	-	Under	No	
Willow Road	8900	0.50	4.30	0.50	58	1	N/A	Yes, but realigned	
Ash Avenue	9600	0.50	3.20	0.50	45	6	N/A	Yes, but realigned	Connected to Drumenny Road west of A5WTC
Drumenny Road	10000	1.50	4.10	1.50	79	2	Under	No	
Ballydonaghy Road	10900	0.50	2.90	0.50	60	0	N/A	Yes, but realigned	Connected to Moss Road west of A5WTC
Moss Road	11000	1.50	2.30	1.50	10	0	Under	No	
Greenlaw Road	12900	0.50	3.30	0.50	18	24	N/A	Yes	NMU link provided to Park Road North on west side of A5WTC
Park Road (North)	13500	1.50	2.80	1.50	126	18	Under	No	.
Junction 3 Existing A5 (Victoria Road)	14700	N/A	N/A	N/A	-	-	N/A	No	New roundabout on existing A5 with connection to B49

© Mouchel 2016

		Average Existing Cross-section (F denotes footway)			Traffic Movements (2 way, 12hr) from TCS			Closure Option	
Side Road	Approx. Mainline Chainage	Nearside Verge (m)	Carriageway (m)	Offside Verge (m)	Vehicle	NMU	Over/Under the A5	Permanently Stop Off	Other Comments/details e.g. Bus Route, NMU issues, business considerations
Woodend Road (B49)	14750	1.00	7.00	1.00	-	-	N/A	No	Connects to new roundabout from east. Section of road retained for local use.
Junction 3 Link to East Roundabout	14720	N/A	N/A	N/A	N/A	N/A	Over	N/A	New link road. Bridge over watercourse and flood plain
Junction 3 Link to West Roundabout	14720	N/A	N/A	N/A	N/A	N/A	Over	N/A	New link road. Bridge over dual carriageway
Old Park Road	14720	N/A	N/A	N/A	126	18	N/A	No	New link road to Park Road
Spruce Road	15000	0.50	3.30	0.50	150	14	N/A	Yes	Connection via Junction 3 to existing A5.
Park Road South	17300	1.00	4.50	1.00	126	18	N/A	Yes, but realigned	Realigned via new link road to Lifford Road (Junction 4)
Junction 4 Roundabout Link	17650	N/A	N/A	N/A	N/A	N/A	N/A	N/A	New link road between Lifford Road and Park Road
Lifford Road (A38)	17800	13.70	9.60	N/A	-	-	Under	No	New roundabout for link road to slip road (Northbound) and Park Road
Junction 4-5 Link (Lifford Road)	17800	13.70	9.60	N/A	-	-	N/A	No	
Junction 5 Existing A5 (Barnhill Road and Bradley Way)	17680	2.50	10.00	2.50	-	-		No	Upgrade of existing roundabout

1 INTRODUCTION

1.1 Project Summary

The Department for Regional Development (DRD) TransportNI is proposing improvements to the A5 Western Transport Corridor (A5WTC). The proposals include the construction of 85km of new build road at dual carriageway standard.

The scheme has been divided into three sections for the purposes of delivery, each subject to a separate construction contract.

1.2 Purpose of this Document

Each contractor is required to develop and implement a Construction Environmental Management Plan (CEMP) to help ensure that construction activities are planned and managed in accordance with the environmental requirements identified within the Environmental Statement (ES).

It is anticipated that the contractors use this document as the template for their individual CEMP.

Further details specific to the works being undertaken under each of the three construction contracts will be worked up by the Contractors into their CEMP as the scheme progresses.

1.3 Scope of the Construction Environmental Management Plan (CEMP)

This document provides a summary of the generic principles applicable to all three contracts and provides guidance on a consistent approach to ensure that the requirements of the ES are incorporated in the CEMP and within method statements prepared by each of the three Contractors.

The CEMP will document the Contractors' plans to ensure compliance with their legal and contractual obligations as well as implement best practice in construction environmental management.

The CEMP will be applicable to all works associated with the A5WTC scheme including those carried out by sub-contractors.

1.4 Structure of the CEMP

The structure of this guidance document mirrors that anticipated for the section CEMP to be prepared by each of the three Contractors. The contents can be summarised as follows:

- Chapter 1 - Introduction
- Chapter 2 - Training and Induction
- Chapter 3 - Consultation and Communication
- Chapter 4 - Environmental Impacts and Mitigation
- Chapter 5 - Pollution Control and Contingency Plan
- Chapter 6 - Auditing and Monitoring of Environmental Performance
- Annex 1 – Environmental Advice Notes

© Mouchel 2016

- Annex 2 – Construction Procedures
- Annex 3 – Construction Information

1.5 Roles and Responsibilities

The Contractor is responsible to ensure that all members of the Project Team, including sub-contractors comply with the procedures set out in the CEMP. The Contractor will ensure that all persons working on site are provided with sufficient training, supervision and instruction to fulfill this requirement.

The Contractor will ensure that all persons allocated specific environmental responsibilities are notified of their appointment and confirm that their responsibilities are clearly understood.

The principal environmental responsibilities for key staff can be identified as follows:

1.5.1 Site Manager

The Site Manager's environmental management responsibilities include but are not limited to:

- preparation and implementation of the CEMP;
- close liaison with the Environmental Manager to ensure adequate resources are made available for implementation of the CEMP;
- ensuring that the risk assessments for control of substances hazardous to health regulations (COSHH), noise and environmental risk are prepared and effectively monitored, reviewed and communicated on site; and
- managing the preparation and implementation of method statements. Ensuring that the Environmental Manager reviews all method statements and that relevant environmental protocols are incorporated and appended.

1.5.2 Environmental Manager (EM)

The responsibilities of Environmental Manager include but are not limited to:

- maintaining environmental records;
- providing guidance for the site team in dealing with environmental matters, including legal and statutory requirements affecting the works;
- reviewing environmental management content of method statements;
- reporting environmental performance to the Site Manager;
- liaison with statutory and non statutory bodies and third parties with an environmental interest in the scheme; and
- collection and collation of CEEQUAL evidence.

1.5.3 Engineering Staff

The engineers' environmental management responsibilities include but are not limited to:

- reporting any operations and conditions that deviate from the CEMP to the Site Manager;

© Mouchel 2016

- taking an active part in site safety and environmental meetings; and
- ensuring awareness of the contents of method statements, plans, supervisors' meetings or any other meetings that concern the environmental management of the site.

1.5.4 Supervisors

The supervisors' environmental management responsibilities include but are not limited to:

- ensuring all personnel affected by a method statement are briefed and fully understand its content. Monitor operatives for compliance, including sub-contract operatives;
- implementation of environmental management activities required by the CEMP and works method statements; and
- ensuring that all inspections are carried out as prescribed in the CEMP.

1.5.5 Ecological Clerk of Works (ECoW) (part of the Client's supervisory site staff)

The ECoW will be on site when required to monitor work to ensure that no wildlife comes to harm and also to provide advice to site workers regarding best practices. ECoW duties include, but are not limited to:

- monitoring site works;
- provision of status reports and updates;
- provision of advice to and liaison with workers on site;
- identifying environmental risks and developing environmental controls;
- delivery of environmental training for site personnel and sub-contractors; and
- liaison with the Site Manager.

1.5.6 Archaeologist

The Archaeologist will be on site when required to monitor excavation works and also to provide advice to site workers regarding best practices. The archaeologist's duties include but are not limited to:

- completion of mitigation works; in the form of targeted trial trenching, archaeological excavation and watching briefs, as required;
- production of detailed method statements to define how archaeological mitigation is sequenced with earthworks operations;
- certification of cleared areas prior to commencement of construction works;
- agreeing areas for topsoil strip or the use of toothless buckets;
- ensuring that all scheduled state care monuments and other known archaeological features requiring protection are demarcated with protective fencing and adequate signage;
- provision of induction training to site teams on archaeological controls;
- providing instructions to the site teams on how and when to access expert advice and opinions; and

© Mouchel 2016

- examination of incidental or unexpected finds; and agreeing programmes with the Site Manager for investigation and recording of the archaeological remains.

© Mouchel 2016

2 TRAINING AND INDUCTION

2.1 Site Induction

All personnel involved in the Scheme will receive environmental awareness training. The environmental training and awareness procedure will ensure that staff are familiar with the principles of the CEMP, the environmental aspects and impacts associated with their activities, the procedures in place to control these impacts and the consequences of departure from these procedures.

2.2 Specific Training and Awareness Raising

A project specific training plan that identifies the competency requirements for all personnel allocated with environmental responsibilities will be produced by the Contractor.

Training will be provided by the Contractor to ensure that all persons working on site have a practical understanding of environmental issues and management requirements prior to commencing activities.

A register of completed training is to be kept by the Environmental Manager.

The Site Manager will ensure that environmental emergency plans are drawn up and the Environmental Manager will conduct regular checks to ensure that the plan is effective by means of emergency drills.

© Mouchel 2016

3 CONSULTATION AND COMMUNICATION

3.1 Statutory and Non-Statutory Bodies

During the construction works, communication will be required with external parties such as, statutory authorities, interest groups and the public. Communication may take the form of scheduled meetings, site visits and written correspondence.

3.2 Public

The Site Manager shall ensure that the public is kept informed of operations that may have an effect upon them. This may involve letter drops and meetings to keep local residents up to date with progress with the scheme and any new operations that are to be carried out. The Site Manager will provide details of contacts within the project team for the public to contact should any issues arise.

3.3 Statutory Consents, Licences and Permits

The provisions for controlling, pumping and discharging water will be agreed with the Northern Ireland Environment Agency (NIEA). The Contractor will ensure that any licences required are in place prior to works commencing.

3.4 Environmental Alerts

Legislative changes or proposed improvements to manage processes on site that have a bearing on the commitments given in the Environmental Statement or other consultations will be communicated by the Site Manager to the Client.

3.5 Meetings and Records

Environmental issues relevant to the project will be discussed during weekly Site Progress Meetings attended by the Site Manager and Environment Manager. Environmental performance will also be discussed at regular HSEQ meetings. This will include dissemination and discussion of the findings of audits, environmental reports and other inspections where appropriate.

© Mouchel 2016

4 ENVIRONMENTAL IMPACTS AND MITIGATION

An environmental review of the Scheme has been completed to identify all the commitments and agreements made within the ES and other consultations. From this, a schedule of environmental commitments has been produced, which details deliverables including measures identified for the prevention of pollution or damage to the environment during the construction phase. Environmental commitments have also been incorporated by the design team into archaeological, ecological, landscape and other relevant designs and specifications.

© Mouchel 2016

5 POLLUTION CONTROL AND CONTINGENCY PLAN

5.1 Surface Water Run-off, Groundwater and Silt

All operations on site will be carried out in a manner to minimise the production and discharge of silty waters. In particular, where any dewatering has to be carried out an assessment will be made as to the method of disposal of the waters and agreed with the Site Manager.

The management of surface water run-off will be defined within the operation specific method statement and risk assessment. This will ensure that the right solution is implemented for each works activity.

5.2 Fuel, Oil and Chemical Spillage

All fuel, oil and chemical deliveries will be supervised by a responsible person who will be trained to deal with any spillage to prevent a pollution problem occurring.

Storage tank levels will be checked before delivery to prevent overfilling and to ensure that the product is delivered to the correct tank.

The storage of materials in the main compound and work sites will be controlled in such a manner to ensure that materials are not damaged prior to use either through vehicle or people movements or through exposure to the elements.

All fuel, oil and chemicals will be stored on an impervious base within a bunded area and secured. The bund shall have a capacity of 110% of the volume of the products stored within it. All tanks and containers will be kept in a secure compound and be protected from vandalism, and will be clearly marked with their contents. Stores shall be located at least 10 metres from any watercourse.

All mobile plant will be refuelled in a designated area on an impermeable surface and away from drains. In case of any spillages there will be a spill response kit available at each refuelling point and within each machine working within the highway corridor. Where it is impractical to refuel within a bunded area, a drip tray will be available to catch any spills caused by over fuelling.

5.3 Concrete/Mortar Washout

There will be a designated area for the washout of concrete wagons, shoots and mortar bins at each work site. This will be either a lined skip or a pit lined with an impervious membrane to prevent the escape of the alkaline and silty waters entering groundwater or surface water. These pits will be located in areas of low groundwater sensitivity. Excess concrete remaining in the delivery wagon at the end of a pour will be returned to a designated collection area. Once each worksite has been completed any solid concrete in the washout area will be broken out and used either as suitable fill or disposed of to a licensed waste facility.

5.4 Material Storage

Stockpiles should be positioned as far away from sensitive receptors as possible and suitable measures implemented to prevent run off and dispersion if left for any length of time. Any powders

© Mouchel 2016

should be stored in sealed bags or silos prior to use. All deliveries of dry powder should be undertaken in a manner to minimise dust emissions.

5.5 Emergency Procedures

A Site Environmental Emergency Plan will be prepared prior to construction and communicated to all members of the project team including sub-contractors and Emergency Services.

The plan will detail the following controls:

- site drainage controls;
- fuel handling procedures;
- incident notification procedures;
- pollution control equipment requirements;
- procedures for the control of dust and mud;
- protection of aquifer; and
- measures to protect watercourses and wildlife from chemical spills or sediment laden run off.

Responsible staff will be trained in emergency procedures to form an Emergency Team, so that these procedures can be implemented swiftly and effectively. Periodic testing of emergency procedures will be undertaken by the Site Manager. The Environmental Manager will observe the test and to report on results. Any corrective actions are taken forward for review and approval.

Should an emergency incident occur, the Environmental Manager will be notified immediately. The emergency response will be co-ordinated by the Site Manager. Protective measures, mitigation, clean up and remediation actions will be identified from the evaluation and shall be put into place, having regard for the sensitivities of the environment. A record of the emergency incident will be kept to show the nature of the corrective action undertaken.

© Mouchel 2016

6 ENVIRONMENTAL PERFORMANCE MANAGEMENT

6.1 Environmental Risk Register

The Environmental Manager will prepare and maintain an Environmental Risk Register having regard for legal requirements, project environmental commitments the potential for aspects of works to cause significant environmental impact.

The Environmental Manager will record responsibilities assigned for actions required for mitigation and control of the environmental risks in the Environmental Risk Register.

The Environmental Risk Register will be subject to regular review by the Environmental Manager together with the Site Manager.

6.2 Consents and Exemptions

The Scheme will require consents and exemptions from various regulatory bodies in advance of construction activities. Copies of legal consents, permits, assents and licences of exemptions obtained will be held in the site environmental file by the Environmental Manager.

6.3 Method Statements and Risk Assessments

Specific environmental risks will be assessed during preparation of method statements. Actions and environmental constraints associated with specific construction operations will be included in method statements, field control sheets and activity plans where appropriate. Generic environmental requirements will be included in all method statements.

6.4 Inspections

Routine inspections to check that pollution control measures are in place will be undertaken by the Environmental Manager, who will produce weekly inspection reports.

Daily inspections will be made by the supervisors during each shift and any environmental problems or risks that are identified will be actioned as soon as is reasonably practicable. Any issues arising from the daily inspections will be notified to the Environmental Manager.

6.5 Auditing

A Project HSEQ internal audit schedule will be prepared. This will include: audits of the implementation of the CEMP and audits of sub-contractor and supplier environmental performance by the Environmental Manager.

6.6 CEMP Review Programme

The CEMP is a live document that will be updated by the Contractor and reviewed by the Environmental Manager on a monthly basis.

6.7 Environmental Complaints

The Environmental Manager will ensure that all environmental complaints and concerns will be responded to in 24 hours.

© Mouchel 2016

6.8 Notices of Non-Conformance

In instances where the requirements of the CEMP are not upheld a Non-Conformance and Corrective Action Notice will be produced. The Notice will be generated during the inspections conducted by the Supervisors, the Site Manager, Environmental Manager or external third-party audits. The Site Manager will be responsible for ensuring a corrective action plan is established and implemented to address the identified shortcoming.

6.9 Complaints Handling

The response to any complaints will be managed by the Site Manager, who will inform the Environmental Manager of any environmental complaints.

A Complaints Register will be maintained to detail the name and contact details of the complainant, date and time of the complaint, nature of complaint, action taken to resolve issues, and date of complaint handover.

6.10 Key Performance Indicators and Objectives

The Contractor will set Environmental Objectives in order to continuously improve environmental performance on the site. The Contractor will set objectives based on each significant environmental impact and they will be reviewed, and revised if necessary, on a monthly basis. Procedures, monitoring requirements and key performance indicators will be measured against achievable targets.

WFD	Water Framework Directive
HQA	Habitat Quality Assessment (product from RHS survey)
HMS	Habitat Modification Score (product from RHS survey)

Table 6G.5 WFD Risk Categorisation

WFD Risk Category	UKTAG Reporting Category
1. Water bodies at risk of failing to achieve an environmental objective	**(1.a) Water bodies at significant risk** *Note: Identifies water bodies for which consideration of appropriate measures can start as soon as practical*
	(1.b) Water bodies probably at significant risk but for which further information will be needed to make sure this view is correct *Note: Focus for more detailed risk assessments (including, where necessary, further characterisation) aimed at determining whether or not the water bodies in this category are at significant risk in time for the publication of the interim overview of significant water management issues in 2007*
2. Water bodies not at risk of failing to achieve an environmental objective	**(2.a & 2.b) Water bodies not at significant risk on the basis of available information** **(2.a) Water bodies for which confidence in the available information being comprehensive and reliable is low** *Note: Work on these water bodies will be focused on appropriately improving the quality of information on pressures and their likely environmental effects in time for the second pressures and impacts analysis due to be completed in 2013*
	(2.b) Water bodies for which confidence in the available information being comprehensive and reliable is high *Note: Review for the next pressures and impacts analysis report in 2013 to identify any significant changes in the situation*

Annex 1.2 EAN 002 Protected Species Timing Restrictions

Table 6G.6 Protected Species Work Timing Restrictions

Species	Section	Chainage	Legal protection	Timing Restriction	Working Windows											
					Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sept	Oct	Nov	Dec
Winter birds	1	5000-6000 and 8500 - 10500	HRA process	No heavy works October - March. No piling, large scale earth movement etc.												
Nesting birds	All	All woody vegetation	WO 85	Woody vegetation clearance September - February												
Nesting Barn owl	All	None found in baseline surveys, but potentially throughout scheme	WO 85	Destruction of existing nests Sep-Feb only; replacement provided up to 1 year in advance of destruction												
Nesting king fishers	All	None found in baseline surveys, but potentially throughout scheme	WO 85	Netting of suitable river banks to prevent summer nesting where necessary												
Otter holts	2	34400 and 50000 confirmed, 17500, 41800 and 71700 likely.	HR 95 & HRA Process	No time restriction on closure, will be dependant upon activity. Licence and creation of artificial holt up to 1 year in advance of holt closure												
Bat roosts**	1	3250 and 19000 confirmed (more likely during veg clearance).	HR 95	Bat licence and creation of artificial roosts up to one year prior to roost closure (Preferred October - April)												
Badger setts	All	Main setts: 7200, 7700, 34250, 54750, 79500, 81100, 83500 (A4 link road) (more likely during veg clearance)	WO 85	Badger licence up to one year prior to sett closure (only allowed 1st July – 30th November) creation of alternative sett up to 1 year prior to original's closure												
Smooth newt breeding ponds	2	19500	WO 85	Licence required for trapping and relocation of newts up to one year prior to pond destruction (trapping March-August) creation of alternative pond up to 2 years prior to original's destruction												
Red Squirrel dreys	3	possible 34400 and 79400-79700	WO 85	No time restriction on destruction, will be dependant upon activity. Licence up to 1 year in advance of drey destruction												
White clawed crayfish	3	All water courses 78000 - 93000	WO 85	No works affecting stream May-June. Licence may be required for removal of individuals from works area July - October												
Protected flora	1	18000	WO85	Translocation of trees November to Feb												

*It will not be possible to locate all breeding sites or resting places prior to vegetation clearance and site construction works. Provision should be made for the unexpected discovery of any of these features.

Bat Roosts** timings only applicable for summar roosts, if maternity or hibernation roosts discovered in update surveys further restrictions will apply.

Annex 1.4 EAN 004 Invasive Species Risk Register

Table 6G.10 Invasive Species Risk Register

Species to be added to Sch. 9 Wildlife Order 1985	Risk Category	Latin	Habitat Occurrence	Means of Spread	Impacts	Current Range in Co. Tyrone	Confirmed A5 Locations	Control Methods
Knotweed, Japanese		*Fallopia japonica*	Waste ground, river banks and parks.	vegetative fragments in contaminated soil	Forms extensive stands	Widespread throughout Tyrone.	Burn Dennet (chainage) Mourne (chainage), Strabane Nature Reserve. River Derg (NVC ID Area 26).	Attempting to get rid of stands of Japanese knotweed by digging up or cutting the plant rarely succeeds unless combined with herbicide applications. Fragments of the rhizomes or aerial shoots can regenerate, so must be destroyed by burning. Riverside colonies may spread by fragments floating downstream. The Centre for Aquatic Plant Management (CAPM) recommends control by herbicides as the best option. Transport of soil away from the site containing fragments of Japanese knotweed should be avoided; it might introduce the species to uninfected sites.
Knotweed, Giant		*Fallopia sachalinensis*	Waste ground, river banks, lakesides, old gardens, etc.	Flowers, rhizomes and vegetative fragments in contaminated soil	Forms extensive stands	Scattered throughout Tyrone.	Burn Dennet	Currently the most effective method of control is repeated spraying with herbicides over a number of years, which gradually reduces the vigour of the plant. This is carried out in early autumn, when the herbicide in thought to have the most impact on the plant. New sites and larger stands may also be sprayed in early summer as well, to stunt the growth before the autumn spraying.
Hogweed, Giant		*Heracleum mantegazzianum*	Along riversides, stream banks, and other damp waste sites. In suitable environments, it can be abundant. It can extend along several miles of river bank.	Seed dispersal via water transportation and in soil adhering to shoes and machinery. Seeds can stay viable for several years.	Poisonous to people and animals	Widespread throughout Tyrone.	Large stands along R. Finn and Mourne confluence near Strabane.	Eradication programmes may vary depending on the degree of infestation. Small numbers can be controlled by digging out the whole individual plant; docking the plant to prevent it flowering will divert reserves to ensuring the plant survives to attempt to flower the following year. It is best to cut the stem at below ground level, to ensure that the rootstock is damaged. Larger numbers can be sprayed, preferably when the plants are actively growing and less than 1m tall, with a glyphosate herbicide (this is the only herbicide which can be used near water). This can be done either as a spot treatment, or using long reach sprays. The monitoring of the treated area for several years is necessary, to find new seedlings. Establishing greensward or reseeding with native plants is also beneficial after initial eradication.
Salmonberry		*Rubus spectabilis*	Country parks, river banks, forestry plantations etc.	This plant spreads rapidly by vigorous suckering from the base. It is likely that it could also be spread by careless disposal of garden waste.	Displaces native species.	Widespread throughout Tyrone.	None confirmed.	With well-established large infestations only physical removal involving cutting or digging up the plants, either by hand or mechanically, is feasible. Herbicide should be applied to remaining stumps.
Balsam, Himalayan		*Impatiens glandulifera.*	River banks and lakesides.	There are no special vectors for long-distance dispersal, although dispersal by water is probable. Local dispersal is by seed from existing colonies.	Displaces native species. Bare patches created in winter when the plant dies back may result in increased riverbank erosion.	Widespread throughout Tyrone.	Scattered along route, particularly along watercourses.	Mechanical control, by repeated cutting or mowing, is an effective control, but plants can regrow if the lower parts are left intact. Regular grazing also suppresses this species. Control by herbicides is effective — for detailed advice on this, see the Centre for Aquatic Plant Management web site (Information Sheet 3: Himalayan Balsam). Herbicide should be sprayed before flowering.

© Mouchel 2016

Species to be added to Sch. 9 Wildlife Order 1985	Risk Category	Latin	Habitat Occurrence	Means of Spread	Impacts	Current Range in Co. Tyrone	Confirmed A5 Locations	Control Methods
Waterweeds (all species)		*Elodea* (all species)	Still or slow-flowing, shallow or deep water.	vegetative fragments in water courses	Can impede flow, increase flooding, destroy ecosystem and affect recreation	*E. canadensis* scattered throughout Tyrone. *E. nuttallii* rare in Tyrone.	*E. canadensis* abundant in pond adjacent to River Finn H32509673.	*Elodea canadensis* is now an established part of Ireland's aquatic ecosystems. It provides good habitat for many aquatic invertebrates and cover for young fish and amphibians and food for waterfowl. In the case of excessive growth, physical removal is probably the best option, taking care to dispose of the excess material responsibly (by composting or burning). It can also be controlled by suitable herbicides and there is a biological method of control using grass carp (*Ctenopharyngodon idellav*) which graze the plant. Control of *Elodea nuttalli* is similar although this species is less widespread than *E. canadensis* although it is reported to be increasing across the British Isles whilst *E. canadensis* has declined. This has been linked with generally increasing eutrophication of waters.
Knotweed (all species)		*Fallopia* (all species)	Comments as per *F. japonica* and *F. sachalinensis.* Hybrid between these two spp. - *Fallopia x bohemica. F. baldschuanica* (a climber) rarely becomes established in wild.					
Rhubarb, Giant		*Gunnera tinctoria*	Damp grassland, woodland and shaded areas near water	self sown and vegetative fragments	Forms extensiev stands and may impede stream flow	Rare in Tyrone.	River Derg	Mechanical removal and chemical treatment.
Bluebell, Spanish		*Hyacinthoides hispanica*	Woodlands, parkland and gardens.	bulbs in waste soil	Hybridisation with native species	Rarely naturalised in Tyrone. Hybrid with native species is more common. Native sp. is most widespread.	None confirmed.	The complete removal of Spanish or hybrid bluebells from an extensively contaminated site is probably uneconomic and undesirable. The focus of management should be on prevention of further spread into natural woodland or other natural habitats by the removal of garden escapes as and when discovered.

Annex 1.5 EAN 005 Environmental Consents

Table 6G.12 EAN 005 Consents

Licence	Info	Responsibility	Programme	Input Required (input and team)
FEPA **FEPA guidance note information:** **http://www.ni-environment.gov.uk/fepa_guidance_notes.pdf** **Construction Licence Application Form:** **http://www.ni-environment.gov.uk/construction_application.pdf** **the Deposits in the Sea (Exemptions) Order (Northern Ireland), 1995:** **http://www.ni-environment.gov.uk/ni_wml_consultation_document.pdf**	WMU has suggested that the construction works may occur within 50 metres of the Mean High Water Spring Tide mark of the tidal section of the River Foyle. Therefore you may require a licence issued under Part II of the Food and Environment Protection Act 1985 (A FEPA Licence). This also applies to proposed pipeline outfalls terminating in the sea. WMU's Marine Assessment and Licensing Team should be contacted to determine if the construction works are within this zone and to determine if an FEPA Licence is required. If the works are within 50 m then a **CONSTRUCTION LICENCE** will be required. Some minor works of construction may be exempt from FEPA licensing, these arelisted in the Deposits in the Sea (Exemptions) Order (Northern Ireland), 1995, please find attached link in left hand column.	Contractor	It is recommended that contact of the environment and heritage team Northern Ireland takes place as soon as possible. An application form will need to be submitted **FOUR MONTHS BEFORE LICENCE IS REQUIRED.** Please find attached link in left hand column. FEPA licences cannot be issued retrospectively. Licences are valid for **12 months.** A separate application must be submitted for each stage of construction work. The application will need to be submitted to the environment and heritage team with the following application fee: • Marine Construction: £175 administration fee. The application fee must be paid **before** the application can be processed.	The following information is required for the construction licence application: Project costs (Project Manager) Environmental Statement; only If the project is subject to a planning application (Environment Team) Description of materials to be deposited (Design Engineers) Method of construction; is needed if the project involves land reclamation (Construction Engineers)
Discharge Consent **Discharge Consent application form:**	The scheme will require discharge consent, issued under the Water (Northern Ireland) order 1999, prior to commencement of any works. Discharge	Contractor	It is recommended that contact of the environment and heritage team Northern Ireland takes place as soon as possible. An application form will need to be submitted **FOUR MONTHS BEFORE LICENCE IS REQUIRED.** Please find attached link in left	The following information is required for the discharge consent licence application: Need to state the nature of the discharge, type amount etc (waste team)

Licence	Info	Responsibility	Programme	Input Required (input and team)
http://www.ni-environment.gov.uk/discharge_consent_gn.pdf **Annex 2 (WO1 – Annex 2 Trade Effluent Discharge, includes site drainage):** **http://www.ni-environment.gov.uk/wo1-annex2-trade-effluent-and-site-drainage.pdf**	consents will also be required for any temporary toilets or wash areas that discharge to the aquatic environment. The scheme is most likely to fall under Annex 2 of the discharge consent application.		hand column. The Department has **four months** from the date on which a valid application is received (or such further period as may be agreed in writing between the applicant and the Department) to determine the application, otherwise it is deemed to have been refused by the department. **Annex 2** (WO1 – Annex 2 Trade Effluent Discharge, includes **site drainage**) should be completed in addition to the main application form. A separate application form and fee must be submitted for each type of effluent discharge. Please find attached link in left hand column.	Site details including site drainage (Engineers) Details of receiving Environment and impacts (Environment Team)
Abstraction /impoundment **Abstraction/Impoundment Application form:** **http://www.ni-environment.gov.uk/licence_abstract_impound_water.pdf**	If the scheme involves abstraction (e.g. dewatering of an excavation) or an impoundment a pool of water formed by a dam or pit) an appropriate abstraction/impoundment license may be required.	Contractor	It is recommended that contact of the Abstraction and Impoundment Licensing Team of WMU takes place as soon as possible. For Impoundment and Abstraction a Comprehensive Application for a Licence to Abstract and/or Impound Water F0002 will be required. Please find attached link in left hand column. The form will **NOT** be required if extraction is below **10m³ per day** (conditions in annex A) Please find attached link in left hand column. With effect from 1st April 2010 the following charges will apply: • A flat rate fee of £135 for all abstraction • applications of 20 cubic metres per day or more. • A fee of £30 for any variations to an existing licence. • For abstractions greater than 100 cubic metres per • day an annual charge may apply	The following information is required for the discharge consent licence application: Proposed and existing abstraction/impoundments of water. Abstraction volume details including volume per day for surface, estuarine or coastal waters and groundwater. Monthly Abstraction Volumes in Cubic Metres (m3) (daily maximum). Information on water storage, land etc. (All from engineers)

ANNEX 2: CONSTRUCTION PROCEDURES

The Contractors and their sub-contractors shall employ the Construction Procedures listed below as a practical means to effect environmental mitigation while working on the project.

Annex 2.1 Procedures Site Clearance

Table 6G.13 Procedure for Site Clearance

Procedure for Site Clearance	CP01	
	Rev: A	Date: Nov 2010
Purpose	To minimise the impacts of site clearance works on ecological habitats and wildlife in the area.	
Responsibility for control	Environmental Manager	
Procedures	Before any work is undertaken the proximity to water bodies and ecologically sensitive features shall be assessed. Whole trees shall be removed by trained operators using mulchers specifically designed for the purpose. As far as possible all woody vegetation shall be removed outside of the bird breeding season (March-August inclusive). Where this is not possible woody vegetation shall be checked prior to removal for active birds nests. If any are found works in that location shall cease until the nest can be confirmed as no longer active. Removal of top soil shall be undertaken in accordance with the soil stripping methods detailed in Procedure CP02. Removal of vegetation or top soil within 20m of a water course shall be carried out under the supervision of the Ecological Clerk of Works. If active birds nests, animal holes of sufficient size to be used by badger or otter, squirrel dreys, bats, lizards or newts are found during vegetation clearance then works in that location shall cease and ecologist advice sought. Removal of trees highlighted as potential bat roosts in the ES or in update surveys shall be undertaken using a 'soft felling' method as detailed in the ES. A licence from NIEA may be required if a roost is confirmed as present. Removal of confirmed bat roosts shall take place under NIEA licence and in accordance with the method detailed in the ES. As the confirmed roosts to be destroyed are summer roosts the licence would probably only be granted between October and February. Removal of vegetation or top soil within 50m of an otter holt or breeding site as highlighted in the ES or update surveys shall be carried out under licence from NIEA. Construction activities that are likely to damage or disturb an active badger sett as highlighted in the ES or update surveys shall be carried out under a licence from NIEA. Closure of badger setts can only be undertaken between July and November Removal of ground flora or top soil within 250m of a newt pond as highlighted in the ES or update surveys shall be carried out in accordance with the specific newt habitat clearance guidance as detailed in the ES.	

© Mouchel 2016

Procedure for Site Clearance	CP01	
	Rev: A	Date: Nov 2010
	Removal of ground flora or top soil within or adjacent to a newt pond as highlighted in the ES or update surveys shall be carried out under a licence from NIEA. This licence shall be required for the destruction of a newt pond and most probably only be granted between March and September. Removal of woody vegetation within 30m of an active squirrel drey as highlighted in the ES or update surveys shall be carried out following the methodology detailed in the ES and may require an NIEA licence. Removal of invasive species highlighted within the ES, update surveys or by site contractors shall be carried out under specific invasive species clearance methodology detailed in Environmental Consents (Appendix 1.4 of the CEMP).	
Environmental Controls	All necessary, ecological licenses shall be in place prior site clearance start.	
Plant & Equipment	Excavator mounted and purpose built tracked mulchers. Excavator harvesters. Hand strimmers. Chainsaws. Tree climbing equipment.	
Monitoring	The Ecological Clerk of Works shall supervise vegetation removal in ecologically sensitive areas, all sites within 20m of water courses, all sites subject to a licence from NIEA, all vegetation cleared during bird breeding season and be on call during all vegetation clearance works.	
Emergency, preparedness and response	If active birds nests, animal holes of sufficient size to be used by badger or otter, bats or squirrel dreys are found during vegetation clearance the works in that location shall cease and the Ecological Clerk of Works shall be contacted.	
References	Environmental Statement.

Annex 2.2 Soil Strip

Table 6H.14 Procedure for Soil Strip

Procedure for Soil Strip	CP02	
	Rev: A	Date: Nov 2010
Purpose	To minimise the impacts on ecological habitats and wildlife in the area during soil stripping. To prevent damage to any archaeological remains discovered during construction. To enable the re-use of topsoil and the re-establishment of vegetation after work is complete.	
Responsibility for control	Environmental Manager	
Procedures	Prior to any topsoil being stripped, the topsoil shall be assessed for suitability for re-use on agricultural land, cut and fill slopes, planted landscape mitigation areas or on any areas of ecological interest. Method statements shall be prepared to identify the locations where the topsoil shall be stripped from, temporarily stockpiled and spread. Topsoil stripped from the area of excavations and the footprint of structural fill embankments shall be stockpiled in locations convenient for re-use once cut and fill slopes and landscape mitigation areas are ready for top soiling. Topsoil deemed suitable for re-use for agricultural regeneration or for shrub planting and other landscape mitigation shall be placed in stockpiles not exceeding 3 metres high. Stockpiles shall be allowed to vegetate to prevent erosion or weathering and shall be located away from drainage ditches. Finished worked slopes that are to be spread with topsoil shall be prepared as the earthworks progress and topsoil shall be spread as early as is practicable.	
Environmental Controls	Where required, Archaeological observers shall be present during the topsoil strip for a watching brief. Topsoil that has been identified as “ecologically interesting” shall be recorded as such within the method statement and shall be stockpiled for reuse in windrows no more than 1.5 metres high by 3 metres wide, shaped to shed water. Silt control measures shall consist of small bunds at the toe of the stockpiles as required. Spraying shall be carried out to prevent the proliferation of weeds.	
Plant & Equipment	Topsoil shall be removed and loaded by a 360° excavator using a toothless bucket to dump trucks for transport to stockpile. A 360° excavator shall handle and shape the topsoil at the stockpile site.	
Monitoring	Daily haulage record sheets used in productivity analysis shall provide a second reference to identify which topsoil is stripped from where and where it was placed.	
Emergency, preparedness and response	If animal holes of sufficient size to be used by badger or otter are found during vegetation clearance the works in that location shall cease and the Ecological Clerk of Works shall be contacted. If items of potential archaeological value are uncovered then works in that location shall

Annex 2.3 Earthworks and Drainage

Table 6G.15 Procedures for Earthworks and Drainage

Procedure for Earthworks and Drainage	CP03	
	Rev: A	Date: Nov 2010
Purpose	To minimise the impacts of earthworks on ecological habitats and wildlife in the area. To avoid pollution to water courses. To minimise nuisance to the local community due to deterioration of air quality and the creation of dust, noise and vibration. Minimise the surplus materials arising from earthworks.	
Responsibility for control	Environmental Manager	
Procedures	Landowners and authorities shall be informed in advance of commencement of filling at deposition areas. Bunting poles shall be erected around overhead services. Advance pre-earthworks, temporary drainage and dewatering shall be undertaken as required to prevent ingress of water to the earthworks and discharge away from the earthworks. Discharge licenses shall be in place before commencement of any works and appropriate treatment provided prior to discharge to watercourses. No water shall be allowed to pond on the formation layer. When unsuitable material is encountered this shall be removed in accordance with the Site Waste Management Plan. Method statements shall be prepared setting out procedures to monitor and control dust, noise, vibration and deposition on roads. Haul Roads shall be constructed to enable access to the works and movement of the earthworks through the site and to disposal areas. Temporary stockpiles of excavated earth shall be constructed within the lands made available. Stockpiles shall be shaped to ensure rainfall does not degrade the stored material. Drains shall be installed along the toe of embankments in fill areas. Embankments shall be constructed and graded to allow water to shed off the completed earthworks. Embankments shall be sealed at the end of each working shift to avoid ingress of water. The earthworks material shall be placed and compacted in layers to prevent water ingress and degradation of the material.	
Environmental Controls	Temporary drainage or dewatering shall be in place to prevent ingress of water to the earthworks and discharge away from the earthworks. Discharge licenses shall be in place and appropriate treatment provided prior to discharge to watercourses.	
Plant & Equipment	50t – 70t primary excavators 20t – 30t excavators	

© Mouchel 2016

Procedure for Earthworks and Drainage	CP03	
	Rev: A	Date: Nov 2010
	Rock breaking and processing equipment Bulldozers Graders 30t – 40t articulated dump trucks Compaction plant including various rollers Soil stabilisation plant	
Monitoring	Daily physical inspection of the site including; watercourses, haul roads, mechanical state of all plants, shall be undertaken to detect any signs of contamination or disturbance. A program to monitor watercourses, air quality, dust, noise and vibration shall be in place during the construction phase.	
Emergency, preparedness and response	If animal holes of sufficient size to be used by badger or otter are found during vegetation clearance the works in that location shall cease and the Ecological Clerk of Works shall be contacted. If items of potential archaeological value are uncovered then works in that location shall cease and the Archaeologist shall be contacted. An emergency plan shall be prepared to ensure that any unforeseen release of silty water or other polluted effluents are brought quickly under control and remediated in consultation with the NIEA.	
References	Environmental Statement.

Annex 2.4 Bridge Construction

Table 6G.16 Procedure for Bridge Construction Across the Rivers

Procedure for bridge construction across the rivers	**CP04**	
	Rev: A	**Date: Nov 2010**
Purpose	To minimise the impacts on ecological habitats and wildlife in the area during bridge construction. To minimise noise nuisance. To prevent environmental pollution incidents.	
Responsibility for control	Environmental Manager	
Procedures	**Installing temporary bridges** Bunds shall be constructed to surround the working platforms at a level to prevent floodwaters overtopping. Erosion protection shall be installed to the temporary bridge abutments and lead-in and lead-out edges of the bunds. The bridge shall be assembled in sections on a working platform. A crawler or all terrain mobile crane shall be used to lift the longitudinal truss sections over the river. Cross members between the trusses shall be infilled using a crane. To remove the bridge the reverse process to erection shall be employed. The deck shall be longitudinally sloping to give positive drainage of the deck surface. The water from rain or cleaning operations shall be channelled into the moat areas on the floodplain to be pumped to the discharge area. Solid face ply board panelling shall be installed to the sides of the deck to prevent any material that might fall from the trucks from falling into the river. It shall also stop splash water entering the river. Open flooring decking shall not be used. A maintenance regime for cleaning the deck of the bridge and cleaning the approach ramps to the bridge shall be in place. Regular dust suppression shall be required during dry periods to keep the surface of the haul road damp. **Piling for foundations** Any vibration shall be limited to those agreed with the local authorities. Spoil shall be removed by excavator to keep the work area clear and when necessary the excavator shall load the spoil to transportation for removal. Ground water within the bore displaced during placing of concrete shall be pumped away to a washout facility set up off the flood plain. Any spills of concrete shall be cleared up to avoid the possibility of cement contaminating water from rainfall or washing down of equipment. **Excavation for pier foundations** Prior to commencing the bulk excavation of the cofferdam one or more sump holes shall be excavated to the full depth of the excavation. The cofferdam shall be excavated using an excavator with a perforated bucket.	

© Mouchel 2016

Procedure for bridge construction across the rivers	CP04	
	Rev: A	Date: Nov 2010
	Low water table levels shall be maintained inside the cofferdam by pumping. Water from the pumping shall not be discharge back into any watercourse without appropriate attenuation and treatment. **Structure base construction** Prefabrication of formwork shall be undertaken remote from the floodplain and any debris from onsite fixing and fabrication shall be sent in skips for recycling. Dewatering of the cofferdam shall be maintained until the concrete base has been constructed, the piers are constructed to above ground level and the cofferdam has been backfilled. **Deck construction** The sub-deck shall have edge upstands, shall be watertight and shall drain to the moats either side of the river. The sub-deck shall provided a second line of protection to catch debris and liquids that would otherwise reach the river. It shall be designed to deflect objects away from the river to a place where they can be collected and disposed of. Until the permanent deck drainage is installed, measures shall be implemented to ensure run-off water from the deck is collected and piped to the moat area on the floodplain where it shall be pumped to discharge areas following suitable attenuation and treatment.	
Environmental Controls	Method statements shall be prepared for the control of noise and vibration. A 15 M.P.H. speed limit shall be imposed on the haul road across the floodplains and watercourses. This shall reduce the risk of dust contamination and pollution of the river. Equipment shall be selected to minimise noise and where appropriate with built in noise attenuation. Some construction materials will be subject to a COSHH assessment.	
Plant & Equipment	Crawler or all terrain mobile crane. Vibrating hammer/extractor. Breakers or crushing plant. Jack hammering. Crane pitching. Vibrating internal poker Concrete pumps. Vibrating rolling screed. Mechanical scabblers. Blacktop pavers and rollers.	
Monitoring	Drainage treatment areas used to accept dewatering and drainage water shall be subject to regular maintenance and monitoring.	
Emergency, preparedness	An emergency plan shall be prepared to ensure that any unforeseen release of silty water or other polluted effluents are brought under control and remediated in consultation

Annex 2.5 Blasting

Table 6G.17 Procedure for Blasting

Procedure for Blasting	CP05	
	Rev: A	Date: Nov 2010
Purpose	To minimise the impacts on ecological habitats and wildlife in the area from blasting. To avoid pollution to water courses and land. To minimise nuisance to the local community cause by deterioration of air quality and the creation of dust, noise and vibration.	
Responsibility for control	Environmental Manager	
Procedures	An explosives supervisor shall be appointed. A site specific method statement and detailed risk assessment shall be produced prior to any blasting operations taking place. Notice shall be provided to the public informing them of the timing of planned blasts and providing the name, address and telephone number of a contact within the project team, who shall deal with their queries. Method statements shall be prepared to specify arrangements for the monitoring of noise and vibration. Site Rules shall be drawn up to govern shot-firing for rock extraction. These rules shall state how explosives are stored, transported, used and disposed of. Method Statements shall be prepared to specify arrangements for the safety of the workforce and the public. They shall also set down permitted shot-firing times, the determination of danger zones for vibration, warning systems, arrangements for disposal of surplus explosives and monitoring. The disposal of surplus explosives and packaging shall be carried out in strict accordance with the manufactures or suppliers instructions and guidelines. Where rock is excavated and stored temporarily, stockpiles shall be constructed within the lands made available. No water shall be allowed to pond on the rock surface. PSNI shall be fully involved in the approval and awareness of any activities associated with the use of explosives	
Environmental Controls	Design of blasting methodology to maximize efficiency and reduce the transmission of vibration including appropriate charging based upon site specific regression analysis.	
Plant & Equipment	Rotary drill rig Explosives delivery truck or explosives mixing truck Exploders Circuit Testers Wooden or anti-static plastic hand tools	

© Mouchel 2016

Procedure for Blasting	CP05	
	Rev: A	Date: Nov 2010
Monitoring	A program to monitor watercourses, air quality, dust, noise and vibration shall be put in place during the construction phase. Continuous vibration meters shall be positioned at receptors adjacent to the site prior to shot-firing.	
Emergency, preparedness and response	The Site Manager shall ensure that emergencies response procedures are in place to cover situations involving injury, unforeseen damage to property and unaccountable loss of explosive materials. These procedures shall clearly identify responsibilities for liaison with Police, Fire and Ambulance forces.	
References	Environmental Statement.

Annex 2.6 Demolition

Table 6G.18 Procedure for Demolition

Procedure for Demolition	CP06	
	Rev: A	Date: Nov 2010
Purpose	To avoid pollution to water courses and land during demolition works. To minimise nuisance to the local community cause by deterioration of air quality and the creation of dust, noise and vibration.	
Responsibility for control	Environmental Manager	
Procedures	A site specific method statement and detailed risk assessment shall be produced prior to commencement of any demolition works. All underground pipes, tanks and services shall be located and marked. All tanks shall be labelled with their content and capacity. Visible signs of leaking tanks or pipes and any signs of contaminated ground or groundwater shall be checked. Recyclable waste arisings shall be segregated at source. Asbestos and other hazardous materials shall be separated for safe disposal. Licences shall be obtained from the local environmental health officer before any concrete, masonry or other material is crushed on site. Before removing or perforating tanks, all of their contents and residues shall be emptied for safe disposal by a competent operator in accordance with the Site Waste Management Plan. Pipes shall be capped or valves closed, to prevent spillage. Measures to avoid noise and vibration nuisance shall be agreed with the Local Planning Authority (LPA) and NIEA in advance. A method statement shall be prepared to specify how dust control measures (such as damping down) shall be implemented. All runoff from the site shall be controlled. Discharge licenses shall be in place and appropriate treatment provided prior to discharge to watercourses. Dust shall be prevented from escaping from materials in lorries leaving the site. If it is not possible to cover lorries because there are pieces of protruding material, they shall be sprayed them with water just before they leave.	
Environmental Controls	Adequate inspection to plant and equipment in operation shall be carried out prior to demolition works to ensure that noise and vibration levels do not exceed those agreed with the local authorities. Suitable spill response materials and emergency instructions shall be available on site and staff shall have been adequately trained.	
Plant & Equipment	360^0 tracked excavator fitted with breaker Saw fitted with dust suppressant 40 Tonne tracked crawler crane / 80t mobile if necessary	

© Mouchel 2016

Procedure for Demolition	CP06	
	Rev: A	Date: Nov 2010
	Stihl saw Harness and appropriate Personal Protective Equipment (PPE) if necessary	
Monitoring	A program to monitor air quality, dust, noise and vibration shall be put in place during the construction phase.	
Emergency, preparedness and response	Emergency response plans will be incorporated into the Contractors' method statements for each individual demolition operation.	
References	Environmental Statement.	

Draft versions of the Construction Procedures are set out below for guidance purposes.

The Contractor shall develop these further as an integral part of their operational procedures for issue as Controlled Documents.

ANNEX 4: TRAFFIC MANAGEMENT

Table 6G.20 Traffic Management Description

Side Road Ref	Side Road/ Junction	Mainline Chainage	Side Road Stopped Up	Preferred for Import of Materials & all Vehicles	Comments Temporary Diversion / Road Closure
Section 1					
	Junction 1 (New Buildings)	500	No	Yes	One way TM (traffic lights) to complete tie-ins with the existing A5 and the junction changes associated with Woodside Road.
	Junction 2	1750	No	Yes	One way TM to complete tie-ins.
S1 / SR / 01	Dunnalong Road	3900	No	No	Local School bus route. Temporary diversion to the north of the existing road.
	Meenagh Road	4950	Yes	Yes	No TM requirements. Landowner access will be maintained during works.
	Existing A5	6400	No	Yes	Traffic flows will be maintained on existing A5 during bridge construction works. Assumed that A5 remains at grade and only requires the relocation of a bus lay-by to the north of the proposed structure. Night closure required for bridge beam lifts.
S1 / SR / 05	Tamnabrady Road	6400	No	No	New link road running across the top of the Bready cutting will require TM to complete tie-in.
S1 / SR / 04	Cloghboy Road	6500	No	No	Realigned Cloghboy Road constructed offline.
S1 / SR / 06	Donagheady Road	7750	No	No	No TM requirements. Existing Donagheady Road maintained until new side road / structure

1 Introduction

This plan sets out site controls for management of sediment generated from over pumping during the construction of the new culverts and precipitation run off during earthwork operations.

All relevant construction activities for temporary and permanent works will follow relevant environmental legislation in consultation with Northern Ireland Environment Agency (NIEA) and where required, Rivers Agency, Loughs Agency and the Department of Culture Arts and Leisure, Inland Fisheries Team (DCAL). The main objective of the Silt Management Plan is to ensure that all drainage of temporary works is carried out in adherence with current regulation and to provide guidance on how to prevent water pollution.

Various agencies are responsible for control of distinct elements of the works:

- Rivers Agency – proposals do not cause flooding upstream of the works.
- NIEA – discharge of precipitation water, extraction and ecological licenses.
- Loughs Agency – fish within the Foyle Catchment.
- DCAL – fish within the Blackwater Catchment.

The construction phase of all projects is a period within which there is a significant potential for pollution, in particular silt pollution to local watercourses due to unearthed alluvium. The objective of this plan is to provide guidance on the relevant statutory provisions, including any consents required, in respect of the water environment, to protect both physical habitat and morphology and to avoid unacceptable adverse impacts including changes to flow volume, water levels and water quality due to construction.

This plan aims to address the requirements of the Rivers Agency, NIEA, Loughs Agency and DCAL and detail Road Service's strategy for dealing with these key environmental risks.

A Discharge License will be required from NIEA to enable the works to commence. This licence will be granted for each phase of the works and the works will then be monitored on a month by month basis by the NIEA. Each month contractors will be required to issue a monthly return to the NIEA which will be the projected discharges for the following month. These will be linked to the construction programmes. These plans will be reviewed every three months and updated if required.

Where construction activities near water courses and water bodies are essential, steps have been undertaken to identify sufficient mitigation measures for the protection of the watercourses against pollution. The Silt Management Plan also

© Mouchel 2016

includes details for pollution prevention measures and construction methodologies to be incorporated during the construction phase of the project.

Caution is required to prevent pollution and/or environmental damage, particularly when the following activities are undertaken:

- Construction of permanent and temporary bridges.
- Discharges into a surface water drainage system.
- Operating plant or machinery in, or in the vicinity of water.
- Discharges of surface water run-off.
- Laying of pipeline or cable.

© Mouchel 2016

2 Silt Mitigation

2.1 Scheme Overview

The proposed A5WTC would be an 85km long dual carriageway, running between New Buildings and the border with the Republic of Ireland (ROI), immediately south of Aughnacloy.

The proposed scheme runs along the Foyle Valley, close to the River Foyle, crossing the Burn Dennet

A full description of the scheme alignment is presented in Appendix A.

The works consist of a number of watercourse crossings which require the construction of new piped or box culverts to carry the streams under the new mainline. An example detailed method statement has been developed to control the construction of these and is included in Appendix B.

2.2 Sensitive Areas

The following areas are considered to be particularly sensitive with respect to potential impacts from pollution which may result from inadequate drainage control:

The River Foyle has a catchment area of approximately 2890km2 and extends into the counties of Londonderry, Tyrone and Donegal. The major tributaries of the Foyle include the Burn Dennet, Glenmornan, Finn, Mourne, Strule, Owenkillew, Derg, Fairy Water, Camowen and Drumragh Rivers. The northern section of the proposed route lies within the Lower Foyle Catchment, where the Mourne and the Finn converge at Strabane to form the River Foyle. From Strabane the Foyle flows north to Londonderry and Lough Foyle. The lough is tidal and exerts a tidal influence up the River Foyle as far as Strabane. The tidal reach of the Foyle has a tidal range of approximately 3m and is up to 750m wide in places. The main tributaries to the Foyle in the vicinity of the route are discussed in the following paragraphs. However, there are also a significant number of smaller tributaries which the route crosses. These tributaries are generally large man-made field drains and small streams which have been heavily modified / straightened where they pass through villages and agricultural land. The proposed scheme runs along the eastern side of the River Foyle from New Buildings to Strabane, primarily through agricultural land.

The Burn Dennet has a catchment of approximately 150km2. It rises in the Sperrin Mountains, and flows 35km west to the River Foyle. The catchment is predominantly agricultural, although there are significant sand and gravel quarries close to its lower reaches. The Proposed Scheme crosses the river in the vicinity of Burn Dennet Bridge. Here, the watercourse is approximately 15m wide and typically transitional in character, the valley being relatively unconfined with a wide floodplain and a channel which is relatively shallow in gradient and meandering in form with riffle/pool sequences.

© Mouchel 2016

The Glenmornan River has a catchment of approximately 35km2. It rises in the foothills of the Sperrins and flows 16km west to the River Foyle passing through the villages of Artigarvan and Ballymagorry. The upper catchment comprises peat covered hills. The landscape of the mid and lower reaches is predominantly agricultural. There are some sand and gravel workings adjacent to the middle reaches of the watercourse. Where the Proposed Scheme crosses the river, north-west of Ballymagorry, the river channel is between 4m and 20m wide and typically transitional in character.

The River Finn rises in Lough Finn in County Donegal and flows east for 60km to Strabane, where it joins with the River Mourne. The upper reaches of the catchment, which has an area of 495km2, generally flow through mountainous terrain. The route runs along the eastern bank of the lower reaches of the river, which by this point is a mature lowland river, with a wide unconfined valley and floodplain that is relatively deep and slow flowing.

The River Mourne forms the middle section of the main spine of the Foyle Catchment and has a catchment area of 1860km2. The Mourne is formed at the confluence of the River Strule and River Derg near Ardstraw. The river flows north to Strabane, where it merges with the River Finn to form the River Foyle. The route runs parallel with the western bank of the Mourne. The Mourne is a transitional river with numerous riffle and pool sequences, which flow in a relatively unconfined valley within a large floodplain. The river channel is on average 60m wide and has been heavily modified at Sion Mills, where historically a large weir has been constructed. As the Mourne passes through Strabane the river channel has been modified by various flood defences.

The River Derg rises in the Killeter Uplands to the west of the route and flows eastwards to its confluence with the Strule River near Ardstraw. The route crosses the lower reaches of the Derg close to the confluence. The upper reaches of the catchment, which is approximately 440km2, are characterised by peatlands, while the lower reaches flow predominantly through farmland. The main stream length of the River Derg is 53km. Within the vicinity of the Proposed Scheme the River Derg is a transitional (piedmont) river characterised by a well-developed valley, reasonably large floodplain and variable substrate with riffle and pool sequences.

The River Strule forms the upper section of the main spine of the Foyle Catchment, and has a catchment area of 1340km2. The Strule is formed by the confluence of the Camowen and Drumragh rivers in the centre of Omagh. The Strule then flows northwards for approximately 21km before merging with the River Derg to form the Mourne. The entire length of the Strule runs parallel to the route. The Strule has two major tributaries, the Owenkillew which joins the Strule from the east at Newtownstewart and the Fairy Water which joins to the north of Omagh. As the proposed route passes to the west of Newtownstewart the Owenkillew is unlikely to be affected by the proposed road scheme. The route does cross numerous small stream tributaries on the western slopes of the Strule valley. The Strule is a transitional river with variable bed materials, riffle and pool sequences, an

© Mouchel 2016

unconfined valley and floodplain. The catchment is predominantly agricultural, although peat bog is present in the upper reaches of the large tributaries and sand and gravel quarrying is present in the Strule valley, particularly north of Newtownstewart.

The Fairy Water rises on the slopes of Bolaght Mountain in west Tyrone and flows eastwards to its confluence with the River Strule to the north of Omagh. It has a catchment area of 180km2 and a main stream length of 30km. The catchment is predominantly agricultural grassland; however there are significant areas of peat throughout the catchment, particularly in the valley floor. The Proposed Scheme crosses the Fairy Water approximately 500m upstream of its confluence with the Strule. In this area the river is approximately 16m wide and has typical transitional characteristics with a meandering channel pattern and riffle and pool sequences.

The Drumragh River lies in the upper reaches of the Foyle Catchment and is formed to the south of Omagh by the confluence of the Ballynahatty Water and Quiggery Water. It has a catchment area of 321km2. The Drumragh flows generally north through the centre of Omagh before merging with the Camowen to become the River Strule. The route crosses the Drumragh approximately 2.5km downstream of the Ballynahatty-Quiggery confluence. At this point the river is approximately 10-15m wide and has typical transitional characteristics with variable bed material, riffle and pool sequences and an unconfined valley and floodplain. Due to the nature of the topography in the Drumragh catchment there is an intricate dendritic drainage network, with a large number of tributary streams. The route skirts around the eastern extent of the upper Drumragh catchment, crossing a number of small streams / large field drains within the Routing Burn and Eskragh Water sub-catchments. Many of the streams have been straightened or otherwise modified, with the exception of the Routing Burn main stream length, which is largely unmodified.

The Camowen River rises in the hills to the west of Pomeroy and flows westwards to Omagh, where it joins with the Drumragh to form the River Strule. It has a catchment area of 276km2. The Proposed Scheme passes through the western extent of the Camowen watershed, crossing the headwaters of a minor tributary to the Camowen River, namely the Ranelly Drain. These headwaters generally rise in the low lying peatlands which have formed between the drumlins that characterise the area. The reaches that the route pass over range from small semi-natural streams a few metres wide with good flow to very narrow ditches with limited flow.

The River Blackwater rises to the west of Fivemiletown and flows eastwards to Aughnacloy then north-east to Lough Neagh. It has a catchment area of 1493km2. The Proposed Scheme crosses the eastern part of the Upper Blackwater catchment, passing through the major tributary sub-catchments of the Roughan Burn and Ballygawley River, before terminating on the northern bank of the River Blackwater immediately south of Aughnacloy.

The Roughan Burn rises on the southern slopes of Slievemore and flows south through Ballymackilroy before joining the River Blackwater downstream of Augher. It

© Mouchel 2016

has a catchment of 27.02km2. Where the Proposed Route is crossed by the Roughan Burn it is a small, shallow stream with gravel and cobble bed. Although this reach is generally unmodified the lower reaches have been extensively straightened.

The Ballygawley Water rises on the slopes of Eshmore Hill approximately 12.5km northeast of Ballygawley. It has a catchment of 53.25km2. The river flows through the town before joining the river Blackwater at Lismore Bridge, approximately 6km downstream. The Proposed Scheme crosses the Ballygawley Water approximately 2km downstream of the town. At this point the river is approximately 10m wide with a shallow cobble and gravel bed.

2.3 Environmental obligations of the project during construction phase

The surface water management plan and pollution prevention measure installed as part of the A5WTC will be constructed using best practice and in conformance with the requirements of NIEA and other relevant governing bodies. The key legislation and guidance which will be adhered to are as follows:

- Water Framework Directive (Directive 2000/60/EC)
- Water (Northern Ireland) Order 1999
- Water abstraction and impoundment regulations (licensing) Northern Ireland 2006
- Groundwater regulations (Northern Ireland) 1998 (as amended)
- Control of pollution (oil storage) regulations (Northern Ireland) 2010
- Drainage (Northern Ireland) Order 1973 (as amended)
- Environmental Liability (Prevention and Remediation) Regulations (Northern Ireland) 2009
- Pollution Prevention Guidance Notes (PPGs):
  - PPG01 General guide to the prevention of water pollution
  - PPG02 Above ground oil storage tanks
  - PPG05 Works in near or liable to affect watercourses
  - PPG06 Working at construction and demolition sites
  - PPG07 Refueling Facilities
  - PPG11 Preventing pollution at industrial sites
  - PPG18 Control of spillages and fire fighting run-off
  - PPG20 Dewatering underground ducts and chambers
  - PPG21 Pollution Incident Response Planning
  - PPG23 Maintenance of Structures over Water
  - PPG26 Pollution Prevention Storage and Handling of Drums & Intermediate Bulk Containers
- CIRIA Report C502 Environmental Good Practice on Site

- CIRIA Handbook C651 Environmental good practice on site checklist
- CIRIA Report C697 - The SUDS Manual

2.4 Silt Management

Contamination by silt from site run off into adjoining water courses is a key risk for this Project if not properly controlled throughout the construction of the Scheme.

Site discharge licences will be required from NIEA prior to works commencing. Any application for such consent must clearly state how site run off with be managed, treated and returned to the water course.

Site run off is made up of two components and are the direct results of heavy rain.

The first component is run off from adjoining land that is not affected by the works. Run off from adjoining land would be intercepted by the early construction of Pre-earthwork drained ditches (PED). This will be one of the first earthwork operations. Where the new road is in a cutting then the PED would be located at the top of the cut any water entering this ditch would be run off from adjoining land thus would not need treating.

The second component is run off across the works once the topsoil strip has been completed, this could be any of the following:

- Run off across topsoil strip
- Run off down embankment cuttings
- Run off down embankments being constructed.

2.5 General Construction Policies

The Silt Management Plan has been developed to minimise and mitigate for the effects of pollution to all local watercourses. However, this does not remove environmental responsibilities from the contractor / sub-contractors. All site personnel should be made aware of their environmental responsibilities through the production of this Construction Method Statement and an environmental induction.

In accordance with BS6031: 1981 Code of Practice for Earth Works, land disturbance will be kept to minimum and disturbed areas will be stabilised as soon as possible. Soil handling will be undertaken with reference to best practice guidelines.

In general the following will be adhered to in terms of the general Earthworks:

- All roads will be kept free from dust and mud deposits.

© Mouchel 2016

- Areas of extraction and deposition will be carried out according to BS6031:1981 Code of Practice for Earth Works. Risk assessment will be evaluated to ensure all surface water will be appropriately treated prior to entering a discharge point.
- Any clean surface water not directly linked to a watercourse will be dealt with in the appropriate manner and field drainage introduced to the nearest stream before work begins.
- Retention ponds will be dug out first. These retention ponds will form part of the permanent SUDS and will be used during the construction period to deal with any surface water and act as sedimentation control.
- Trapezoidal-ditches will be dug out where required to channel any surface water from haul roads into these retention ponds. These will be to minimal gradient and if required straw bales or clean stone will be installed to act as weirs.
- Cut-off drains will be installed around the working areas to intercept uncontaminated surface runoff and divert it around and away from the works; surface water runoff may also be diverted around the excavations using heavy timbers or similar laid on the surface of the ground.

2.6 Installation Programme

At all times silt management features should be constructed prior to, or at the same time as the construction of the works. Before runoff is allowed to flow through the ditches, or across embankments scrutiny must be given by the contractor that the ditches, ponds slopes and embankments are fully stabilised and will not be affected by erosion. This will prevent the clogging of other parts of the system by the silt that is generated.

2.7 Working in the vicinity of water / Buffer zones

The following recommendations apply to the general construction activities either with the watercourses or in the vicinity of watercourses:

- Where practicable construction near streams should be avoided in wet weather.
- Keep cement and raw concrete out of watercourses.
- Plan so that roadside drains do not discharge directly into watercourses, but rather through a vegetated buffer area of adequate width.
- Runoff from excavations will NOT be pumped directly to watercourses.
- Should there be any incidents of pollution to the watercourses NIEA should be notified immediately. Immediate steps will be undertaken to resolve the cause of the pollution and where feasible mitigate against the impact of pollution, following the advice set out in PPG21.

2.8 Temporary Haul Roads

It is proposed that as the scheme progresses, the finished permanent roads will act as the temporary haul roads during the construction phase.

© Mouchel 2016

- Construction activities will be scheduled to minimise the area and period of time that soil will be exposed, particularly during winter periods.
- Cut-off drains will be installed around the working areas to intercept uncontaminated surface runoff and divert it around and away from the works.
- Stockpiling of materials will be minimized and essential stockpiles will be located as far away as possible from watercourses.
- Drains and culverts will be kept clear of debris and silt traps will be maintained appropriately. Spoil will not be dumped within buffer areas.
- Erosion of embankments will be avoided and, where possible, a vegetation cover will be maintained.
- Roads, drains and silt traps will be inspected for damage after intense storms and also before and after any intensive use.
- Site roads and approaches to river crossings will be regularly brushed or scraped and kept free from dust and mud deposits. Rubble slumps will be introduced prior to road crossings.

2.9 Settlement Ponds

Where possible, permanent SUDS pond locations will be used during the temporary construction phase to collect silt. At completion of the construction phase the settlement ponds will be fully reinstated to final design requirements.

Site run off will be intercepted by PED and the ditches will feed into temporary balancing ponds. Straw bales will be placed along the length of the ditch to help early removal of silt.

The ponds will be a minimum of 20m x 10m x 3m deep so that the pond can store approximately 500m3. The maximum precipitation on a 1 in 75 year rainfall has been used in the storage calculations. An example of the calculations is attached in Appendix C.

The strategy is to collect the silt contaminated run off at the temporary pond locations, allow the silt to settle and gravity feed the pond water back into the watercourse.

The outlet will be set at a higher level in relation to the inlet so that the pond fills up and allows the silt to settle.

Construction waste materials such as generated silts will be disposed of in such a manner that it does not add risk of additional silt load in the construction run-off.

Settlement ponds will be inspected for damage after intense storms in particular at the entry point and around the forebay area.

© Mouchel 2016

In most instances the works will only be affected by normal rain showers and thus operations would stop. Following heavier rainfall events the trace will be allowed to dry before recommencing earthworks operations.

2.10 Exposed Ground and stockpiles

As part of the surface water management plan for the site the following measures have been incorporated for spoil management areas.

- The amount of exposed ground and soil stockpiles will be kept to a minimum.
- Stockpile which will be in place for an extended period of time will be allowed to re-vegetate naturally.
- Short term stock piles will be sealed.
- Cut-off trenches will be installed uphill of spoil management areas to divert flows away from potential sources of silt pollution.
- Silt fences made from a suitable geotextile material will be used alongside all exposed ground where there is a pollution risk. Areas on a steep gradient will be managed to make sure erosion does not take place and small ditches will be considered around the perimeter.

2.11 Excavations

Every effort will be made to prevent water from entering excavations. Cut off ditches will be used to prevent entry of surface water. Clean runoff within the cut off trenches will be discharged back into the natural drainage system.

2.12 Over Pumping

Over Pumping will be avoided for construction of culverts within this scheme wherever possible.

Where over pumping is essential, no direct discharge to the existing watercourse will be permitted. Water from the over pumping operation will pass through a stilling pond and a settlement pond before being discharged to the receiving watercourse.

Any over pumping that may be required for other works such as below ground excavations will be strictly controlled by the on-site Environmental Manager using a ‘permit to pump’ system and regular monitoring of compliance with control measures.

All pumping operations will ensure that the pumps are sited a minimum of 15m away from the water course, drip trays or lined bunds are used to avoid accidental spillage. Spill kits will be located at the pump locations.

All over pumping would be undertaken using the one of the methods outlined below:

- Water pumped into a silt tank will allow any silt to settle before being gravity fed back into the watercourse downstream of the works back into an approved discharge location.

© Mouchel 2016

- Water pumped into the PED which incorporate mitigation measures such as check dams and silt traps which would make its way to a settlement lagoon allowing sediment to settle before water is discharged back into an approved discharge location.

If heavy rain was encountered which could result in flood upstream of the works then over pumping and construction operations will be stopped and the works will be allowed to re-fill with water.

2.13 Plant Crossings

In Salmonid catchments, all in stream works will be carried out during the months of May to September inclusive.

In Brook/Sea Lamprey catchments, all in stream works will be carried out during the months of September to March inclusive. It is intended that culverts that are piped in the permanent solution will be piped using the permanent diameter pipe size as a temporary crossing during this 5-7 month timeframe.

Crossing that are required outside of the windows listed above will require a temporary bridge crossing which will span the top bank of the existing watercourse. Precast concrete abutments will be used in order to mitigate the risk of contamination of the watercourse using concrete. The bridge will use steel beams to span the watercourse and precast concrete planks. Details are contained within Appendix D.

2.14 Sampling

A programme of water monitoring will be carried out during the construction phase. The extent and frequency of the monitoring will be proportionate to the level of activity. Such monitoring will be required in order to:

- Demonstrate that the mitigation measures and surface water management plan is performing as designed;
- Provide reassurance that the in-place mitigation measures are not having a significant impact upon the environment;
- Indicate whether further investigation is required and, where any risks are unacceptable, the need for additional mitigation measures to prevent, reduce or remove any impacts on the water environment.

This monitoring will commence prior to the start of work activities to establish the baseline conditions at each work site.

The surface water-monitoring programme will be site-specific and tailored to provide a meaningful and pragmatic indication of the state of the water environment. Given the nature of the development, it is considered that the surface water monitoring programme will comprise:

- An initial site walkover to establish base line conditions and identify watercourses which are presently polluted from silt deposition or any other waterborne pollutants.

© Mouchel 2016

- Regular visual inspections of surface water management features, such as culverts and receiving watercourses, in order to establish whether there is increased erosion or deposition and sediment.
- Regular visual inspections of watercourses during construction and decommissioning stages, particularly during periods of high rainfall, in order to establish that levels of suspended solids have not been increased by site activities.
- Periodic and ad-hoc sampling of surface waters and private water supplies in order to complement the programme of visual inspection.
- Additional monitoring required as a condition of discharge consents, abstraction licences or other environmental regulation.

All subsequent monitoring results will be compared with the baseline data-set to identify any impacts of the development on the surface water environment and to identify the requirement for any appropriate remedial measures. The impacts of the development will be deemed acceptable if there is no significant net deviation from the baseline monitoring results.

© Mouchel 2016

3 Flood Defences

For works that affect any existing flood defences a secondary defence will be constructed prior to the removal of the existing defence.

No works will be allowed to take place that affects flood defences without prior approval from the Rivers Agency and NIEA.

© Mouchel 2016

4 Monthly Reporting

NIEA, Rivers Agency and Loughs Agency are all key stakeholder on this project and will be part of the monthly stake holder meetings. These meetings will review the last months work, discuss the following months works and discuss and lessons learnt. As part of this forum contractors will submit their monthly work schedule, two monthly rolling programme which clearly show the works areas for the following month their anticipated discharge rates. These will be based on the works area affected and the potential of a 1 in 75 year storm event happening.

APPENDIX 8A LEGISLATIVE CONTEXT

European Clean Air for Europe programme (CAFE) Directive and UK 2010 Regulations

The Directive details air quality limit values, target values, and critical levels for a number of air pollutants established by the European Parliament and Council for the protection of human health, vegetation and ecosystems. The 2008 directive replaced nearly all the previous EU air quality legislation and was made law in England through Air Quality Standards Regulations (2010).

Air Quality Standards Regulations (2010)

The regulations provide definitions and designate The Department of the Environment as the competent authority, who for these regulations, must divide the territory of Northern Ireland into zones and agglomerations. Zones are classified as an agglomeration if it is a conurbation with a population in excess of 250,000 inhabitants.

The Department of the Environment must assess the levels of sulphur dioxide, nitrogen dioxide, benzene, carbon monoxide, lead and particulate matter in all zones and the levels must not exceed the limit values set out in Schedule 2.

In zones where levels of the pollutants are below the limit values set, the Secretary of State must ensure that levels are maintained below those limit values and must endeavour to maintain the best ambient air quality compatible with sustainable development.

The Regulations impose requirements on the Secretary of State to draw up air quality plans in relation to limit values and target values and short-term action plans in relation to alert thresholds. Where the levels of specified pollutants exceed their limit values the Secretary of State must draw up and implement an air quality plan so as to ensure compliance within the shortest possible time

The Environment (Northern Ireland) Order 2002

Part III The Environment (Northern Ireland) Order 2002 provides Northern Ireland legislation broadly similar to the UK Environment Act 1995 for protecting air quality and for local air quality management, whereby all local authorities are required to assess air quality within their area. If a likely exceedence of an objective is identified, then the authority must declare an Air Quality Management Area (AQMA) and prepare an Action Plan with the aim of improving air quality in that area.

Air Quality Strategy (2007)

The UK Government and the devolved administrations are required under the Environment Act 1995 to produce a national air quality strategy. The latest Air Quality Strategy for England, Scotland, Wales and Northern Ireland was published in 2007. Standards and objectives for each of a range of air pollutants, defined in Volume 2 are based on assessment of the effects of each pollutant on human health and ecosystems

© Mouchel 2016

The pollutants are as prescribed within the Air Quality Standards Regulations (Northern Ireland) 2010 (S.R. 2010 No. 188). The standards and objectives are equal to or more stringent than those at the European level, also with a view to protecting human health and ecosystems1.

Objectives included in the Regulations which are relevant to the current assessment (Nitrogen Dioxide (NO2) and fine particulate matter (PM10)) are outlined in Table 8A.1

Table 8A.1 Objectives for NO2 and PM10

Pollutant	Objective	Measured as	To be achieved by and maintained thereafter	
			AQS	2008/50/EC
NO_2	200 µg.m^{-3} Not to be exceeded more than 18 times per year	1 Hour Mean	31 December 2005	1 January 2010
	40 µg.m^{-3}	Annual Mean	31 December 2005	1 January 2010
PM_{10}	50 µg.m^{-3} Not to be exceeded more than 35 times per year	24 Hour Mean	31 December 2004	1 January 2005
	40 µg.m^{-3}	Annual Mean	31 December 2004	1 January 2005
$PM_{2.5}$	25 µg.m^{-3}	Annual Mean	2020	2010

United Nations Economic Commission for Europe (UNECE) Critical Loads

Critical loads have been defined as: "the highest load that will not cause chemical changes leading to long-term harmful effects in the most sensitive ecological systems". Critical loads are the maximum amount of pollutants that ecosystems can tolerate without being damaged. The definition has been redrafted in order to fit specialist areas of interest, most particularly the acidification of freshwater and soils.

This document describes the critical load adopted by the United Nations Economic Commission for Europe (UNECE) defined as "a quantitative estimate of exposure to one or more pollutants below which significant harmful effects on sensitive elements of the environment do not occur according to present knowledge".

[1] DMRB Volume 11 Section 3 Part 1 HA207/07 paragraph 1.1 – the pollutants of most concern near roads are nitrogen dioxide (NO_2) and particles (PM_{10}) in relation human health and oxides of nitrogen (NO_x) in relation to vegetation and ecosystems.

© Mouchel 2016

The Environmental Protection Act 1990 (EPA)

Dust and air pollution, have the potential to generate nuisance affecting properties and the public adjacent to construction sites as well as other sensitive environmental receptors such as watercourses.

This Act contains a definition of what constitutes a 'statutory nuisance' with regards to dust, and places a duty on Local Authorities to take action if they believe a statutory nuisance is occurring within their area and to serve an abatement notice requiring the abatement or prevention of such nuisances if they believe a nuisance is likely to occur or recur.

Local Authorities have the power under Section 80, Chapter 43, Part III of the EPA to serve an abatement notice requiring the abatement of a nuisance or requiring works to be executed to prevent their occurrence.

Regional Development Strategy 2035

Paragraph 3.24 of the Regional Development Strategy 2035 states that "Climate change is increasingly seen as one of the most serious problems facing the world. Air pollution from particulate matter is currently estimated to reduce the life expectancy of every person in the UK by an average of 7-8 months. The young and infirm are often particularly affected, as well as people living in deprived areas. In addition, emissions of sulphur dioxide (SO2), nitrogen (NOx) and ammonia (NH3) can be deposited on land and water causing either acidification, or nutrient enrichment (eutrophication). Whilst action is required internationally, it is important that Northern Ireland plays its part by reducing air pollution and greenhouse gas emissions and preparing for the impacts of climate change. These include the effects on species and habitats and on health as a result of warmer temperatures, storms, floods and coastal erosion."

Local Planning Policy

The Regional Strategic Transport Network Transport Plan (RSTN)2 is Northern Irelands primary transport plan until 2015. Within RSTN (P94) Annex A the plan highlights that where urban areas are bypassed, congestion would improve, thus leading to improved air quality. Increased road capacity would increase a use of private cars and higher inter urban speed, leading to an increase of +2% annual CO2 production, despite the reduction of congestion.

Ensuring a Sustainable Transport Future: A new approach to Regional Transportation describes how transport interventions would rebuild and rebalance the economy centred on transport networks which would be balanced against reducing the environmental impact of transport, including;

- Reduce greenhouse gas emissions,
- Protect biodiversity,

[2] Northern Ireland Department for Regional Development (2005) Regional Strategic Network Transport Plan 2015. http://www.drdni.gov.uk/index/roadimprovements/strategic_proposals/regional_strategic_transport_network/regional_strategic_transport_network_transport_plan.htm accessed 06/07/2014

© Mouchel 2016

- Reduce water, noise and air pollution.

Guidance

The following guidance was taken into consideration during the air quality assessment undertaken:

DMRB

The Design Manual for Roads and Bridges (DMRB) is a series of 15 volumes that provide official guidance, advice notes and other documents relating to the design, assessment and operation of trunk roads, including motorways in the United Kingdom. Air Quality is addressed in HA207/07 DMRB Volume 11 Section 3 Part 1.

IAN 170/12v3 Updated air quality advice on the assessment of future NOx and NO2 projections for users of DMRB Volume 11, Section 3, Part 1 'Air Quality'.

The Interim Advice Note (IAN) 170/12v3 provides updated advice for users of DMRB HA207/07 on long term trends (LTT) for NO2 and enables HA scheme assessments to take into account the impact of future projects. Updated NOx and NO2 projection factors issued by the Highways Agency on 28th October 2013 and used in this assessment can be found in Appendix 8E.

IAN 174/13 Updated air quality advice on the application of the test for evaluating significant effects; for users of DMRB Volume 11, Section 3, Part 1 'Air Quality'.

This Note provides a methodology for the assessment of the significance of the predicted change in air quality associated with the Proposed Scheme to be evaluated.

UK Local Air Quality Management Technical Guidance (LAQM.TG (09))

This document published in February 2009 provides guidance to support Local Authorities in carrying out their Review and Assessment of air quality and outlines the general approach to be used in local air quality assessment, including monitoring and modelling methods.

TG(09) states:

"2.03 Background concentrations of nitrogen dioxide are expected to decline, in the future, despite the recent increasing proportion of primary nitrogen dioxide in nitrogen oxides emissions. This increase in primary nitrogen dioxide has had a greater impact at roadside locations, but even here concentrations of nitrogen dioxide are expected to resume a downward trend."

"2.23 Recent trends in concentrations of NOx have shown a general downward trend across urban areas, in line with the reductions in emissions from road traffic. However, measured NO2 concentrations have not declined as expected, particularly at roadside sites, and at some locations have actually increased in recent years."

Air Quality Plans

In June 2011, Defra published draft air quality plans that set out the action taken and being planned at national, regional and local levels to meet the annual and hourly EU NO2 limit values in the UK, as soon as possible. "The UK notification, for those parts of the country where there is sufficient evidence, will seek to postpone for up to five years from January 2010 the compliance date for the NO2 limit values".

© Mouchel 2016

Update to the Air Quality Plan to meet the Annual Mean NO2 Limit Value in the Northern Ireland Zone, UK (UK0043)

In November 2012 updated evidence of the impact of current and planned measures set out in the existing Air Quality Plan for the Northern Ireland Zone (UK0043) showed that the earliest date for attainment of compliance with the annual mean limit value for NO2 is expected to be 1st January 2014.

Dust Risk

The following documents provide guidance on evaluation of construction dust risk, examples of reducing and controlling dust, and outline good practice in dust assessment:

- Minerals Policy Statement 2: Controlling and mitigating the environmental effects of mineral extraction in England;
- Annex 1: Dust and Control of Dust Emissions from Construction Activities, The Greater London Authority (GLA); and
- London Councils Best Practice Guidance on Control of Dust Emissions from Construction Activities.

© Mouchel 2016

APPENDIX 8B SCHEME SPECIFIC MONITORING

There is no continuous monitoring or passive diffusion tube monitoring being undertaken by the local authorities within the TRA at this time2. Therefore a scheme specific programme of NO2 diffusion tube monitoring was undertaken for six months to establish the baseline condition and for model verification purposes. The monitoring started in November 2013 and ended May 2014.

Monitoring Locations

90 sites were selected for diffusion tube monitoring. Details of the site locations are provided in **Table 8B.2**.

Bias Adjustment

It is has been shown that NO2 tubes typically over-read. For this reason a bias factor is calculated and applied to the raw (analysed) results. The factor is generated using data gained from three tubes co-located at a continuous monitor site. Bias adjustment factors should be applied to the diffusion tube measurement data to adjust for any systematic bias. These factors should be determined for the particular exposure time period and site location type i.e. roadside or background. Detail guidance on bias correction of nitrogen dioxide diffusion tube data is given in LAQM TG (09)1.

For this scheme specific monitoring programme, two continuous monitoring stations at Armagh and Dales Corner were used and triplicate diffusion tubes were set up to determine bias adjustment factors. Details of the co-location sites are presented in **Table 8B.1**.

Table 8B.1 Co-location Site Details

Site No	Location	X	Y	Height (m)
Co-location 1	Armagh CM	287527.1	345841.3	2.3
Co-location 2	Dales Corner	244213.4	416733.6	2.9

However poor diffusion tube precision and bad data capture (50%) Co-location 1 (Armagh CM) required national bias adjustment factors to be applied.

A bias adjustment factor of 0.58 was determined for Co-location 2, situated at Dales Corner in Derry. This factor was much smaller than the national bias adjustment factor of 0.81. Therefore the conservative national bias adjustment factor of 0.81 was used.

[1] LAQM TG(03) Chapter 6 Box 6.4: Approach to bias correction of nitrogen dioxide diffusion tube data

© Mouchel 2016

Annual Mean (Equivalent)

As monitoring was carried out for a period of less than a year, adjustment was applied to provide an Annual Mean (Equivalent) in accordance with LAQM TG (09)2. The annual mean factors are listed within column 16 of **Table 8B.2**.

Verification Sites

Considered the location of the site, roadside sites/background sites, traffic data network coverage and data capture, 41 monitoring locations were selected for model verification. These sites used for the verification process are further categorised and identified within Table 8B.2. Details of verification is presented in **Appendix 8D**.

Results

The bias adjusted and annualised results show that NO2 concentrations ranged from 3.9µg.m-3to 71.8µg.m-3. The monitoring highlighted four locations which exceeded the Annual Mean NO2 limit value of 40µg.m-3. MCHL 1 is located on a hill on the existing A5 Victoria Road approximately 800 metres from the A5/A2 Duke Street junction which experiences a high traffic flow. MCHL 13 is located on the existing A5 Great Northern Link and approximately 500 metres from Melmount Road and approximately 200 metres from Orchard Road on the existing A5. MCHL 70 was located on the N14 Letterkenny Road approximately 130 metres from the N14/N15 roundabout where traffic queuing is likely to occur. MCHL 79 is located on the A5 Great Northern Road. This is located below the level of Sunningdale which is the access road to the Sacred Heart College. This site may be influenced by stationary and very slow moving traffic during college opening and closing times.

41 monitoring locations were selected for model verification based on location of the site, roadside /background location, traffic data network coverage and data capture.

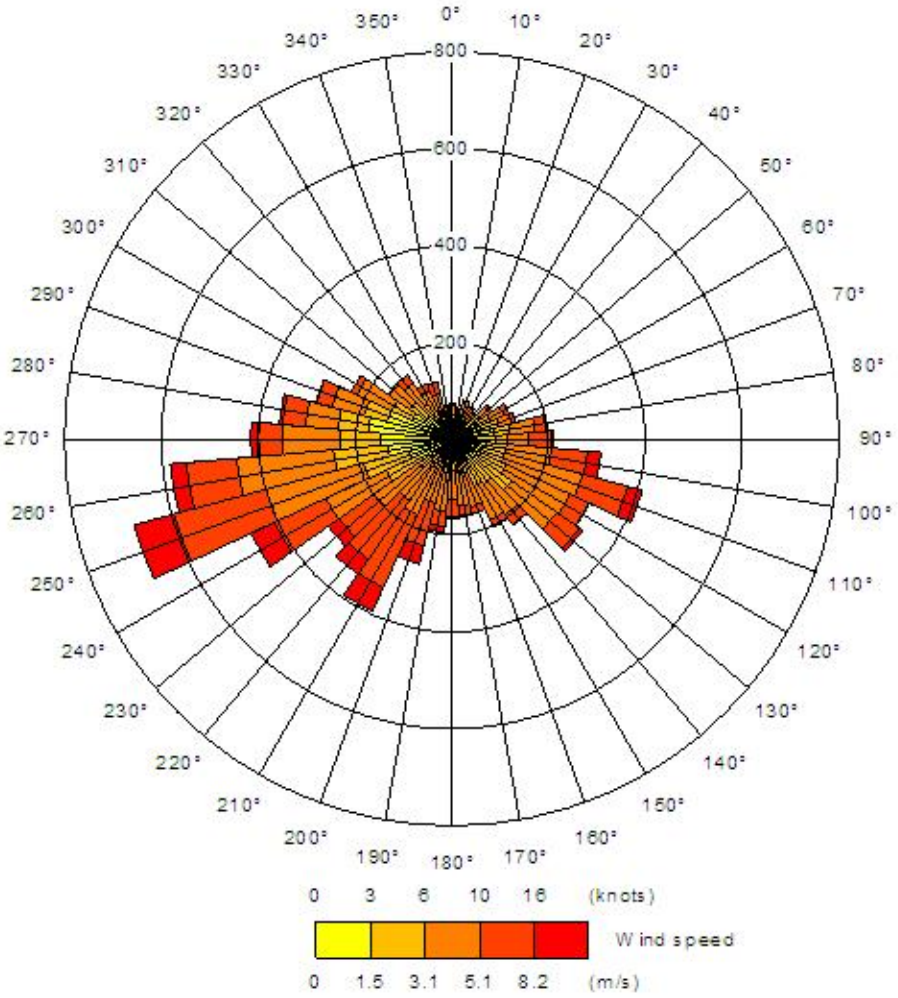
APPENDIX 8C WIND ROSE CASTLEDERG 2013



APPENDIX 8D VERIFICATION

The ADMS-Roads dispersion model has been validated for road traffic assessments and is considered to be fit for purpose. Model validation undertaken by the software developer Cambridge Environmental Research Consultants (CERC) is unlikely to have included validation in the vicinity of the scheme considered in this assessment. It is therefore necessary to perform a comparison of model results with local monitoring data at relevant locations.

Verification

The comparison of modelled concentrations with local monitored concentrations is a process termed 'verification'. Model verification investigates the discrepancies between modelled and measured concentrations, which can arise due to the presence of inaccuracies and/or uncertainties in model input data, modelling and monitoring data assumptions.

The following are examples of potential uncertainty:

1. estimates of background pollutant concentrations;
2. meteorological data uncertainties;
3. traffic data uncertainties;
4. model input parameters, such as 'roughness length'; and
5. overall limitations of the dispersion model.

Model Precision

Residual uncertainty may remain after systematic error or 'model accuracy' has been accounted for in the final predictions. Residual uncertainty may be considered synonymous with the 'precision' of the model predictions, i.e. how wide the scatter or residual variability of the predicted values compare with the monitored true value, once systematic error has been allowed for. The quantification of model precision provides an estimate of how the final predictions may deviate from true (monitored) values at the same location over the same period.

Scheme specific monitoring data was used for the verification process. The monitoring data was been used to validate the dispersion model prediction and obtain adjustment factors which were applied to predictions of pollutant concentrations in the base and future years.

Model Performance

An evaluation of model performance has been undertaken to establish confidence in model results in accordance with LAQM.TG(09) Box A3.7.

© Mouchel 2016

Table 8D.1 Model Performance Statistics

Statistical Parameter	Comments	Ideal value
RMSE	RMSE is used to define the average error or uncertainty of the model. The units of RMSE are the same as the quantities compared. If the RMSE values are higher than 25% of the objective being assessed, it is recommended that the model inputs and verification should be revisited in order to make improvements. For example, if the model predictions are for the annual mean NO_2 objective of 40 µg/m^3, if an RMSE of 10 µg.m^{-3} or above is determined for a model it is advised to revisit the model parameters and model verification. Ideally an RMSE within 10% of the air quality objective would be derived, which equates to 4 µg/m^3 for the annual mean NO_2 objective.	0.01
FB	It is used to identify if the model shows a systematic tendency to over or under predict. FB values vary between +2 and -2 and has an ideal value of zero. Negative values suggest a model over-prediction and positive values suggest a model under-prediction.	0.00
CC	It is used to measure the linear relationship between predicted and observed data. A value of zero means no relationship and a value of 1 means absolute relationship. This statistic can be particularly useful when comparing a large number of model and observed data points.	1.00

These parameters highlight how the model results agree or diverge from the observations.

Where all input data, such as traffic data, emissions rates, and background concentrations have been checked and considered as reasonable, then the modelled results require adjustment to best align with the monitoring data. This may either be a single verification adjustment factor to be applied to the modelled concentrations across the study area, or a range of different adjustment factors to account for different zones in the study area e.g. motorways, local roads.

The model verification review identified a range of adjustment factors to be applied to the modelled concentrations to achieve a realistic representation of the monitored NO2 concentrations.

Adjustment Zones

The scheme was divided into four verification adjustment zones (VAZs) based generally on four geographical locations within the scheme traffic reliable area (TRA), Urban Areas, Rural Areas, Aughnacloy and Sacred Heart College, as displayed in Table **8D.2.**

© Mouchel 2016

Table 8D.2 Verification Adjustment Zones

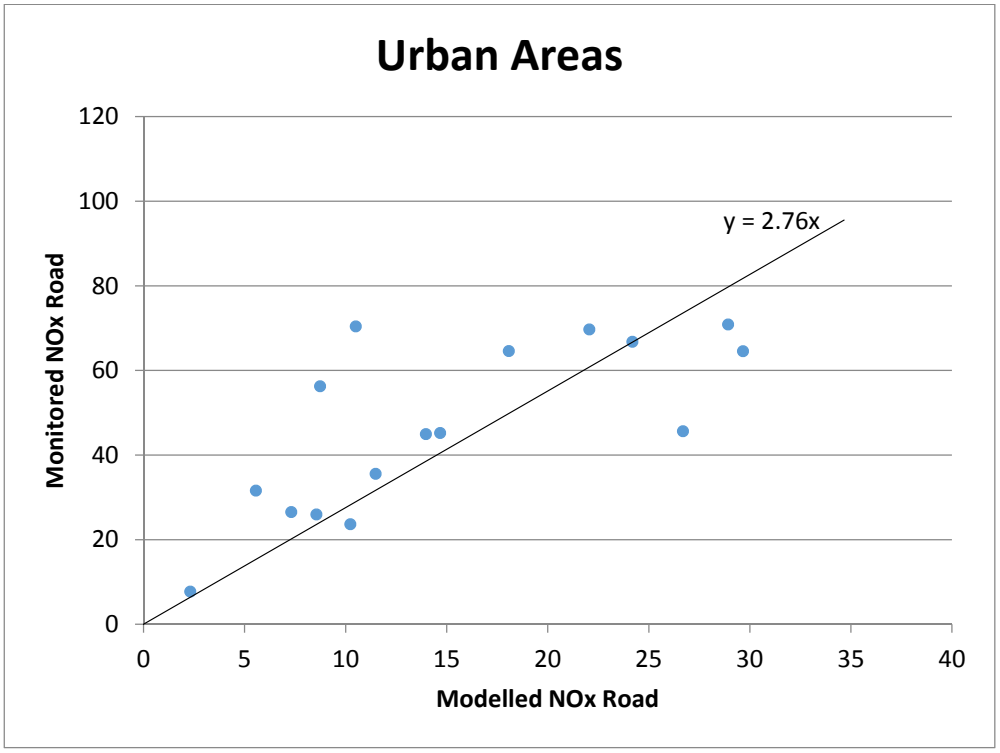
Zone No.	Location
1	Urban Areas
2	Rural Areas
3	Aughnacloy
4	Sacred Heart College

Urban Areas

The modelled versus monitored NO2 concentrations are presented in Table 8D.3. The initial comparison between the predicted concentrations and monitoring data illustrates that the model tends to under predict NO2 concentrations over the modelled area. Data was collected from sixteen suitable diffusion tube monitoring sites in the urban areas for the chosen base year of 2013.

The relationship between measured and predicted NOx concentrations of road contribution at the monitoring locations is presented in Figure 8D.1.

Figure 8D.1 Modelled (x axis) vs Monitored (y axis) Road NOx – Urban Areas

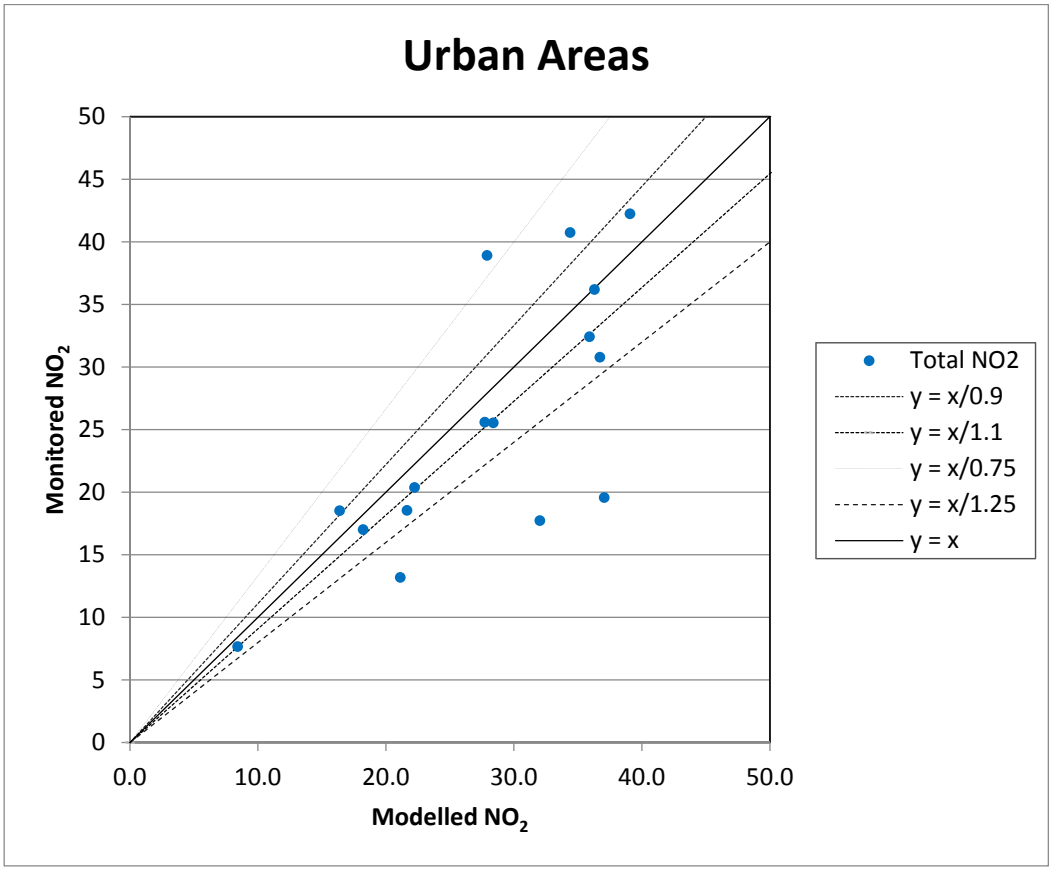


The results suggested that the model was under-predicting NOx concentrations. The ratio between monitored and modelled NOx in the urban areas was 2.76. Modelled road-component NOx concentrations predicted at sensitive receptors in the base and opening year scenarios were multiplied by this ratio to account for the under-prediction of Road NOx by the model.

© Mouchel 2016

Adjusted modelled total NO2 versus monitored NO2 concentrations are presented in Figure 8D.2. 75% of the sites are within +- 25%, and the figure shows that the model is performing slightly better at higher concentrations.

Figure 8D.2 Modelled (x axis) vs Monitored (y axis) Total NO2 – Urban Areas



Rural Areas

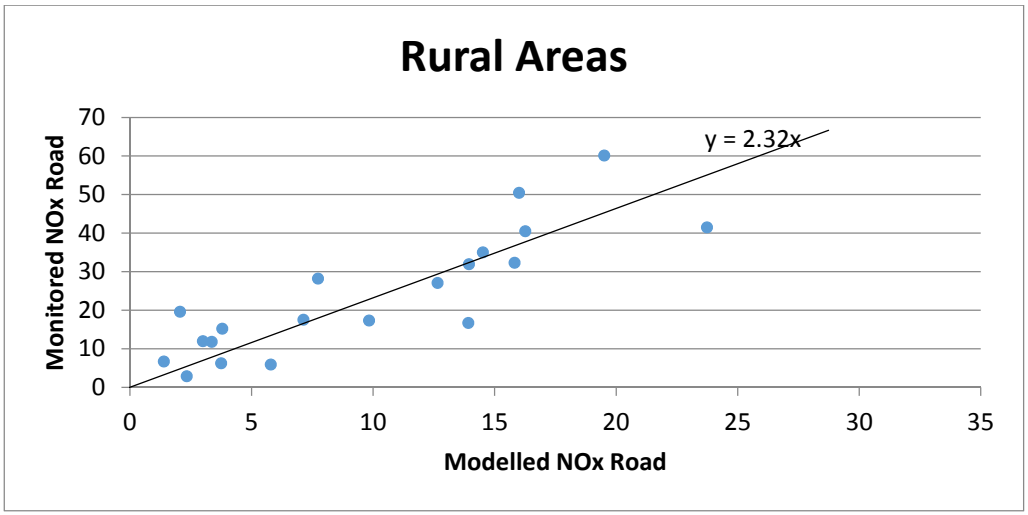
The modelled versus monitored NO2 concentrations are presented in Table **8D.3**. The initial comparison between the predicted concentrations and monitoring data illustrates that the model tends to under-predict NO2 concentrations over the modelled area.

Model verification was therefore undertaken in accordance with LAQM.TG (09). Data was collected from twenty suitable diffusion tube monitoring sites in the rural areas for the chosen base year of 2013.

Concentrations at the monitoring locations were predicted by inputting base year traffic data into a dispersion model. The relationship between measured and predicted NOx concentrations of road contribution at the monitoring locations was determined following the procedure outlined in LAQM.TG(09), as presented in **Table 8D.3**.

© Mouchel 2016

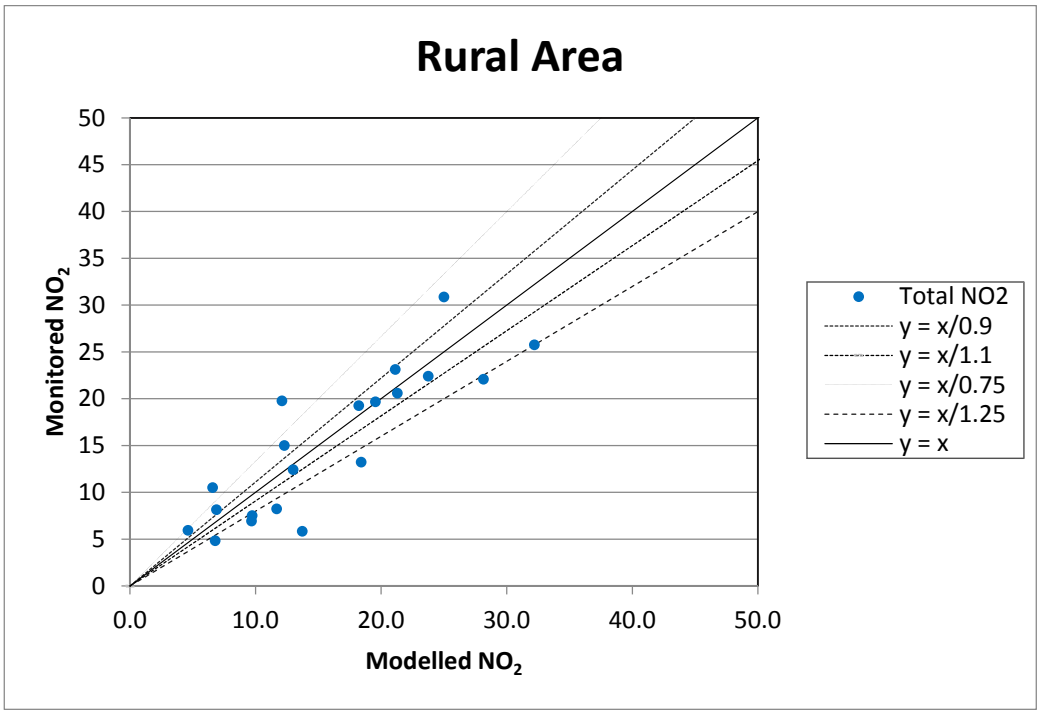
Figure 8D.3 Modelled (x axis) vs Monitored (y axis) Road NOx – Rural Areas



The ratio between monitored and modelled NOx in the rural areas was 2.32. Modelled road-component NOx concentrations predicted at sensitive receptors in the base and opening year scenarios were multiplied by this ratio to account for the over-prediction of Road NOx by the model.

Adjusted modelled total NO2 versus Monitored total NO2 concentrations are presented in Figure 8D.4 60% are within +- 25%.

Figure 8D.4 Modelled (x axis) vs Monitored (y axis) Total NO2 – Urban Areas



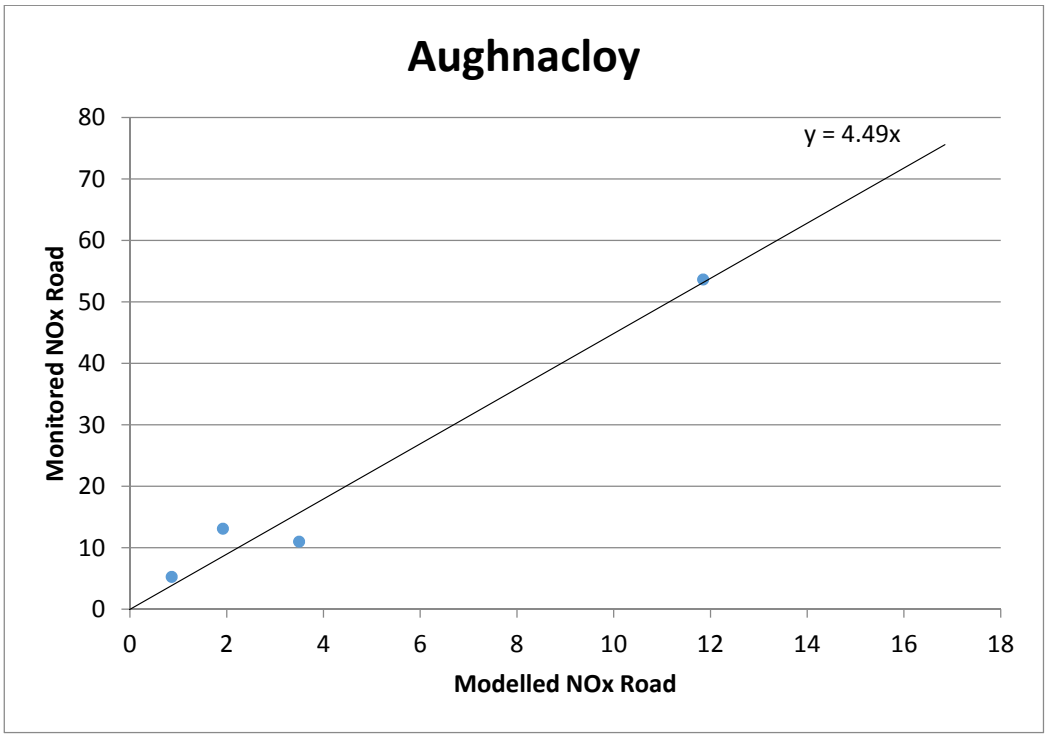
Aughnacloy Area

The modelled versus monitored NO2 concentrations are presented in **Table 8D.3**. The initial comparison between the predicted concentrations and monitoring data illustrates that the model tends to under-predict NO2 concentrations.

Data was collected from four suitable diffusion tube monitoring sites in the Aughnacloy area for the chosen base year of 2013.

The relationship between measured and predicted NOx concentrations of road contribution at the monitoring locations is presented in Figure 8D.5.

Figure 8D.5 Modelled (x axis) vs Monitored (y axis) Road NOx – Aughnacloy

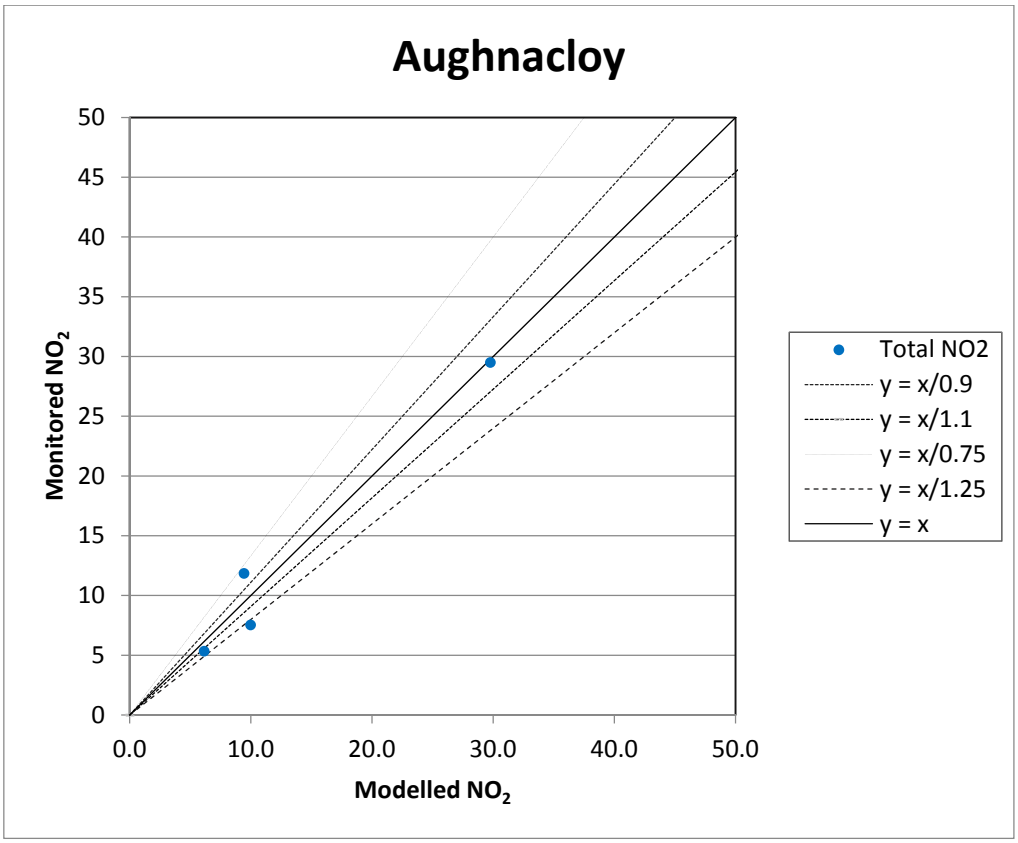


The results suggested that the model was under-predicting NOx concentrations. The ratio between monitored and modelled NOx in the Aughnacloy area was 4.49. Modelled road-component NOx concentrations predicted at sensitive receptors in the base and opening year scenarios were multiplied by this ratio to account for the over-prediction of Road NOx by the model.

Adjusted modelled total NO2 versus monitored total NO2 concentrations are presented in Figure 8D.6. The adjusted results show 75% are within +- 25%.

© Mouchel 2016

Figure 8D.6 Modelled (x axis) vs Monitored (y axis) Total NO2 – Urban Areas



Sacred Heart College

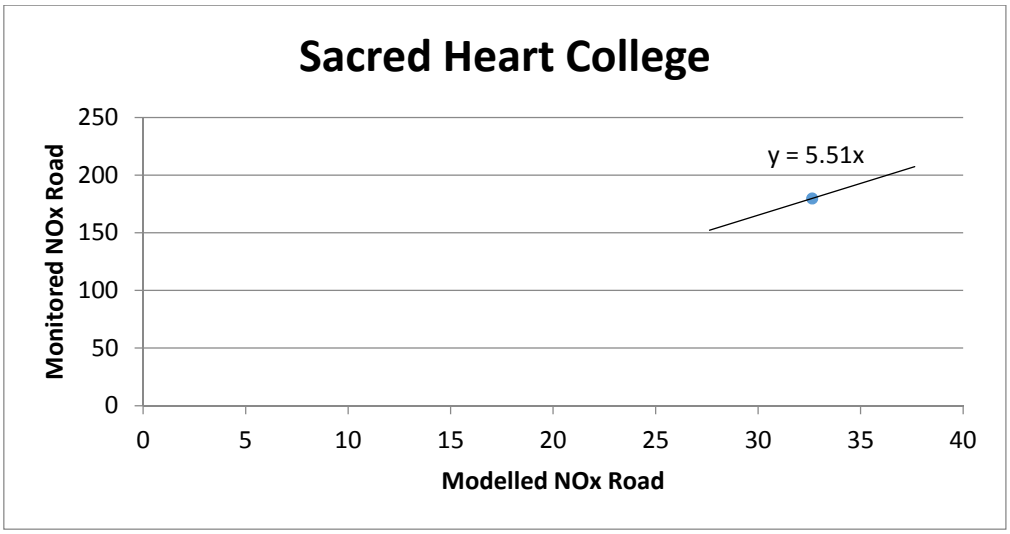
The modelled versus monitored NO2 concentrations are presented in **Table 8D.3**. The initial comparison between the predicted concentrations and monitoring data illustrates that the model tends to under-predict NO2 concentrations over the modelled area.

Data was collected from one diffusion tube monitoring sites in the vicinity of Sacred Heart College for the chosen base year of 2013.

The relationship between measured and predicted NOx concentrations at the monitoring locations is presented in Figure 8D.7.

© Mouchel 2016

Figure 8D.7 Modelled (x axis) vs Monitored (y axis) Road NOx – Sacred Heart College



The results suggested that the model was under-predicting NOx concentrations. The ratio between monitored and modelled NOx in the vicinity of Sacred Heart College was 5.51. Modelled road-component NOx concentrations predicted at sensitive receptors in the base and opening year scenarios were multiplied by this ratio to account for the under-prediction of Road NOx by the model.

Adjusted modelled total NO2 versus monitored total NO2 concentrations are presented in Figure 8D.8.

Summary

The summary results and model performance statistics defined in LAQM.TG (09) are provided in **Table 8D.4**.

A comparison of the performance of the modelled concentrations from the air quality model against the monitoring data was undertaken. The results show that the verification performance for each individual VAZ are satisfactory. The model performance statistics show that the uncertainty in the predictions of adjusted total NO2 was acceptable as the RMSE is less than 10µg.m-3 for each verification zone.

Purpose

This notes describes an interim alternative set of NOx and NO_2 projections developed by the HA which start to describe the anticipated reduction in NOx emissions associated with Euro 6/VI vehicles beyond 2015. The HA are currently working with Defra and other Government Departments to agree a revised set of NOx and NO_2 projections for use to support scheme assessments, and there may be need to update these interim projections at a later time.

This advice set out in this note can be used to inform scheme air quality assessments. However, a judgement by the scheme's air quality specialist should be made as to which set of NOx and NO_2 projections (Defra's technical guidance, Long Term Trends (LTT) or interim alternative long term trend projections) should be relied upon to form a concluding view of significance of the schemes impacts. This set of results should then be used in a discussion of the impacts of the scheme and to determine the overall significance of the scheme's impacts.

The rationale behind the choice of results on which to base the judgement of significance should also be included in the Environmental Assessment Report / Environmental Statement.

Background

Based on monitoring and vehicle emissions testing evidence [as of September 2013] it is apparent that emissions from vehicles have not decreased in line with expectations set out in Defra's technical air quality guidance. Following publication of a Defra research note and follow-on advice on this issue, the HA produced guidance (IAN 170/12) indicating how AQ assessments should be undertaken, taking account of this slower than expected decline in emissions, using a LTT future projection extrapolated from historic monitoring.

However, it is reasonable to consider the LTT projection, past the introduction of Euro 6/VI vehicles into the fleet, could be pessimistic, and therefore would not necessarily support the reporting of 'likely' impacts as required under EIA. The evidence to date, which is very limited, suggests that there should be an improvement in emissions following the introduction of the Euro standard. As a result the HA has undertaken work to determine a future NO_2 and NO_x projection, in variation to the LTT projection, based on the assumed benefits from only Euro 6/VI vehicles.

To identify a future trend based on the impact of Euro 6/VI vehicles emissions into the fleet the HA has made a number of assumptions:

1. Future emission reductions result only from Euro 6/VI vehicles, this is consistent with observations in remote sensing studies
2. Euro 6/VI vehicle emission standards will be achieved (note, emissions from early euro standard vehicles have failed to achieve their Euro standard)
3. Non-Euro 6/VI emissions were obtained from the EFT v5.2c for 2008 which may still be too optimistic given the evidence in relation to emissions to date, however, if they are pessimistic, successful Euro 6 standards would have an even greater impact
4. Assumed penetrations rates of Euro 6/VI vehicles are as set out in the fleet projections included in the EFT v5.2c. This has the greatest impact in relation to when the alternative trend will diverge from LTT. If penetration rates were slower the benefits in emissions reductions would also reduce

© Mouchel 2016

5 The NOx to NO_2 ratio and the amount of primary NO_2 are as set out in Defra's spreadsheet;

6 Rates of change in background NO_2 are based on Defra's projections.

The outcome of the analysis based on assumed emission reductions from only Euro 6/VI vehicles is presented in Figure 1 as trend line labelled 'Assumed Benefits from Euro 6 Vehicles Only (ABE6)'.

Analysis

ABE6 (Figure 1) represents a most optimistic outcome assuming all benefits from Euro VI/6 are fully realised, as well as achievement of predicted penetration rates of new vehicles in to the fleet as set out in EFT v5.2c and reductions in the amount of primary NO_2. Experience with the real world performance of vehicles relative to previous standards suggests that this is an unrealistic expectation. However, it appears equally improbable that the Euro 6/VI emission standard will have no notable impact on NOx emissions.

LTT represents the most pessimistic outcome for NO_2 concentrations up to 2030, based on current observation monitoring data over the last 10 years. This is an improbable outcome, as it would imply a complete failure of the Euro VI/6 emission standards (and any other subsequent standards).

It is probable, therefore, that future changes in NO_2 concentrations would lie between the pessimistic (LTT) and optimistic future projections (ABE6). The degree to which future NO_2 projections assuming benefits from Euro 6/VI vehicles would deviate from either of the two extreme outcomes is not currently possible to quantify without a more substantial evidence base on the actual performance of Euro 6/VI vehicles, both in terms of vehicle emission tests and measurements of ambient air quality. A qualitative view is possible, taking into account the optimistic and pessimistic view of success of Euro 6/VI and other factors that could influence future changes in NO_2 concentrations. This is depicted by the trend line LTT_{E6} in Figure 1.

It is difficulty to estimate precisely where the balance lies in defining the trend line LTT_{E6}, especially on a timescale where the end point is as far away as 2030. Assuming a balance between the two extremes is a prudent way of describing a reasoned NOx and NO_2 trend line up to 2030 that could be applied to scheme assessments. Clearly this assumption will be revisited in the light of any new evidence on the performance of Euro 6/VI vehicles and their penetration into the fleet.

APPENDIX 8F OPERATIONAL PHASE SIGNIFICANCE CRITERIA - ENVIRONMENTAL PROTECTION UK (EPUK)

The EIA process requires the magnitude of changes to be considered in the assessment. The Institutes of Air Quality Management (IAQM) advised an approach to defining the magnitude of changes and describing the air quality impacts at the sensitive receptors, as well as assigning the overall significance of the air quality impacts. This assessment is following the IAQM guidance listed in the Development Control: Planning for Air Quality (2010 Update) by Environmental Protection UK (EPUK).

The criteria for magnitude of an impact is described in **Table 8F.1**. These criteria are based on the change in concentration brought about by the scheme as a percentage of the AQS objective limits.

Table 8F.1 Air Quality magnitude of changes for annual mean NO2, NOx and PM10

	Annual Mean for NO_2 and PM_{10}	Short Term Mean for PM_{10}	Annual Mean NO_x for vegetation
Large (increase/decrease >10%)	>4 µg.m^{-3}	>4 days	>3 µg.m^{-3}
Medium (increase/decrease 5-10%)	>2 – 4µg.m^{-3}	2 - 4 days	>1.5 - 3 µg.m^{-3}
Small (increase/decrease 1-5%)	>0.4 – 2 µg.m^{-3}	1 – 2 days	>0.3 – 1.5 µg.m^{-3}
Imperceptible (increase/decrease <1%)	>0 - 0.4 µg.m^{-3}	< 1 day	>0 – 0.3 µg.m^{-3}

The evaluation of significance relative to changes in 24-hour mean values for PM10 has been based on the guidance provided by EPUK in 'Development Control: Planning for Quality (2010)'. Sensitivity has been based on the proximity of a receptor to the number of days stipulated in the Objective Limit when the receptor would be subject to concentrations exceeding 50µg.m-3. Magnitude has been based on an increase or reduction in the number of days as detailed in **Table 8F.1.**

To evaluate the impact of the air quality, the actual concentration at the receptor should be considered in combination with the magnitude of change, using the approach set out in the **Table 8F.2** and **Table 8F.3** for annual mean NO2 and PM10.

Table 8F.2 Air Quality impact descriptors for changes to annual mean NO2 and PM10 at receptors

Absolute Concentration in Relation to Objective/Limit Value	Change in Concentration		
	Small	Medium	Large
Increase with Scheme			
Above Objective/Limit Value *With* Scheme (>40µg.m^{-3})	Slight Adverse	Moderate Adverse	Substantial Adverse
Just Below Objective/Limit Value *With* Scheme (36-40 µg.m^{-3})	Slight Adverse	Moderate Adverse	Moderate Adverse
Below Objective/Limit Value *With* Scheme (30-36 µg.m^{-3})	Negligible	Slight Adverse	Slight Adverse
Well Below Objective/Limit Value *With* Scheme (<30 µg.m^{-3})	Negligible	Negligible	Slight Adverse
Decrease with Scheme			
Above Objective/Limit Value *Without* Scheme (>40 µg.m^{-3})	Slight Beneficial	Moderate Beneficial	Substantial Beneficial
Just Below Objective/Limit Value *Without* Scheme (36-40 µg.m^{-3})	Slight Beneficial	Moderate Beneficial	Moderate Beneficial
Below Objective/Limit Value *Without* Scheme (30-36 µg.m^{-3})	Negligible	Slight Beneficial	Slight Beneficial
Well Below Objective/Limit Value *Without* Scheme (<30 µg.m^{-3})	Negligible	Negligible	Slight Beneficial

Table 8F.3 Air Quality impact descriptors for changes to short term mean PM10 at receptors

Absolute Concentration in Relation to Objective/Limit Value	Change in Concentration		
	Small	Medium	Large
Increase with Scheme			
Above Objective/Limit Value *With* Scheme (>35 days)	Slight Adverse	Moderate Adverse	Substantial Adverse
Just Below Objective/Limit Value *With* Scheme (32-35 days)	Slight Adverse	Moderate Adverse	Moderate Adverse
Below Objective/Limit Value *With* Scheme (26-32 days)	Negligible	Slight Adverse	Slight Adverse
Well Below Objective/Limit Value *With* Scheme (<26 days)	Negligible	Negligible	Slight Adverse

APPENDIX 8G CONSTRUCTION TRAFFIC EMISSION

The proposed A5WTC would be built in three separate phases. These phases consist of:

- Phase One - Junction 1 to Junction 3 (New Buildings to West of Ballymagorry), and J13 to J15 (South of Omagh to Aughnacloy). Construction to commence in 2017 with Phase One opening in 2019
- Phase Two – Junction 3 to Junction 13 (West of Ballymagorry to South of Omagh). Construction to commence in 2021, with Phase Two opening in 2023
- Phase Three – Junction 15 to Junction 17, (Aughnacloy to South of Aughnacloy). Construction to commence in 2026, with Phase Three opening in 2028

An assessment was undertaken to ascertain the potential worst case impacts resulting from construction vehicle emissions on local air quality during construction.

The assessment has focused on nitrogen dioxide (NO2) and particulate matter (PM10); key pollutants associated with road traffic; the magnitude of change and its potential impact on human health.

Due to the long term phased construction of the scheme and uncertainty regarding the number and routing of construction vehicles, a worst case assessment has been undertaken by uplifting base year conditions with the emissions from the average number of predicted HGV movements during the construction phases (see **Table 8G.1**)

The impact of construction traffic emissions was determined on road links within 1km of a proposed construction site.

Traffic Data

Traffic flow characteristics and the distance of that traffic from sensitive receptors has the potential to impact on local air quality. The quantities of pollutants emitted depend upon the type and quantity of fuel used, engine size, speed of the vehicle and the type of emissions abatement equipment fitted.

Potential HGV emissions were assessed using Base Year traffic data and predicted HGV vehicle fleet compositions for 2013.

Base year traffic data was provided by Mouchel Transport Planning (MTP). The predicted construction traffic data was provided by BAM construction as outlined in **Table 8G.1**.

© Mouchel 2016

Table 8G.1 Predicted Daily Average Vehicle Movements

Name of Construction Entrance	Construction Entrance Reference Chainage	Access Description	Average Daily Two Way HDV Movements	Traffic Comments
Junction 3	14700	New Junction 3 link road	180	Surplus from south of river Mourne & imported fill material
Existing A5	16700 - 17900	Directly off existing A5	180	Surplus from south of river Mourne & imported fill material
Strahans Rd	20400	Using existing side road	450	Surplus cut south of river Mourne hauled north via Strahans road

DMRB guidance indicates that changes in HGV movements below 200 vehicles a day would not give rise to a significant impact on local air quality. Consequently, the worst case assessment was undertaken on relevant sensitive receptors identified within 200m of relevant links, where HGV traffic was predicted to generate significant vehicle movements per day over an extended period.

The roads traversed by construction traffic were identified and the volume of HDV traffic on each of these roads was increased from the Base Year scenario as outlined in **Table 8G.2**.

Table 8G.2 HGV Traffic Movements

Name of Construction Entrance	Construction Entrance Reference Chainage	Additional HDV flow on the links to the north of the entrance	Additional HDV flow on the links to the south of the entrance
Junction 3	14700	45	135
Existing A5	16700 - 17900	45	135
Strahans Rd	20400	113	337

APPENDIX 8I LOCAL AIR QUALITY HUMAN RECEPTORS DETAILED RESULTS

Human Receptors (Phase One)

Modelled annual mean NO_2 concentrations without and with the Proposed Scheme for the 1,680 receptors identified within the local air quality study area are summarised in **Table 8I.1**.

Table 8I.1 Breakdown of Predicted Annual Mean NO2 Concentrations in Opening Year 2019

Annual Mean NO_2 Concentration (µg.m^{-3})	TG(09)		LTT	
	Without Scheme	With Scheme	Without Scheme	With Scheme
> 0 – 20	1,676	1,680	1,644	1,673
> 20 – 30	4	0	32	7
> 30 – 36	0	0	3	0
> 36 – 40	0	0	0	0
>40 (Exceedance)	0	0	1	0

The majority of the receptors modelled as part of Phase One are predicted to experience annual mean NO_2 concentrations that are below 20µg.m^{-3} with and without the Proposed Scheme. Only one receptor in the DM scenario exceeds the annual mean NO_2 objective when applying HA Guidance IAN170/12v3 (LTT). This exceedance was removed when Phase One of the A5WTC scheme is operational. Details of this receptor are presented in **Table 8I.2.**

Table 8I.2 Receptor exceeds Annual Mean NO2 objective in Opening Year 2019 (LTT)

Receptor ID	XY	Address	DM	DS	Change
185484748	241171.50 412638.31	Victoria Road	41.4	14.6	-26.8

Analysis of the results indicates that there would be no receptor experiencing annual mean NO_2 concentrations greater than 60µg.m^{-3} with and without the scheme. Therefore no exceedance of the short-term objective for this pollutant is predicted in both DM and DS scenarios.

No receptors were predicted to be subject to concentrations above the annual mean objective for NO_2 with and without the Proposed Scheme when using TG (09) adjustment only. Analysis of results indicates that there would be no receptors receiving annual mean NO_2 concentrations greater than 60µg.m^{-3} with and without the scheme. Therefore no exceedance of the short-term limit value for this pollutant is predicted.

The changes in NO_2 annual mean concentrations (LTT) with the Proposed Scheme are presented in **Table 8I.3.**

© Mouchel 2016

Table 8I.3 Changes NO2 Concentrations in Opening Year 2019 Do Minimum and Do Something (LTT)

Change in annual mean NO_2 ($\mu g.m^{-3}$)	No. of Sensitive Receptors	Percentage (%)
>4 Increase	6	0.4
>2 to 4 Increase	10	0.6
>0.4 to 2 Increase	183	10.9
0 to 0.4 Increase	169	10.1
No Change	7	0.4
0 to 0.4 Decrease	270	16.1
>0.4 to 2 Decrease	636	37.9
>2 to 4 Decrease	182	10.8
>4 Decrease	217	12.9

The results show that approximately 77.7% of receptors would be subject to reductions in NO_2 concentrations, 0.4% would be unchanged and 21.9% would be subject to an increase in NO_2 concentrations with the scheme compared to without the Proposed Scheme.

With LTT adjustment, the highest increase in NO_2 concentration is predicted at the property in Victoria Road, Ballymagorry (Receptor 185852279). The property lies along the Proposed Scheme alignment. The largest improvement in NO_2 concentration is predicted at the property in No.74 Victoria Road, New Building, Derry (Receptor 185484748). The property is next to the existing A5 Victoria Road. Traffic would be relocated on to the new A5 scheme. Details of the receptors with maximum worsening and benefit with Phase One (LTT) are presented in **Table 8I.4.**

Table 8I.4 Receptors with maximum worsening and benefit for annual mean NO2 in Opening Year 2019 (LTT)

Maximum	Receptor	X	Y	DN	DS	Change
Worsening	185852279	237104	403207	7.8	15.2	7.4
Benefit	185484748	241172	412638	41.4	14.6	-26.8

With TG09 adjustment only, the highest increase in NO_2 concentration is predicted at the property in Victoria Road, Ballymagorry (Receptor 185852279). The property lies along the Proposed Scheme. The largest improvement in NO_2 concentration is predicted at the property on Victoria Road, New Building, Derry (Receptor 185484748). The property lies on the existing A5, Monaghan Road, which traffic would be relocated on the new A5 with the scheme. Details of the receptors with maximum worsening and benefit with Phase 1 (TG09) is presented in **Table 8I.5.**

© Mouchel 2016

Table 8I.5 Receptors with maximum worsening and benefit for annual mean NO2 in Opening Year 2019 (TG09)

Maximum	Receptor	X	Y	DN	DS	Change
Worsening	185852279	237104	403207	5.5	10.6	5.2
Benefit	185484748	241172	412638	29.4	10.4	-19.1

Annual mean PM_{10} concentrations predicted at receptors with and without scheme are summarised in **Table 8I.6**.

Table 8I.6 Breakdown of Predicted Annual Mean PM10 Concentrations in Opening Year 2019 (TG09)

Annual Mean PM_{10} Concentration ($\mu g.m^{-3}$)	Without Scheme	With Scheme
> 0 – 20	1,680	1,680
> 20 – 30	0	0
> 30 – 40	0	0
>40 (Exceedance)	0	0

No exceedances of the annual mean PM_{10}/$PM_{2.5}$ and short-term mean PM_{10} objectives are predicted with and without implementation of Phase One of the A5WTC scheme.

The changes in PM_{10} annual mean concentrations with the proposed Phase One scheme are presented in **Table 8I.7**.

Table 8I.7 Changes PM10 Concentrations in Opening Year 2019 Do Minimum and Do Something (TG09)

Change in annual mean PM_{10} ($\mu g.m^{-3}$)	No. of Sensitive Receptors	Percentage (%)
>4 Increase	0	0.0
>2 to 4 Increase	0	0.0
>0.4 to 2 Increase	6	0.4
0 to 0.4 Increase	203	12.1
No Change	340	20.2
0 to 0.4 Decrease	863	51.4
>0.4 to 2 Decrease	259	15.4
>2 to 4 Decrease	9	0.5
>4 Decrease	0	0.0

The results show that approximately 67.3% of receptors would be subject to reductions in PM_{10} concentrations, 20.2% would be unchanged and 12.4% would be subject to an increase in PM_{10} concentrations with Phase One of the A5WTC scheme in place.

The highest increase in PM_{10} concentration is predicted at the property on Victoria Road, Ballymagorry (Receptor 185852279). The property lies along the Proposed Scheme. The largest improvement in PM_{10} concentration is predicted at the property on Victoria Road, New Building, Derry (Receptor 185484748). The property lies along the existing A5, Monaghan Road, which traffic

© Mouchel 2016

would be relocated onto the new A5 with the scheme. Details of the receptors with maximum worsening and benefit are presented in **Table 8I.8**.

Table 1 Receptors with maximum worsening and benefit for annual mean PM10 in Opening Year 2019 (TG09)

Maximum	Receptor	X	Y	DN	DS	Change
Worsening	185852279	237104	403207	8.8	9.7	0.9
Benefit	185484748	241172	412638	13.7	10.4	-3.3

Human Receptors (Phase Two)

Modelled annual mean NO_2 concentrations without and with the Proposed Scheme for the 9082 receptors identified within the local air quality study area are summarised in **Table 8I.9**.

Table 8I.9 Breakdown of Predicted Annual Mean NO2 Concentrations in Opening Year 2023

Annual Mean NO_2 Concentration ($\mu g.m^{-3}$)	TG (09)		LTT	
	Without Scheme	With Scheme	Without Scheme	With Scheme
> 0 – 20	8924	9007	8448	8614
> 20 – 30	154	74	465	404
> 30 – 36	3	0	134	52
> 36 – 40	0	0	20	8
>40 (Exceedance)	1	1	15	4

The majority of the receptors modelled within Phase Two experience annual mean NO_2 concentrations below 20µg.m-3 with and without the Proposed Scheme.

With LTT adjustment, the majority of the receptors modelled within Phase Two experience annual mean NO2 concentrations below 20µg.m-3 with and without the Proposed Scheme. There are 15 receptors that are predicted to exceed the annual mean NO_2 objective limit in the DM scenario. 11 of these exceedances would be removed with Phase Two of the proposed A5WTC scheme in place. Details for the remaining four receptors that are above the annual mean NO_2 objective are presented in **Table 8I.10**.

Table 8I.2 Receptor exceeds Annual Mean NO2 objective in DS Opening Year 2023 (LTT)

Receptor ID	XY	Address	DM	DS	Change
185669128	245003.50 372264.31	ORCHARD TERRACE, OMAGH	49.9	41.7	-8.1
185669242	244937.30 372264.22	STARRS CRESCENT, OMAGH	50.4	42.2	-8.2
185669823	244718.03 372354.88	JAMES STREET, OMAGH	47.6	40.7	-7.0
187143853	245203.36 372297.97	KEVLIN ROAD, OMAGH	86.7	69.9	-16.9

© Mouchel 2016

With LTT adjustment, analysis of results indicates that there would be one receptor (receptor ID187143853), located at the northeast corner of the junction by A5 Great Northern Road and Kevlin Road, receiving an annual mean NO_2 concentration greater than 60µg.m-^{3} both with and without Phase Two of the A5WTC scheme in place, which predicts short term 1-hour NO2 exceedences are likely. The results also indicate a beneficial effect at the receptor as a decrease in NO2 annual mean concentration is predicted from 86.7 µg.m-3 in DM to 69.9 µg.m-3 in DS.

The TG (09) adjusted results indicate that there would be a single exceedance of annual mean NO2 objective with and without the scheme. No receptors receiving annual mean NO2 concentrations greater than 60µg/m3 are predicted with and without the scheme. Therefore no exceedance of the short term limit value for this pollutant is predicted.

The changes in NO_2 annual mean concentrations (LTT) with the Proposed Scheme are presented in **Table 8I.11**.

Table 8I.3 Changes NO2 Concentrations in Opening Year 2023 Do Minimum and Do Something (LTT)

Change in annual mean NO_2 (µg.m^{-3})	No. of Sensitive Receptors	Percentage (%)
>4 Increase	46	0.5
>2 to 4 Increase	121	1.3
>0.4 to 2 Increase	877	9.7
0 to 0.4 Increase	1285	14.1
No Change	76	0.8
0 to 0.4 Decrease	2252	24.8
>0.4 to 2 Decrease	3220	35.5
>2 to 4 Decrease	791	8.7
>4 Decrease	414	4.6

The results show that approximately 73.5% of receptors would be subject to reductions in concentrations, 0.8% would be unchanged and 25.6% would be subject to an increase in NO2 concentrations with Phase Two of the A5WTC scheme in place compared to without the Proposed Scheme.

With LTT adjustment, the highest increase in NO2 concentration is predicted at the existing occupied property on Rarone Road, Rarone, Seskinore(Receptor 185671881). The largest improvement in NO_2 concentration is predicted at the property in Kevlin Road, Omagh (Receptor 187143853). The property is located next to the existing A5 Great Northern Road. Traffic would be relocated on to the new A5 scheme. Details of the receptors with maximum worsening and benefit with Phase Two (LTT) are presented in **Table 8I.12.**

© Mouchel 2016

Table 8I.4 Receptors with maximum worsening and benefit for annual mean NO2 in Opening Year 2023 (LTT)

Maximum	Receptor	X	Y	DN	DS	Change
Worsening	185671881	249200	365561	2.9	17.6	14.7
Benefit	187143853	245203	372297	86.7	69.9	-16.9

With TG09 adjustment only, the highest increase in NO_2 concentration is predicted the existing occupied property on Rarone Road, Rarone, Seskinore (Receptor 185671881). The largest improvement in NO_2 concentration is predicted at the property on. 74 Victoria Road, New Building, Derry (Receptor 185484748). The property lies on the existing A5. Traffic would be relocated onto the new A5 with the scheme. Details of the receptors with maximum worsening and benefit with Phase Two (TG09) are presented in **Table 8I.13**.

Table 8I.13 Receptors with maximum worsening and benefit for annual mean NO2 in Opening Year 2023 (TG09)

Maximum	Receptor	X	Y	DN	DS	Change
Worsening	185671881	249200	365561	2.5	15.0	12.6
Benefit	185484748	241172	412638	22.8	8.5	-14.3

Annual mean PM_{10} concentrations predicted at receptors with and without scheme are summarised in **Table 8I.14**.

Table 8I.5 Breakdown of Predicted Annual Mean PM10 Concentrations in Opening Year 2023

Annual Mean PM_{10} Concentration ($\mu g.m^{-3}$)	Without Scheme	With Scheme
> 0 – 20	9076	9081
> 20 – 30	6	1
> 30 – 40	0	0
>40 (Exceedance)	0	0

No exceedences of the annual mean PM_{10}/$PM_{2.5}$ and short term mean PM_{10} objectives are predicted without and with Phase Two of the proposed A5WTC scheme in place.

The changes in PM_{10} annual mean concentrations with the Proposed Scheme are presented in **Table 8I.15**.

Table 8I.6 Changes to PM10 Concentrations in Opening Year 2023 Do Minimum and Do Something

Change in annual mean PM_{10} ($\mu g.m^{-3}$)	No. of Sensitive Receptors	Percentage (%)
>4 Increase	0	0.0
>2 to 4 Increase	2	0.0
>0.4 to 2 Increase	69	0.8
0 to 0.4 Increase	1088	12.0
No Change	1342	14.8

© Mouchel 2016

0 to 0.4 Decrease	5181	57.0
>0.4 to 2 Decrease	1381	15.2
>2 to 4 Decrease	18	0.2
>4 Decrease	1	0.0

The results show that approximately 72.5% of receptors would be subject to reductions in concentrations, 14.8% would be unchanged and 12.8% would be subject to an increase in annual mean PM10 concentrations with Phase Two of the A5WTC scheme in place compared to without the Proposed Scheme.

The highest increase in PM10 concentration is predicted the existing occupied property on Rarone Road, Rarone, Seskinore(Receptor 185671881). The largest improvement in PM_{10} concentration is predicted at the property on Kevlin Road, Omagh (Receptor 187143853). The property lies along the existing A5, where traffic would be relocated onto the new A5 with the scheme. Details of the receptors with maximum worsening and benefit are presented in **Table 8I.16.**

Table 8I.7 Receptors with maximum worsening and benefit for annual mean PM10 in Opening Year 2023 (TG09)

Maximum	Receptor	X	Y	DN	DS	Change
Worsening	185671881	249200	365561	8.1	10.5	2.4
Benefit	187143853	245203	372298	27.5	23.3	-4.2

Human Receptors (Phase Three)

Modelled 2028 annual mean NO_2 concentrations without and with the Proposed Scheme for the 10,263 receptors identified within the local air quality study area are presented in **Table 8I.17.**

Table 8I.17 Breakdown Predicted Annual Mean NO2 Concentrations in Opening Year 2028

Annual Mean NO_2 Concentration ($\mu g.m^{-3}$)	TG(09)		LTT	
	Without Scheme	With Scheme	Without Scheme	With Scheme
> 0 – 20	10218	10246	9550	9734
> 20 – 30	44	16	525	470
> 30 – 36	0	0	153	48
> 36 – 40	0	1	22	8
>40 (Exceedance)	1	0	13	3

The results of the assessment indicate that 13 receptors would be subject to concentrations above the annual mean objective for NO_2 without the Proposed Scheme, and three with the scheme when applying HA Guidance IAN170/12v3 (LTT). Details of the receptors with exceedences are presented in **Table 8I.18.**

With LTT adjustment, analysis of results indicates that there would be one receptor (receptor ID187143853), located at the northeast corner of the junction by A5 Great Northern Road and Kevlin Road, receiving annual mean NO_2 concentration greater than $60\mu g.m^{-3}$ in both with and without

© Mouchel 2016

Phase Three of the A5WTC scheme in place, which predicts short term 1-hour NO_2 exceedences are likely at the receptor. The results also indicate a beneficial effect at the receptor as a decrease in NO_2 annual mean concentration is predicted from 81.8 $\mu g.m^{-3}$ in DM to 66.2 $\mu g.m^{-3}$ in DS.

Table 8I.18 Receptors exceeding Annual Mean NO2 objective in Opening Year 2028 (LTT)

Receptor ID	XY	Address	DM	DS	Change
185668825	245172.3 372261.6	KEVLIN ROAD, OMAGH	40.9	35.4	-5.5
185669124	245019.7 372275.8	ORCHARD TERRACE, OMAGH	40.6	34.8	-5.8
185669125	245014.9 372273.4	ORCHARD TERRACE, OMAGH	41.5	35.5	-6.0
185669126	245012.5 372269.3	ORCHARD TERRACE, OMAGH	44.2	37.6	-6.6
185669127	245007.8 372267.3	ORCHARD TERRACE, OMAGH	45.4	38.6	-6.8
185669128	245003.5 372264.3	ORCHARD TERRACE, OMAGH	47.7	40.5	-7.3
185669241	244933.8 372272.5	STARRS CRESCENT, OMAGH	41.7	35.7	-6.0
185669242	244937.3 372264.2	STARRS CRESCENT, OMAGH	48.3	40.9	-7.4
185669243	244875.3 372289	STARRS CRESCENT, OMAGH	41.4	35.3	-6.2
185669244	244871.1 372293.1	STARRS CRESCENT, OMAGH	40.1	34.2	-5.8
185669823	244718 372354.9	JAMES STREET, OMAGH	45.7	39.3	-6.4
185837478	245396.2 372358.3	DUBLIN ROAD, OMAGH	42.4	34.8	-7.7
187143853	245203.4 372298	KEVLIN ROAD, OMAGH	81.8	66.2	-15.6

With TG09 adjustment only, the results of the assessment indicate that one receptor would be subject to concentrations above the annual mean limit value for NO_2 in the DM scenario. This exceedance was removed with the Phase Two of the proposed A5WTC scheme in place. Details of the receptor in exceedance of the NO_2 annual mean objective in Phase Three is listed in **Table 8I.19.**

Table 8I.19 Receptors exceed Annual Mean NO2 objective in Opening Year 2028 (TG09)

Receptor ID	XY	Address	DM	DS	Change
187143853	245203.4 372298	KEVLIN ROAD, OMAGH	49.0	39.6	-9.4

The changes in NO_2 annual mean concentrations with the Proposed Scheme are presented in **Table 8I.20**.

© Mouchel 2016

Table 8I.20 Changes NO2 Concentrations in Opening Year 2028 Do Minimum and Do Something (LTT)

Change in annual mean NO_2 ($\mu g.m^{-3}$)	No. of Sensitive Receptors	Percentage (%)
>4 Increase	48	0.5
>2 to 4 Increase	80	0.8
>0.4 to 2 Increase	989	9.6
0 to 0.4 Increase	1642	16.0
No Change	119	1.2
0 to 0.4 Decrease	2702	26.3
>0.4 to 2 Decrease	3333	32.5
>2 to 4 Decrease	850	8.3
>4 Decrease	500	4.9

The results show that approximately 72% of receptors would be subject to reductions in concentrations, 1.2% would be unchanged and 26.9% would be subject to an increase in NO2 concentrations with Phase Three of the A5WTC scheme in place compared to without the Proposed Scheme.

With LTT adjustment, the highest increase in NO_2 concentration is predicted the existing occupied property on Rarone Road, Rarone, Seskinore (Receptor ID 185671881). The largest improvement in NO_2 concentration is predicted at the property on Victoria Road, New Building, Derry (Receptor 185484748). The property lies on the existing A5, which traffic would be relocated on the new A5 with the scheme. Details of the receptors with maximum worsening and benefit for annual mean NO_2 (LTT) in Phase Three is presented in **Table 8I.21**.

Table 8I.8 Receptors with maximum worsening and benefit for annual mean NO2 in Opening Year 2028 (LTT)

Maximum	Receptor	X	Y	DN	DS	Change
Worsening	185671881	249200	365561	2.7	14.9	12.2
Benefit	185484748	241171	412638	37.7	14.9	-23.0

With TG09 adjustment only, the highest increase in NO_2 concentration is predicted the existing occupied property at Rarone Road, Rarone, Seskinore (Receptor ID 185671881). The largest improvement in PM_{10} concentration is predicted at the property on Victoria Road, New Building, Derry (Receptor 185484748). The property lies on the existing A5, which traffic would be relocated on the new A5 with the scheme. Details of the receptors with maximum worsening and benefit for annual mean NO_2 (TG09) in Phase Three is presented in **Table 8I.22.**

Table 8I.9 Receptors with maximum worsening and benefit for annual mean NO2 in Opening Year 2028 (TG09)

Maximum	Receptor	X	Y	DN	DS	Change
Worsening	185671881	249200	365561	2.4	12.9	10.6

© Mouchel 2016

Annual mean PM_{10} concentrations predicted at receptors with and without Phase Three of the A5WTC scheme are summarised in **Table 8I.23**.

Table 8I.10 Predicted Annual Mean PM10 Concentrations in Opening Year 2028

Annual Mean PM_{10} Concentration ($\mu g.m^{-3}$)	Without Scheme	With Scheme
> 0 – 20	10254	10262
> 20 – 30	9	
> 30 – 40	0	0
>40 (Exceedance)	0	0

The majority of the receptors modelled as part of Phase Three of the A5WTC scheme are predicted to experience PM_{10} concentrations below 20 $\mu g.m^{-3}$. There is an improvement with the scheme in that the number of receptors receiving an annual mean concentration more than 20 to 30$\mu g.m^{-3}$ PM_{10} is reduced. No exceedences of the annual mean and short-term mean PM_{10} objective is predicted neither with nor without Phase Three of the A5WTC scheme.

The changes in PM_{10} annual mean concentrations with the Proposed Scheme are presented in **Table 8I.24.**

Table 8I.11 Changes PM10 Concentrations in Opening Year 2028 Do Minimum and Do Something

Change in annual mean PM_{10} ($\mu g.m^{-3}$)	No. of Sensitive Receptors	Percentage (%)
>4 Increase	0	0.0
>2 to 4 Increase	2	0.0
>0.4 to 2 Increase	110	1.1
0 to 0.4 Increase	1055	10.3
No Change	1578	15.4
0 to 0.4 Decrease	5630	54.9
>0.4 to 2 Decrease	1819	17.7
>2 to 4 Decrease	68	0.7
>4 Decrease	1	0.0

The results show that approximately 72.6% of receptors would be subject to reductions in concentrations, 16.6% would be unchanged and 10.8% would be subject to an increase in PM_{10} concentrations with Phase Three of the A5WTC scheme in place compared to without the Proposed Scheme

The details of receptors with maximum worsening and benefit for PM_{10} are presented in **Table 8I.25.**

Table 8I.25 Receptors with maximum worsening and benefit for annual mean PM10 in Opening Year 2028 (TG09)

Maximum	Receptor	X	Y	DN	DS	Change
Worsening	185671881	249200	365561	8.1	11.2	3.1
Benefit	187143853	245203	372298	28.3	24.0	-4.3

© Mouchel 2016

The highest increase in PM_{10} concentration is predicted at the existing occupied property at 52 Rarone Road, Rarone, Seskinore (Receptor 185671881). The largest improvement in PM_{10} concentration is predicted at No. 13 Kevlin Road, Omagh (Receptor 187143853) . The property lies on the existing A5 which the road would be closed and accessed only by local traffic.

APPENDIX 8J LOCAL AIR QUALITY (HUMAN RECEPTORS) SIGNIFICANCE IMPACTS

Phase One

Significance impact for human receptors and designated sites were assessed based on IAN174/13 and summary of results for Phase One are listed in **Tables 8J.1** and **Table 8J.2**

Table 8J.1 Phase One Local Air Quality Receptors Informing Scheme Significance in 2019 – TG09

Magnitude of Change in Annual Average NO_2 or PM_{10} ($\mu g.m^{-3}$) – TG09	Total Number of Receptors with:	
	Worsening of air quality objective already above objective or creation of a new exceedence	Improvement of an air quality objective already above objective or the removal of an existing exceedence
Large (>4)	0	0
Medium (>2 to 4)	0	0
Small (>0.4 to 2)	0	0

There is no improvement nor worsening of air quality objective with the scheme implemented.

Table 8J.2 Phase One Local Air Quality Receptors Informing Scheme Significance in 2019 – LTT

Magnitude of Change in Annual Average NO_2 or PM_{10} ($\mu g.m^{-3}$) – LTT	Total Number of Receptors with:	
	Worsening of air quality objective already above objective or creation of a new exceedence	Improvement of an air quality objective already above objective or the removal of an existing exceedence
Large (>4)	0	1
Medium (>2 to 4)	0	0
Small (>0.4 to 2)	0	0

There is an improvement with the scheme in that one receptor receiving an annual mean NO2 concentration exceeding the objective value of 40 µg.m-3 is reduced with the scheme. No worsening of the air quality objective is predicted with Phase One of the A5WTC scheme implemented.

Phase Two

Significance impact for human receptors and designated sites were assessed based on IAN174/13 and summary of results for Phase Two are listed in **Table 8J.3** and **Table 8J.4.**

© Mouchel 2016

Table 8J.3 Phase Three Local Air Quality Receptors Informing Scheme Significance in 2023 – TG (09)

Magnitude of Change in Annual Average NO_2 or PM_{10} ($\mu g.m^{-3}$) – TG(09)	Total Number of Receptors with:	
	Worsening of air quality objective already above objective or creation of a new exceedence	Improvement of an air quality objective already above objective or the removal of an existing exceedence
Large (>4)	0	1
Medium (>2 to 4)	0	0
Small (>0.4 to 2)	0	0

There is an improvement with the scheme in that one receptor receiving an annual mean NO2 concentration exceeding the objective value of 40 µg.m-3 is reduced with the scheme. No worsening of the air quality objective is predicted with Phase Two of the A5WTC scheme implemented.

Table 8J.4 Phase Two Local Air Quality Receptors Informing Scheme Significance in 2023 – LTT

Magnitude of Change in Annual Average NO_2 or PM_{10} ($\mu g.m^{-3}$) - LTT	Total Number of Receptors with:	
	Worsening of air quality objective already above objective or creation of a new exceedence	Improvement of an air quality objective already above objective or the removal of an existing exceedence
Large (>4)	0	15
Medium (>2 to 4)	0	0
Small (>0.4 to 2)	0	0

There is an improvement with the scheme in that the number (15) of receptors receiving an annual mean NO2 concentration exceeding the objective value of 40 µg.m-3 is reduced with the scheme. No worsening of the air quality objective is predicted with Phase Two of the A5WTC scheme implemented.

© Mouchel 2016

Phase Three

Significance impact for human receptors and designated sites were assessed based on IAN174/13 and summary of results for Phase Three are listed in **Tables 8J.5** and **Table 8J.6.**

Table 8J.5 Phase Three Local Air Quality Receptors Informing Scheme Significance in 2028 – TG (09)

Magnitude of Change in Annual Average NO_2 or PM_{10} ($\mu g/m^3$) – TG(09)	Total Number of Receptors with:	
	Worsening of air quality objective already above objective or creation of a new exceedence	Improvement of an air quality objective already above objective or the removal of an existing exceedence
Large (>4)	0	1
Medium (>2 to 4)	0	0
Small (>0.4 to 2)	0	0

There is an improvement with the scheme in that one of receptor receiving an annual mean NO2 concentration exceeding the objective value of 40µg.m-3 is reduced with the scheme. No worsening of the air quality objective is predicted with Phase Three of the A5WTC scheme implemented.

Table 8J.6 Phase Three Local Air Quality Receptors Informing Scheme Significance in 2028 – LTT

Magnitude of Change in Annual Average NO_2 or PM_{10} ($\mu g/m^3$) – TG(09)	Total Number of Receptors with:	
	Worsening of air quality objective already above objective or creation of a new exceedence	Improvement of an air quality objective already above objective or the removal of an existing exceedence
Large (>4)	0	13
Medium (>2 to 4)	0	0
Small (>0.4 to 2)	0	0

There is an improvement with the scheme in that the number (13) of receptors receiving an annual mean NO_2 concentration exceeding the objective value of 40µg.m^{-3} is reduced with the scheme. No worsening of the air quality objective is predicted with Phase Three of the A5WTC scheme implemented.

© Mouchel 2016

EPUK Significance

Phase One

The summary of significance impacts on Annual Mean NO2, Annual Mean PM10 and Short Term Mean PM10 concentration is summarised in **Table 8J.7** below.

Table 8J.7 Phase One - Significance Impact Summary for Annual Mean NO2, Annual Mean PM10 and Short Term Mean PM10

	Annual Mean NO_2		Annual Mean PM_{10}		Short Term Mean PM_{10}	
	No. of Property	%	No. of Property	%	No. of Property	%
Substantial Adverse	0	0.0	0	0.0	0	0.0
Moderate Adverse	0	0.0	0	0.0	0	0.0
Slight Adverse	6	0.4	0	0.0	0	0.0
Negligible	1457	86.7	1680	100.0	1680	100.0
Slight Beneficial	216	12.8	0	0.0	0	0.0
Moderate Beneficial	0	0.0	0	0.0	0	0.0
Substantial Beneficial	1	0.1	0	0.0	0	0.0

Using EPUK Impact descriptors, the majority (99.6%) of properties experience a slight beneficial to negligible impact on annual mean NO2 concentrations. One receptor received a substantial beneficial with the scheme in place. For annual mean and short-term mean PM10, all of the properties experience a negligible impact. Overall it is concluded that the impact on local air quality is negligible to slight beneficial with the Proposed Scheme in place for Phase One.

Phase Two

The summary of significance impacts on Annual Mean NO2, Annual Mean PM10 and Short Term Mean PM10 concentration is summarised in **Table 8J.8** below.

© Mouchel 2016

Table 8J.8 Phase Two - Significance Impact Summary for Annual Mean NO_2, Annual Mean PM10 and Short Term Mean PM_{10}

	Annual Mean NO_2		Annual Mean PM_{10}		Short Term Mean PM_{10}	
	No. of Property	%	No. of Property	%	No. of Property	%
Substantial Adverse	0	0.0	0	0.0	0	0.0
Moderate Adverse	0	0.0	0	0.0	0	0.0
Slight Adverse	46	0.5	0	0.0	0	0.0
Negligible	8608	94.7	9089	100.0	9087	100.0
Slight Beneficial	407	4.5	1	0.0	3	0.0
Moderate Beneficial	14	0.2	0	0.0	0	0.0
Substantial Beneficial	15	0.2	0	0.0	0	0.0

Using EPUK Impact descriptors, the majority (99.5%) of properties experience a slight beneficial to negligible impact on annual mean NO2 concentrations. Fifteen receptors would receive a substantial beneficial impact and fourteen receptors receive a moderate beneficial impact with the scheme in place. For annual mean and short term mean PM10, the majority (99.9 - 100%) of properties experience a negligible to slight beneficial impact. Overall it is concluded that the impact on local air quality is negligible to slight beneficial with the Proposed Scheme in place for Phase Two.

Phase Three

The summary of significance impacts on Annual Mean NO2, Annual Mean PM10 and Short Term Mean PM10 concentration is summarised in **Table 8J.9** below.

Table 8J.9 Phase Three - Significance Impact Summary for Annual Mean NO2, Annual Mean PM10 and Short Term Mean PM10

	Annual Mean NO_2		Annual Mean PM_{10}		Short Term Mean PM_{10}	
	No. of Property	%	No. of Property	%	No. of Property	%

	Annual Mean NO_2		Annual Mean PM_{10}		Short Term Mean PM_{10}	
	No. of Property	%	No. of Property	%	No. of Property	%
Moderate Beneficial	8	0.1	0	0.0	0	0.0
Substantial Beneficial	12	0.1	0	0.0	0	0.0

Using EPUK Impact descriptors, the majority (99.5%) of properties experience a slight beneficial to negligible impact on annual mean NO2 concentrations. Twelve receptors would receive a substantial beneficial impact and eight receptors receive a moderate beneficial impact with the scheme in place. For annual mean and short term mean PM10, the majority (99.9%) of properties experience a negligible to slight beneficial impact. Overall it is concluded that the impact on local air quality is negligible to slight beneficial with the Proposed Scheme in place for Phase Three.

APPENDIX 8K - SCHEDULE OF NO2 CONCENTRATIONS AT INDIVIDUAL MODELLED RECEPTORS

All NO2 (Nitrogen Dioxide) values in the tables below are an annual mean concentration in µg m-3.

The assessment has looked at the following scenario years;

2019 – Opening year Phase 1

2023 – Opening year Phase 2

2028 – Opening Phase 3

Glossary

DM – Do-minimum

DS – Do-something

CH – Change
