APPENDIX 11A DESIGNATED WILDLIFE SITES

Designated wildlife sites are significant nature conservation factors for the scheme as many wildlife sites receive significant legal and policy protection from activities that may harm them; and wildlife sites generally contain the best examples of high quality ecological features within Northern Ireland.

Legislation

This list below summarises the legislation which is relevant to the assessment, i.e. legislation relevant to designated sites which may be affected by the Proposed Scheme.

Northern Ireland

- Amenity Lands Act (Northern Ireland) 1965;
- The Wildlife (Northern Ireland) Order 1985 (as amended);
- The Nature Conservation and Amenity Lands (Northern Ireland) Order 1985 (as amended);
- The Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended);
- The Environment (Northern Ireland) Order 2002 (as amended); and
- The Wildlife and Natural Environment Act (Northern Ireland) 2011.

Republic of Ireland

- The Wildlife Act, 1976;
- The Flora (Protection) Order, 1999;
- The Wildlife (Amendment) Act, 2000; and
- European Union (Birds and Natural Habitats) Regulations 2011.

The following EC Directives and international conventions are implemented by some of the above NI and ROI Acts and Regulations:

- Council Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora (the Habitats Directive);
- Convention on Wetlands of International Importance (the Ramsar Convention on Wetlands) (1971) (as amended by the Paris Protocol 1992 and the Regina amendments 1987);

© Mouchel 2016

- Convention on the Conservation of European Wildlife and Natural Habitats (the Bern Convention) (1979);
- Convention on the Conservation of Migratory Species of Wild Animals (the Bonn Convention) (1979);
- Council Directive 79/409/EEC on the Conservation of Wild Birds (the Birds Directive); and
- Agreement on the Conservation of Populations of European Bats (EUROBATS) (1991) (as amended).

Special Protection Areas (SPA)

SPA receive full protection under the Birds Directive and are areas of the most important habitat for rare (listed on Annex I to the Directive), vulnerable, and migratory birds within the European Union. SPA form part of the Natura 2000 network, and are therefore protected under the Habitats Directive. All NI SPA are also designated as ASSI and therefore receive additional protection under the Part IV of The Environment (Northern Ireland) Order 2002. Any development likely to have significant impacts upon a Natura 2000 site will have to be assessed for its implications on the site's conservation status, an obligation under the aforementioned Regulations.

Ninety three species are listed upon Annex I to the Birds Directive, of which approximately thirty are regularly recorded in NI (although many of these occur solely as summering migrant populations, passage migrants or scarce visitors). The presence of important populations of Annex I bird species, or non-Annex I migratory birds, is a primary consideration in the identification of SPA.

Special Areas of Conservation (SAC)

SAC are designated under the EC Habitats Directive. SAC are areas that have been identified as best representing the range and variety within the European Union of habitats and (non-bird) species listed on Annexes I and II to the Directive. SAC, together with SPA, form the Natura 2000 network. As part of the Natura 2000 network, all SAC in the study area receive legal protection under The Conservation Regulations or the European Union (Natural Habitats). Where projects are likely to, or there is residual uncertainty as to whether they may, have a significant effect on the ecological integrity of a Natura 2000 site, that project must fully ascertain the nature of these potential effects and be subject to an 'Appropriate Assessment' as defined by the legislation. The Regulations require competent authorities to consider or review planning permission, applied for or granted, affecting a European site, and, subject to certain exceptions, restrict or revoke permission where the integrity of the site would be adversely affected. Equivalent consideration and review provisions are made with respects to highways and roads. Candidate SAC (cSAC) receive the same level of protection as full SAC.

© Mouchel 2016

Ramsar Sites

Ramsar sites are designated under the Convention on Wetlands of International Importance, agreed in Ramsar, Iran, in 1971. They were originally intended to protect sites of importance, especially as waterfowl habitat, although the Convention has broadened its scope over the years to cover all aspects of wetland conservation and wise use, recognising wetlands as ecosystems that are extremely important for biodiversity conservation in general and for the well-being of human communities. Ramsar sites are not legislated under European legislation, although national Planning Policy Statement 2 (PPS2) recommends they should be afforded the same level of consideration and protection as Natura 2000 sites.

Areas of Special Scientific Interest (ASSI) (NI)

ASSI provide statutory protection for the best examples of NI's flora, fauna, or geological or physiographical features. These sites are also used to underpin other national and international nature conservation designations. ASSIs are notified under Part IV of The Environment (Northern Ireland) Order 2002. Under this legislation they have powers to prevent damaging operations affecting such sites. Any such operation must be notified to the Northern Ireland Environment Agency (NIEA) beforehand and permission sought. Various offences and provisions apply to these sites, but in summary, any persons who intentionally or recklessly damages or disturbs each ASSI may be liable to a criminal conviction and a fine of up to £20,000. Public bodies are required to further the conservation and enhancement of ASSI land through the appropriate exercise of their functions.

Policies

Regional Development Strategy (RDS)

In 2010 The Department for Regional Development in Northern Ireland published a revised Regional Development Strategy (RDS) for the future development of Northern Ireland to 2035. RDS 2035: Building a Better Future provides an overarching long term strategic planning framework to facilitate and guide the public and private sectors long term directions.

The RDS is material to decisions on individual planning applications and appeals. Changes to the legislative requirements were made under the Planning Act (Northern Ireland) 2011. The bulk of the Act will not come into force until planning powers transfer to local councils in April 2015 as agreed by the Executive. When planning powers transfer the Department of the Environment (DoE) will continue to be responsible for planning policy and guidance. The Order currently requires Departments to "have regard to the regional development strategy" in exercising any functions in relation to development. The requirement for these policies to be in general conformity with the RDS will remain.

Whilst many of the objectives of the previous strategy published in 2001 and amended in 2008 are still valid the RDS 2035 now replaces it.

© Mouchel 2016

Of particular importance to ecology and the current project are the policies contained in Regional Guidance RG11: Conserve, protect and, where possible, enhance our built heritage and our natural environment. This includes the following aim of relevance to wildlife sites:

- Identify, establish, protect and manage ecological networks. Ecological networks, including the protection of priority species, are needed to maintain environmental processes and help to conserve and enhance biodiversity. A well established ecological network, including designated sites, should provide the habitats needed for ecosystems and species populations to survive in an increasingly human dominated landscape.

- Protect designated areas of countryside from inappropriate development (either directly or indirectly) and continue to assess areas for designation. Designating special areas for protection is an effective way of ensuring our wildlife and natural landscapes retain their individual characteristics. Some areas are deemed of such importance that they are formally designated under various pieces of national and international legislation.

Northern Ireland National Planning Guidance (Planning Service)

The two national Planning Policy Statements (PPS) which are most relevant to Ecology and Nature Conservation are PPS1 and PPS2.

PPS 1: General Principles
This guidance document introduces the general framework for local development control within NI. It includes the following statement in paragraph 12 which is of relevance to ecology and nature conservation.

'*When working towards sustainable development the department will aim to: conserve...natural resources (including wildlife...), taking particular care to safeguard designations of national and international importance.'*

PPS 2: Natural Heritage (July 2013)
This guidance document introduces principles for the protection, mitigation and compensation of features of nature conservation value (sites, habitats and species) within NI. The policies specific to designated wildlife sites are:

- Policy NH 1 - European and Ramsar Sites - International outlines measures to protect international sites;

- Policy NH 3 - Sites of Nature Conservation Importance - National outlines measures to protect national sites; and

- Policy NH 4 - Sites of Nature Conservation Importance – Local outlines measures to protect sites of local conservation importance.

© Mouchel 2016

Local planning context

In addition to planning guidance at a national and regional scale, local planning policies are of relevance and local development documents should be of some consideration to trunk road projects, especially if any potential affects resonate beyond the boundary of the existing Transport NI lands. The development plan policies which Transport NI should have regard to in relation to this scheme and biodiversity are outlined in the Local Development Plans

Local Development Plans
In accordance with national policy guidance contained in the RDS and PPSs, Local Development Plans have been published by the Planning Service, part of the DoE. The following Local Plans affect the current scheme:

- Derry Area Plan 2011 – adopted May 2000;
- Dungannon & South Tyrone Area Plan 2010 adopted March 2005; and
- West Tyrone Area Plan 2019 – Issues Paper published October 2005 and Draft Area Plan currently in preparation (covers districts of Strabane & Omagh).

When published the latter is likely to contain policies such that '*account will be taken of national and international nature conservation designations together with any sites identified as being of local nature conservation importance'*.

Details of Development Plans in NI can be found on the Planning Services website at: http://www.planningni.gov.uk/index/policy/dev_plans.htm

Statutory designated sites

The statutory nature conservation sites listed below were all recorded within the ecology study area. The site boundaries of these sites are shown on Figure 11.4.

International sites

Six sites with international designations are located within the study area. These sites are listed below with a brief summary of the reasons for their designation taken from the official JNCC declarations.

Lough Foyle SPA (NI/ROI) (Site Code UK9020031)
Lough Foyle lies on the north-west coast of NI and straddles the international border with the ROI. The site comprises a large shallow sea lough that includes the estuaries of the rivers Foyle, Faughan and Roe. The site contains extensive intertidal mud-flats and sand-flats (with mussel *Mytilus edulis* beds), saltmarsh and associated brackish ditches. The diversity of coastal habitats has resulted in the lough being of major importance for a diverse assemblage of waterbirds both during the spring and autumn migration periods, and in winter (Joint Nature Conservation Committee (JNCC) website).

© Mouchel 2016

The site supports populations of European importance of bar-tailed godwit *Limosa lapponica* (1,896 individuals, representing 10.8% of the wintering population in Ireland (5 year peak mean 1991/2 - 1995/6)), Bewick's swan *Cygnus columbianus bewickii* (78 individuals, representing 3.1% of the wintering population in Ireland (5 year peak mean 1991/2 - 1995/6)), golden plover *Pluvialis apricaria* (4,891 individuals, representing 2.4% of the wintering population in Ireland (5 year peak mean 1991/2 - 1995/6)) and whooper swan *C.cygnus* (890 individuals, representing 8.9% of the wintering population in Ireland (5 year peak mean 1991/2 - 1995/6)).

The site also supports populations of European importance of the migratory light-bellied brent geese *Branta bernicla hrota* (3,730 individuals representing 18.6% of the wintering Canada/Ireland population (5 year peak mean 1991/2 - 1995/6)), in addition to regularly supporting at least 20,000 waterfowl (and thereby qualifying as a wetland of international importance) (JNCC website).

A section of Lough Foyle located within the ROI (between Muff and Whitecastle) is also designated as Lough Foyle SPA (site code 004087). The site synopsis document supplied by the NPWS website (http://www.npws.ie/protectedsites/specialprotectionareasspa/loughfoylespa/) does not highlight the qualifying features of the site. The site comprises a section of the western shore of Lough Foyle from Muff to north of Vances Point in Co. Donegal. The site is part of the larger cross-border Lough Foyle complex. The majority of the wintering waterbirds that utilise this site occur along the southern and eastern shoreline of Lough Foyle in Derry. Statutory Instrument S.I. No. 341 of 2011 states that the wetland habitat that is contained within the SPA and the waterbirds that utilise this resource are listed as a special conservation interest for this site. It is therefore considered practical to consider the designated area of Lough Foyle residing within the ROI as contiguous with that (and its associated qualifying features) designated within NI.

Lough Swilly SPA (ROI) (Site Code 004075)
This site comprises the inner part of Lough Swilly in north Co. Donegal and extends from just east of Letterkenny northwards to Killygarvan (c. 2 km north of Rathmullan) on the west side and to c. 2 km south of Buncrana on the east side; it includes the adjacent Inch Lough (formerly Inch Lough and Levels SPA, Site Code 004130). Between Farsetmore and Inch Levels a series of improved pasture and arable fields of importance to geese and swans are included. The site includes sections of the estuaries of the River Swilley, the River Leannan and the Isle Burn and the predominant habitat is a series of extensive sand and mud flats which are exposed at low tide. Other habitats represented in the site are salt marshes, lagoons (at Inch Lough and Blanket Nook), rivers and streams, sand and shingle beaches, lowland wet and dry grasslands, drainage ditches, reedbeds and scrub. Inch Lough, whilst artificial in origin, is one of the largest and best examples of a shallow, low salinity lagoon in the country; it supports what is probably the largest population in the country of the Red-listed charophyte *Chara canescens*. A small sandy island within the lough, used during the summer months supports nationally important breeding populations of Sandwich *Sterna sandvicensis* and common terns *S.hirundo*, mute swans and tufted duck *Aythya fuligula*.

Lough Swilly SPA supports internationally important numbers of Whooper Swan (1,673 - mean peak for the five winters 1995/96-1999/2000), Greenland White-fronted Goose (847 for the Lough Swilly flock - mean peak for the five winters 1994/95-1998/99) and Greylag Goose (1,218 - mean peak for the five winters 1995/96-1999/2000). The main areas of the site used by these species are at Big Isle, Farsetmore, Blanket Nook, Ballylawn and Inch Levels. The flock sizes for Whooper Swan and Greylag Goose are the highest in the country**.** Considerably higher numbers of

© Mouchel 2016

Whooper Swan (peak of 1,946) have been recorded, especially early in the season, as this is the area where the swans make their Irish landfall in autumn on their return from breeding grounds in Iceland. Both Greenland White-fronted Goose and Whooper Swan are listed on Annex I of the E.U. Birds Directive. The site is also of special conservation interest for holding an assemblage of over 20,000 wintering waterbirds (NPWS website).

The site additionally supports a nationally important wintering wildfowl assemblage.

Lough Neagh & Lough Beg SPA (Site Code UK9020091)
This site in the centre of Northern Ireland and includes three eutrophic water bodies, Lough Neagh and two related loughs, Lough Beg and Portmore Lough, together with surrounding swamp, fen, wet grassland and swampy woodland. The boundary of the proposed Special Protection Area follows the boundaries of the Lough Neagh ASSI, Lough Beg ASSI and Portmore Lough ASSI and also forms part of another site which is listed as a wetland of international importance under the Ramsar Convention. The site qualifies for designation by supporting internationally important numbers of wintering birds and nationally important breeding birds. The site regularly supports pochard *Aythya farina* (26,341 individuals representing 7.5% of the population (5 year peak mean 1991/92-1995/960)), tufted duck *Aythya fuligula* (22,372 individuals representing 2.2% of the population (5 year peak mean 1991/92-1995/96)), goldeneye *Bucephala clangula* (10,776 individuals representing 3.6% of the population (5 year peak mean 1991/92-1995/96)), Bewick's swan *Cygnus columbianus bewickii* (136 representing 5.4% of the all-Ireland population (5 year peak mean 1991/92-1995/96)), whooper swan *Cygnus cygnus* (1,031 individuals representing 10% of the all-Ireland population (5 year peak mean 1991/92-1995/96)) and common tern *Sterna hirundo* (185 individuals representing 6% of the all-Ireland breeding population (count, as at 1995). The site additionally qualifies as a wetland of international importance by regularly supporting over 20,000 of a variety of species of waterfowl in winter.

The site additionally supports a nationally important breeding bird assemblage.

Lough Neagh & Lough Beg Ramsar (Site Code UK12016)
The site is designated as a Ramsar site for the following criteria: Criterion 1; Lough Neagh is the largest freshwater lake in the United Kingdom and is very shallow for its size, covering an area of 383 km2 with a longest length of 30.5 km and narrowest width of 12.1 km across the middle. This site also contains a smaller lake, Lough Beg (1,125 ha) to the north, as well as a small satellite lake, Portmore Lough (286 ha) which is situated to the east of Lough Neagh. The site supports beds of submerged aquatic vegetation fringed by associated species-rich damp grassland, reedbeds, islands, fens, marginal swampy woodland and pasture.

Criterion 2; the site supports over 40 rare or local vascular plants and a large number of rare or local invertebrates. Criterion 3; the site regularly supports substantial numbers of individuals from different groups of waterfowl which are indicative of wetland values, productivity and diversity, and has a large number of plants and animal species that are confined or almost confined to this areas within NI. Criterion 4; the site supports an important assemblage of breeding birds which occur in nationally important numbers. Criterion 7; the site supports a population of pollan *Coregonus autumnalis*, one of the few locations in Ireland and one of the two known locations in the UK (the other is Lower Lough Erne). It is one of the most important species in Ireland in terms of faunal biodiversity since it occurs nowhere else in Europe. Criterion 5 the site supports an assemblage of

© Mouchel 2016

wintering birds of international importance totalling 86,639 waterfowl (5 year peak mean 1998/99-2002/2003).

Criterion 6; the site supports species/populations occurring at levels of international importance in spring/autumn: Tundra swan *Cygnus columbianus bewickii*, (26 individuals, representing an average of 0.1% of the all-Ireland population (5 year peak mean 1998/9-2002/3)) and in winter: Whooper swan *Cygnus cygnus*, (1,523 individuals, representing an average of 7.2% of the population), Common pochard *Aythya ferina*, (20,279 individuals, representing an average of 5.7% of the population), Tufted duck *Aythya fuligula*, (17,807 individuals, representing an average of1.4% of the population), Greater scaup, *Aythya marila marila*, (3,377 individuals, representing an average of 1% of the population) Common goldeneye *Bucephala clangula clangula*, (6,645 individuals, representing an average of 1.6% of the population)) all from 5 year peak mean 1998/9-2002/3.

The River Foyle and Tributaries SAC (NI) (Site Code UK0030320)
This SAC is designated for both its Habitats Directive Annex I habitat and Annex II species it supports. Its primary reasons for designation are:

- Water courses of plain to montane levels with the *Ranunculion fluitantis* and *Callitricho-Batrachion* vegetation (this habitat type is characterised by the abundance of water-crowfoots *Ranunculus* spp., subgenus *Batrachium* (*Ranunculus fluitans*, *R. penicillatus ssp. penicillatus*, *R. penicillatus* ssp. *pseudofluitans*, and *R. peltatus* and its hybrids). Floating mats of these white-flowered species are characteristic of river channels in early to mid-summer. They may modify water flow, promote fine sediment deposition, and provide shelter and food for fish and invertebrate animals.); and

- Atlantic salmon *Salmo salar* (the river has the largest population of Atlantic salmon *Salmo salar* in Northern Ireland, with around 15% of the estimated spawning numbers. The majority of the salmon returning are grilse (single wintering salmon), with a smaller but important number of spring salmon (multi-wintering salmon) also occurring.)

A qualifying feature, but not primary reason for designation is its population of otter *Lutra lutra*.

The habitat occurrence account for this SAC is not yet available.

The River Finn SAC (ROI) (Site Code IE0002301)
This site, all within Co. Donegal, comprises almost the entire freshwater element of the River Finn and its tributaries, as well as Lough Finn, where the river rises and the spawning grounds at the headwaters of the Mourne and Derg Rivers, Loughs Derg and Belshade. The tidal stretch of the Foyle north of Lifford to the border is also part of the site where the River Finn SAC is more or less contiguous with the River Foyle SAC. This SAC is designated for both the Habitats Directive Annex I habitat and Annex II species it supports.

- Active blanket bog, oligotrophic waters of sandy plains, wet heath and transition mires.

- Atlantic salmon; and

© Mouchel 2016

- Otter.

None of the habitats for which the site is designated are present within the section of the River Finn SAC that is included within the study area. Habitat that supports the Annex II species is adjacent to the site for about a 2km length between Strabane in NI and Lifford in ROI and a 1km length to the west of Magheramason.

Owenkillew River SAC (NI) (Site Code UK0030233)
This SAC is designated for both its Habitats Directive Annex I habitat and Annex II species it supports. Its primary reasons for designation are:

- Water courses of plain to montane levels with the *Ranunculion fluitantis* and *Callitricho-Batrachion* vegetation;
- Old sessile oak woods with *Ilex* and *Blechnum*; and
- Freshwater pearl mussel *Margaritifera margaritifera*.

Habitats Directive Annex I habitats present as a qualifying feature, but not a primary reason for selection of this site include:

- Bog woodland (priority feature).

Habitats Directive Annex II species present as a qualifying feature but not a primary reason for selection of this site includes:

- Atlantic salmon; and
- Otter.

None of the habitats for which the site is designated are present within the section of the Owenkillew SAC that is included within the ecology study area.

Tully Bog SAC (NI) (UK0030326)
Tully Bog is an isolated lowland raised bog lying in a shallow hollow within the former flood-plain of the Fairy Water River. This SAC is designated for its Habitats Directive Annex I habitats only. The primary reason for designation is:

- Active raised bogs (priority feature)

There are no other qualifying features for this site.

© Mouchel 2016

National sites

Ten sites with a national statutory designation were recorded within the ecology study area. These sites are listed below with a brief summary of the reasons for their designation taken from the official DoE ASSI declarations.

River Foyle and Tributaries ASSI (component ASSI to River Foyle and Tributaries SAC) (NI) (declared 2003)
This site is designated for the physical features of river and associated flora and fauna including Atlantic salmon and other fish species, otter, birds, fresh water mussel and aquatic vegetation communities and riparian woodland. Of particular importance is the population of Atlantic salmon, which is one of the largest in Europe. The area is also important as a river habitat. In their upper catchments, the rivers are all fast-flowing spate rivers with dynamic flow regimes characterised by sequences of rapid, riffle and run. Although the banks may have been modified in the past, the channels are natural and composed of large cobble substrate with scattered boulders and sandy marginal deposits, while cobble side and point bars and discrete sand deposits are common features. At the upper reaches of the River Derg and its two tributaries, the aquatic flora reflect the highly acidic character of the water, with mosses and liverworts dominant. Beds of stream water crowfoot occur where the flow is less dynamic.

Owenkillew River ASSI (component ASSI to River Owenkillew SAC) (NI) (declared 2001)
This site is designated for the physical features of river and associated flora and fauna, with adjacent woodlands providing additional interest. The river is notable for the physical diversity and naturalness of the bank and channel, and the richness and naturalness of its animal and plant communities. It is a very important river for aquatic plant communities and rare plant and animal species; it includes the largest known population of freshwater pearl mussel in NI and it also supports a diverse fish community including Atlantic salmon and other species. The river gradually changes in character from ultra-oligotrophic to mesotrophic as it flows from its source to its confluence with the Strule. The river flows through plantations, moorland, riparian semi-natural broad leaved woodland, rough pasture and some fen/swamp communities. The woodlands are characteristically acid in type and provide shelter for riverine animals such as otter and a wide variety of riparian bird species.

Tully Bog ASSI (component ASSI to Tully Bog SAC) (NI) (declared 1996)
This site is designated for the peatland flora and associated fauna. Biological interest relates to size and intactness of the bog, in addition to the diversity of the vegetation and structural features and presence of rare and notable species. Special features include a well-defined dome. Hand cutting has been restricted to edges of the peat and the lagg and has created a mosaic of habitat including pools which are known to support characteristic invertebrate fauna including a diverse water beetle, damselfly and dragonfly assemblage.

Strabane Glen ASSI (NI) (declared 1993)
This site is designated for the woodland flora and characteristic associated fauna: calcareous upland mixed Ash/Hazel woodland which is considered atypical and rare for the region and is due to the underlying geology. The valley represents a line of weakness between the Upper Dalradian schists and a basic igneous unit. The woodland has developed along both sides of the valley and has a wide diversity in structure, plant communities and overall species richness.

© Mouchel 2016

McKean's Moss ASSI (NI) (declared 1996)
This site is designated for the peatland flora and associated flora: biological interest relates to its position within NI being the most north-westerly lowland raised bog in the country, in addition to the diversity of peatland flora and fauna and the presence of rare and notable species. It has a moderately well defined dome and the bog has been cut in the past and is dominated by wet woodland. The hand cuttings are extensive but are confined to the edges of the site.

McKean's Moss Part II ASSI (NI) (declared 1997)
McKean's Moss Part II is an integral part of McKean's Moss ASSI designated for the peatland flora and associated flora, and is the most north-westerly lowland raised bog in NI. This part of the bog system has been cut for turf in the past and is now dominated by woodland with a ground flora dominated by *Sphagnum* mosses and Purple Moor-grass *Molinia caerulea*. The old hand cuttings provide additional habitat diversity to McKeans Moss ASSI and are integral to the hydrological integrity of the bog.

Grange Wood ASSI (NI) (declared 1999)
This site is designated for the woodland flora and fauna: a range of woodland vegetation types are present including base-rich woodland communities that are characteristic of Carboniferous limestone rocks. The structure and composition of the wood is very variable and reflects the variation in environmental conditions and past and present management practices. Due to the diversity of woodland communities the wood has one of the richest plant assemblages in the Sperrins region. The canopy is generally dominated by hazel with occasional tall ash standards; there are some water logged areas that support alder and willow species. The field layer is diverse. The woodland supports many animal species including breeding birds.

Baronscourt ASSI (NI) (declared 2011)
This site is designated for its parkland habitat and associated species. This historic parkland is characterised by a wide variety of parkland tree and shrub species including significant numbers of open-grown veteran trees and some ancient trees. The biological interest comes from the standing and fallen dead wood which provides a specialist habitat for rare and uncommon species of invertebrates (particularly beetles and flies), lichens and fungi. The parkland tree habitat also provides an important habitat for a wide range of plants and animals including birds, invertebrates and mammals including bats and red squirrels *Sciurus vulgaris*.

Lough Neagh (component ASSI to Lough Neagh and Lough Beg SPA and Lough Neagh & Lough Beg Ramsar Site (NI) (declared 1992)
This site is designated for its large shallow freshwater eutrophic lake and associated flora and fauna. It is of biological interest for wintering breeding birds, wetland vegetation, invertebrates and fish species. The site consists of the open lake, marginal waters and fringing land including wet grassland, fens, woodland, swamp, cut-over bog, basalt rock outcrops and boulders and mobile sandy shores. These habitats provide niches for exceptional numbers of rare plants, including those protected under Part 1 of Schedule 8 of the Wildlife (NI) Order 1985, invertebrates, rare fish and large numbers of waterfowl and breeding birds.

Lough Beg ASSI (component ASSI to Lough Neagh and Lough Beg SPA and Lough Neagh & Lough Beg Ramsar Site (NI) (declared 1987)

© Mouchel 2016

This site is designated for its very shallow lake and the diversity of habitats and wildlife that it supports. The lake formed from a widening on the River Bann at its exit from Lough Neagh supports extensive submerged aquatic vegetation, with swamp vegetation to the east shore and some of the most extensive areas of unimproved wet meadows in NI. These habitats support large numbers of rare plants including those protected under Part 1 of Schedule 8 of the Wildlife (NI) Order 1985 and large numbers of wintering waterfowl and breeding birds.

Non-statutory designated sites

One non-statutory wildlife site is located within the study area. This is Strabane Nature Reserve which is designated for its wet woodland and ponds.

© Mouchel 2016

APPENDIX 11B FRESHWATER FISH

Certain freshwater fish are significant nature conservation receptors for the Proposed Scheme for the following reasons:

- Atlantic salmon *Salmo salar*, allis shad *Alosa alosa*, twaite shad *A. fallax*, river lamprey *Lampetra fluviatilis*, brook lamprey *L. planeri* and sea lamprey *Petromyzon marinus* are listed on Annex II to the Council Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora (the Habitats Directive). A site that is considered to be of significance to any of these species may be designated as a Special Area of Conservation (SAC);

- The abundance, composition, and age class of freshwater fish, are biological components of the surface water/ecological status of a watercourse classified under The Water Framework Directive 2000/60/EC (WFD);

- The water quality variables of a watercourse enable classification under The Surface Waters (Fishlife) (Classification) Regulations (Northern Ireland) 1997 (as amended), with the classification identifying the species composition most likely to be present or potentially supported; and

- Some fish are Species of Conservation Concern (SoCC) in Northern Ireland (NI) and Priority Species under the UK post-2010 Biodiversity Framework (former UK Biodiversity Action Plan (BAP)). These include European smelt *Osmerus eperlanus*, Atlantic salmon, brown trout *Salmo trutta*, European eel *Anguilla anguilla*; river lamprey, brook lamprey and sea lamprey.

Legislation

Some national and European legislative frameworks give legal protection to certain fish species. The most significant of these is Council Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora (the Habitats Directive), which makes provision for the protection of certain habitats and species, listed in Annex II to the directive, through the designation of SAC for sites that will make a significant contribution in the conservation of the habitats/species. The SAC receive full protection under The Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended) (the Habitats Regulations). Significant fish species likely to be present within the extents of the scheme include Atlantic salmon, river lamprey, brook lamprey and sea lamprey.

The Environment (Northern Ireland) Order 2002 makes provision for ASSIs.

Salmonid fish species receive further and specific protection because of the importance of their supporting habitat in NI and the importance of these species as a commercial resource (angling). The Foyle Fisheries Act (Northern Ireland) 1952 (as amended) and the Fisheries Act (Northern Ireland) 1966 (as amended) (the Fisheries Act) provide protection to salmonid spawning habitat and legislate against disturbance of species using this habitat (young and breeding individuals),

© Mouchel 2016

obstruction to migration, and the capture, disturbance or obstruction of spawn or fry passage, and capture of salmonid fish by certain methods. The Fisheries Act also provides legislative protection against the taking, disturbing or obstructing the passage of eels.

Directive 2000/60/EC, The Water Framework Directive (WFD), implemented in Northern Ireland by The Water Environment (Water Framework Directive) Regulations (Northern Ireland) 2003, makes provision for the maintenance and improvement of the ecological status of inland surface waters. The ecological status of a waterbody is determined from three elements (biological, hydro-morphological and chemical/physico-chemical). The abundance, composition, and age class of fish are factors that contribute to the assessment of biological quality of the watercourse. Although the Directive does not place specific requirements upon developers, the Northern Ireland Environment Agency (NIEA), acting as the competent authority, is able to object to proposals or insist on the implementation of mitigation measures where schemes are likely to adversely impact the ecological quality of inland surface waters designated under the Directive.

Directive 2006/44/EC on the quality of fresh waters needing protection or improvement in order to support fish life (the Freshwater Fish Directive (consolidated)) (FFD), makes provision for the protection and improvement of the quality of running and standing waters capable of supporting, or would become capable of supporting if pollution was reduced or eliminated, fish species belonging to indigenous species offering natural diversity or species the presence of which is judged to be desirable for water management purposes. The FFD defines a waterbody as either a “Salmonid” or “Cyprinid” waterbody, based upon species assemblages, and prescribes physical and chemical water quality objectives. Although the Directive does not place specific requirements upon developers, the NIEA, acting as the competent authority, is able to object to proposals or insist on the implementation of mitigation measures where schemes are likely to adversely impact the ecological quality of inland surface waters designated under the Directive.

Directive 2004/35/EC, The Environmental Liability Directive is implemented in Northern Ireland by The Environmental Liability (Prevention and Remediation) Regulations (Northern Ireland) 2009. The Directive establishes a framework for environmental liability based on the “polluter pays” principle, with a view to preventing and remedying environmental damage. Under the terms of the regulations, environmental damage to protected species is that which has a significant adverse effect on the species reaching or maintaining favourable conservation status, and where it is caused by an activity where the operator was at fault or was negligent as to whether such damage would be caused. The Directive defines protected species as those listed in Annex I to the Directive 2009/147/EC on the conservation of wild birds (codified version) (the Birds Directive) and in Annexes II and IV to the Habitats Directive.

Finally, and more generally, The Water (Northern Ireland) Order 1999 makes provisions to combat and prevent pollution affecting waterways and groundwater, and therefore has implications for all fish species.

© Mouchel 2016

Conservation status

Atlantic salmon

The Atlantic salmon is of European importance as it is listed in Annexes II and V of the Habitats Directive and Appendix III of the Bern Convention. The species is listed in the International Union for Conservation of Nature (IUCN) Red List of Threatened Species and as a Priority Species in the UK, and as a NI SoCC. Atlantic salmon are also considered to be a major commercial species.

Brown/sea trout

Brown trout and sea trout are the same species, distinguished from each other by whether they are predominantly freshwater populations (brown trout) or anadromous (moving between freshwater and sea water - sea trout) This species is important commercially, considered as possibly the most important single sport species over Europe as a whole (Maitland and Linsell, 2006). This species is listed as a Priority Species in the UK and as a NI SoCC.

Lamprey

All three lamprey species are of European importance following listing on Annex II of the Habitats Directive and Appendix III of the Bern Convention. The river lamprey is also listed in Annex V of the Habitats Directive. The sea lamprey and river lamprey are both listed as Priority Species in the UK.

Maitland (2000) considers all three species of lamprey to be of vulnerable conservation status, with the Red Data Book for Ireland listing all three species as indeterminate (Maitland, 2003). None of the lamprey species are listed as NI Priority Species or SoCC.

European smelt

European smelt are considered by Maitland and Lyle (1991) to be one of the ten fish species in the British Isles under greatest threat. However, this has not been recognised through national or European legislation. The European smelt is, however, listed as a Priority Species and as a NI SoCC.

Shad

Both species of shad are of European importance following listing in Annexes II and V of the Habitats Directive and Appendix III of the Bern Convention. The allis and twaite shad are both listed as Priority Species and as a NI Priority Species, and SoCC.

Although there is not Red Data Book for fish in Britain, Maitland (2000) considers allis shad to be Critically Endangered and twaite shad to be endangered. The Red Data Book for Ireland, published before the revision of categories lists the allis shad as endangered and twaite shad as vulnerable (IUCN, 1994; Maitland and Ellis, 2003).

© Mouchel 2016

European eel

The European eel has recently been listed as a Priority Species because of population declines across much of Western Europe. Scientific research by the Joint European Inland Fisheries Advisory Commission (EIFAC) and International Council of the Exploration of the Sea (ICES) Working Group on Eels in 2006 supported this, identifying a decline in most of its distribution and that it is now outside safe biological limits (IUCN, 2008). The species is not, however, listed as a NI SoCC.

Other species

Species that do not receive specific legal protection but which may be present within the study area are components of the freshwater fish assemblage. These include the following which are known to occur in the study area:

- Flounder *Platichthys flesus*;
- Stone loach *Barbatula barbatula*;
- Gudgeon *Gobio gobio*;
- Roach *Rutilis rutilis*;
- Perch *Perca fluviatilis*;
- Pike *Esox lucius*;
- 3-spined stickleback *Gasterosteus aculeatus*; and
- Minnow *Phoxinus phoxinus*.

Baseline data collection

The ecological baseline for freshwater fish has been derived from field survey data, including surveys undertaken in 2008 and 2009 to inform the A5WTC ES 2010 and extensive consultation with Loughs Agency relating to watercourses with potential for important fish species undertaken in 2012 and 2013. Desk study information has also been sourced to supplement the field survey data. These methods are described in greater detail below.

Desk Study Data

Existing species records of freshwater fish were sourced from the Loughs Agency (LA) and the Agri-fisheries and Biosciences Institute (AFBI) for the A5WTC ES 2010. Additionally, freshwater fish species records and habitat data were obtained from the LA in 2013. This data covered the period 2009 – 2012, and included the results of electrofishing and habitat suitability assessments undertaken by the LA for the study area (see Figure 11.5).

© Mouchel 2016

A5WTC ES 2010 Field Surveys

Selection of field survey sites

Forty-seven aquatic survey sites, identified from the River Habitat Survey (RHS) data collected in 2008, were scrutinised for their fisheries habitat quality and fish utilisation potential using a Fisheries Habitat Survey (FHS) method.

The surveys followed standard RHS guidance presented in the Field Survey Guidance Manual: 2003 Version, which describes the method for collecting data associated with the physical structure of watercourses. This includes the extent of artificial modification and presence of natural features within the watercourse which are favoured by wildlife (see Table 11B.1). Data was collected along a 500m stretch of watercourse, which extended to 250m upstream and downstream from the crossing point of the Proposed Scheme.

Table 11B.1 RHS survey criteria recorded during the field visits

Habitat modification score criteria	Features recorded in RHS
A	Field survey details
B	Predominant valley form
C	Number of riffles, pools and point bars
D	Artificial features
E	Physical attributes
F	Banktop land-use and vegetation structure
G	Channel vegetation types
H	Land-use within 50m of banktop
I	Bank profiles
J	Extent of trees and associated features
K	Extent of channel and bank features
L	Channel dimensions
M	Features of special interest
N	Choked channel, >33% vegetation
O	Notable nuisance plant species
P	Overall characteristics
Q	Alders, presence/diseased

The data collected during the RHS was analysed to produce two numerical scores for each river: the Habitat Modification Score (HMS) and Habitat Quality Assessment (HQA). The HMS is a numerical score that provides an indication of the extent of artificial modification on the

© Mouchel 2016

watercourse along the survey reach (Table 11B.3). A higher HMS score indicates a greater degree of artificial modification. The inverse is true for the HQA score, which provides an indication of the extent of natural features within the watercourse, which are of value to wildlife. Generally speaking, higher HQA scores indicate a more 'natural' watercourse which is likely to be of greater nature conservation interest. The HMS score relates only to modification of the channel, while the HQA score is derived from features in the channel and the river corridor.

Table 11B.2 Habitat modification score (HMS) categories for describing the physical state of the river channel

HMS score	Descriptive category of channel
0-2	Pristine / Semi-natural
3-8	Predominately unmodified
9-20	Obviously modified
21-44	Significantly modified
>45	Severely modified

The FHS was informed by the Scottish Fisheries Coordination Centre (SFCC) (SFCC 2007) method and provided a standardised methodology for the recording of environmental variables specific to the sampling locations, providing a greater detail of information on the exact habitat in survey locations to that of the RHS.

Following the FHS appraisal 16 of the 47 RHS survey sites were selected for detailed fish survey and assessment due to their habitat suitability for fish species of importance to the assessment. Table 11B.3 presents these field survey locations and the results of the RHS assessment.

Table 11B.3 Field survey locations and assessment

River	Aquatic site number	Habitat quality assessment (HQA) score	Habitat modification class (derived from the Habitat Modification Score (HMS))
Burn Dennet	6	40	Obviously modified
Glenmornan River	7	31	Significantly modified
Mourne River	8	16	Severely modified
	10	46	Predominantly unmodified
River Finn	9	33	Obviously modified
River Derg	14	36	Significantly modified
River Strule	18	25	Significantly modified
	20	46	Obviously modified
Fairy Water	28	30	Significantly modified
Drumragh River	32	35	Significantly modified

© Mouchel 2016

River	Aquatic site number	Habitat quality assessment (HQA) score	Habitat modification class (derived from the Habitat Modification Score (HMS))
Camowen River	34	35	Obviously modified
Ranelly Drain	36	18	Significantly modified
Routing Burn	38	54	Obviously modified
Roughan River	41	55	Obviously modified
Ballygawley River	42	44	Significantly modified
River Blackwater	47	60	Obviously modified

Fish Survey

Electrofishing

Assessment of the composition, abundance, and age class of fish fauna using electrofishing techniques was carried out following techniques developed by the SFCC, the Environment Agency (EA) and the EU LIFE in UK Rivers project. The methodology conformed to British Standard guidance BS EN 14011:2003 (water quality – sampling of fish with electricity), using an Electracatch International ELBP2 back pack unit (battery powered) with a single anode.

The electrofishing surveys were carried out by a team of three experienced surveyors, all of whom were accredited by the SFCC to Level II (undertaking electrofishing operations). The team was led by a SFCC Level III accredited surveyor (leading electrofishing operations and undertaking fisheries habitat surveys) at all times. Each survey was undertaken with only two surveyors in the watercourse and a banks person for health and safety purposes.

Fully quantitative sampling was undertaken for all sites where this was possible, however where sites exceeded 1m in depth or 15m in width qualitative sampling was utilised as quantitative sampling could not be carried out effectively/safely. Each qualitative and quantitative survey was progressed carefully in an upstream direction, from bank to bank wherever possible, following the SFCC guidelines on undertaking electrofishing operations.

All captured fish were retained in well oxygenated holding facilities prior to processing. All species that are identified as threatened, of conservation concern or where age class determination is possible in-situ were anaesthetised using a dilute solution of benzocaine, 40 mg/l, so that body lengths and weights could be recorded (to determine population structure/age class). All other fish species were inspected without using the anaesthetic solution and abundance only was recorded. After processing, all fish were transferred to well-oxygenated recovery tanks, with battery powered air pumps inserted, and were returned to the area from which they were sampled when all fish had completely recovered (normal activity observed and maintaining their position/orientation constantly in the water column).

© Mouchel 2016

Lamprey

Areas of suitable lamprey habitat (nursery), following APEM (2002) guidance, were subject to standard electrofishing techniques to ascertain the presence / likely absence of lamprey ammocoetes (juveniles) using a fully quantitative sampling methodology. The methodology was undertaken following that described in the EU LIFE in UK River project (Harvey and Cowx, 2003), with the timing of the surveys vital to ensure capture of a range of age classes that would include ammocoetes and transformers (juveniles that are changing into adult lamprey).

Netting

Netting surveys were undertaken in all watercourses considered to be unsuitable for assessment by electrofishing techniques, largely due to the geomorphological characteristics of the watercourses (e.g. depth/width variation). Two netting methodologies were undertaken in unison, seine netting and fyke netting, with both types of net deployed from a 14ft heavy duty inflatable boat.

For each of these methodologies, catch per unit of effort (CPUE) was the main objective, which was controlled through the total number of nets per site. The set-up of holding facilities and processing of fish fauna species is the same as that described above.

Seine netting

Seine netting was undertaken using a 25m long and 4m deep net (2mm fryma mesh), with a float line at the top and lead line at the bottom, which was deployed from the front end of the boat. The seine netting methodology was repeated a total of three times for each site to increase the precision of the sample from the reach and ensure an effective sample of the area, following the requirements for CPUE. Depletion in the abundance of fish in the catches from the sample runs will identify an effective result.

Fyke netting

Fyke netting was undertaken using four nets (5x100 with 10mm mesh), with two placed in the margins of each side of the channel.

Licensing

To legally undertake electrofishing and netting surveys in the watercourses identified within the study area, it was necessary to obtain the following permits from the appropriate authorities:

- Section 69 Permit from the Loughs Agency (LA) for aquatic site numbers 6 to 38 (those which fall within the River Foyle catchment and under the jurisdiction of the Loughs Agency);

- Section 14 Permit from the Department of Culture, Arts and Leisure (DCAL) for aquatic site numbers 41 to 47 (those which fall within the River Blackwater catchment and under the jurisdiction of DCAL); and

© Mouchel 2016

- Section 14 Permit from the Department of Communications, Energy and Natural Resources (Republic of Ireland) for aquatic site number 47 (that which falls within the River Blackwater catchment and is under the jurisdiction of the Department of Communications, Energy and Natural Resources).

In addition to these permits, it was necessary to demonstrate to the NIEA that methodologies of ecological assessment would not have adverse impacts upon the River Foyle and its Tributaries ASSI and obtain their permission prior to undertaking surveys. The NIEA had no concerns with regards to impacts to the ASSI from the methodologies proposed.

Population estimation

Population estimation was undertaken for all fish populations caught using quantitative survey methodologies (including the lamprey electrofishing methodology) as the statistical model assumes that there is a stationary population during the trapping programme. The method of obtaining an estimate of the population size follows that prescribed by Zippin (1956).

Limitations

Due to the nature of river systems, impacts of heavy rainfall can persist for a long period of time, with surface runoff leading to an immediate spike in the quantity of water in the channel and groundwater flows resulting in a more prolonged increase in river levels. In the time following a heavy rainfall event the turbidity of the river can still be elevated due to the high sediment input associated with watercourses which flow through rural farm land. No surveys could be undertaken during elevated flows or high turbidity for health and safety reasons and because reduced sampling efficiency would not be representative of the reach. Weather conditions and associated impacts upon the watercourse were avoided through forward planning, using weather forecasts, and as such were not a limitation to the overall survey.

The biggest limitation to the survey was due to land access difficulties. Due to the heavy and bulky equipment that was required during the fish fauna surveys and the necessity for 4x4 vehicular access to the river where boat based surveys were required, choice of survey locations were limited. In addition to this, refusal of permission to access land in some areas caused problems with access to the watercourse. However, forward planning helped to negate land access problems with the optimal site access being identified and alternatives considered when access was refused.

A single site visit combining the collection of information and sampling of a small proportion of the habitat could potentially not be representative of the reach. However, this limitation does not influence the ability to achieve the objectives of the report as consideration of species composition, abundance and age class and fisheries habitat within the study area can enable the identification of ecological value. Similarly, due to a petrochemical pollution incident upstream of the Ballygawley River survey site, it was not possible to quantitatively sample the fish population present. However, the qualitative results are considered appropriate to determine the value of the population and habitat present.

Designated sites

Three sites of European importance are present within the study area, the River Foyle and its Tributaries SAC, River Finn SAC and Owenkillew River SAC. The Proposed Scheme crosses the

© Mouchel 2016

River Foyle and its Tributaries SAC twice, on the River Mourne and the River Derg. There are also four drainage outfalls in to the River Finn, and the boundary of the works is at the top of the river bank and within approximately 4m of the normally wetted channel.

The River Foyle and its Tributaries SAC is noted for the physical diversity and naturalness of the banks and channels, especially in the upper reaches, and the richness and naturalness of its plant and animal communities. The SAC is primarily designated for the presence of watercourses of plain to montane levels with the *Ranunculion fluitantis* and *Callitricho-Batrachion* vegetation. Atlantic salmon are a primary reason for designation as the river supports the largest population in NI with approximately 15% of the estimated spawning numbers. Otter *Lutra lutra* are also a qualifying feature. The site is also designated as an ASSI.

The River Finn SAC is an ROI designated site and comprises almost the entire freshwater element of the River Finn and its tributaries. The site is designated because of the presence of Atlantic salmon, otter, active blanket bog, lowland oligotrophic lakes, wet heath and transition mires. The Finn catchment is one of Ireland's premier salmon waters and is considered to be important in an international context because of the stability of its spring salmon population.

The Owenkillew River SAC lies to the east of the preferred route and is entirely upstream of the scheme. The Owenkillew River SAC is primarily designated for the presence of freshwater pearl mussel *Margaritifera margaritifera*, watercourses of plain to montane levels with the *Ranunculion fluitantis* and *Callitricho-Batrachion* vegetation and old sessile oak woods with *Ilex* and *Blechnum* in the British Isles. Atlantic salmon, otter and bog woodland are additional qualifying features of the SAC. The Owenkillew River is also designated as an ASSI for the same reasons, but also notes the presence of brook lamprey which has a population category of D from the Natura 2000 data form.

River classifications/designations

Water Framework Directive designation

A total of 13 watercourses within the study area are classified under the WFD, with surface water status determination undertaken for each classified watercourse by the NIEA. The determination of surface water status under the WFD considers the status of biological (benthic invertebrate fauna, fish, macrophytes, phytobenthos), hydromorphological (hydrological regime, river continuity morphologial conditions) and chemical and physico-chemical (thermal conditions, oxygenation conditions, nutrient conditions, priority substances and other substances) elements. Table 11B.4 identifies the surface water status of each of the 16 surveyed watercourses, with the fish status (abundance, composition and age class) identified where this has been determined.

Table 11B.4 Surface water status of classified rivers under the WFD

River	Aquatic site ID	Waterbody ID	Surface water status	Fish fauna status

A5WTC ES 2010 field survey results

Field surveys for the A5WTC ES 2010 recorded a diverse composition, abundance, and age class of fish fauna was recorded. Twelve species were identified across the study area, including Atlantic salmon, brown trout, European eel, lamprey sp., flounder, 3-spined stickleback, minnow, stone loach, gudgeon, roach, pike and perch.

Of the key species listed as being of conservation concern (NI SoCC), Atlantic salmon were recorded in 10 of the aquatic survey locations, brown trout were recorded in 13, lamprey sp. in 9 and European eel in 4. All of the aquatic sites subject to fish fauna surveys contained at least one species listed as being of conservation concern.

Of the more common species, minnow and 3-spined stickleback were the most frequently caught species, with large numbers of each species recorded in the Mourne River, River Finn, River Strule and Fairy Water. Flounder only occurred in the rivers subject to tidal influence. A very large number of cyprinid species were both observed and caught during the surveys in the Fairy Water, with huge numbers of gudgeon, minnow and roach caught along with perch and a pike.

Table 11B.5 presents the results of the electrofishing and netting surveys undertaken at each aquatic site during the A5WTC ES 2010 assessment.

© Mouchel 2016

Table 11B 5 Electrofishing and netting survey results as presented in the A5WTC ES 2010

River	Aquatic site number	Species recorded (composition and abundance)
Burn Dennet	6	Atlantic salmon: 2 Brown trout: 2 European eel: 4 Lamprey sp.: 34 Flounder: 1 3-spined stickleback: 2 Minnow: 63
Glenmornan River	7	Atlantic salmon: 21 Brown trout: 3 European eel: 4 Flounder: 30 3-spined stickleback: 1
Mourne River	8	Atlantic salmon: 4 Brown trout: 5 Flounder: 60 Stone loach: 1 Minnow: 183 3-spined stickleback: 498
River Finn	9	Atlantic salmon: 2 Lamprey: 1 Flounder: 1 Stone loach: 1 Minnow: 103 3-spined stickleback: 414
Mourne River	10	Brown trout: 2 European eel: 2 Lamprey: 32 Flounder: 10 Stone loach: 10 Gudgeon: 1 Minnow: 65 3-spined stickleback: 3

River	Aquatic site number	Species recorded (composition and abundance)
Routing Burn	38	Brown trout: 13 Lamprey: 7 Stone loach: 9 Minnow: 3 3-spined stickleback: 1
Roughan River	41	Brown trout: 7 Lamprey: 18 3-spined stickleback: 2
Ballygawley River	42	Brown trout: 3 Stone loach: 3 3-spined stickleback: 1
River Blackwater	47	Minnow: 5

The following paragraphs discuss the results of these electrofishing and netting surveys. Additionally, the results of the RHS and FHS surveys undertaken at each aquatic site for the A5WTC ES 2010 are presented, with particular reference to habitat features within each survey site that were of importance to freshwater fish at the various stages in their lifecycle. This included identification of habitat used for spawning, shelter, or as a juvenile nursery, as well as determining whether the watercourse was accessible during migration.

Burn Dennet - 6

Four species of conservation concern in NI were identified in the survey reach, which were Atlantic salmon, brown trout, European eel and lamprey sp. Atlantic salmon, brown trout and European eel were caught in low abundances during the qualitative electrofishing survey with a high abundance of juvenile lamprey sp. (ammocoetes) caught during the targeted electrofishing surveys. As there was no depletion in the lamprey surveys, a population estimate could not be made using Zippin (1956). More common fish species caught from the reach were flounder, 3-spined stickleback and minnow.

The habitat of the Burn Dennet within the A5WTC ES 2010 survey area was relatively diverse, with a variety in the flow structure, substrate and depths. The presence of instream vegetation was fairly restricted with siltation evident. The riparian vegetation provided suitable fish cover predominantly on the right bank, with some overhanging boughs, despite a relatively simple vegetation structure which was dominated by Japanese knotweed *Fallopia japonica* on the right bank. The river site was noted as accessible to salmon and trout, with stocking unlikely, and suitable spawning habitat for salmonids present. The age class, identified from measurements taken, of Atlantic salmon and brown trout caught suggested they were parr, identifying the habitat as being of importance as a nursery site. It was noted that the spawning habitat present could be used for salmonid spawning, however more significant spawning habitat upstream is more likely to be utilised.

© Mouchel 2016

Suitable juvenile lamprey habitat existed in the marginal areas of the Burn Dennet, with the sediments composed of silt and sand with suitable depths (>15cm) to classify as optimal habitat. Two of the three targeted lamprey surveys were undertaken in optimal habitat, with the third in sub-optimal habitat. The spawning habitat present in the reach was thought to be of importance to lamprey, particularly as juvenile (0+) lamprey were recorded during the survey.

Glenmornan River - 7

Three species of conservation concern in NI were identified in the survey reach, which were Atlantic salmon, brown trout and European eel. As the fully quantitative survey methodology was utilised, higher species numbers were caught from the reach. Atlantic salmon were caught in high abundance, with 21 individuals caught, however the brown trout and European eel were caught in low abundances. More common fish species caught from the reach were flounder and 3-spined stickleback. The population estimate for all fish fauna in the Glenmornan River, using Zippin (1956), identified that a maximum of 79 individuals could have been present in the surveyed habitat.

The habitat of the Glenmornan River within the survey area was relatively diverse, with a variety in the substrate and depths. However, the flow structure and river widths were uniform along the length of the site. The structure of the river banks were relatively diverse, although dominated by vegetation rooted in the stream/bed or banks, however the vegetation structure was simple and provided little fish cover. The site was considered to be accessible for both Atlantic salmon and brown trout, and unlikely to be stocked with either. The age class of Atlantic salmon and brown trout caught suggested they were parr, identifying the habitat as being of importance as a nursery site.

Mourne River - 8

Two species of conservation concern in NI were identified in the A5WTC ES 2010 survey reach, which were Atlantic salmon and brown trout. Atlantic salmon and brown trout were caught in low abundance, however the reach is known to support substantial populations of anadromous salmonids during migratory periods, which would be of high importance. More common fish species caught from the reach were flounder, stone loach, minnow and 3-spined stickleback.

The habitat of the Mourne River within the survey area was relatively uniform, with little variation in the flow structure, substrate or depths. The riparian vegetation was of a simple structure, dominated on the left bank by Japanese knotweed, giant hogweed *Heracleum mantegazzianum* and Himalayan balsam *Impatiens glandifera*. Approximately a quarter of the right bank provided overhanging boughs, although the canopy cover was very low. The site was considered to be accessible for both Atlantic salmon and brown trout, and unlikely to be stocked with either. The age class of Atlantic salmon and brown trout caught suggested they were parr, identifying the habitat as being of importance as a nursery site. Further to this, the site was noted as being included under the River Foyle and its tributaries SAC designation, which lists Atlantic salmon as a primary qualifying feature, with the habitat known to be of great importance to salmonids for migration.

River Finn - 9

Two species of conservation concern in NI were identified in the survey area, which were Atlantic salmon and lamprey. Atlantic salmon were caught in low abundance, however the reach was known to support substantial populations of anadromous salmonids during migratory periods,

© Mouchel 2016

which would be of high importance. The presence of lamprey sp. in the juvenile stage was a by-catch during netting surveys. More common fish species caught from the reach were flounder, stone loach, minnow and 3-spined stickleback.

The habitat of the River Finn within the Mouchel (2009) survey area was relatively uniform, with little variation in the flow structure, substrate or depths. The riparian vegetation was predominantly of simple structure, although the bank top vegetation of the right bank was complex, with about a quarter of the right bank providing overhanging boughs. The site was considered to be accessible for both Atlantic salmon and brown trout, and unlikely to be stocked with either. The age class of Atlantic salmon caught suggested they were parr, identifying the habitat as being of importance as a nursery site. Further to this, the site was noted as being included within the River Finn SAC designation, which lists Atlantic salmon as a qualifying feature, with the habitat known to be of great importance to salmonids for migration.

Mourne River - 10

Three species of conservation concern in NI were identified in the A5WTC ES 2010 survey area, which were Atlantic salmon, European eel and lamprey. Brown trout and European eel were caught in low abundance during the qualitative electrofishing surveys, however a high abundance of juvenile lamprey sp. (ammocoetes) were caught during the targeted electrofishing surveys. Although two of the lamprey surveys could not produce a population estimate as there was not a clear depletion in numbers caught, one of the sites did produce a population estimate of 27 individuals in the $1m^2$ survey area. More common fish species caught from the reach were flounder, stone loach, gudgeon, minnow and stickleback.

The habitat of the Mourne River within the survey area had some diversity in the substrate, which was stable and partly compacted, and depth, however the flow structure was entirely dominated by rippled flow. There was an absence of instream vegetation with some areas showing evidence of siltation. The riparian vegetation structure was largely complex, with the exception of the left bankface vegetation, with the right bank providing approximately 40% cover with approximately 50% containing overhanging boughs. The site was considered to be accessible for both Atlantic salmon and brown trout, and unlikely to be stocked with either. The age class of brown trout caught suggested they were parr, identifying the habitat as being of importance as a nursery site. Further to this, the site is included within the River Foyle and its Tributaries SAC designation, which lists Atlantic salmon as a primary qualifying feature, with the habitat known to be of great importance to salmonids for migration.

Suitable juvenile lamprey habitat was noted in the marginal areas of the Mourne River at this location, with the sediments composed of silt and sand with suitable depths to classify as optimal habitat. Two of the three targeted lamprey surveys were undertaken in optimal habitat, with the third in sub-optimal habitat.

River Derg - 14

Three species of conservation concern in NI were identified in the A5WTC ES 2010 survey area, which were Atlantic salmon, brown trout and European eel. Atlantic salmon were caught in high abundance, despite using a timed qualitative electrofishing methodology which is a sampling methodology that is used to determine presence/likely absence as opposed to determining the

overall population. The abundance of brown trout and European eel caught were both low. More common fish species caught from the reach were stone loach, roach and minnow.

The habitat of the River Derg within the survey area was largely uniform, with the depths, substrate and flow structure each dominated by one category. The substrate of the channel was largely stable and not compacted, dominated by cobbles, with almost a third of the survey area containing aquatic vegetation. The structure of the riparian vegetation of the right bank was uniform, with a simple bankface vegetation structure and complex banktop vegetation structure on the left bank. Only a small proportion of the left bank provided fish cover, despite a high proportion containing overhanging boughs. The site was considered to be accessible for both Atlantic salmon and brown trout, and unlikely to be stocked with either. The age class of Atlantic salmon and brown trout caught suggested both fry and parr were present, identifying the habitat as being of importance as a nursery site. The presence of salmonid fry suggests that spawning habitat is in close proximity to this site, as their dispersal from redds at this stage in the life cycle is often limited in extent (Crisp, 1996). Further to this, the site was noted as being included within the River Foyle and it's Tributaries SAC designation, which lists Atlantic salmon as a primary qualifying feature, with the habitat known to also be of great importance to salmonids for migration.

River Strule - 18

Three species of conservation concern in NI were identified in the A5WTC ES 2010 survey area, which were Atlantic salmon, brown trout and lamprey sp. Atlantic salmon were caught in high abundance, with brown trout caught in a moderate abundance. The presence of lamprey sp. in the juvenile stage was a by-catch during netting surveys, with targeted surveys for the species not undertaken due to the absence of optimal habitat. More common fish species caught from the reach were minnow and stickleback.

The habitat of the River Strule within the survey area was fairly diverse, with variation in the flow structure, substrates and depths within the survey area. The structure of the riparian vegetation on the banks was largely simple, with little overhanging boughs or cover present. The site was considered to be accessible for both Atlantic salmon and brown trout, and unlikely to be stocked with either. The age class of the Atlantic salmon caught suggest they were parr, identifying the habitat as being of importance as a nursery habitat. A significant riffle habitat was present upstream from the survey area at the confluence of the Owenkillew River and River Strule, and the absence of salmonid fry (0+) from the sample should not be considered conclusive in determination of no spawning habitat (due to catch efficiency and timing). The site falls at the upstream end of the River Foyle and its Tributaries SAC designation, which lists Atlantic salmon as a primary qualifying feature, and at the downstream end of the Owenkillew River SAC, which lists Atlantic salmon as a qualifying feature but not a primary reason for site selection.

River Strule - 20

Only one species of conservation concern in NI was identified in the A5WTC ES 2010 survey area, which was Atlantic salmon. Only one individual Atlantic salmon was caught during the netting survey of the reach. More common fish species caught from the reach were stone loach, minnow, 3-spined stickleback and roach.

The habitat of the River Strule within the survey area was very diverse, with variation evident in the flow structure, substrate and depths. The structure of the riparian vegetation on the right bank was

© Mouchel 2016

complex, with a quarter of the bank containing overhanging boughs, and the left bank was simple on the bankface and uniform on the banktop. The site was considered to be accessible for both Atlantic salmon and brown trout, and unlikely to be stocked with either. The age class of the Atlantic salmon caught suggested it was a parr, identifying the habitat as being of importance as a nursery habitat. The site was noted as falling outside of the River Foyle and its Tributaries SAC designation, but Atlantic salmon are known to be present upstream of this location.

Fairy Water - 28

Only one species of conservation concern in NI was identified in the A5WTC ES 2010 survey area, which was brown trout. Only one individual brown trout was caught during the netting survey of the reach. More common fish species caught from the reach were pike, minnow, 3-spined stickleback, roach, gudgeon and perch. Both roach and gudgeon were caught in huge numbers, and shoaling of roach was observed prior to the survey.

The habitat of the Fairy Water within the survey area was relatively diverse, with variation evident in the flow structure, substrate and depths. The vegetation structure of the left bank was complex, providing cover for fish fauna and about half of the bank containing overhanging boughs. The vegetation structure of the left bank was simple on the bankface and uniform on the banktop. The site was considered to be accessible for both Atlantic salmon and brown trout, and unlikely to be stocked with either. The age class of the brown trout caught suggested it was an adult, identifying the habitat as containing suitable flow, abundant cover (instream and bankside) and sufficient depth for this age class. A total of seven species of fish were caught from the habitat identifying it as being of importance to support a number of both salmonid and cyprinid species.

Drumragh River - 32

Two species of conservation concern in NI were identified in the A5WTC ES 2010 survey area, which were Atlantic salmon and lamprey sp. Atlantic salmon were caught in a low abundance, with only three individuals caught during the qualitative electrofishing survey. The targeted lamprey survey also found a low abundance of lamprey sp. present, with only one individual caught. More common fish species caught from the reach were stone loach, minnow and stickleback.

The habitat of the Drumragh River within the survey area shows a low level of diversity, with a variation in the substrate. The depth and flow structure show some variation, however they are dominated by one depth bracket/flow type. A large proportion of the channel contained instream vegetation, providing in-channel cover for fish species, with the channel showing some signs of siltation. The complex vegetation structure on the right bank provided fish cover for the whole reach with the majority of the site containing overhanging boughs. In contrast, the left bank had a simple bankface vegetation structure with a uniform banktop structure which provided only a small amount of fish cover and overhanging boughs. The site was considered to be accessible for both Atlantic salmon and brown trout, and unlikely to be stocked with either. The age class of Atlantic salmon caught suggested they were parr, although one was at the lower end of the age class scale for parr. This suggests that nursery habitat for fry and suitable spawning habitats are not far off this location, but identify the habitat as being of importance for salmonid nursery at the very least.

Suitable juvenile lamprey habitat existed in the marginal areas of the Drumragh River at the Mouchel (2009) survey location, with the sediments composed of silt and sand with suitable depths

© Mouchel 2016

to classify as optimal habitat. Two of the three targeted lamprey surveys were undertaken in optimal habitat, with the third in sub-optimal habitat.

Camowen River - 34

Three species of conservation concern in NI were identified in the A5WTC ES 2010 survey area, which were Atlantic salmon, brown trout and lamprey sp. Atlantic salmon were caught in high abundance, despite using a timed qualitative electrofishing methodology which is a sampling methodology that is used to determine presence/likely absence instead of determining the overall population. The abundance of brown trout caught during the qualitative electrofishing survey methodology was low, with a low abundance of lamprey caught during the species targeted electrofishing survey. A population estimate for lamprey species could not be completed as there was not a clear depletion in numbers caught. More common fish species caught from the reach were stone loach and minnow.

The habitat of the Camowen River within the survey area showed a high diversity in the range of habitats, with variation in the depths, substrate and flow structure. The complex vegetation structure of each bankface provided fish cover across almost half of the reach surveyed. There was a limited presence of instream vegetation, with the channel substrate unstable and partly compacted and showing evidence of siltation. The site was considered to be accessible for both Atlantic salmon and brown trout, and unlikely to be stocked with either. The age class of Atlantic salmon and brown trout caught suggested that both salmonid fry and parr were present, identifying the habitat as being of importance for nursery. The presence of salmonid fry also suggests the presence of spawning habitat in close proximity of the site.

Suitable juvenile lamprey habitat was found to exist in the marginal areas of the Camowen River at this location, with the sediments composed of silt and sand with suitable depths to classify as optimal habitat. Two of the three targeted lamprey surveys were undertaken in optimal habitat, with the third in sub-optimal habitat.

Ranelly Drain - 36

Two species of conservation concern in NI were identified in the survey area, which were Atlantic salmon and brown trout. Both species were caught in low to moderate abundance, with 11 Atlantic salmon and 1 brown trout. Only one more common species was caught during the quantitative survey methodology, although stone loach were caught in very high abundance (83 individuals). The population estimate for the reach identified that a maximum of 115 individuals could have been present in the surveyed habitat.

The habitat of the Ranelly Drain within the survey area was relatively uniform geomorphologically, with little diversity in the flow structure and depth variation. The substrates present showed a little variation, which was stable and uncompacted, however cobbles dominated. The vegetation structure on each bankface was simple, with a complex vegetation structure on the right bank top and uniform on the left banktop. Consequently, about a third of the channel on the right bank had suitable fish cover, with that on the left bank being very limited in extent. The site was considered to be accessible for both Atlantic salmon and brown trout, and unlikely to be stocked with either. The age class of Atlantic salmon caught suggested that both salmonid fry and parr were present, identifying the habitat as being of importance for nursery. The presence of salmonid fry also suggests the presence of spawning habitat in close proximity of the site.

© Mouchel 2016

Routing Burn - 38

Two species of conservation concern in NI were recorded in the A5WTC ES 2010 survey area, which were brown trout and lamprey sp. Despite using a quantitative survey methodology, a low abundance of brown trout was caught. More common fish species caught from the reach were stone loach, minnow and 3-spined stickleback. A population estimate for fish fauna species caught, excluding lamprey sp., identified that a maximum of 30 individuals could have been present in the habitat. The targeted lamprey survey found a low abundance of lamprey ammocoetes present, with the population estimate for these identifying that it is likely all individuals were caught.

The habitat of the Routing Burn showed little diversity, with a dominant depth category and flow structure. The substrate does, however show some variation within the survey area. Instream vegetation is only present in limited extent, with the substrate being stable and compacted with evidence of siltation. The vegetation structure of the left bank is simple with a simple vegetation structure on the right banktop and complex on the right bank. Consequently, the riparian vegetation provided extensive fish cover on both banks, although the presence of overhanging boughs was more significant on the right bank. The site was considered to be accessible for both Atlantic salmon and brown trout, and unlikely to be stocked with either. The age class of brown trout caught suggested they were parr, with the habitat being of importance for nursery.

Suitable juvenile lamprey habitat exists in the marginal areas of the Routing Burn at this location, with the sediments composed of silt with suitable depths (>15cm) to classify as optimal habitat. The depths in some locations were up to 100cm. Two of the three targeted lamprey surveys were undertaken in optimal habitat, with the third in sub-optimal habitat.

Roughan River - 41

Two species of conservation concern in NI were in the survey area, which were brown trout and lamprey. Despite using a quantitative survey methodology, a low number of brown trout were caught. Only one more common fish species was caught, which was a low abundance of 3-spined stickleback. A population estimate for fish fauna, excluding lamprey sp., identified a maximum of 19 individuals in the surveyed reach. The targeted lamprey survey found a moderate abundance of ammocoetes present, with the population estimate for the species indicating that the population from the surveyed area is not dissimilar to that caught.

The habitat of the Roughan River within the survey area exhibited a high diversity, with variations evident in the flow structure, substrate and depths, although the channel width was relatively constant. The riparian vegetation structure was a mixture of simple and complex on both banks, providing extensive fish cover on both banks throughout the survey area. The site was considered to be accessible for brown trout, however accessibility for Atlantic salmon is unknown given that low numbers of individuals were known from historic records and that it has not been classified under the FFD as a salmonid river. The age class of brown trout caught suggested they were parr, with the habitat being of importance for nursery.

Suitable juvenile lamprey habitat existed in the marginal areas of the Roughan River at Mouchel (2009) location, with the sediments composed of silt and sand with suitable depths to classify as optimal habitat. Two of the three targeted lamprey surveys were undertaken in optimal habitat, with the third in sub-optimal habitat.

© Mouchel 2016

Ballygawley River - 42

Only one species of conservation concern in NI was caught during the survey, which was brown trout, with two common species caught in addition, which was stone loach and 3-spined stickleback. All of the species were caught in low abundance, however a couple of large adult brown trout were observed during the survey which evaded capture.

The habitat of the Ballygawley River within the survey area exhibited limited diversity, with the depth, substrate and flow structure largely dominated by one depth category/flow type/substrate. The extent of instream vegetation was also very limited. However, the structure present in the river, most notably deep water downstream of a small weir and marginal vegetation, did prove to provide significant habitat and cover for fish fauna. The substrate, which was stable yet uncompacted and showed signs of siltation. The riparian vegetation structure was complex, with 20% fish cover provided on each bank and 30% canopy cover over the reach. The site was considered to be accessible for both Atlantic salmon and brown trout, and unlikely to be stocked with either. The age class of brown trout caught suggested they were adults.

River Blackwater - 47

Two species of conservation concern in NI were in the survey area, which were brown trout and lamprey. A low abundance of brown trout was caught by the qualitative survey methodology, with more common species caught consisting of stone loach and minnow. The targeted lamprey survey found low numbers of ammocoetes present, with the population estimate for the species showing a low population.

The habitat of the River Blackwater within the survey area exhibited a high diversity, with large variation in the depth, substrate and flow structure. Instream vegetation was clearly evident, occupying almost a third of the survey area. The substrate was stable and partly compacted, however there was no evidence of siltation. The riparian vegetation structure on each bankface was complex, with a simple vegetation structure on the banktop, providing fish cover over a fifth of the site on both banks. The site was considered to be accessible for Atlantic salmon and brown trout, and unlikely to be stocked with either. The age class of brown trout caught suggested they were parr and adults, identifying the habitat as being of importance for nursery.

Suitable juvenile lamprey habitat existed in the marginal areas of the River Blackwater at this location, with the sediments composed of silt and sand, although silt dominated, with suitable depths to classify as optimal habitat. All three targeted lamprey surveys were undertaken in optimal habitat, with the depths of the sediment being at least 30cm. The presence of gravel-bed riffles also suggest possible spawning habitat for lamprey within the survey area.

Other existing records

Historical records of fish species obtained from the LA and Agri-fisheries and Biosciences Institute (AFBI), within the A5WTC ES 2010 study area are identified in Table 11B.6 below.

© Mouchel 2016

Table 11B.6 Records of freshwater fish as presented in the A5WTC ES 2010

River	Fish fauna species present

Results of salmonid habitat surveys undertaken by the LA are presented in Table 11B.8 and presented as 'Important Salmonid Habitat' on Figure 11.5. The LA identified the following important habitats for salmonids:

- Nursery – habitat suitable for sustaining juvenile salmonids;
- Holding – deep pools which are important resting sites for adult salmonids; and,
- Spawning – habitat used by salmonids for breeding.

© Mouchel 2016

The LA survey reaches of the Burn Dennet, River Mourne, River Derg, Fairy Water, Drumragh, and Routing Burn, are crossed or in close proximity to the Proposed Scheme. The reach of the Strule surveyed by the LA is over 100m away from the Proposed Scheme, although it is connected to the Derg, which is crossed by the Proposed Scheme. The Camowan River is located over 100m away and is not crossed by the Proposed Scheme.

APPENDIX 11C MACROPHYTES

Legislation

The legislation which is relevant to the appraisal of macrophytes within the corridor includes:

- *The Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended)* which make provision for implementing Council Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora (the Habitats Directive), one of the main initiatives of which is the creation of a European network of wildlife sites to be known as 'Natura 2000' for the protection of certain wild animals and plants;

- *The Water (Northern Ireland) Order 1999* - provisions to combat and prevent pollution affecting waterways and groundwater;

- *The Environment (Northern Ireland) Order 2002* – provisions to protect ASSIs and further protect sites of community importance designated under the Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended); and

- *The Water Environment (Water Framework Directive) Regulations (Northern Ireland) 2003* - which implement in Northern Ireland Directive 2000/60/EC, The Water Framework Directive (WFD) which aims to establish a framework for the protection of inland surface waters, transitional waters, coastal waters and groundwater.

Statutory protected sites

Special Areas of Conservation (SAC)
SAC receive full protection under Council Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora (the Habitats Directive). SAC are areas that have been identified as best representing the range and variety within the European Union of habitats which are listed on Annex I to the Directive. SAC, together with Special Protection Areas (SPA), form the Natura 2000 network. Natura 2000 sites are protected under the Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended) and any development likely to have significant impacts upon such a site will have to be assessed for its implications on the site's conservation status, an obligation under the aforementioned Regulations.

Areas of Special Scientific Interest (ASSI)
ASSI provide statutory protection for the best examples of Northern Irelands flora, fauna (including notable fish species), or geological or physiographical features. These sites are also used to underpin other national and international nature conservation designations. Declaration of an ASSI is made under Article 28 of The Environment (Northern Ireland) Order 2002, Part IV of which made new provision with respect to ASSIs. Under this legislation they have powers to prevent damaging operations affecting such sites. Any such operation must be notified to the Northern Ireland Environment Agency (NIEA) beforehand and permission sought. Various offences and provisions apply to these sites, but in summary, any persons who intentionally or recklessly damages or disturbs each ASSI may be liable to a criminal conviction and a fine of up to £20,000. Public bodies

© Mouchel 2016

are required to further the conservation and enhancement of ASSI land through the appropriate exercise of their functions.

Designated/categorised watercourses
Watercourses are designated and categorised in accordance with Directive 2000/60/EC - the Water Framework Directive (WFD) - implemented in Northern Ireland by The Water Environment (Water Framework Directive) Regulations (Northern Ireland) 2003.

The aims of the Water Framework Directive are:

"*to establish a framework for the protection of inland surface waters, transitional waters, coastal waters and groundwater which:*

- *prevents further deterioration and protects and enhances the status of aquatic ecosystems and, with regard to their water needs, terrestrial ecosystems and wetlands directly depending on the aquatic ecosystems;*

- *aim at enhanced protection and improvement of the aquatic environment, inter alia, through specific measures for the progressive reduction of discharges, emissions and losses of priority substances and the cessation of phasing-out discharges, emissions and losses of the priority hazardous substances; and*

- *ensures the progressive reduction of pollution of groundwater and prevents its further pollution".*

Through the Water Environment (Water Framework Directive) Regulations (Northern Ireland) 2003, a duty is placed upon the Department of the Environment (DoE) and other specified Northern Ireland departments including NIEA to exercise relevant functions in ensuring that the requirements of the directive are met.

Although these Directives do not place specific requirements upon developers, the NIEA, acting as the competent authority, are able to object to proposals, or insist on the implementation of mitigation measures, where schemes are likely to affect the objectives they are required to meet through these Directives.

Conservation status

SAC watercourses characterised by submerged or floating-leaved vegetation form a priority habitat of international importance, and are listed on Annex II to the Habitats Directive. The riverine plant communities occurring in the UK are important in a European context providing good examples of the range of river types and variability of associated plant communities (Hatton-Ellis & Grieve, 2003).

The *Ranunculion fluitantis* and *Callitricho-Batrachion* vegetation communities are fairly common in the north west of the UK where geological conditions allow. However, many have been adversely affected by nutrient enrichment, mainly from sewage inputs, agriculture and serious siltation. They are also vulnerable to artificial reductions in river flows and to unsympathetic channel engineering

© Mouchel 2016

works. Consequently, the habitat has been reduced or has disappeared from parts of its range in Britain (Joint Nature Conservation Committee (JNCC) (jncc.defra.gov.uk accessed October 2014).

The current status of areas designated for the protection of habitats or species (Natura 2000 sites) are given as favourable or unfavourable in compliance with Habitats Directive (92/43/EEC). The River Foyle & Tributaries Special Area of Conservation is however not yet assessed.

The North Western River Basin Management Plan Summary gives the 2009 overall status of surface water classification as 30% of waters in the North Western District are at good status or better, 63% are classified as less than good status, with the remaining 7% classified as moderate ecological potential or worse.

The Neagh Bann River Basin Management Plan Summary gives the 2009 overall status of surface water classification as 14.4% of waters in the Neagh Bann District are at good status or better, and 0.4% are classified as good ecological potential or better. Of the other watercourses in the district, 72.6% are classified as less than good status, with the remaining 12.6% classified as moderate ecological potential or worse.

In accordance with the WFD, River Basin Management Plans will be implemented through Local Management Areas (LMAs) during the 2010 to 2015 planning cycle. The LMAs include details of the current overall status of the water bodies, the characteristics and quality of the water environment within the area.

The Burn Dennet and Foyle LMA is part of the North Western River Basin District and covers an area of approximately 491km^2. The main river in this LMA is the River Foyle and its tributaries including the Burn Dennet and Glenmornan River. Within the Burn Dennet and Foyle LMA, 72.7% of surface waters are classified as less than good status (published December 2009) with a target of 45.5% reaching good status by 2015. None of these surface water bodies were failing to achieve good status on the basis of adverse effects on macrophytes.

The Derg and Mourne LMA is part of the North Western River Basin District and covers an area of approximately 410km^2. There are several main rivers in this LMA including the River Mourne, River Strule, River Derg and River Finn. Within the Derg and Mourne LMA, 82.4% of surface water bodies have been classified as less than good status (published December 2009) with a target of 47.1% reaching good status by 2015. However macrophytes are not cited as a reason for the surface water bodies failing to reach good status in the LMA.

The Strule LMA is part of the North Western River Basin District and covers an area of approximately 869km^2. There are several major rivers in this LMA including the River Strule and the Fairy Water. Within the Strule LMA, 75% of surface water bodies have been classified as less than good status (published December 2009) with a target of 77.5% reaching good status by 2015. Many of the rivers in this LMA are failing to achieve good status because of adverse effects occurring on macrophytes.

The River Blackwater LMA is part of the Neagh Bann River Basin District and covers an area of 1103km^2. The main river is the River Blackwater. Within the River Blackwater LMA, 88% of surface water bodies have been classified as less than good status (published December 2009) with a

© Mouchel 2016

target of 31% reaching good status by 2015. In this LMA three of the 17 surface water bodies are failing because of suppression of their aquatic plants.

Policies and guidance notes

The following policies and guidance documents aim to help conserve and protect freshwater ecosystems within NI and the study area:

- Roads Service Biodiversity Implementation Plan (2008);
- Planning Policy Statement (PPS) 2: Planning and Nature Conservation - outlines the need to consider SAC and protected species during the planning process within NI;
- The Regional Development Strategy for Northern Ireland 2025: Shaping Our Future (RDS);
- Northern Ireland Biodiversity Strategy (2002) - Outlines the requirement to identify Species of Conservation Concern (SoCC) and Priority SoCC and the delivery of Species and Habitat Biodiversity Action Plans; and
- Local Development Plans - The West Tyrone, Dungannon and South Tyrone, and Londonderry Area Plans, all highlight the need to maintain existing levels of biodiversity within their jurisdictions.

Baseline data collection

Desk study

A desk study including reference to Mouchel (2010) was undertaken in February 2014 to identify the rivers and streams that would potentially be affected by the scheme. The desk study area for macrophyte communities consisted of the river channels within and downstream of the scheme footprint up to the transition zone between fresh and saline water around Strabane. As the design of the scheme is well advanced at this stage, this study considered habitats extending to 100m from the edge of the vesting line, the study area.

The desk study identified watercourses that were designated SAC or ASSI where macrophytes were either a qualifying feature or the primary reason for designation (for example, as Habitats Directive Annex I and Annex II species). Classified water bodies under the Water Framework Directive were also identified.

Field survey sites

Field survey sites for the 2014 assessment were selected from watercourses that were subject to macrophyte survey in 2009 (Mouchel 2010). This included 47 watercourses which were within this Proposed Scheme's zone of influence and which exhibited some value to macrophytes. Following the macrophyte field surveys in 2009, 22 of the 47 watercourses were shown to support very few or no macrophyte assemblages, with their aquatic flora mainly comprised of single species of common mosses, liverworts, and / or filamentous algae (Mouchel, 2010). These watercourses were generally heavily modified field drains or sites subject to eutrophication due to agricultural

© Mouchel 2016

runoff or sewage, severely affecting the diversity of aquatic plant growth. These 22 watercourses were consequently not included in the current assessment. A further 14 watercourses were excluded from the Mouchel 2014 assessment as they were not crossed by or within 100m of the Proposed Scheme's footprint, and therefore were unlikely to be affected by the development. The remaining 13 survey sites which were of some value to aquatic macrophytes, were, where access permitted, subject to macrophyte surveys in 2014. These sites are presented in Table 11C.5 below

Field survey methodology

The survey method employed was based upon the standard method for river macrophyte survey outlined in the Common Standards Monitoring guidance for Rivers (JNCC 2005). This method is broadly compatible with that for calculating EQR values in the WFD-UKTAG methodology and also the Life in UK Rivers series publication Monitoring Watercourses Characterised by *Ranunculion fluitantis* and *Callitricho-Batrachion* Vegetation Communities (Life in UK Rivers, 2003). Some finer detail was also recorded to provide the correct parameters for both analytical methods to be undertaken. The survey method used aims to conform to BS EN 14184:2014 Water quality; Guidance for the surveying of aquatic macrophytes in running waters.

Survey areas on these watercourses were identified within 500m of the line of the route, wherever possible including the crossing point of the proposed road and as much of the length of river within the vested land as possible. In areas where this was not possible, sections of the river downstream of the scheme were favoured for the survey. Each 500m survey site was surveyed using a check-list of species combined from the JNCC (2005) and the Scottish and Northern Ireland Forum for Environmental Research (SNIFFER) (2009) assessment lists, with additional species of interest also noted. Separate records were made of macrophytes present in the river and on the bank. The relative abundance and percentage cover of check-list species was recorded as 'river' records and 'bank' records as determined by the level of submergence.

The 'river' is defined as all parts of the substratum which is likely to be submerged for more than 85% of the year. The 'bank' is defined as that part of the side of the river (or islands) which are submerged for more than 50% but less than 85% of the time. Although such estimates have to involve guesswork, estimates of submergence levels do allow better interpretation of the data and clearer insights into the ecology of individual species and communities at different sites (JNCC 2005).

Each of the macrophyte species or taxon present in the 500m survey site in the 'river' or 'bank' were assigned a score 1-5 (r) based on their relative abundance. This corresponds to the DAFOR scale, 1 being rare 5 being dominant. The absolute abundance of each species identified within the 500m survey site was recorded on a scale of 1-9 (a) based on the percentage of the river bed or bank covered by each macrophyte species. The percentage cover range and mid-point percentage as required for the assessment are shown in Table 11C.1.

© Mouchel 2016

Table 11C.1 Summary of taxon cover values for macrophyte taxa

Percentage cover range (% of channel area)	Taxon cover value (a)	Mid-point percentage
<0.1	1	0.05
0.1<1	2	0.5
1<2.5	3	1.7
2.5<5	4	*3.8*
5<10	5	7.5
10<25	6	17.5
25<50	7	37.5
50<75	8	62.5
≥75	9	87.5

Based on the EUNIS guidance (Council Directive 97/62/EC), key taxa for defining the habitat of the Annex III *Ranunculon fluitantis*/ *Callitricho-Batrachion* (CB) communities are subdivided into seven main vegetation groups (Hatton-Ellis & Grieve, 2003). The vegetation groups reflect a combination of the taxa identified in the directive and ecological components of a healthy aquatic plant community. The identification of these 'vegetation components' from survey data has been used for comparison with published CB plant communities from a wide range of river types. The number of vegetation components is used to describe the differences between macrophyte assemblages, identify key species of conservation interest and act as indicators of favourable or unfavourable condition. A summary of the CB vegetation components are given in Table 11C.2.

Table 11C.2 Summary of vegetation components in CB vegetation

Vegetation group	Vegetation components
Crowfoots	Selected batrachian *Ranunculus* spp.
Starworts	All *Callitriche* spp.
Pondweeds	All *Potamogeton* spp., plus *Groenlandia* and *Zannichellia* spp.
Milfoils	*Myriophyllum* spp.
Bryophytes	A selection of important mosses and liverworts characteristic of rivers, inc. *Fontinalis* spp.
Emergents	Selected emergents closely associated with the above vegetation
Other aquatics	Mainly submerged and floating-leaved species commonly occurring in rivers

LEAFPACS2 assessment methodology

River LEAFPACS2 classification method (WFD-UKTAG 2014) enables the assessment of macrophytes in rivers according to the requirements of the WFD. River LEAFPACS2 uses information from the abundance of taxa and four metrics: a River Macrophyte Nutrient Index (RMNI) derived from taxa recorded in the field; number of macrophyte taxa (NTAXA), a diversity

© Mouchel 2016

metric of taxa recorded in the field survey which are truly aquatic (i.e. hydrophytes); number of functional groups (NFG), a diversity metric where individual taxa are allocated to one of 24 functional groups which exploit resources in a similar way; and percentage cover of green filamentous green algae (ALG).

River LEAFPACS2 uses factors such as the geographic location, gradient and alkalinity of the river reach to give expected scores or predicted reference values for each of the four metrics, except ALG which could not be modelled using environmental predictors and consequently a global reference value of 0.05% is used, based on the median ALG value of the population of reference sites (WFD-UKTAG 2014).

Ecological quality ratios (EQRs) are derived for each of the metrics, based on observed data and predicted reference values. The values are then normalised so they fit the same scale, and finally combined by a set of rules to provide an overall EQR (River LEAFPACS2). An EQR of one represents reference conditions and zero represents severe impact. The EQR represent an ecological status class as defined by the WFD (High, Good, Moderate, Poor or Bad) as shown in Table 11C.3. The WFD status classes represent the changes in the biological community in response to disturbance.

Table 11C.3 River macrophyte LEAFPACS2 EQR and WFD status class boundaries

Status class boundary	EQR
High/Good	0.8
Good/Moderate	0.6
Moderate/Poor	0.4
Poor/Bad	*0.2*

River LEAFPACS2 was felt to be a useful and nationally standardised tool in evaluating the rivers biodiversity values, and to assess the scheme for impacts on the attainment of WFD macrophyte objectives or ecological status of any waterbodies.

Limitations

The description of river macrophyte communities is extremely problematic, because these are comparatively species-poor systems consisting of a range of clonal species growing patchily in a complex, disturbed habitat. This makes community description extremely sensitive to patch scale, Hatton-Ellis & Grieve (2003), and there is as yet no national database that would allow the analysis of the information.

The monitoring methodology presented here focuses on the extent and composition of the *Ranunculion fluitantis/Callitricho-Batrachion* plant communities, for comparison with the characteristic communities in the Hatton-Ellis & Grieve classification for that river type, Life (2003).

The descriptions of CB communities as given in Hatton-Ellis & Grieve (2003) use only British data as a basis for classification. It is noted that although a difficult community to describe and classify

© Mouchel 2016

throughout Europe, many communities will be recognisable outside the UK, though there will also be differences in detail. This is particularly pertinent where the same species has different habitat preferences, for example, *Ranunculus penicillatus* ssp. *penicillatus* occurs only in rather base-poor water in Britain, whereas in Ireland it is virtually ubiquitous. The evaluation of sites based on JNCC criteria for SSSI is therefore limited as the classification does not include sites in Northern Ireland.

Macrophytes and their distributions respond to changes in solar radiation, flow and nutrients very quickly in the growing season, which means that species present and their densities are likely to vary between years (Wright *et al* 2002). This may therefore mean that the macrophyte assemblage at any site may vary in value from year to year. However with the use indicator values such as River LEAFPACS2 the results of this study should represent a sufficient baseline of the macrophyte assemblages present.

Designated sites

There is one main river system, the River Foyle and its tributaries, which is designated as a SAC and an ASSI within the zone of influence of the Proposed Scheme. The 120 km of designated watercourses include the rivers Foyle, Finn, Mourne, Strule (up to its confluence with the Owenkillew River), Derg, Mourne Beg and the Glendergan.

The Annex I habitat that is the primary reason for selection of this site as a SAC is given as *Water courses of plain to montane levels with the Ranunculion fluitantis and Callitricho-Batrachion vegetation* or CB communities. The habitat occurrence description for the River Foyle and its tributaries is not yet available. In general however the occurrence of this habitat type is characterised by the abundance of water-crowfoots *Ranunculus spp*., subgenus *Batrachium*. These plant types grow submerged or floating on the surface and rooted in the substrate at a depth of up to around a metre. The mass of capillary leaves and/ or laminar leaves produced can modify the flow, promote fine sediment deposition and provide shelter and food for young fish and invertebrate species.

The water crowfoots are often associated with different assemblages of other aquatic plants such as water-cress *Rorippa nasturtium-aquaticum*, water-starworts *Callitriche spp*., water-parsnips *Sium latifolium* and *Berula erecta*, water-milfoils *Myriophyllum spp*. and water forget-me-not.*Myosotis scorpioides*

The different macrophyte assemblages that can occur are partly dependent on the geology and river type. In the UK there are three general sub types of the *Ranunculion fluitantis* and *Callitricho-Batrachion* vegetation, with Northern Ireland most typical of sub-type CB3: Large *Ranunculus* Rivers. This generally occurs on hard rocks in the north and west UK and comprises mesotrophic to oligotrophic communities.

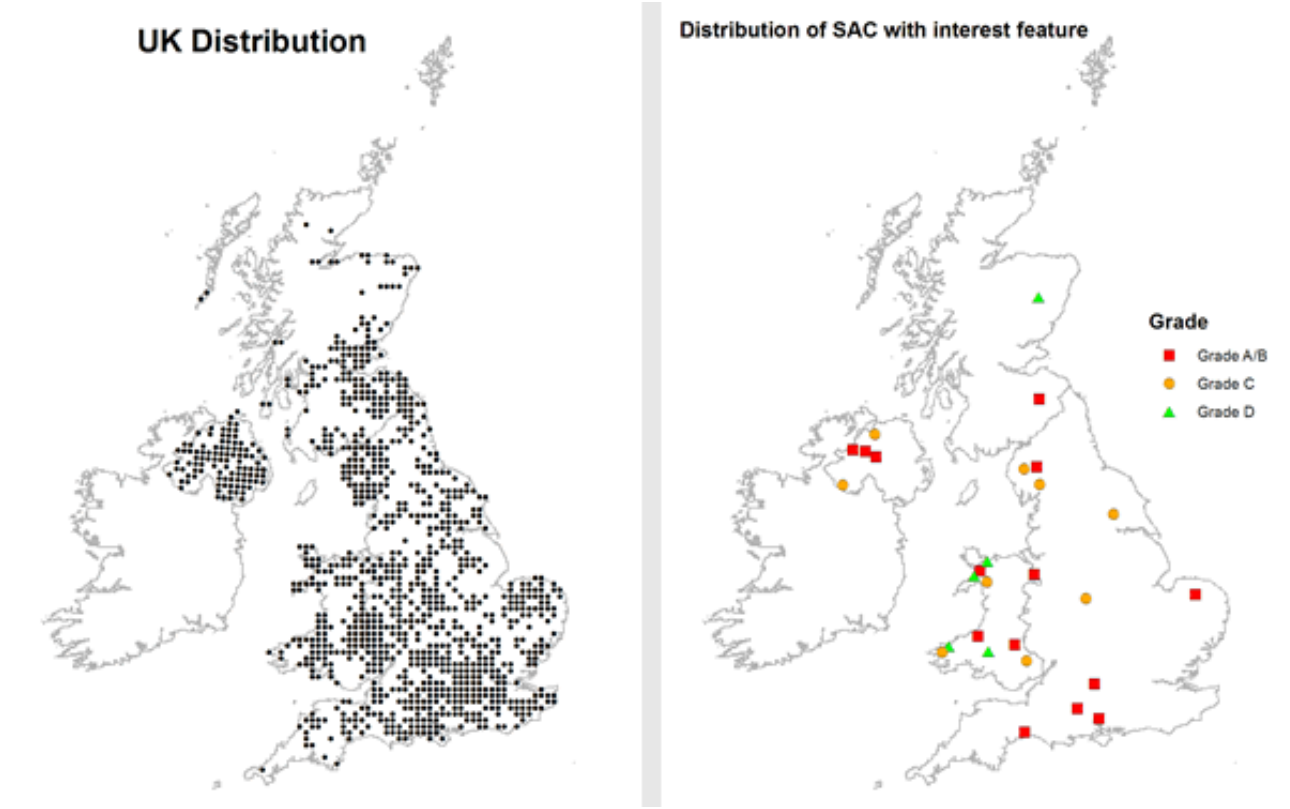
Rivers in Northern Ireland, and Wales and south-west England, are significant for the occurrence of *Ranunculus penicillatus ssp. penicillatus* stream water-crowfoot. Other typical species include *Fontinalis squamosa* alpine water-moss, *Myriophyllum alterniflorum* alternate water-milfoil and *Callitriche hamulata* intermediate water-starwort. In more oligotrophic communities water crowfoots may be replaced by milfoils, water starworts and *Potamogeton polygonifolius* bog pondweed.

© Mouchel 2016

No specific data exists for any sections within the study area. The watercourse reaches that are designated as SAC that have field survey data include the River Mourne (3) and the Derg (5).

The UK resource and distribution of the Annex I habitat *Water courses of plain to montane levels with the Ranunculion fluitantis and Callitricho-Batrachion vegetation* designated as SAC with that interest feature is shown in Figure 11C.1.

Figure 11C.1 Comparison of UK resource and SAC distribution of Annex I Habitat 3260 watercourses of plain to montane Levels with the Ranunculion fluitantis and Callitricho-Batrachion vegetation



The River Foyle and Tributaries SAC also adjoins the River Finn SAC in Co. Donegal in the Republic of Ireland. The site is a SAC selected for active blanket bog, lowland oligotrophic lakes, wet heath and transition mires all habitats listed on Annex I to the E.U. Habitats Directive. The site is also selected for Atlantic salmon and otter listed on Annex II to the same directive. The SAC does not however recognise any riverine macrophyte flora in its selection criteria and although the River Finn is potentially important for the salmon and otter populations, this aspect of the designation is not relevant to this baseline assessment.

The River Foyle and Tributaries ASSI, including that part of the River Finn which lies within Northern Ireland, is notable for the physical diversity and naturalness of the banks and channels, especially in the upper reaches, and the richness and naturalness of its plant and animal communities. It is of particular importance for the Atlantic salmon, but also is important as a river habitat. In their upper catchments, the rivers are all fast-flowing spate rivers with dynamic flow regimes characterised by sequences of rapid, riffle and run. Although the banks may have been modified in the past, the channels are natural and composed of large cobble substrate with

© Mouchel 2016

scattered boulders and sandy marginal deposits, while cobble side and point bars and discrete sand deposits are common features. At the top end of the River Derg and its two tributaries, the aquatic flora reflects the highly acidic character of the water, with mosses and liverworts dominant. Beds of stream water crowfoot *Ranunculus penicillatus var. penicillatus* occur where the flow is less dynamic. Other associated fauna include otter and freshwater pearl mussel.

A summary of the findings of the desk study is detailed in Table 11C.4.

Table 11C.4 Summary of desk study baseline results

Site	Reasons for selection	Conservation status	Distance from scheme	Macrophyte biodiversity value
River Foyle and Tributaries (excluding River Finn) SAC	*Water courses of plain to montane levels with the Ranunculion fluitantis and Callitricho-Batrachion vegetation*.	Unknown	The Rivers Mourne and Derg are crossed by the scheme at multiple channels that flow directly into the SAC are crossed by the scheme	International
River Finn SAC	Active blanket bog, lowland oligotrophic lakes, wet heath and transition mires, Atlantic salmon and otter	Unknown	The scheme runs adjacent to the SAC for 500m and is within the Finn floodplain for 1.5km at this location.	Not applicable
River Foyle and Tributaries (including River Finn) ASSI	Physical diversity and naturalness of the banks and channels, and the richness and naturalness of its plant and animal communities	Unknown	As for SAC	National

Field survey results

An overview of the survey findings followed by a summary of the macrophyte communities and habitats present is presented for each site in the subsections below.

Overview

Of the 13 watercourses identified as requiring survey, 7 of them were unable to be surveyed because of access restrictions. These were the Glenmornan River (2), River Finn (4), Fairy Water (6), Loughmuck drain (8), Froughmore drain (10), watercourse (11) and the Coolaghy Burn (13). In the cases of watercourses 2, 4, 6, 10, and 13, macrophyte survey data from Mouchel (2010) is available, and this information has been presented in the sections below. No data is however available for watercourses 8 and 11.

The remaining watercourses all had some aquatic or marginal macrophyte species present, and although many are still severely modified or degraded in some way, appeared to have some value at least in the immediate vicinity.

© Mouchel 2016

The most commonly occurring communities of the surveyed reaches were the submerged bryophytes *Fontinalis antypyretica* and *Cinclidotus fontinaloides* and stream water crowfoot *Ranunculus penicillatus* subsp. *penicillatus*. The macrophyte communities within the survey area are species poor compared to their River LEAFPACS2 reference conditions, and only one watercourse contained notable/Species of Conservation Concern (SoCC) and plants listed under Schedule 8 to The Wildlife (Northern Ireland) Order 1985 (as amended), the River Mourne. There were a few exceptions to this where rich and diverse aquatic plant assemblages were recorded in the River Derg and Drumragh River.

Although generally widespread the presence of non-native taxa was particularly prevalent in the River Mourne (1) and the Burn Dennet (1). The Burn Dennet was dominated on one bank by very dense stands of invasive Japanese knotweed *Fallopia japonica* and bohemian knotweed *Fallopia x bohemia* a hybrid of Japanese knotweed *and giant knotweed Fallopia sachalinensis*. These species completely excluded all other bankside flora. On one bank of the Mourne (8), giant hogweed *Heracleum mantegazzianum*, Japanese knotweed and Himalayan balsam *Impatiens glandulifera* had the same effect.

River LEAFPACS2 results

A summary of the calculated normalised metrics, EQR LEAFPACS2 and WFD classes are given in Table 11C.5 (the greyed out cells denote results which have been derived from the Mouchel 2010 data due to access restrictions in 2014). The River Derg and the Drumragh River were the only watercourses whose observed NTAXA and NFG were higher than the expected values. All of the rivers observed RMNI were close to the expected RMNI score. The Aghnamoyle drain had a much higher observed value for ALG than the reference value of 0.05.

© Mouchel 2016

Table11C.5 River macrophyte LEAFPACS2 analysis summary

Watercourse name (ID)	RMNI	NTAXA	NFG	ALG	Expected RMNI score	Expected number taxa	Expected number functional group	EQR LEAFPACS	WFD class

Analysis of rivers for macrophyte assemblages

Watercourse 1 Burn Dennet - Table 11C.6

The Burn Dennet had a low abundance of aquatic macrophytes with the dominant species including reed canarygrass *Phalaris arundinacea* and *Fontinalis antipyretica* found predominantly on the larger more stable rocks to the margins of the channel.

The undesignated Burn Dennet has one CB vegetation group present at this reach, predominantly bryophytes. The reach has a moderate structural diversity although the banks are extensively modified greatly reducing the habitat diversity. The riparian community is dominated by extensive stands of non-native taxa included in Part II of Schedule 9 of The Wildlife (Northern Ireland) Order 1985 (as amended). The measured EQR of 0.832 corresponds to a high biological quality and indicates that the macrophyte community is subject to no or very minor disturbance. There are no SoCC rare, scarce or BAP species present.

Watercourse 2 Glenmornan River

Although access was not granted to survey the Glenmornan River in 2014, the Mouchel 2010 surveys of the undesignated watercourse recorded a macrophyte assemblage represented by two CB vegetation components *Callitriche brutia* agg. and *Fontinalis antipyretica*. The reach had a moderate physical diversity although the channel was extensively and significantly modified with the substrate composed of unstable gravel and pebble. The measured EQR was 0.57 which equated to a moderate biological status compared to the WFD published high status, suggesting the reach is much more impacted than the river as a whole. The number of taxa and biodiversity of the assemblage was also low. Additionally there were no SoCC, rare, scarce or BAP species present.

Watercourse 3 River Mourne - Table 11C.7

The River Mourne had a moderate floral diversity (NTAXA 5; NFG 5) although the distribution of the macrophytes was often patchy. Here only species such as riverine mosses *Cinclidotus fontinaloides* and *Fontinalis antipyretica* were present as well as a generally low cover of *Callitriche sp.* and *Ranunculus subgenus Batrachium sp*.

The Mourne was the only watercourse to have present the Schedule 8 / SoCC / NI Priority Species *Orthotrichum sprucei,* and growing with it *Syntrichia latifolia* which is considered as rare in Ireland (Smith, 2004). The distribution of these species is restricted because they only occur on trees or rocks in the silty flood zone of large lowland rivers (Atherton, Bosanquet & Lawley, 2010).

The River Mourne is designated as a SAC because of the presence of the Annex I habitat *Ranunculion fluitantis* and *Callitricho-Batrachion* communities. At the reach sampled, the River Mourne has a macrophyte assemblage comprised of three CB vegetation groups including crowfoots, bryophytes and starworts. Although each of these communities is present at very low abundance, because the reach mostly more than two metres deep and close to the tidal limit and is therefore saline at times, much of the expected aquatic flora may be expected to be absent (NIEA). The measured EQR of 0.689 corresponds to a good biological quality and indicates that the macrophyte community is subject to slight disturbance. The reach has a very low physical diversity and is heavily modified with a long vertical concrete bank in the upstream section of the reach. The riparian community contains extensive stands of non-native taxa included in Part II of Schedule 9 of The Wildlife (Northern Ireland) Order 1985 (as amended). The SoCC / NI Priority Species *Orthotrichum sprucei* and *Syntrichia latifolia* which are only found within a very narrow habitat

© Mouchel 2016

niche and considered as rare in Ireland (Smith, 2004) were recorded beside the River Mourne. The population of *Orthotrichum sprucei* along the River Mourne is important for this species in Ireland and is designated under the Wildlife and Natural Environment (Northern Ireland) Act 2010.

Watercourse 4 River Finn

The River Finn is part of the River Foyle & Tributaries ASSI, designated for its riverine habitat including aquatic flora communities. Although access was not granted to survey the Finn in 2014, the Mouchel 2010 surveys recorded a macrophyte assemblage at this reach represented by two CB communities including pondweeds and bryophytes. The reach had a moderate structural diversity and level of obvious modification to the channel. The measured EQR of 0.75 recorded in Mouchel 2010 equates to a good biological status compared to the WFD published high status suggesting this reach is more impacted than the river as a whole. There was some natural riparian floral community intact although a non-native taxon does persist and in some cases dominates the vegetation. This species is listed on Schedule 9 to The Wildlife (Northern Ireland) Order 1985 (as amended). The SoCC / NI Priority Species *Orthotrichum sprucei* was recorded previously in the NVC by Mouchel 2010 survey beside the River Finn, near Strabane. It is only found within a very narrow habitat niche and is very rare in Ireland. The population along the River Finn is potentially very important for this species in Ireland and is of national importance, with significant conservation status for NI, and is to be designated under the proposed Wildlife and Natural Environment (Northern Ireland) Act.

Watercourse 5 River Derg - Table 11C.8

The River Derg had abundant and healthy communities of *Ranunculus penicillatus subsp. penicillatus*, and bryophyte species including *Fontinalis antipyretica, Leptodictyum riparium* and *Platyhipnidium ripariodes* in the Drumragh. The floral diversity of these reaches was also quite high (NTAXA 13 and 9; NFG 9 and 8), particularly in the River Derg where Callitriche sp. and bryophytes including *Brachythecium plumosum, Chiloscyphus polyanthos, Cinclidotus fontinaloides, Conocephalum conicum, Fontinalis antipyretica, Lunularia cruciata* and *Marchantia polymorpha* were recorded in the channel.

The River Derg is designated as a SAC because of the presence of the Annex I habitat *Ranunculion fluitantis* and *Callitricho-Batrachion* communities. At the reach sampled, the River Derg has a macrophyte assemblage comprised of three CB vegetation groups including bryophytes, starworts and crowfoots. The crowfoot communities in particular appear healthy and are generally abundant on suitable substrate and flow conditions throughout the reach (Preston et al 2001). The starworts although less abundant are also found throughout the reach. A diverse assemblage of aquatic bryophytes was recorded within this reach, all with a high absolute abundance. The reach has a moderate physical diversity and is generally unmodified, apart from boulders placed to the base of the steeper banks. The measured EQR of 0.937 corresponds to a high biological quality and indicates that the macrophyte community is subject to no or very minor disturbance. The riparian community is limited on the banks by shading from dense tree cover on alternate banks within the reach. The shading also appears to limit the growth of the submerged aquatic macrophytes such as the *Ranunculus spp.* and the *Callitriche spp*. in the river. There are no SoCC, rare, scarce or BAP species present. The non-native taxa is limited to two patchy distributions of two species on the banks included in Part II of Schedule 9 of the Wildlife (Northern Ireland) Order 1985 (as amended).

Watercourse 6 Fairy Water

Although access was not granted to the site in 2014, the undesignated Fairy Water had a recorded macrophyte assemblage in Mouchel 2010 represented by at least four CB vegetation components

© Mouchel 2016

predominantly bryophytes, milfoils and pondweeds with also some starworts. The reach had a moderate physical diversity although the channel was significantly modified. The measured EQR of 0.92 equates to a high biological status compared to the WFD published good status suggesting this reach is much less impacted than the river as a whole. The number of taxa and biodiversity of the assemblage is also quite high with a relatively high abundance of aquatic species. The riparian community was however less diverse. There were no SoCC, rare, scarce or BAP species present. The non-native Himalayan balsam and Canadian pondweed *Elodea canadensis* were found growing along/in the channel in this reach which are listed on Schedule 9 to The Wildlife (Northern Ireland) Order 1985 (as amended). Although the macrophyte assemblage was quite diverse and close to that of a natural assemblage based on the WFD criteria the flora did not fit closely any of the JNCC vegetation communities for the UK (Holmes et al, 1999), and keys out as Type IV Group A4, rivers with impoverished ditch floras in lowland England (NCC 1989). The Fairy Water is noted for its biodiversity value in the Omagh District Local Biodiversity Action Plan, and although macrophytes are not specifically mentioned, due to its connectivity with the protected Fairy Water Bogs and other smaller watercourses with diverse macrophyte communities they are likely to be an important component of the watercourse.

Watercourse 7 Aghnamoyle drain - Table 11C.9

The Aghnamoyle drain, a tributary of the Fairy Water via the Coneywarren drain, and watercourse 12, a tributary of the River Blackwater, both were heavily modified streams with ditch like floras. The Aghnamoyle drain had a diverse macrophyte community in the channel with species recorded including broad-leaved pondweed *Potamogeton natans, Sparganium sp.* Common duckweed *Lemna minor* and *Callitriche sp*. These plants dominated the flora in the slower deeper section of the surveyed reach downstream of a bend in the stream where a large pool was present and silt was the dominant substrate. Upstream of the pool, the stream was shallow and faster flowing over a gravel and cobble substrate which was dominated by bryophytes including *Leptodictyum riparium* on the rocks and *Lunularia cruciata, Marchantia polymorpha* and *Pellia epiphylla* on the exposed earth banks.

The very high cover of filamentous green algae in the Aghnamoyle drain, particularly abundant in the shallower upstream section of the reach, indicates the presence of high nutrient loading within the silt. This may be the result of a recent agricultural pollution event or, given the presence of agricultural land all around this reach, the effect of diffuse agricultural runoff.

The undesignated Aghnamoyle drain flows into the Coneywarren drain and then into the Fairy Water through a flap valve which artificially raises the water level. The Aghnamoyle drain has a macrophyte assemblage comprised of three CB vegetation groups including starworts, pondweeds and bryophytes. The overall abundance of these groups is quite patchy along the reach as the flow and bed composition changes from shallow water with gravel and cobble substrate where bryophytes and some emergents were found, to deeper canalised sections with silt substrate where starworts and pondweed dominate the open water in the narrow channel. The bank flora is restricted by the steep banks and encroachment of the agricultural sward adjacent to the watercourse. The measured EQR of 0.379 corresponds to a poor biological quality and indicates that the macrophyte community is subject to major disturbance. There are no SoCC, rare, scarce or BAP species present; although neither were there any non-native invasive species present.

© Mouchel 2016

Watercourse 9 Drumragh River - Table 11C.10

The Drumragh had abundant and healthy communities of *Ranunculus penicillatus subsp. penicillatus*, and bryophyte species including *Fontinalis antipyretica, Leptodictyum riparium* and *Platyhipnidium ripariodes* in the Drumragh. The floral diversity of these reaches was also quite high (NTAXA 13 and 9; NFG 9 and 8), particularly in the River Derg where *Callitriche* sp. and bryophytes including *Brachythecium plumosum, Chiloscyphus polyanthos, Cinclidotus fontinaloides, Conocephalum conicum, Fontinalis antipyretica, Lunularia cruciata* and *Marchantia polymorpha* were recorded in the channel.

In the slack margins of the Drumragh, species including curled pondweed *Potamogeton crispus* and broad-leaved pondweed were also abundant alongside European bur-reed *Sparganium emersum* and branched bur-reed *Sparganium erectum*, although diverse the aquatic floral assemblage was very patchy, with lower cover in the deeper upper section of the surveyed reach and higher cover in the riffle sequence downstream.

© Mouchel 2016

The undesignated Drumragh has a macrophyte assemblage at this reach comprised of four CB vegetation groups including crowfoots, bryophytes and pondweeds with also some starworts and milfoils. The reach has a moderate physical diversity although the channel is severely modified. The measured EQR of 0.854 corresponds to a high biological quality and indicates that the macrophyte community is subject to no or very little disturbance. The aquatic flora was diverse with NTAXA and NFG both higher than the predicted reference values for those parameters and had high absolute abundance. There are no SoCC, rare, scarce or BAP species present. The non-native species growing along the bank in this reach were all very patchy in their distribution but of frequent abundance relative to the flora as a whole.

Table11C.10 Survey data for Watercourse 9 Drumragh River

	River		**Bank**	
Macrophyte species	**(a)**	**(r)**	**(a)**	**(r)**
Veronica beccabunga			1	1
Invasive non-native species in (parentheses), SoCC, rare or notable species in **bold**				

Watercourse 10 Froughmore Drain

The site was not granted access for survey in 2014. The Mouchel 2010 surveys determined that the Froughmore drain had no assemblages associated with CB vegetation components. The abundance of aquatic vegetation along the reach was very limited with only sparse occurrences of an emergent species and some marginal species. No SoCC, rare, scarce or BAP species were recorded. One non-native species growing along the bank of the river was noted, which is listed on Schedule 9 to The Wildlife (Northern Ireland) Order 1985 (as amended). The reach exhibited a moderate physical diversity although the channel was significantly modified. The measured EQR of 0.56 equates to a moderate biological status compared to the WFD published moderate status suggesting this reach is typical of the naturalness of the river as a whole. There was insufficient data to recorded in Mouchel 2010 (due to access restrictions) to assign a JNCC vegetation type, although due to the recorded low species diversity and low cover and abundance of the macrophytes present, the reach would not meet the national criteria of an ASSI.

Watercourse 12 River Blackwater tributary - Table 11C.11

The channel of Watercourse 12 is dominated by the emergent species branched bur-reed which in some places completely chokes the open water. Interspersed with the bur-reed, fool's water-cress *Apium nodiflorum* and brooklime *Veronica beccabunga* were also prevalent on the margins of the channel. The upper banks were dominated by great willowherb *Epilobium hirsutum* and common alder *Alnus glutinosa* with reed canarygrass found along much of the surveyed reach close to the water's edge.

The undesignated watercourse 12 has a macrophyte assemblage at this reach comprised of just one CB vegetation group, namely bryophytes. Although the biodiversity of this reach is limited with the number of recorded taxa and functional groups being far less than the predicted reference values for those parameters, the absolute abundance of the small number of aquatic species was moderately high. There are no SoCC, rare, scarce or BAP species present; although neither were there any non-native invasive species present. The reach has a moderate physical diversity and the channel is obviously modified. The measured EQR of 0.664 corresponds to a good biological quality and indicates that the macrophyte community is subject to slight disturbance.

© Mouchel 2016

Invasive non-native species in (parentheses), SoCC, rare or notable species in **bold**				

Watercourse 13 Coolaghy Burn

The undesignated Coolaghy Burn was not surveyed in 2014 due to access restrictions. Surveys for Mouchel 2010 recorded macrophyte assemblage represented by four CB vegetation components including bryophytes, crowfoots, starworts and marginals. The number of taxa and diversity of the assemblage is also relatively high with an abundance of aquatic species. The crowfoot communities in particular appeared healthy and were generally abundant on suitable substrate and flow conditions throughout the reach (Preston et al 2001). A diverse assemblage of aquatic and riverine bryophytes was also recorded within this reach. The reach had a relatively high physical diversity although the channel was significantly modified. The measured EQR of 0.74 equates to a good biological status compared to the WFD published good status suggesting this reach is typical of the naturalness of the river as a whole. Based on WFD criteria this reach also had the second highest number of taxa and functional groups of all the river reaches assessed behind that of the River Derg of which this watercourse is a tributary. The riparian community is less diverse than that of the River Derg however possibly due to shading from tree cover and/or poaching from adjacent agricultural land. There were no SoCC, rare, scarce or BAP species present; although neither were there any non- native invasive species present. The

© Mouchel 2016

recorded flora is similar to that of the JNCC vegetation communities CVIIIa and CVIIIb for the UK (Holmes et al, 1999) having between 12 and 15 species present of the top 30 macrophytes characteristic of these river types. The macrophyte community also keyed out as Type VII group C2 mesotrophic rivers downstream from oligotrophic catchments (NCC 1989). Apart from the human impacts to the modification of the channel and degradation of the riparian community the generic indicators of habitat quality of this river appear to be positive based on CB criteria. Additionally due to the plant community and species diversity and the habitat connectivity with the SAC designated River Derg it could be argued that this river be of national importance for biodiversity being close to fulfilling the ASSI selection criteria.

© Mouchel 2016

APPENDIX 11D BRYOPHYTES

Notable bryophytes are significant nature conservation factors for the A5WTC scheme as there are currently thirty one species of moss and thirteen species of liverwort that are listed as NI Priority Species; and such species are under particular threat and require conservation action. They are listed within the NI Biodiversity Strategy, statement of intent that has been fully recognised by the NI Environment Agency (NIEA).

In NI, many species are under threat & require conservation action. Much of the conservation action required for Priority Species is being achieved through the UK Species Action Plans, management of designated sites or as part of the NI Habitat Action Plans. Some of the species, however, require NI or All-Ireland Species Action Plans. The selection criteria used to identify a Priority Species is stated below. Bryophyte species that meet any one of the six criteria are considered a NI Priority Species:

1. Listed as a UK Priority Species.

2. Rapid decline (2% per year).

3. Decline (1%) with NI being a stronghold consisting of either >50% Irish population or >20% UK population/range, or with the Irish or UK population restricted to NI.

4. Rare: confined to a small population of one of two sites in NI, with NI being a stronghold consisting of >50% Irish population or >20% UK population/range, or with the Irish or UK population restricted to NI.

5. At least 20% of international population of species or well-recognised subspecies occurring in NI.

6. Irish Red Data Book species classed as ‘critically endangered’, ‘endangered’ or ‘vulnerable’.

In 2011 the Wildlife and Natural Environment Act (NI) amended the Wildlife (NI) Order 1985 to give protection to a wider range of species. Previously Schedule 8 of the Order listed fifty six vascular plant species which were given protection but the 2011 amendments added three species of moss and two species of liverwort to the list of fully protected species.

Legislation

There are five bryophyte species that receive special protection through listing within Schedule 8 of the Wildlife (NI) Order 1985 (as amended). It is prohibited to intentionally pick, uproot or destroy any wild plants listed in the Schedule, without a licence. The five Schedule 8 bryophyte species are also NI bryophyte Priority Species, which are indicated in the table below (Table 11D.1).

© Mouchel 2016

Conservation Status

The EC Habitats Directive (Article 1, sections (e) and (i)) offers a definition of conservation status for species:

'*the sum of influences acting on the species concerned that may affect the long-term distribution and abundance of its populations within a given geographical area*'.

The definition implies that two factors are paramount when assessing the conservation status of a species: (1) threat (a decline in abundance and / or distribution / range) and (2) rarity (limited abundance and / or distribution / range). Such considerations were made when drafting lists of bryophyte species that were of conservation concern.

In *Biodiversity in Northern Ireland: Recommendations to Government for a Northern Ireland Biodiversity Strategy*, the NI Biodiversity Group recognised the need to develop lists of NI Priority Species (which require conservation action). Draft lists of NI Priority Species were published in NI Biodiversity Strategy Proposals in 1999. In 2004 these lists were reviewed by collating proposals and supporting information supplied by experts on species groups, then refining and applying the selection criteria. Within the current list there are thirty one species of moss and thirteen species of liverwort that are listed as NI Priority Species. The Priority Species list is shown in Table 11D.1 below, with historical occurrence within County Tyrone or County Derry indicated. The table also highlights the five Schedule 8 bryophyte species.

Table 11D.1 NI Priority Species bryophytes

Latin Name	Common Name	Co. Tyrone	Co. Derry	Schedule 8
Liverworts / Hornworts				
Anthoceros agrestris	Field Hornwort	X		
Calypogeia integristipula	Meylan's Pouchwort			
Cephalozia pleniceps	Blunt Pincerwort			
Cephaloziella rubella	Red Threadwort

Policies and guidance notes

The following policies and guidance documents aim to help conserve and protect notable bryophyte species within NI and the study area:

- Planning Policy Statement 2;
- Policy ENV1.1 in Section 12 of the Regional Development Strategy 2025 “Caring for the Environment”;
- UK Biodiversity Plan;
- NI Biodiversity Strategy;
- RSNI Biodiversity Plan.

There are no local planning policies that offer specific protection for notable bryophyte species.

Baseline data collection

The methods used to collect information regarding notable bryophytes were selected with consideration of guidance provided within Part 4, Volume 11, of the DMRB (HA, 2008). This included:

© Mouchel 2016

- Obtaining up-to-date details of the location and nature of all statutory and non-statutory designated sites, notified for their value to notable bryophytes, within the study area from the NI Environment Agency (NIEA) (formerly Environment and Heritage Service [EHS]);

- Collation of information from desk-based sources relating to the presence of notable bryophytes in NI and, where possible, potential distribution and habitat preferences;

- Completion of detailed field surveys to identify and help predict the presence / likely absence of notable bryophytes within the vicinity of the preferred route.

The historical and current distribution of bryophyte Priority Species within County Tyrone and County Derry (counties containing the A5WTC) was researched to enable potential target species to be identified. Bryophyte species recorded within the study area were identified by downloading the latest 2012 census catalogue of British and Irish bryophytes from the British Bryological Society website. This list has been updated from the last printed census catalogue (Hill *et al.*, 2008) to include records published up to and including 2012. The distribution of species from the bryophyte Priority Species list was then compared with those species previously recorded from counties Derry and Tyrone.

Further information regarding locations and latest records for the Priority Species was obtained from the NI Priority Species Website (NMNI, 2006-10) and *Research on Biodiversity Priority Bryophyte Species in NI* (Holyoak, 2006a & 2006b) and *The Distribution of Bryophytes in Ireland* (Holyoak, 2003).

Selection of field survey sites

Within the study area six discrete sites were selected for field survey, having been identified as having the most potential to support notable bryophytes (see below for the approach taken).

The six field survey sites were identified using information collected by Mouchel during the Phase 1 Habitat Survey (Volume 3 – Chapter 11 – 11G)This work identified areas of likely significant biodiversity value (Ecological Identity Areas (ID Areas)). These were established by identifying land parcels in the study area from aerial photography and preliminary site inspection. The areas were then subject to a Joint Nature Conservation Committee (JNCC) Phase 1 Habitat survey, where the potential for supporting notable bryophytes was assessed. The habitat types present within each, and its qualifying features were recorded on a standardised ID Area proforma. This was developed considering standard principles for nature conservation site appraisal as embodied in Ratcliffe (1977). The information from this assessment was used to identify habitat areas, which may be suitable for bryophyte Priority Species.

It was found during the desk study that the major habitat types for NI Priority Species, previously recorded within counties Tyrone and Derry, include moorland / bogs, hillside boulders, woodlands, ravines, fens and dune slacks. Within the study area there are no dune slack habitats and very little fen habitat. The most likely habitats for the occurrence of Priority Species within the study area were moorland / bogs, rocky hillsides, woodlands and ravines. Bryophyte surveys were therefore planned to incorporate a range of ID Areas of differing habitats, with each ID Area containing at least one of these habitat types.

© Mouchel 2016

The six sites selected for field survey were identified on the grounds that they offered the best opportunity for recording notable bryophyte species within the study area. If significant numbers of notable bryophyte species were recorded, within the six sites, then the sampling strategy would have to be expanded to provide reasonable estimates of the distribution and frequency of species within the study area. However, if very few notable bryophytes were encountered then the probability of notable bryophytes being present elsewhere in the study area, in significant numbers, was considered to be low. Therefore the data collected from the initial field survey sites would act as a benchmark to demonstrate the relative value of the whole study area for bryophytes, identifying whether additional survey effort was required, or adequate baseline data collection had been undertaken for the EcIA. This assumption is based on the fact that the majority of habitat within the study area is improved grassland, which supports a very species-poor bryophyte flora and very few, if any, Priority Species. If Priority Species were not present within the sampled sub-set of ID Areas with suitable habitat then the likelihood of them being present in significant numbers throughout the mostly sub-optimal habitat throughout the study area, would be considered low.

Survey locations and habitat types, informed by data from ID Area forms and the bryophyte desk study are identified in Table 11D.2 below.

Table 11D. 2. Location and description of bryophyte field survey areas

ID Area/Site Name	Habitats Present
467 / Sixpenny Hill	Area of long established & semi-natural ancient woodland alongside riparian corridor. Stream tree lined in places.
31 / Strabane Glen ASSI	Semi-natural ancient and long established woodland in a steep sided valley with marshy grassland along parts of the valley floor and numerous springs and flushes along its sides.
217 / Eastern Slopes of Bessy Bell	An extensive area of modified bog / wet heath with the most intact areas on the hill tops only. Areas of rush pasture / marshy grassland and acid grassland / heather mosaic also occur on the eastern slopes.
8C / Tully Bog SAC / ASSI.	An extensive area of intact bog with lagg woodland surrounding much of its perimeter. The notable *Sphagnum* species *S. imbricatum* (syn. *S. austinii*) and *S. fuscum* have historically been recorded from the site and are listed in the SAC and ASSI declaration documents.
812 / Tattykeel Bog	An extensive area of raised bog with an intact surface over much of the site. The site also comprises areas of scrub and acid grassland / heathland mosaic.
970 / Woodland at Ravella	ID Area 970 comprises a small woodland copse with mature trees and an earth and stone bank (covered in abundant bryophytes) marking its perimeter. It is possibly long established.

Field survey

During the site visits bryophytes were comprehensively searched for within all habitats present, including features such as walls, fences and trees, which are often very rich bryophyte habitats. Fieldwork was undertaken between 2nd June and 16th July 2014 by two or three surveyors, Paul Hanson, Sarah Ive and Tom Ryan (all of whom are full members of the Chartered Institute of Ecology and Environmental Management (CIEEM), with Paul Hanson previously holding the post of British Bryological Society vice-county (v.c.) recorder for Cheshire (v.c. 58)).

© Mouchel 2016

The relative abundance of each species within the different habitat types at each site was recorded using a DAFOR scale and locations of any notable species were recorded. Notes were also made of the dominant vascular plant associates and habitats within each site.

As far as was practicable, identification was carried out in the field using a x20 hand lens but any unfamiliar, suspected notable species or those species which cannot be determined without microscopic examination were collected and examined under a compound microscope using appropriate identification keys. Nomenclature for both mosses and liverworts used within this report follows Hill *et al.* (2008).

Limitations

Several sites (Sixpenny Hill, Strabane Glen and Tattykeel Bog) were not fully accessible due to permissions not being granted for the full survey areas.

A limitation to the evaluation of the data collected is the lack of detailed published guidance notes concerning the evaluation of bryophyte communities and non-designated species within ecological assessments. This was overcome by assessing communities using a combination of the conservation status of their component species and through professional judgement, regarding the quality of habitats present with regard to Ratcliffe (1977) criteria. Assessment of the importance of individual species initially involved whether the species was included within the NI Priority Species list but for non-Priority Species several factors were considered including;

- the distribution and abundance of the species within the British Isles,
- the distribution and abundance of the species within Ireland,
- the distribution and abundance of the species within NI, and
- the native / non-native status of the species.

Information regarding distribution, abundance and native status was sourced from Hill *et al.* (1991, 1992 and 1994), Smith (2004), Paton (1999) and Hill *et al.* (2008).

Designated sites

There are no sites within the study area that are designated specifically for the presence of notable bryophyte species. Tully Bog Area of Special Scientific Interest (ASSI) and Special Area of Conservation (SAC), however, receives both its' designations on account of its characteristic peatland flora, of which bryophytes constitute the significant biological resource. The biological interest relates to size and intactness of the bog, in addition to the diversity of the vegetation and structural features and presence of rare and notable species. Special features include a well-defined dome. Hand cutting has been restricted to edges of the peat and the lagg and has created a mosaic of habitat including pools which are known to support characteristic invertebrate fauna including a diverse water beetle, damselfly and dragonfly assemblage. The SAC citation and the ASSI declaration also note the presence of the rare *Sphagnum* moss species *Sphagnum imbricatum* (syn. *Sphagnum austinii*) and *Sphagnum fuscum.*

© Mouchel 2016

The Declaration for Strabane Glen ASSI states that the area is of scientific interest because of its woodland flora and chacteristic associated fauna. The semi-natural deciduous woodland and scrub has a markedly calcicolous character, which is atypical for the region and is due to the underlying geology. The rarity of this type of woodland in the region along with the geomorphological interest combines to increase the overall scientific value of the site.

Existing species records

Two NI liverwort / hornwort Priority Species and four NI moss Priority Species have been historically recorded within County Tyrone, whilst two NI liverwort Priority Species and seventeen NI moss Priority Species have been historically recorded within County Derry. The conservation status of bryophytes within the counties of Derry and Tyrone was assessed in 1999 (Holyoak, 2006a) and 2002 (Holyoak, 2006b) respectively. Within County Tyrone there are recent records for the four moss Priority Species but the two liverwort / hornwort species were last recorded in the 1950s. Within County Derry there are recent records for the two liverwort Priority Species and nine of the moss Priority Species. Most of these species, however, are restricted to sand dunes along the north Derry coast or mountainous areas in the northern Sperrins and the western Antrim Plateau, including Benbradagh and Binevenagh. These types of habitats do not occur adjacent to the A5WTC.

Further information regarding locations and latest records of Priority Species bryophytes can be obtained from the *Northern Ireland Priority Species* website (NMNI, 2006-10), *Research on Biodiversity Priority Bryophyte Species in Northern Ireland* (Holyoak, 2006a & 2006b) and *The Distribution of Bryophytes in Ireland* (Holyoak, 2003).

Field surveys

The habitat and bryophyte interest within each of the sites is summarised below. Incidental records of relevance to the assessment are also incorporated below.

ID Area 467-Sixpenny Hill

The woodland at Sixpenny Hill consists of distinct habitats including an area of hazel coppice / scrubby woodland, an area of gorse scrub (to the north of Lowertown Road) and an area of long-established woodland, dominated by mature beech *Fagus sylvatica* (to the south of Lowertown Road). During the 2009 survey of the site the woodland either side of Lowertown Road was accessed and separate species lists were compiled for the scrubby and long-established woodland. Access was not granted to the south of the site in 2014 so the table just shows species present within the coppice / scrubby woodland and gorse scrub.

The coppice woodland consists predominantly of coppiced hazel *Corylus avellana*, birch *Betula* spp., holly *Ilex aquifolium*, ivy *Hedrea helix* and honeysuckle *Lonicera periclymenum* with a rich ground flora including wood anemone *Anemone nemorosa*, pignut *Conopodium majus*, bluebell *Hyacinthoides non-scripta* and lesser celandine *Ficaria verna*. The bryophyte species list for this area consisted of nine liverwort and twenty eight moss species, compared to ten liverwort and thirty moss species in 2009. No notable species or new v.c. record species were recorded during the 2014 survey.

© Mouchel 2016

ID Area 31-Strabane Glen ASSI

The long-established woodland at Strabane Glen is located at the northern end of the site, along the steep valley sides. A number of springs flow down the sides into a small stream at the bottom of the glen. The southern part of the glen is dominated by wet grassland and patches of soft rush *Juncus effusus*. There are trees along the edge of the grassland including several elder *Sambucus nigra* which possess an abundant coverage of epiphytic bryophytes.

In 2009 access was granted for the entire length of the glen but in 2014 access was only available for the southern section, which includes the marshy grassland and a small section of the southern part of the glen. A single bryophyte species list was compiled for this site but with abundance scores given separately for woodland floor, wet grassland and species growing on rock or trees. The species list for the portion of the site surveyed consisted of seven liverwort and thirty two moss species, compared to fifteen liverworts and thirty seven mosses recorded in 2009. No notable species or new v.c. record species were recorded during the 2014 survey.

Section 1 Incidental Records

During 2014 NVC surveys along the River Finn floodplain (ID Area 561b), willows along the riverbank were inspected for the presence of Spruce's bristle-moss *Orthotrichum sprucei,* which was recorded as a new v.c. record for Tyrone in 2009. This species was found to still be present on silt-encrusted branches. This NI Priority Species has also been added to Schedule 8 of the Wildlife (NI) Order 1985 (as amended) since the 2011 Wildlife and Natural Environment Act (NI) amended the Wildlife (NI) Order 1985 to give protection to a wider range of species.

The other known site for *Orthotrichum sprucei* in County Tyrone (collected during A5 macrophyte surveys on 04/08/09), a short distance north of the River Finn floodplain site, at the edge of the River Mourne, near its confluence with the River Finn (H33769807) was not re-visited in 2014.

ID Area 217-Eastern Slopes of Bessy Bell

This site includes a number of different habitats within the survey area including modified bog, wet grassland, acid grassland and a small area of plantation woodland. A single bryophyte species list was compiled for this site but with abundance scores given separately for the different habitats. Access was available for the entire site and the same area as during 2009 was surveyed.

The species list for the entire site consisted of twelve liverwort species and fifty two moss species, compared to eleven liverworts and forty five mosses recorded in 2009. No notable species or new v.c. record species were recorded during the 2014 survey.

ID Area 8C-Tully Bog SAC / ASSI

The survey area at Tully Bog consisted of the bog surface and an area of lagg woodland surrounding the perimeter of the bog. Separate species lists were compiled for the bog and the woodland area. Dominant vascular plants on the bog included heather *Calluna vulgaris*, cross-leaved heath *Erica tetralix*, cotton sedges *Eriophorum spp.* and common deergrass *Trichophorum germanicum*; with widespread coverage of *Cladonia* lichen species. The bog varies in quality, with the central area exhibiting greater *Sphagnum* coverage and larger hummocks, with *Sphagnum capillifolium sensu lato* dominant. The end sections of the bog still have extensive *Sphagnum* coverage but with smaller hummocks and greater numbers of birch *Betula* sp. and pine *Pinus* sp. seedlings. The lagg woodland is dominated by birch.

© Mouchel 2016

Access was available for the entire site and the same area as during 2009 was surveyed. The bryophyte species list for the bog consisted of three liverwort and twenty moss species, compared to three liverworts and eighteen mosses recorded in 2009. No new v.c. record species were recorded during the 2014 survey but the notable species *Sphagnum fuscum* was still found to be present around the same area of the bog surface as in 2009 (towards the eastern edge of bog, to the north of the power lines which cross near the centre of the bog).

Another notable species *Sphagnum austinii* was also found around the same location as *S. fuscum.* This species was not found in 2009 but was known to have been recorded at Tully Bog as it is listed (as *S. imbricatum*) in the SAC and ASSI declarations. This species was also recorded as an incidental by P. Hanson on 24/06/10. Both of these species are indicators of areas of undamaged bog habitat and are often found in association. They have not been found on any other areas of Tully Bog.

The species list for the lagg woodland consisted of three liverwort and twenty one moss species, compared to two liverworts and thirteen mosses recorded in 2009. No notable species or new v.c. record species were recorded in the woodland during the 2014 survey.

ID Area 812-Tattykeel Bog

The survey area at Tattykeel Bog consisted of the bog surface, areas of lagg woodland surrounding the bog and a grass track which leads from the road to the bog. Access was available for areas of the bog to the east and west of the road, which forms a triangle with the existing A5, in 2009 but was restricted to the west of this road during 2014. Separate species lists were compiled for the bog and the woodland area.

Dominant vascular plants on the bog were similar to those for Tully Bog but with more extensive areas of purple moor-grass *Molinia caerulea* and large patches of bare peat, which are being colonised by the non-native heath star-moss *Campylopus introflexus*. This is as a result of a section of the bog surface being burnt in 2008. Although heather is now abundant in these areas *Sphagnum* spp. coverage is still very sparse or non-existant where the fire occurred. The species list for the bog consisted of three liverwort and sixteen moss species, compared to one liverwort and seventeen mosses recorded in 2009. No notable species or new v.c. record species were recorded on the bog surface during the 2014 survey.

The lagg woodland at Tattykeel Bog is also dominated by birch, but with more mature trees and sections of the woodland floor having extensive coverage of typical woodland *Sphagnum* species including *S. fallax, S. fimbriatum* and *S. palustre* var. *palustre,* which very rarely grow on bogs. The species list for the lagg woodland and grass track consisted of seven liverwort and thirty six moss species, compared to two liverworts and twenty one mosses recorded in 2009. No notable species or new v.c. record species were recorded in the woodland area during the 2014 survey.

ID Area 970-Woodland at Ravella

The woodland at ID Area 970 consists of an area of semi-mature woodland with a stone and earth perimeter wall and an adjacent area of mature beech woodland. The western edge of area 970 borders the River Blackwater (ID Area 1300) which consists of riparian corridor. Access was not

© Mouchel 2016

available to ID Area 1300 during the 2014 surveys. The two woodland habitats were recorded separately.

The perimeter wall / bank surrounding the semi-mature woodland is almost completely covered in bryophytes, predominantly *Rhytidiadelphus triquetrus*, and was therefore included in the species table as a separate column. The species list for the semi-mature woodland and perimeter wall / bank woodland area consisted of six liverwort and twenty nine moss species, compared to seven liverworts and thirty four mosses recorded in 2009. No notable species or new v.c. record species were recorded during the 2014 survey.

The mature beech woodland possesses a very poor ground flora, with the majority of open ground being covered in a dense carpet of dead beech leaves. Bryophytes were restricted to four liverwort and thirteen moss species, compared to six liverworts and nineteen mosses recorded in 2009. No notable species or new v.c. record species were recorded during the 2014 survey.

© Mouchel 2016

APPENDIX 11E – HABITATS AND FLORA

Legislation

The legislation which is relevant to the appraisal of habitats and flora within the corridor includes:

- *The Wildlife and Natural Environment (NI) Act 2011* – provides for the protection of certain flora and fauna and for the creation of conservation sites. This Act is an amendment to *The Wildlife (Northern Ireland) Order 1985 (as amended).* The 2011 Act made a number of significant changes, including giving the police, the Department's Wildlife Inspectors and the Courts, additional powers to combat wildlife crime. In addition, the list of birds, animals and plant species receiving special protection was significantly enlarged. The 2011 Act also introduced a new statutory duty upon government departments and all public bodies, in exercising their functions, to take action to further the conservation of biodiversity.

- *The Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended)* which make provision for implementing Council Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora ("the Habitats Directive"), one of the main initiatives of which is the creation of a European network of wildlife sites to be known as 'Natura 2000' for the protection of certain wild animals and plants;

- *The Surface Waters (Fishlife) (Classification) (Northern Ireland) Regulations 1997 (as amended)* which implement in Northern Ireland Directive 2006/44/EC on the quality of fresh waters needing protection or improvement in order to support fish life (the Fish Directive (consolidated)) (FD);

- *The Environment (Northern Ireland) Order 2002.* Part IV of The Environment (Northern Ireland) Order 2002 is the relevant legislation with regard to the declaration and protection of ASSIs. The Regulations make provision for implementing Council Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora (the Habitats Directive), one of the main initiatives of which is the creation of a European network of wildlife sites to be known as 'Natura 2000' for the protection of certain wild animals and plants; and

- *The Water Environment (Water Framework Directive) Regulations (Northern Ireland) 2003* which implement in Northern Ireland Directive 2000/60/EC, The Water Framework Directive (WFD).

The following EC Directives and international conventions are implemented by some of the above NI legislation:

- Council Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora (the Habitats Directive);

- Convention on the Conservation of European Wildlife and Natural Habitats (the Bern Convention) (1979); and

© Mouchel 2016

- Directive 2000/60/EC, The Water Framework Directive (WFD).

Policies and guidance notes

Those policies and guidance documents considered within this appraisal included the following:

- Roads Service Biodiversity Implementation Plan (BIP);
- The Regional Development Strategy for Northern Ireland 2025: Shaping Our Future (RDS);
- Planning Policy Statements (PPS 1 - General Principles, PPS 2 – Natural Heritage); and
- Northern Ireland Biodiversity Strategy (2002).

Full details of the NI Biodiversity Action Plans are available on the following website: http://www.ni-environment.gov.uk/biodiversity/local_biodiversity_action/lbaps.htm

Baseline data collection

The following tasks have been undertaken to inform the identification and description of the baseline environment relating to habitats and flora:

- A review of relevant data from desk based resources including: Northern Ireland Environment Agency (NIEA) website, Flora of NI, Ulster Wildlife Trust website, Woodland Trust website, Centre for Environment and Data Recording, Countryside Survey for NI 2000 and relevant publications such as Local Plans, Local BAPs, Roads Service Biodiversity Implementation Plan, The Royal Irish Academy Research Reports; and the Habitats in Ireland Handbook (Heritage Council 2000);
- A desk based review of the Phase 1 Habitat survey undertaken in 2008 and 2009 during the preliminary planning, selection of a preferred route and assessment of the scheme proposed in the A5WTC ES 2010. The desk based review was used to identify the habitats within the study area which comprised of habitats within 250m of the Proposed Scheme.
- A detailed walkover habitat survey of the study area, during February to April 2014, to Phase 1 Standards (JNCC, 2003) and with consideration of the Guide to Habitats in Ireland (Heritage Council, 2000). The detailed walkover habitat survey was undertaken by experienced ecologists, who were members of CIEEM, or were supervised by a member of CIEEM.

Field surveys

Detailed walkover habitat survey

The detailed walkover habitat survey classified the habitats present in accordance with the Guide to Habitats in Ireland (Heritage Council, 2000). These categories represent the closest match to those found in NI which lacks its own habitat classification system. As no mapping convention exists for the Habitats in Ireland classification system, the mapping convention presented in the Joint Nature Conservation Committee (JNCC) Handbook, *Phase 1 habitat survey; A Technique for*

© Mouchel 2016

Environmental Audit (2003) was used and the closest equivalent habitat in the Habitats in Ireland classification was noted.

The surveys captured data including the dominant and indicator floral species present at each site and also noted physical characteristics appropriate to each habitat. For example the presence or absence of canopy, sub-canopy, shrub, herb and field layers were noted in woodlands and the presence of micro-topographical variety was noted for bogs. These physical characteristics aided in the assessment of the biodiversity value of the habitats within each site surveyed.

Habitat classification
Mires have been divided into types recognised by Scottish Natural Heritage (Lindsay, 1995); for example 'natural primary bog – modified' or 'secondary active bog'; hedgerows have been further classified into different types according to the JNCC, 1993 classification; and running waters were subject to River Habitat Surveys (RHS) carried out by Mouchel ecologists in accordance with the Environment Agency's published guidelines (Environment Agency, 2003).

The RHS methodology provides a Habitat Assessment Score based upon the river's utility to wildlife and physical diversity, and a River Modification Score measuring the 'naturalness' of the water course. These scores were used to help appraise the value of each watercourse to freshwater species, principally fish. The data was then used, alongside other considerations such as water course size and catchment connectivity to inform a likely intrinsic biodiversity value of each water course. Details are provided in the accompanying Appendix 11B.

Limitations

Access restrictions caused by lack of permission from land owners or dangerous site conditions limited the extent of areas that could be surveyed at some sites (approximately 15% of the survey area).

The significance of these limitations was reduced by the examination of recent aerial photography and ground validation from areas of public access or from where access was granted. The relatively uniform agricultural grassland character most land areas within the study area were found to typically support few features of special nature conservation interest.

Existing species records

The desk study revealed relatively few records of significant plants. The presence of legally protected species was confirmed in only 3 10km grid squares within the corridor (National Museums & Galleries of NI 2000-2005). These were:

- *Trichomanes speciosum* – Killarney fern, OS Grid Square H39 within Strabane Glen ASSI. Killarney fern is a European Protected Species (EPS) and as such has enhanced protection under the Habitats (NI) Regulations 1995 (as amended);

- *Neottia nidus-avis* – birds nest orchid, OS Grid Square H65 between Aughnacloy and Ballygawley. A member of the public also stated that bird nest orchids were found on their land east of Aughnacloy in OS grid square H65; and

© Mouchel 2016

- *Primula veris* – cowslip, OS Grid Squares H65 & H75 between Aughnacloy and Ballygawley and east of Aughnacloy.

No other records of legally protected plant species were reported from any of the resources consulted/searched.

Habitat descriptions

The following sections describe the baseline condition of key habitat types recorded outside of residential areas within the study area. Those found were grouped into the following broad habitat classes listed within Habitats in Ireland (Heritage Council, 2000):

- Woodland and scrub;
- Grasslands and marsh;
- Heath and dense bracken;
- Peatlands;
- Freshwater;
- Littoral sediment;
- Cultivated and built land; and
- Exposed rock and disturbed ground.

Most broad habitat types have then been divided into the more detailed Habitats in Ireland categories such as ‘improved agricultural grassland’ or ‘dry meadows and grassy verges’. The mires and open waters have been further subdivided to more accurately describe the conditions found and effectively discriminate between the large volumes of data collected on these potentially valuable habitats.

In each case the general habitat category is introduced and each subdivision within it described according to the following points:

- Definition of its normal physical and biological properties;
- General occurrence and abundance within the study area;
- Typical condition and key indicator species found in the walkover surveys;
- Examples of higher quality and lower quality sites;
- Evaluation of likely biodiversity value;
- Supporting value for notable fauna; and

© Mouchel 2016

- Table of key locations of the more valuable habitats.

Typical species lists for each habitat type are presented below. These lists give an indication of *typically dominant* flora for each habitat, though the occurrence and abundance of each species in any specific location is likely to vary. The key indicators used to identify each habitat type are highlighted with asterisks in each table. They are neither intended as an exhaustive species list for each habitat, nor do they contain details of individual species' abundances or occurrences.

Woodlands and scrub

NI is the least wooded part of the UK with just 6% of the land wooded (NI BAP 2005). Native woodlands are an even smaller percentage of this figure with less than 2% of NI's land surface covered by broadleaved woodlands, with semi-natural ancient woodland rarer still (Woodland Trust, 2008). Woodlands are defined in the Habitats in Ireland as habitats with greater than 30% cover of trees above 5m high when mature (4m for bog woodlands) and include both natural and planted woods. In the walkover surveys they were recorded as either semi-natural broadleaved or highly modified or non-native woodlands and then further subdivided into mixed stands or plantations. In order to aid with evaluation of biodiversity value, these woodlands were further divided into categories outlined in the Guide to Habitats in Ireland relating both to their 'naturalness' as Irish habitats and the NI BAPs.

Woodlands are relatively widespread though scattered throughout the study area, with coverage approximately evenly divided between semi-natural broadleaved and plantation/heavily modified woodlands. However, most are of relatively recent origin and occupy sites less than 5ha in extent. As a result many do not display features typical of larger more established woodlands such as structural diversity and a diverse woodland ground flora. Nevertheless those in a more semi-natural state form valuable habitats, with two woodlands forming ASSIs within the survey area and several stands occurring within SAC as described in the accompanying Designated Sites Appendix 11A. There are also multiple small fragments of long established and ancient woodland.

Semi-natural woodlands (JNCC habitat A1.1.1)

Oak-birch-holly woodland (habitats in Ireland type WN1)

These woodlands are typified by a dominance of sessile oak *Quercus petraea* and downy birch *Betula pubescens* with a scrub layer of holly *Ilex aquifolium*. They are the native woodlands on damp, but not waterlogged, acid or base poor soils. This woodland type is not common in the study area

The WN1 woodlands in the study area generally have a canopy of sessile oak with holly and bramble *Rubus fruticosis* agg. frequent in the scrub layer. Both of the largest examples contain even-aged oaks suggesting that the canopy was historically planted for timber. The field layer is dominated by great wood rush *Luzula sylvatica* with broad buckler fern *Dryopteris dilatata*, hard fern *Blechnum spicant* and honeysuckle *Lonicera periclynum* all frequently found. An example of WN1 woodland occurs within Volume 2: Figure 11.10 west of Victoria Bridge which contains an even aged canopy of oaks.

WN1 woodlands represent only small areas of semi-natural woodlands in the corridor. The two largest have also been subject to historic management limiting their true naturalness. They are

© Mouchel 2016

however, among the most likely types of woodland to be of long established/ancient origin, with two sites appearing on the Woodland Trust's inventory of ancient and long established woodlands in NI (Woodland Trust, 2008). Such woodlands represent a rare resource in NI and are a priority habitat under the NI *oak woodlands* BAPs. They may also represent the Annex I habitat *old sessile oak woods with Ilex and Blechnum in the British Isles (91A0)* as listed within the Habitats Directive, though the examples within the corridor often have highly modified canopies reducing their value.

Oak-ash-hazel (habitats in Ireland type WN2)

These woodlands are typified by a dominance of these three tree species in the canopy and include coppiced woodland and more 'natural' stands of mature trees. They represent native woodland for that part of NI where geological and physical conditions allow (Heritage Council, 2000, NI BAP, 2005). Soils can be acid or base rich, with both found in the corridor where variations in the local geology create some of the best woodland sites of this type e.g. Strabane Glen ASSI. Soils may be damp, but they are not waterlogged, with wetter sites described under WN4.

Examples of this woodland type are found throughout the corridor, often associated with river corridors or other steeply sloping land where they may grade into wetter woodland types such as WN4. These sites have typically been too steep or inaccessible for agriculture historically which could account for the relatively large proportion of long established/semi-natural ancient woodland within this category. They typically occur in small fragments and, with the exception of the ASSIs no stands over 5ha are found in the study area.

The WN2 woodlands within the corridor often consist of old hazel *Corylus avellana* coppice dominating the sub-canopy layer with scattered *Quercus spp*. oak and ash *Fraxinus excelsior* standards in the canopy, or with standards absent. Where not coppiced the hazel is less prevalent and a greater diversity of canopy species is found including beech *Fagus sylvatica* and sycamore *Acer pseudoplatanus*. In most of the recent stands ash is by far the most common canopy component. Many of these sites contain a few potentially veteran trees. However, most of the standard trees appear less than 150yrs old.

The WN2 woodlands support the widest diversity of typical woodland herbs in the field layer such as primrose *Primula vulgaris*, wood anemone *Anemone nemorosa*, bluebell *Hyacinthoides nonscripta*, wood avens *Geum urbanum,* wood sorrel *Oxalis acetosella* and common dog violet *Viola riviniana*. Some of these species are evidence of the woodland's longevity, as several are indicators of long established/ancient woodland in NI as determined by the Woodland Trust ancient woodland inventory (Woodland Trust, 2008).

The best examples within the study area are both approximately 1.5ha and occur within the Foyle & Tributaries SAC alongside the River Mourne, north of Victoria Bridge (Volume 2: Figure 11.10).

An unusual example for the study area, though not in the wider landscape is the Old Deer Park Wood (Volume 2: Figure 11.12), the largest area of long established woodland in the corridor. Its interior is now planted with conifers, but a 10-20m band around the woodland's periphery is of mature beech with a remnant WN2 type ground flora around the very edges. However, the majority of WN2 woodlands in the corridor are too small to have such features, and are normally in fairly narrow strips along steep inclines or rivers. The poorest examples floristically, such as in Volume

© Mouchel 2016

2: Figure 11.10 south of Victoria Bridge, are those where poaching and overgrazing have damaged the ground flora and/or where non-native species such as sycamore or Himalayan balsam are abundant. However, these sites typically contain areas of remnant ground flora in more sheltered areas.

The WN2 woodlands recorded represent a mixture of sizes and include the largest areas of semi-natural woodlands in the study area. They are also among the most likely types of woodland to be of long established/ancient origin. Such woodlands represent a rare resource in NI, are a priority habitat under the NI *mixed ash/oak woodlands* BAPs and may contain examples of veteran trees.

Wet pedunculate oak-ash (habitats in Ireland type WN4)

These woodland types are typically found close to rivers or on slopes where poor drainage and flushes keep the soil wet. They are scattered throughout the corridor, but do not cover large areas and therefore form a relatively small proportion of the overall woodland resource. They very commonly grade into the woodland types WN1 & WN2 and have similar woody species, with coppiced hazel by far the most common sub-canopy component in both. Beech is less common in the wetter conditions of WN4 woodlands. However, the field layer differs with many of the species of WN1 woodlands present, but also an abundance of ferns and great woodrush, opposite leaved golden saxifrage *Chrysosplenium oppositifolium* and enchanter's nightshade *Circaea lutetiana* also frequent.

WN4 woodlands are found at a variety of locations within the study area. Key locations are within the two ASSI woodlands where they form a mosaic with the WN1 & WN2 communities. The ground flora present within these WN4 woodlands indicates that they are likely to be of long established/ancient origin (Woodland Trust, 2008). Such woodlands represent a rare resource in NI, are a priority habitat under the NI *mixed ash/oak woodlands* BAPs and may contain examples of veteran trees. It is also possible that some examples may contain the legally protected species Killarney fern *Trichomanes speciosum*.

Wet willow-alder-ash (habitats in Ireland type WN6)

This woodland type occurs on waterlogged soils on a variety of substrates often adjacent to rivers, lakes or bogs and is mostly found in mosaics with other habitats, particularly WN7 bog woodland. This community is rarer in the study area than the other broadleaved woodland types with no large expanses occurring.

The most typical type of WN6 woodlands in the corridor is characterised by a mixed willow *Salix* spp. canopy. This type often represents the primary colonising species of waterlogged soils and as such lacks many of the woodland ground flora species found in WN2 & 4 longer established woodland types. The field layer is typically dominated by grass species such as common bent *Agrostis stolonifera* with floating sweet grass *Glyceria fluitans* in the wettest areas. Marsh horsetail *Equisetium palustre*, creeping buttercup *Ranunculus repens* and fern *Dryopteris* species were common herb components of these woodlands.

More rarely wet woodlands of this type contain common alder *Alnus glutinosa* and ash, with scattered examples in several woodland blocks throughout the Proposed Scheme particularly in flush sites within WN7 bog woodlands. In contrast to the willow dominated areas the field layer of this woodland type is typically more species rich with indicative herbs of lesser spearwort

© Mouchel 2016

Ranunculus flammula, marsh marigold *Caltha palustris* and opposite leaved golden saxifrage found amongst abundant ferns.

WN6 woodlands are typically found in small pockets within the corridor. They are a priority habitat under the NI *wet woodlands* BAP if over 0.5ha.

Bog woodland (habitats in Ireland type - WN7)

This type includes all broadleaved woodlands characterised by canopy trees over 4m tall on intact and modified bogs, normally encroaching once cutting and other management is abandoned. WN7 woodlands often grade into wooded moribund and active bogs discussed below.

WN7 woodlands are the most common broadleaved types found in the study area, though most frequently around Omagh. The majority are of recent origin, with downy birch encroaching over the former peat bogs. Virtually all of the bogs contain woodland fringe of this type, mostly likely to have resulted from vegetation succession on cut over sections of the bogs.

Such woodlands are almost entirely dominated by birch, mostly downy birch, but also included various willows, rowan *Sorbus acuparia*, holly and Scot's pine *Pinus sylvestris*. The dominant species of the field layer in the vast majority is purple moor grass, bramble or broad buckler fern. Remnant bog vegetation also survives in places, but is not as common as these three species.

The best examples, such as within Volume 2: Figure 11.16, Figure 11.17 and Figure 11.18 west of Omaghhave slightly more mature trees, deadwood, abundant bryophytes and standing water all adding to their biodiversity values. Wooded parts of the area west of Omagh (Volume 2: Figure 11.18) occur in a mosaic with other valuable habitats such as bog, swamp and marshy grassland. However, most are of recent origin, self sown at the edges of cutover bogs with few features to increase their value to biodiversity.

The best examples were often recorded within mosaics of other habitat features that are of potentially significant biodiversity value. However, the recent origin, relative lack of diversity and common occurrence of many sites moderates their potential value.

Highly modified/non-native woodlands (JNCC categories A.1.1.2, A.1.2.2 & A.1.3.2)

These consist of woodlands obviously originating from artificial planting where natural regeneration and other processes have not had time to significantly influence the woodland structure and composition. It therefore excludes the beech and oak woodlands described for WN2 and WN4, which, although originating from planting, are sufficiently influenced by natural processes to be considered under the semi-natural category.

Mixed woodlands (habitats in Ireland types WD1 & WD2)

This category includes stands of broadleaved plantations and of mixed woodlands where both broad leaved and coniferous species represent between 25%-75% of the canopy. They are scattered within the study area with the largest examples of mature mixed woodlands occurring close to Carricklee (Volume 2: Figure 11.13), at Mountjoy Forest (Volume 2: Figure 11.16) and Knockmany Forest (Volume 2: Figure 11.25). The mixed woodlands in the latter forest, in particular contain many mature trees, with some areas planted into long established woodland sites. There

© Mouchel 2016

are also examples of more recent broadleaved plantations where the trees have grown above 5m in height, but where natural processes do not appear to have become established.

Only three significant areas of such woodlands are found in the study area. These are on the banks of the Foyle in the north of the study area (Volume 2: Figure 11.06), close to Knockmany Forest (Volume 2: Figure 11.25) and north of Aughnacloy (Volume 2: Figure 11.28). These first two are composed of planted alder and hazel respectively with very limited ground flora diversity indicating that they were not planted into formerly wooded sites. The latter contains mixed broadleaved species and the ground flora within the woodland appears largely ruderal. Strips of woodland, up to 25yrs old are found in several locations alongside the existing A5, probably planted when modifications to that road were undertaken.

As these are modified woodlands, their intrinsic value is lower than that of more natural habitat types. Their species diversity is lower than native woodlands, and the recent plantations are easily replaceable and are not included within any NI BAP categories.

Conifer plantation (habitats in Ireland type WD4)

No native coniferous woodlands exist within the study area, though native coniferous species may be found in other woodland types.

For example several WD4 woodlands in Volume 2: Figure 11.19 were planted on former bogs and contain remnant patches of mire vegetation along with ditches/pools adding to their diversity.

Good examples can also be seen in Volume 2: Figure 11.19 which includes remnant bog and marsh and in Volume 2: Figure 11.16 which has an adjacent area of modified bog. In addition some plantations are on long established woodland sites and so may contain some remnant vegetation of former woodlands. At Old Deer Park Wood (Volume 2: Figure 11.12) the bog is surrounded by screening woodland of mature beech and contains a good array of woodland plants at its periphery. Similarly (Volume 2: Figure 11.25), part of Knockmany forest consists of an area of long established woodland and is part of a much larger network of woodland habitats.

Scrub/transitional woodlands (JNCC categories A.2.1 & A.2.2)

Immature woodland (habitats in Ireland type WS2)

This category includes all young broadleaved plantations which are found at several locations throughout the study area. These consist of a varied mix of native broadleaved species planted into former agricultural land. The ground flora is therefore largely of agricultural grasses and common herbs, but is not as intensively managed as surrounding improved pastures. Other good examples occur alongside existing woodland such as in Volume 2: Figure 11.05 and alongside the River Mourne south of Strabane (Volume 2: Figure 11.08) which contains some mature oak standards. Other examples are scattered throughout the study area, though none cover large areas.

Immature woodlands are not suitable habitat for most notable fauna species. However, they are likely to be less intensively managed than the surrounding improved pasture and as such may support low populations of common lizard and nesting birds which if confirmed on site could have significant legal and policy implications for the Proposed Scheme.

© Mouchel 2016

Scrub (habitats in Ireland type WS1)

This includes habitats consisting of areas dominated by lower growing woody species, often with scattered trees. Such habitat is common throughout the study area, often found colonising neglected sites or planted as screening along the parts of the existing road network. Hawthorn and gorse are generally the most common scrub species. A few areas dominated by grey willow *Salix cinerea* are also found in wetter areas, although this species was more frequently a component of WN6 wet woodland. Blackthorn is a common component of scrub in the south of the corridor where new growth is beginning to encroach into some neglected fields.

Where the scrubland appears to have encroached over former agricultural land its ground flora is species poor and is generally dominated by a few common grass and herb species. The most valuable examples of scrubland are those that form mosaics with other notable habitats such as at Volume 2: Figure 11.10 north of Victoria Bridge and Volume 2: Figure 11.30 east of Auchnacloy. In both cases, the scrubland is likely to perform a useful role as a wildlife corridor. Poorer examples of scrubland occur in more isolated patches and consist mainly of scattered bramble intermixed with common ruderal species.

Nevertheless, scrub has the potential to support some notable fauna, in particular nesting birds. It may also support badgers, common lizard, and occasionally pine marten and red squirrel if the scrubland is close to a larger woodland resource. The presence of these species could have legal and policy implications for the Proposed Scheme.

Linear woodland/scrub (JNCC categories A.3.1, A.3.3, J.2.1, J.2.2, J.2.3)

Hedges (habitats in Ireland type WL1)

Hedgerows are very common within the study area forming the boundaries for the majority of fields and many of the roads. Within Habitat Phase 1 methodology hedgerows are divided into species rich and species poor, with or without trees, and those recorded in the walkover surveys were divided into these categories. The Habitats in Ireland categories divide them into WL1 hedgerows and WL2 tree lines. However, these categories do not take into account the structural variety within each group and associated features such as ditches or old walls which may add to their biodiversity value. A distinction has therefore been made between types of hedgerow largely on the basis of structural character, particularly with reference to their supporting value for fauna.

In general, the supporting value for fauna of hedgerows varies according to their woody species composition and management. Species rich hedgerows are likely to be of supporting value for numerous fauna. The NI HAP specifically mentions numerous birds which rely on the diversity of food plants and the generally less intensively managed structure of such hedges. The more intensively managed hedges are not likely to form good wildlife corridors and are unlikely to be of value to fauna other than nesting birds. However, the taller, wider hedges may be of use to commuting and foraging bats, badgers, red squirrels, pine marten and Irish hare. In addition badgers may use thicker hedgerows for sett locations. If present such species could have policy and legal implications for the Proposed Scheme.

The JNCC habitat classification has been used to distinguish between different types of hedgerows.

© Mouchel 2016

JNCC J2.1 Species poor hedgerows & J2.3 species poor hedgerows with trees

This JNCC habitat type consists of hedgerows with or without trees with 4 or less woody species in a typical 30m stretch. They form the majority of hedgerows found in the study area and are the dominant boundary marker in the study area. They are generally dominated by hawthorn and bramble, with ash standards often forming a common component in hedgerows north of Omagh. Hedgerows in the south of the study area often additionally contain blackthorn and hazel. Where trees are found within the hedges, they are mainly ash under 100yrs, though sycamore, beech and oak spp. of a similar age are not uncommon. More mature trees are rarely found and are discussed below.

The ground flora associated with such hedges is very limited where they occur between agricultural fields, though is often more varied along road verges. Between fields the ground flora is largely the same as the improved grasslands. However, alongside roads, where agricultural improvements have had less of an effect, tussock grass species such as cock's foot *Dactylis glomerata* and false oat grass *Arrhenatherum elatius* are abundant with bush vetch *Viccia sepium*, meadow vetchling *Lathyrus pratensis*, knapweed *Centaura nigra*, smooth hawk's-beard *Crepis capillaris* and cow parsley *Anthriscus sylvestris* also widely found. Some stretches also support fine leaved grass species such as bent *Agrostis* spp. species and fescues *Festuca* spp., though these were less common than the larger grasses, with the latter appearing restricted to the more acidic slopes. These plant species are indicative of dry semi-improved grassland with a more diverse flora, and the grassy banks located beneath hedgerows represented a significant proportion of such habitat within the study area. The more shaded examples of species poor hedges, particularly where management isn't so intense, support abundant ivy *Hedera helix* and common fern species and are generally less species rich.

Most species-poor hedgerows are intensively managed with 'box cutting' a widespread technique limiting the average heights and widths to below 2m. This is particularly common in the north of the study area. However there are concentrations of taller species poor hedges throughout the study area for example in Volume 2: Figure 11.18 or Figure 11.29. Sections of species-poor hedgerow were removed in 2012/2013 in advance of the planned construction of the Proposed Scheme. The areas where hedgerows have been removed are identified in Volume 2, Figures 11.01 – 11.30.

JNCC J2.1.1 Species rich hedges and J2.3.1 species rich hedges with trees

The species rich hedgerows are defined in the NI BAP (2005) as those containing five or more native woody species within a typical 30m stretch. They are not common in the study area, but examples are found throughout. Sleivemore southwards contains the largest number of species rich hedges with higher than average concentrations around Aughnalcoy. Often the best examples are found alongside sunken roads and old tracks where they are likely to be of more ancient origin than those between fields (NI BAP, 2005; NICS 2000). Almost as important as the species composition of these hedges is their structural diversity. The best examples are less intensively managed, higher and wider and therefore likely to be of greater supporting value for a variety of fauna.

These hedgerows contain a greater diversity of woody species often including holly, wild privet *Ligustrum vulgare* and rowan among the more commonly found species. The ground flora is often better than that recorded for species poor hedgerows with many of the species rich hedges supporting woodland ground flora species. These often include false brome *Brachypodium*

© Mouchel 2016

sylvaticum, primrose, herb Robert *Geranium robertianum*, barren strawberry *Potentilla sterilis*, common dog violet and bluebell. Hedge banks within Eco ID Area 1344b support up to seven common fern species along with a variety of typical woodland herb species.

Sections of species-rich hedgerow were removed in 2012/2013 in advance of the planned construction of the Proposed Scheme. The areas where hedgerows have been removed are identified in Volume 2: Figures 11.01 – 11.30.

Examples of species rich hedgerows are associated with Volume 2: Figure 11.05 north of Strabane, and the area west of Omagh (Volume 2: Figure 11.18) and the area north of Aughnacloy (Volume 2: Figure 11.29). Many of these hedges include trees, mostly ash, sycamore, oak and beech, though most are not over 150yrs. However, a few mature trees are found in species rich hedgerows and these are described below.

Treelines/mature trees (habitats in Ireland type WL2)

Mature trees greater than 100 years old are relatively rare within the study area. Older trees within woodlands are discussed above. Outside woodlands, mature trees are limited to a few hedgerows and alongside some of the rivers. Beech, ash, oak and very occasionally birch sp. are the main species recorded. Some of these may qualify as notable, veteran or even ancient following the Ancient Tree Guides No's 3 & 4 (Woodland Trust, 2007).

Mature trees have the potential to host good invertebrate assemblages and so are of potential value to both invertebrates of intrinsic nature conservation interest and to vertebrate species that feed on invertebrates. Mature trees may also support nesting birds and where relevant structural features exist provide bat roosts. If present such species could have policy and legal implications for the Proposed Scheme.

Grasslands and marsh

Grasslands include areas of herbaceous vegetation dominated by grasses and some types of vegetation dominated by rushes *Juncus* spp and sedges *Carex* spp. Grasslands are the dominant habitat within the study area and account for more than ca. 70% of the total non-built up land area. The vast majority of this area consists of intensively managed grazing pasture, with very small amounts of less improved grasslands remaining. Wetter ground supports significant areas of rush dominated grassland and marsh habitats, with scattered fragments of marshy grassland and marsh found throughout the study area.

Improved grassland (JNCC habitat B.4)

Improved agricultural grassland (habitats in Ireland type GA1)

This habitat consists of grasslands 'improved' for agricultural use by the application of chemical and natural fertilisers and often reseeded. It encompasses most of the typical lush green fields characteristic of rural NI which are dominated by a few competitive grass species to the usual detriment of species diversity.

Improved grassland is by far the most frequently occurring habitat in the study area. It is typified by a dominance of agricultural grasses such as perennial ryegrass *Lolium perenne*, Italian ryegrass *Lolium multiflorum*, Yorkshire fog *Holcus lanatus* and meadow grasses *Poa spp.*. There is a very

© Mouchel 2016

limited herb component, normally consisting of clovers *Trifolium spp*., plantains *Plantago spp*., docks *Rumex spp*. and creeping thistle *Cirsium arvense*. Sedges and herbs indicative of less improved conditions are almost universally absent. In addition, virtually all these grassland types lack any physical diversity such as hummocks, hollows or ant hills which would be expected on less disturbed and less managed sites.

The better examples of improved grasslands contain some crested dogs tail *Cynosurus cristatus*, meadow foxtail *Alopecurus pratensis*, sweet vernal grass *Anthoxanthum oderatum*, common cat's ear *Hypochaeris radicata* and autumn hawkbit *Leontodon autumnnalis* among the normal agricultural grass species. These are generally on higher ground or steeper slopes and a typical example can be seen west of Newtonstewart (Volume 2: Figure 11.11). However, this area is still dominated by agricultural species and herbs indicative of improvement and so the majority of their areas are not classified as semi-improved or unimproved grasslands. Sedges are also absent and the herb component is limited to a few common species.

Wetter areas of improved pasture support some large stands of rush-dominated grassland, mostly soft rush *Juncus effusus* with Yorkshire fog, tufted hair grass *Deschampsia cespitosa* and other common herb species. Typical examples can be seen scattered throughout the study area. Areas with greater species diversity are classified as neutral/acid semi-improved or marshy grassland.

Amenity grassland (habitats in Ireland type GA2)

This habitat consists of improved grassland used for recreational purposes. Within the study area these consist of sports fields, school playing fields, large gardens and golf courses, where they are often mixed with WS1 scrub and WD4 plantation woodland.

Large areas of sports fields are located within Strabane alongside the Mourne (Volume 2: Figure 11.07). These are mostly within the town and are not thought to contain any features of significant biodiversity value. There are also 5 golf courses which also support rough grassland possibly of the Habitats in Ireland GS2 type, scrub and woodland.

Semi-natural grasslands (JNCC B.1.2, B.2.2, B.5 & B.6)

Semi-natural grasslands normally constitute those areas where some agricultural improvements have been carried out, but not to the extent that a fairly wide grass, herb and topographical variety have been removed. Within the study area this included grasslands on both neutral and acid soils.

The semi-natural grasslands present are likely to support a diversity of species. It is possible that important flora could be found in some of the better examples along with good invertebrate assemblages. The areas with dense rush coverage may support Irish hare. Some bat species and birds of prey are also likely to use these areas as foraging habitat and the wet grasslands are likely to be used by breeding waders. The marshy grasslands present are likely to support a diversity of species. The presence of these species could have legal and policy implications for the Proposed Scheme.

Wet grassland (habitats in Ireland type GS4)

Wetter rush dominated habitats form the majority of semi improved grassland in the study area, with semi-improved rush pastures distributed throughout and intermixed with improved rush pastures and other grassland communities. The semi-improved neutral and acid rush pasture

© Mouchel 2016

support a wider variety of rush species than the improved areas, including sharp flowered rush *Juncus acutiflorus* and jointed rush *Juncus articulatus* among the soft rush. Although tufted hair grass is often common, there is a greater variety of grass species with sweet vernal grass, Yorkshire fog and creeping bent abundant. A good indicator of this type of grassland differentiating it from poorer types is the presence of common sedges such as oval sedge *Carex ovalis*, glaucous sedge *Carex flacca* or hairy sedge *Carex hirta*. The herb component is also more varied with marsh thistle *Cirsium palustre*, greater bird's-foot-trefoil *Lotus pedunculatus*, devil's-bit scabious *Succisa pratensis*, orchids of the *Dactylorhiza* genus, bulbous buttercup *Ranunculus bulbosus* and cuckooflower *Cardamine pratensis* often present. Good examples of this type of habitat can be seen adjacent to Strabane Canal (Volume 2: Figure 11.07), north of Strabane (Volume 2: Figure 11.05) or close to Knockroe H336960 south of Strabane within an industrial area (Volume 2: Figure 11.08).

More waterlogged examples of wet grassland types also include purple moor grass/rush pastures with a high proportion of broadleaved herbs. These communities generally represent the most floristically diverse of the grassland habitats found in the corridor. However, areas of marshy wet grassland are mostly isolated fragments with none found to be over 1ha. Where they occur they are often associated with modified bogs, either on former bog sites or on wet areas draining from nearby bogs (see the mire and marsh section for a description of some of these habitats). Some mineralisation, an absence of bryophytes as a major component of the flora and a water table normally below ground level distinguishes marshy grasslands from these other wetter habitat types.

The herb component within the study area ordinarily includes those found in the more improved rush pastures, but also meadowsweet *Filipendula ulmaria*, ragged robin *Lychnis flos-cuculi*, marsh cinquefoil *Potentilla palustris*, wild angelica *Angelica sylvestris*, lesser spearwort, horsetails *Equisetum* spp., abundant orchids of the *Dactylorhiza* genus and bottle sedge *Carex rostrata*. A good example can be seen west of Omagh (Volume 2: Figure 11.18)

Neutral grasslands, dry meadows/grassy verges and dry-humid acid grassland (habitats in Ireland types GS1, GS2 and GS3)

Virtually all drier grasslands within the study area have been improved with only a few hilltop locations supporting semi-improved communities, although some examples of very limited extent are found in scattered corners of fields, or on steep banks and some roadsides. The largest area of dry semi-improved grassland are found west of Omagh (Volume 2: Figure 11.18). The dry semi-improved grassland supports a larger percentage of crested dogs tail and sweet vernal grass than sown agricultural species, and less abundant herbs indicative of nutrient enrichment such as docks, nettles and thistle. The two larger areas found in the walkover surveys were on higher ground and supported species indicative of more acid conditions such as tormentil *Potentilla erecta*, heath bedstraw *Galium saxatile* and sheep's sorrel *Rumex acetosella*. This could correspond to the drier examples of the Habitats in Ireland category GS3. However, the most commonly found habitats occur along roadsides, riversides and hedge banks and support a variety of tussock grasses and common flowering herbs corresponding to the Habitats in Ireland category GS2.

Former peat bogs or heaths supporting grass species are described within the modified bog or wet heath habitats as they occur in mosaics with these habitats. Another larger fragment of semi-

© Mouchel 2016

improved grassland of the GS2 type is located immediately north of Strabane Glen ASSI (Volume 2: Figure 11.06). This is dominated by sweet vernal grass and supports a diversity of sedge and herb species. At its northern end it is mixed with wet grassland.

The more acid sites occur on peat substrates less than 0.5m in depth, probably on former bog, but where rushes now predominate. Heath rush *Juncus squarrosus*, heath woodrush *Luzula multiflora*, heath bedstraw and the sphagnum species *Sphagnum capillifolium ssp rubrum*, *Sphagnum capillifolium ssp capillifolium* are characteristic of such sites. These are broadly in agreement with the wetter examples of the Habitats in Ireland GS3 dry-humid acid grassland.

Heath and Dense Bracken

This category consists of habitats with at least a 25% cover of dwarf shrubs on acid soils or peat less than 0.5m in depth. This shallow peat may be natural or the result of historic peat cutting over which vegetation has had a chance to re-colonise. Often heaths occur in mosaics with other habitat types such as mires and acid grassland. They can be divided into wet and dry heaths, with only the former found in the corridor. This category also includes stands of dense bracken.

Dense bracken (JNCC habitat C.1 & C.2)

Dense bracken (habitats in Ireland type HD1)

Dense bracken habitat is a common in the UK and grows in dense stands on heathland, moorland, hillsides and in woodland. This species outcompetes other plants and is damaging to sensitive habitats.

Peatlands

Bogs (JNCC habitat E.1.2, E.1.7 & E.4)

Raised, lowland blanket and cut over bogs (habitats in Ireland type PB1, PB4 & PB5)

Bogs of relevance to the assessment are classed as ombrotrophic mires. These are defined as areas of peat exceeding 0.5m in depth which rely solely on rain water for their moisture and nutrient supply. These correspond to the Habitats in Ireland categories PB1 & PB4. The western oceanic bog type typical of NI are not found throughout the rest of Europe (Lindsay, 1995) and they have suffered such a huge decline in the UK in the past 100yrs (NI BAP, 2005) that they are now considered among the rarest and most valuable habitats in NI. ‘Active raised bogs’ are an Annex I Priority habitat under the Habitats Directive 1992 with Tully Bog SAC (Volume 2: Figure 11.16), designated on this basis, are present within the study area.

NI has some of the best examples of lowland raised bogs in the UK (Lindsay, 1995) with a large concentration of this habitat around Omagh. However, none of the bogs considered for this assessment are in a pristine state, with most historically cut, drained, burnt or afforested. However, the severity of such modification varies considerably (NI BAP, 2005). The JNCC Phase 1 and Habitats in Ireland categories only distinguish between intact and modified or cut over bogs, which does not adequately describe the diversity of habitats found in the course of the walkover surveys. This section therefore classifies the bogs into categories contained within the Scottish Natural Heritage publication *Bogs: the Ecology, Classification and Conservation of Ombrotrophic Mires* (Lindsay, 1995).

© Mouchel 2016

A good description of the ecology of raised bogs with definitions of terms such as active surface and lagg can be found in Chapter 1 of Lindsay (1995). This describes the main factors used in assessing their condition as their intact surface, natural vegetation and hydrological characteristics. Lindsay divides bogs into two main types: primary and secondary with the former retaining their original surface and the latter cut over. Within these two types there is a further subdivision between those where there is a typical bog flora coverage – active, and those where factors have reduced or removed their coverage - moribund. It should be remembered that many types of modification can occur in any one site, but for the purposes of this report each bogs' dominant features are described only.

This extra detail takes into account the rarity of these habitats, the NI BAP which includes modified bogs, and the inclusion of 'degraded raised bogs still capable of natural regeneration' within Annex I to the Habitats Directive, 1992.

Natural primary bog – modified

The quality of near natural bogs includes those with an intact surface often displaying a classic dome shape on raised bog sites with only minor peripheral cutting. Nevertheless, the physical structure of the surface has been simplified due to drainage with the loss of many of the *Sphagnum* hollows and bog pools. The natural lagg is also typically absent, having been removed by agricultural improvement at the bog periphery. Only a few examples of bogs of this quality were found inside the study area with Tully Bog SAC (Volume 2: Figure 11.16) and Tattykeel Bog (Volume 2: Figure 11.20) the only surviving sites. McKean's Moss ASSI, immediately adjacent to the study area (Volume 2: Figure 11.05) is also in this category

Sphagnum mosses are still typically abundant on these bogs with scattered pools, though hummocks tend to be small and generally formed by *Sphagnum capillifolium ssp rubellum & ssp capillifolium* only. *S. papillosum* and *S. magellanicum* are fairly common, with *S. palustre* and *S. cuspidatum* in some of the pools. Other abundant plants are common cotton grass *Eriophorum angustifolium* and deer grass *Trichophorum cespitosum*. The wetter areas support abundant bog asphodel *Narthecium ossifragum*, round leaved sundew *Drosera rotundifloium* and white beak-sedge *Rhynchospora alba*. Hare's tail cotton grass *Eriophorum vaginalis*, ling heather *Caluna vulgaris* and cross leaved heath *Erica tetralix* are frequently found, but not dominant over the surfaces.

Even these sites lack many of the features classically associated with natural ombrotrophic mires such as defined topographical variety, extensive sphagnum lawns or abundant surface pools. In all cases they are dried to some extent by peat cutting. Tattykeel Bog (Volume 2: Figure 11.20) is currently being mechanically milled in part for peat extraction and Tully Bog SAC (Volume 2: Figure 11.16) & McKean's Moss (Volume 2: Figure 11.05) are being encroached in some areas by downy birch and Scot's pine. Species typical of raised bogs, but not recorded in the walkover surveys are a wider variety of *Drosera spp*. the oblong leaved and greater sundew, a wider variety of *Sphagnum* species and common butterwort *Pinguicula vulgaris*. Their absence is an indication of the level of surface drying that has already taken place.

Moribund primary bog

These bogs have intact surfaces, but have either been burnt or drained so that the 'natural' vegetation is now either absent or dominated by dwarf shrubs. This type is fairly common among

© Mouchel 2016

those surveyed, with several examples >1ha. In all cases this type is found alongside secondary bog where the peripheries of its former extent have been cut over.

The flora is similar to that found in the primary modified bogs, though ling heather, hare's tail cotton grass and cross leaved heath generally dominant at the expense of *Sphagnum* coverage. The *Sphagnum* species that are present are often dominated by *S. capillifolium spp*. indicative of drier conditions. The surfaces are drier, almost lacking any pools and are often suffering encroachment by downy birch and willow spp. Bilberry *Vaccinium myrtillis* was also found on the drier sites along with bog myrtle *Myrica gale*. The better examples of this habitat type tended to be the larger sites, often close to primary modified bog sites, that displayed some micro-vegetation patterns and had suffered less encroachment by scrub. Good examples were found within parts of Tattykeel Bog (Volume 2: Figure 11.20), which both covered extensive areas with reasonably abundant *Sphagnum* coverage.

Active secondary bog

This habitat type consists of bogs that have been cut over, but where the water tables have stabilised and so are not necessarily drying. Secondary *Sphagnum* growth covers much of the surface and sufficient peat depth remains for the vegetation to be rooted in acid peat.

Bogs displaying these characteristics are fairly common south of Strabane, often around the edges of primary modified or moribund surfaces, but sometimes over entire sites. Most often they are surrounded by drier birch woodland which is encroaching upon the wetter areas.

The flora is often superficially similar to that of primary bogs, but is likely to lack the diversity of *Sphagnum* mosses and other species characteristic of primary bogs. Often extensive pools and carpets of *Sphagnum palustre* were found in the wetter areas, with drier areas often forming raised ridges of peat left over from cutting, dominated by ling heather closer to the primary moribund vegetation type. Wavy hair grass, cotton grasses and purple moor grass are also abundant on such sites.

Better examples contain a variety of *Sphagnum* and other bog species, with pools, ditches and adjacent areas of marsh adding to their diversity. The area north of Omagh (Volume 2: Figure 11.16) contains a small, but very good example of this, as are parts of Tattykeel Bog (Volume 2: Figure 11.20) and the area west of Omagh (Volume 2: Figure 11.18). The poorer examples are drier, lacking associated features such as pools and *Sphagnum* tussocks that can increase their diversity or are dominated by purple moor grass. The area west of Garvaghy (Volume 2: Figure 11.24) provides a good example of relatively species poor, scrub dominated bog sites. This is in the process of encroachment by bog woodland WN7 with birch dominating over much of their surfaces, for example many of the former bogs west of Omagh (Volume 2: Figure 11.18). Most frequently mixtures of all these secondary types are found in the same site.

Moribund secondary bog – milling

These bogs have been mechanically milled, with efficient drainage ditches drying their surface. Due to vegetation removal and the effective draining it is unlikely that an active bog could regenerate on such sites (Lindsay, 1995). Only part of Tattykeel Bog (Volume 2: Figure 11.20) currently falls into this category.

© Mouchel 2016

Freshwater

These habitats include water lying beyond the limits of swamps and emergent vegetation, both brackish and freshwater. Within the corridor freshwater habitats comprise rivers, ponds, lakes, water filled quarries and wet ditches.

Swamps (JNCC habitat F.1 & F.2)

Reed and large sedge swamps and tall herb swamps (habitats in Ireland FS1 & FS2).

These categories include habitats dominated by tall emergent vegetation, normally found close to open or running water and in standing water for much of the year. It is not a common habitat in the corridor and only four significant stands are recorded on the Phase 1 Map. However, smaller areas may be unmapped and scattered throughout the study area.

The largest example is within the Foyle and Tributaries SAC (Volume 2: Figure 11.01 and Figure 11.02). It is over 17ha of waterlogged ground dominated by reedmace *Typha spp.* and scattered willow sp., meadowsweet, common valerian *Valeriana officinalis* and wild angelica were also recorded. It was not possible to access this site to gain more detailed flora lists due to the waterlogged ground. A smaller area of common reed *Phragmites australis* dominated vegetation is found further north on the banks of the Foyle (also within the SAC boundary).

Swamp habitats have the potential to support a variety of notable fauna. Nesting birds, amphibians and notable invertebrates may also utilise this habitat.

Lakes and ponds (JNCC habitat G.1)

This category includes both artificial and natural water bodies, with those found within the corridor consisting mainly of artificial ponds, natural field ponds, fishing lakes and water collecting in quarries. Due to the lack of limestone substrate within the corridor, particularly valuable water bodies such as Turloughs are likely to be absent.

Standing waters are a widespread habitat with 52 examples identified in walk over surveys or from aerial photography. The largest numbers are between Strabane and Omagh with a concentration north and south of the River Derg. All those found are small with only one over 1ha (the flooded quarry at Ch. 20500), though it should be noted that the NI HAPs *eutrophic* and *mesotrophic standing waters* and marl lakes specifically state no minimum size limits (NIBAP 2005).

The best examples of standing water display an apparent lack of pollution, have abundant aquatic and emergent vegetation, have associated habitats of a high value such as wet woodland, and have a high likelihood of supporting notable fauna. Those included within Tables 11E.16 - 18 are likely to correspond to the Habitats in Ireland categories FL1, 2 & 4. Such examples are not common, with the majority of open water habitats small and/or likely to be disturbed and enriched by agriculture or quarrying. Typical vegetation of the higher quality sites includes emergent species such as reedmace, reed canary grass, and various rushes, with aquatic vegetation such as yellow waterlilly *Nuphar lutea*, pondweeds *Potamogeton* spp. also found. Most standing water bodies appear to be artificial, though not necessarily recent, and many have been created for hunting wildfowl or fishing.

© Mouchel 2016

Examples of poor quality water bodies appear fairly common and are scattered throughout the study area. These poorer examples are generally very small, under 0.25ha, and seasonally dry. Many are likely to correspond to the Habitats in Ireland category FL5. Field ponds are fairly common often with few adjacent habitats of interest, as are ponds within quarries. Often they appear subject to agricultural or industrial pollution.

Running water (JNCC habitat G.2)

Rivers (habitats in Ireland type FW1 and FW2)

This section covers rivers and burns of various sizes corresponding to the Habitats in Ireland categories FW1 eroding/upland rivers and FW2 depositing/lowland rivers. Many of the rivers are of sufficient size to constitute the largest & some of the most valuable semi-natural features in the study area and due to legal designations some of the most protected.

Five rivers receive designations as ASSI and SAC, primarily for their populations of Atlantic salmon and aquatic vegetation. As a result of these designations all significant water courses in the corridor were subjected to a River Habitat Survey following Environment Agency guidelines (Environment Agency, 2003). These surveys provided scores for each river's suitability for significant fauna, focusing on suitability for salmonids, diversity of positive features and naturalness. Details of the methodology, habitat description and RHS scores for each river are presented in Volume 3 – Chapter 11 - Appendix 11B.

Most of the large rivers within the study area are located in the north of the scheme, including the Foyle, Mourne and Finn, all designated as SAC. The Foyle is tidal between New Buildings and Strabane and supports some extensive reedbeds and mudflats, both habitats types that are included within NI BAPs. The Mourne and Finn are not tidal and have a rocky substrate, with the former highly modified as it flows through Strabane. Most of the bankside vegetation along these rivers constitutes improved grassland, scrub and tall ruderal vegetation. Several smaller channels flow east-west into the Foyle including the Burn Dennet and Cavanalee which are considered highly suitable for spawning salmonids. The latter also flows through an impressive gorge with areas of semi-natural ancient woodland on its slopes.

The Mourne, Derg and Owenkillew which are designated as ASSI / SAC are within the study area between Strabane and Omagh. The Strule is also a large river, but is not designated. These rivers have a variety of boulder, rock, cobble, pebble and gravel substrates. The bankside vegetation comprises stretches of very high quality woodland with some semi-natural ancient woodland included within the SAC boundaries. Also rows of mature trees, scrub, tall ruderals and improved pasture are found alongside these large rivers. The numerous smaller channels in this section vary in quality with some very good examples such as Creevan and Gillygooly Burns containing a high diversity of river features and supporting woodland bankside vegetation. The Gillygooly in particular was of note for several mature trees within the woodland along its banks and the absence of any invasive weeds.

The desk study undertaken showed that the Derg, Fairy Water and Gillygooly all receive a GQA score of 'very good' for their biological quality, and all these rivers scored good, fairly good or fair for their biological and chemical assessments.

© Mouchel 2016

The rivers in the south of the study area are generally smaller than those north of Omagh, and none receive legal designations. All contain cobble, pebble or gravel substrates with a variety of flow types recorded in most. The majority of the bankside vegetation consists of improved grassland, although patches of woodland are found along all rivers surveyed, with an area alongside Routing Burn possibly semi-natural ancient woodland. The River Blackwater has a calcareous chemistry and flows through some large areas of riparian woodland. River 33 flowing near Kilgreen is an example of an FW1 eroding/upland channel and flows through some steep sided valleys and woodland close to Knockmany Forest.

The desk study shows that the Drumragh River and Routing Burn received 'very good' scores for their biological assessments. The remaining rivers surveyed all received good, fairly good or fair scores for their GQA.

Many of the rivers within the corridor have the potential to support otter, nesting birds and invertebrates. The River Blackwater is known to support white clawed crayfish. The confirmed presence of many of these species could give rise to significant legal consequences.

Drainage ditches (habitats in Ireland type FW4)

These features are found in very many of the fields and bogs in the study area. They are characterised by their artificial origins for drainage purposes, silt/peat substrate and a slower flow than the natural streams and burns, sometimes resulting in standing water. Very often the water level fluctuates throughout the year with many dry examples choked by tall herb vegetation found throughout the corridor. They can be very important for both their aquatic habitats and their association with adjacent habitats.

The best ditch networks are on the Foyle & Finn floodplains in the north of the study area, with good examples close to McKean's Moss ASSI and grassland adjacent to the River Finn SAC. These contain aquatic vegetation, large sedges and a mixture of emergent herbs.

The majority of wet ditches do not contain such a diversity of aquatic plants. Most are dominated by rushes and contain some emergent vegetation such as reedmace or reed canary grass *Phalaris arundinacea*, with tall herbs also very common in the drier examples particularly willowherbs *Epilobium* spp., thistles, rushes and meadowsweet. Many are associated with bogs, where they reduce the quality of these valuable habitats by draining their surfaces. Some of the poorest examples appear polluted with effluent, such as at H342988 adjacent to the water treatment works west of Strabane. The presence of invasive flora species listed in Schedule 9 to the Wildlife and Natural Environment Act (Northern Ireland) 2011 and agricultural pollution were common features of these ditches greatly reducing many of their biodiversity values.

Ditches, and their ruderal/rough grassland edges may act as wildlife corridors for smaller notable fauna such as amphibians and common lizard. Some of the better examples could also support good invertebrate assemblages. The presence of notable fauna could have legal and policy implications for the Proposed Scheme.

© Mouchel 2016

Littoral sediment (JNCC habitat H.1.1 & H.2.4)

Sand shores and mud shores (habitats in Ireland type LS2 & LS4)

These coastal habitats consist of littoral sediments principally within the intertidal zone. They are found throughout the coast of NI and the only examples of relevance to this report are located along the northern parts of the River Foyle, within the Foyle and Tributaries SAC (Volume 2: Figure 11.01 and Figure 11.02).

Littoral mud/sand often support substantial invertebrate communities and those along the Foyle may provide valuable foraging areas for wintering birds from the nearby Lough Foyle SPA.

Cultivated and built land

Cultivated land (JNCC habitat J.1.1)

Arable crops (habitats in Ireland type BC1)

These habitats consist of the cultivated ground planted with arable crops found widely throughout NI and the study area. Though they are widespread, improved pasture for grazing cattle and sheep is far more abundant. The largest proportion of arable land is located in the study area north of Strabane, with lesser amounts in comparison to grazing land in the study area between Strabane and Aughnacloy. Most are planted with cereal crops, but maize, root crops and legumes are also present. More valuable components such as wildflowers and arable field margins were found to be absent from those areas surveyed.

Built land (JNCC habitat J.2.5, J.2.4 & J.3.6)

Stonewalls and other stone work (habitats in Ireland type BL1)

Old stone walls are a fairly common feature in the vicinity of the Proposed Scheme, generally forming relict field boundaries now often re-enforced by fences and more recently by planted hedgerows. The flora associated with walls is therefore similar to that detailed in the hedgerow section above, although navelwort *Umbilicus rupestris*, harts tongue *Phyllitis scolopendrium*, maiden hair spleenwort *Asplenium trichomanes* and *Sedum spp.* are commonly found on the older, less exposed walls. Heath species such as ling heather and bilberry were also commonly found growing on old walls within upland habitats. Where stone walls and hedges occur together this may increase their combined biodiversity value by adding extra niches for invertebrates and other fauna.

Stone walls can be of supporting value for invertebrate assemblages and of particular value to common lizards by supplying ample refuge, foraging and basking sites. If present, such species could have policy and legal implications for the Proposed Scheme.

Built areas (habitats in Ireland type BL3)

This category includes all built land and artificial surfaces such as car parks and roads. They are mostly modern residential buildings, with industrial sites located around Strabane and Omagh. The most ecologically valuable features within built areas are the many stone bridges across rivers, numerous old or abandoned farm buildings and some large historic buildings in Strabane and Newtownstewart.

© Mouchel 2016

Disturbed ground

Disturbed ground (JNCC habitat I.2, C.1.3.1 & J.4)

Quarries and mines and refuse (habitats in Ireland types ED4 & ED5)

These habitats include spoil heaps and working quarries and are marked on the accompanying Stage 2 Habitat Maps. Five such sites are located within the corridor, with one former quarry currently used as a landfill site. Many of the quarries appeared to contain standing water and to have scrub, bracken or woodland around their edges, all of which could be of some value to fauna.

Re-colonising bare ground (habitats in Ireland type ED3)

This category includes a wide variety of habitats but in the study area vegetation characterised by an abundance of tall competitive herb species are the most common. The tall herb habitat is common and occurs along many riverbanks, roadsides and in waste ground and woodland edges across the study area. The tall ruderal habitats mainly consist of common species such as willowherbs and thistles, though dense stands of species indicative of nutrient enrichment such as common nettle or docks were also present.

Of greater significance are the widespread and often dense stands of non-native invasive species. Japanese knotweed *Fallopia japonica*, giant knotweed *Fallopia sachalinensis*, Himalayan balsam *Impatiens glandulifera*, giant hogweed *Heracleum mantegazzianum*, bamboo species *Bambusa* sp. and giant rhubarbs *Gunnera* sp. are found in many locations within the study area. Rivers and woodlands are particularly badly affected with Japanese knotweed forming a continuous riverside habitat along several stretches exceeding 100m along the Burn Dennet. All of the rivers, with the notable exception of the Gillygooly, are badly affected with invasive species forming much of their bankside vegetation. Himalayan balsam and Japanese knotweed also colonise areas away from rivers, including a large proportion of the field layer in some woodland blocks within Mountjoy Forest (Volume 2: Figure 11.15).

Tall herbs can support a variety of fauna as these may represent the least disturbed areas of habitat in agricultural surroundings. It is possible that nesting birds, mammals, reptiles and amphibians use such habitats for sheltering and foraging. If confirmed in this habitat, their presence could give rise to additional significant legal and policy implications for the Proposed Scheme.

Japanese knotweed, Himalayan balsam and giant hogweed are listed on Part II of Schedule 9 to the Wildlife and Natural Environment Act (Northern Ireland) 2011) which states several offences related to causing their spread in the wild.

Indicative species lists for baseline habitats

Tables 11E.1 – 11E.21 present indicative species for each of the habitats identified in the walkover surveys. The lists are based on the findings from the Phase 1 Habitat surveys for this Proposed Scheme. They do not represent the species present at any one site, but rather are a guide to those species typically representative of such habitats. Key indicators for many of the habitats are highlighted with an asterisk.

APPENDIX 11F – NATIONAL VEGETATION CLASSIFICATION (NVC)

Legislation

Protected species are those that are protected in NI under the Wildlife and Natural Environment Act (NI) 2011. In 2011 the Wildlife and Natural Environment Act (NI) amended the Wildlife (NI) Order 1985 to give protection to a wider range of species. Previously Schedule 8 of the Order listed fifty six vascular plant species which were given protection but the 2011 amenments added three species of moss and two species of liverwort to the list of fully protected species. Sixty-one species of vascular plant, listed in Part I of Schedule 8 to the Wildlife Order, receive special protection against intentional destruction, uprooting or picking, including the collection of seeds or flowers. One species, primrose *Primula vulgaris,* is listed in Part II of Schedule 8 to the Wildlife Act and is protected from uprooting but may be picked. Two species (Killarney fern *Trichomanes speciosum* and yellow marsh saxifrage *Saxifraga hirculus*) also receive protection by their listing on Schedule 4 of the Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended).

Conservation status

In *Biodiversity in Northern Ireland: Recommendations to Government for a Northern Ireland Biodiversity Strategy*, the NI Biodiversity Group recognised the need to develop lists of NI priority species (which require conservation action) and SoCC species (which require monitoring because they may need conservation action in the future). Draft lists of NI priority species and NI SoCC species were published in NI Biodiversity Strategy Proposals in 1999. In 2004 these lists were reviewed by collating proposals and supporting information supplied by experts on species groups, then refining and applying the selection criteria.

NVC methodology also necessitates the recording of lower plants, including bryophytes (mosses, liverworts and hornworts) and lichens. The list includes thirty-one NI priority species mosses, and thirteen NI priority species of liverwort. Eight lichen species are listed as NI priority species. The conservation status of bryophytes within NI and the study area is covered more fully in Appendix 11D.

Policies and guidance notes

The following policies and guidance documents aim to help conserve and protect priority plant communities / habitats and protected or SoCC plants:

- *Roads Service Biodiversity Implementation Plan (2009);*
- *Planning Policy Statement 2 – Natural Heritage* - Outlines the need to consider protected species during the planning process within NI;
- *Northern Ireland Biodiversity Strategy (2002)* - Outlines the requirement to identify SoCC / priority species and the delivery of Species and Habitat Biodiversity Action Plans;

© Mouchel 2016

- *Local Development Plans* - The West Tyrone (in preparation), Dungannon and South Tyrone, and Londonderry Area Plans all highlight the need to maintain existing levels of biodiversity within their jurisdictions;

- *Northern Ireland Biodiversity Strategy and associated Plans* - Individual Species Action Plans exist for blue-eyed grass *Sisyrinchium bermudiana,* one-sided wintergreen *Orthilla secunda,* river water-crowfoot *Ranunculus fluitans,* small cow-wheat *Melampyrum sylvaticum,* wood crane's-bill *Geranium sylvaticum* and yellow bird's-nest *Monotropa hypopitys*;

- *Northern Ireland Biodiversity Strategy and associated plans* – Fifty two Habitat Action Plans exist for NI habitats including the following which occur within the study area; blanket bog, lowland raised bog, oakwood, reedbeds, coastal saltmarsh, lowland meadow, parkland, wet woodland, fens, mixed ashwoods and purple moor-grass & rush pastures. Those UK priority habitats that occur in NI are considered to be automatically selected as priority habitats in NI. To select additional priority habitats for NI, three criteria have been adopted and any habitat satisfying at least one of the following qualifies as a priority habitat;

    - *Habitats at risk in either NI or Ireland generally, because of either rarity or a high rate of decline.*

    - *Habitats for which NI has a large part of either the UK or Irish total (10% of UK: 50% of Irish).*

    - *Habitats of particular importance for priority species.*

- *Local Biodiversity Action Plans* - The Londonderry LBAP lists purple moor-grass *Molinea caerulea* as a priority species, with priority habitats consisting of rivers & streams, bogs, coastal, hedgerows, woodland and urban & gardens. The Omagh LBAP lists bogbean *Menyanthes trifoliata* and all sundew *Drosera* species as priority species. Omagh priority habitats are blanket bog, upland heath, oakwood, mixed native woodlands, hedgerows, lowland raised bog, lakes & ponds, rivers & streams, farmland and urban green space & gardens.

Methodology

Habitats were identified using information gathered during the Phase 1 Habitat Surveys as described in Appendix 11E. NVC sites were initially evaluated according to their overall values which were established by identifying land parcels in the study area from aerial photography and preliminary site inspection. The areas were then subject to a Joint Nature Conservation Committee (JNCC) Phase 1 Habitat survey. The habitat types present within each, and its qualifying features were recorded on a standardised area proforma. This was developed considering standard principles for nature conservation site appraisal as embodied in Ratcliffe (1977). Areas of potentially higher value plant communities were then identified within these sites. NVC surveys were carried out between April and July 2014 by Paul Hanson MCIEEM (member of the Botanical Society of the British Isles, British Bryological Society and has previously held the post of county bryophyte recorder for Cheshire - vice county 58) and Thomas Ryan CENV MCIEEM (Member of the Sussex Botanical Recording Society).

© Mouchel 2016

Selection of field survey sites

Large, open areas of improved grassland are frequent along the length of the Proposed Scheme. Improved grassland is not a NI priority habitat and generally supports very species-poor plant communities. Therefore all areas of improved grassland were discounted as field survey sites. Similarly all areas of arable land and coniferous plantation woodland were excluded from the study. The main broad habitat types selected for the NVC surveys included mires, broad-leaved woodland, unimproved / marshy grassland and swamp vegetation.

Field survey

The methodology employed for the NVC surveys followed the methods outlined in *British Plant Communities* (Rodwell *et al.* 1991a, 1991b, 1992, 1995 & 2000). The extent of areas of homogeneous vegetation was mapped and sample quadrats were located within these areas to record the abundance and frequency of vascular plants, bryophytes and lichens within each compartment. The field data was then analysed and each compartment was assigned, where possible, to a particular plant community.

Sampling compartments
Prior to undertaking vegetation sampling, boundaries of all homogeneous plant communities were mapped, as accurately as possible, on large-scale field maps. The typical habitat types present were then determined for sampling. When defining the extent of the community areas not all plant community boundaries were sharply defined and ecotones (botanical gradational zones) were present on occasions. In these instances, plant community boundaries were defined by drawing a line through the centre of the ecotone between communities.

For each homogenous stand identified, samples were taken using appropriate quadrat size. Within each stand selected for analysis an appropriate number of quadrats (a minimum of 3 and a maximum of 5 quadrats) were positioned in areas supporting representative vegetation. This process follows the standard methodology (Rodwell *et al.* 1991a, 1991b, 1992, 1995 & 2000) which contains some inherent surveyor bias. The methodology does however alleviate some of the issues associated with the arrangement of random samples which can lead to surveys incorporating obvious vegetation boundaries or unrepresentative floristic features.

Quadrat size
Throughout the NVC surveys, the size of the sampling quadrats reflected the scale of the vegetation being sampled. Thus the following quadrat dimensions were employed:

- 2m x 2m for short, herbaceous vegetation and dwarf-shrub heaths;
- 4m x 4m for taller or more open herb communities, sub-shrub heaths and low woodland field layers;
- 10m x 10m for species-poor or very tall herbaceous vegetation or tall woodland field layers/low understorey and dense scrub; and

© Mouchel 2016

- 50m x 50m, where possible, for sparse scrub, woodland canopy and tall understorey.

Stands smaller than the relevant sampling size, were sampled in their entirety. The majority of woodlands within the survey area were too small to accommodate 50m x 50m canopy layer quadrats and so were sampled as 10m x 10m units. Mosaics were treated as a single vegetation type where repeatedly encountered in the same form or where it is was impossible to sample their elements separately due to their small scale.

Woodland was generally sampled at different scales, within the same area, to accommodate the varying scales of vegetation present within woodland plots. Further quadrats of 4m x 4m and 10m x 10m within each canopy layer quadrat were sampled for ground flora and understorey respectively. Some sections of woodland were sampled using only canopy and ground flora quadrats due to the lack of an obvious understorey layer. This was usually the case when surveying areas of willow *Salix* spp. dominated woodland / scrub. It was also necessary to distinguish tree seedlings / saplings from mature trees, with young trees included in the field layer / understorey quadrats and mature trees in the canopy quadrats.

Measuring abundance
Within each quadrat, a quantitative measure of the relative abundance of every vascular plant, bryophyte and lichen species was undertaken using the 10 point Domin scale. Cover was assessed by eye as a vertical projection on to the ground of all live, above-ground parts of the plants within the quadrat. The Domin scale categories are presented below:

- Cover of **91-100%** is recorded as Domin **10**
- Cover of **76-90%** is recorded as Domin **9**
- Cover of **51-75%** is recorded as Domin **8**
- Cover of **34-50%** is recorded as Domin **7**
- Cover of **26-33%** is recorded as Domin **6**
- Cover of **11-25%** is recorded as Domin **5**
- Cover of **4-10%** is recorded as Domin **4**
- Cover of **<4%** with many individuals is recorded as Domin **3**
- Cover of **<4%** with several individuals is recorded as Domin **2**
- Cover of **<4%** with few individuals is recorded as Domin **1**

Frequency was used in conjunction with abundance when determining the community type, either using dichotomous keys within *British Plant Communities* or the MATCH computer program. Roman numerals I-V are used to measure frequency with:

- **I** signifying a species present in **1-20%** of samples (**scarce**)

© Mouchel 2016

- **II** signifying a species present in **21-40%** of samples (**occasional**)
- **III** signifying a species present in **41-60%** of samples (**frequent**)
- **IV** signifying a species present in **61-80%** of samples (**constant**)
- **V** signifying a species present in **81-100%** of samples (**constant**)

Floristic tables were compiled from the quadrat data, showing the range of Domin scores of a particular species, and its frequency class within the community. Species with frequencies of IV and V are described as constants within the community, with species of other frequencies described as companions.

Determining vegetation community type
Shortlists of possible communities were identified using the computer program MATCH (v.2.16) from the Unit of Vegetation Science, Lancaster University. The program compares the survey data with floristic tables of NVC communities. The lists were then refined using NVC keys and the appropriate community descriptions as given in *British Plant Communities.*

The community descriptions were read for the top five matches, before assigning communities, as the programs can sometimes give misleading results. This is because certain species-poor sites such as mires may give high percentage matches which are only achieved due to the short species list for the site. Woodlands, however, usually have a long species list which means it is harder to achieve a high percentage match. Similarly with grassland communities, a short species list is statistically more likely to fit acid grassland than calcicolous grassland which is far more species-rich.

Although sampling was undertaken in areas of homogeneous habitat, no satisfactory NVC match was generated for some communities. In these instances the communities are mapped as broader habitat types such as willow scrub, unclassified woodland or simply unclassified. Further compartments within the NVC sites contained very disturbed or obviously planted communites. In these instances no attempt was made at NVC analysis and, instead, species lists of the areas were compiled, with measures of relative species abundance.

Protected / priority species
Whilst undertaking NVC surveys protected / priority plant species (vascular plants or bryophytes) were searched for outside the sampling quadrats and their presence is noted in –the Baseline Conditions.

Taxonomy
Names of vascular plants generally follow Stace (1997) with all genera of Cyperaceae following the more taxonomically up-to-date Jermy *et al.* (2007). Bryophytes follow Hill *et al.* (2008). Some names of NVC communities are updated from Rodwell *et al.* (1991a, 1991b, 1992, 1995 & 2000) to use current species nomenclature.

© Mouchel 2016

Limitations

Limitations to the collection of baseline data were restricted to lack of direct access to several vegetation compartments within NVC sites for the reasons outlined below:

- Areas of swamp vegetation within NVC sites 1, 2 and 7 were unable to be accessed directly due to being located within river channels or being located on expanses of soft mud, which provided health and safety concerns related to attempting to walk the areas and undertake quadrat sampling of the vegetation.

- Steep riverside banks at NVC sites 6 and 7 prevented direct sampling due to the hazardous nature of the terrain.

- Access permission was not obtained, during the survey period, for the entire NVC site 17 or the entire NVC site 4.

Despite the difficulties described above it is not felt that they provide a significant constraint to the survey objectives. In the case of hazardous terrain at NVC sites 1, 2, 6 and 7 it was still possible to assess the areas from the edge of the compartments, with the dominant species visible from a distance. The habitats contained within NVC site 17 and NVC site 4 were viewed from a distance. The land use did not appear to have changed significantly since the 2009 survey. It is assumed that both areas are broadly similar in species composition to the 2009 survey and that therefore they are likely to possess similar vegetation communities.

The timing of the surveys (April-July) was optimal for NVC data collection over the majority of habitats. A limitation to the evaluation of the data collected is the lack of detailed published guidance notes concerning the evaluation of NVC communities within ecological assessments. This was overcome by using information within the NI HAPs to classify the NVC types within the relevant NI HAP.

Baseline conditions

Detailed results for each site are presented below and in the floristic tables. Survey sites are presented starting at the north of the Proposed Scheme and working sequentially south. A summary table is included at the end of each site description, showing NVC and unclassified communities found to be present within each NVC site.

NVC site 1: Foyle & Tributaries SAC

NVC site 1 is located on the eastern banks of the River Foyle, near New Buildings. It consists of several vegetation communities including an area of willow scrub to the north, swamp vegetation, including reed beds and a narrow strip of salt-marsh vegetation. The land between the NVC site and the town of New Buildings is mostly improved grassland with hedgerows providing field boundaries.

The reed beds were assessed from the edge of the NVC site because of difficulties gaining access to the wetter western sections whilst quadrat sampling was undertaken on other vegetation types.

© Mouchel 2016

Willow scrub

The area of scrub to the north of NVC site 1 is dominated by a mixture of grey willow *Salix cinerea* and goat willow *Salix caprea.* The scrub appears to be recently established with a persistent field layer, not yet shaded-out by the scrub growth. There is still extensive coverage of grasses and forbs which is uncharacteristic of willow-dominated NVC communities. When the vegetation was analysed using MATCH the closest three communities were OV23c, MG5a and MG5 all MG6 *Lolium perenne-Cynosurus cristatus* grassland communities or sub-communities. The presence of a willow canopy, however, means that it is not possible to classify this area, which is currently undergoing succession from grassland to a woodland / scrub habitat and it is therefore mapped simply as willow scrub.

Scrub

Directly to the south of and adjacent to the willow scrub, there is an area of scrub. In the 2009 study this area was identified as a more open habitat with the closest community match (44.9%) being for MG5a *Cynosurus cristatus-Centaurea nigra* grassland-*Lathyrus pratensis* sub-community. The area is now dominated by bramble *Rubus fruticosus agg.*

Reedbed

The vegetation to the west of the scrub and grassland is dominated by common reed *Phragmites australis* and is therefore classified as S4 *Phragmites australis* swamp and reed-beds. Access was not available to the western edge of the reeds so this area is not classified to sub-community although common reed appeared to be the sole constant in the areas nearest to the eastern edge.

Sea club-rush

To the south of the reed beds there is a thin continuous strip of sea club-rush *Bolboschoenus maritimus,* with few associates, which continues along the margins of the river to the southern extent of the NVC site. This area of S21a-*Bolboschoenus maritimus* swamp-*Bolboschoenus maritimus*-dominated sub-community runs parallel to a more diverse community of predominantly salt-marsh species in the central portion of the NVC site. This more diverse community is located between the pure sea club-rush stand and the banks of the river on exposed mud and between stones.

Salt-marsh vegetation

The salt-marsh vegetation area is considerably less substantial in extent in comparison to the 2009 study. This area, identified as SM16c *Festuca rubra* salt-marsh community-*Glaux maritima* sub-community in 2009 has been reduced by the encroachment of the adjacent sea club-rush sub-community. Due to the size of the remaining SM16c *Festuca rubra* salt-marsh community-*Glaux maritima* sub-community it was not possible to obtain sufficient detail to undertake quadrat sampling. However a species list was compiled which contained a species broadly analogous with the species found during the 2009 study. The salt-marsh vegetation contains a high coverage of marine algae, attached to rocks at the river edge. No attempt was made to identify the bladder-wrack species present and marine algae were not scored in the quadrat sampling.

© Mouchel 2016

Table 11F.1 NVC site 1: Foyle & Tributaries SAC~Community Summary

Habitat	Community type	NVC code
Willow scrub	Unclassified	-
Scrub	Unclassified	-
Reed bed	*Phragmites australis* swamp and reed-beds	S4
Sea club-rush	*Bolboschoenus maritimus* swamp-*Bolboschoenus maritimus*-dominated sub-community	S21a
Salt-marsh vegetation	*Festuca rubra* salt-marsh community-*Glaux maritima* sub-community	SM16c

NVC site 2: Foyle & Tributaries SAC

NVC site 2 consists of an area of swamp vegetation fringing the eastern banks of the River Foyle. The land directly to the east of this area is predominantly improved grassland with a thin discontinuous band of scrub along the banks and a small section of broad-leaved plantation near the southern extent. There are two inlets into the Foyle near to the northern and southern ends of the NVC site.

It was not possible to directly access the swamp vegetation along this section because of areas of soft mud presenting a health and safety hazard. Therefore the vegetation was assessed from the river bank. There were two distinct homogeneous vegetation types clearly visible along this stretch, both strongly dominated by a single species. There are no floristic tables produced for this area.

Sea club-rush

The majority of the swamp vegetation consists of S21-*Bolboschoenus maritimus* swamp which stretches from the southern extent of NVC site 2 to the northern inlet. This vegetation type is always dominated by sea club-rush, with no other species frequent throughout. Pure stands are common and there are very rarely more than ten associates. This appears to be the case within this NVC site which would define the sub-community as (a) *Bolboschoenus maritimus*-dominated sub-community. This community is characteristic of ill-drained brackish sites on coastal salt marshes, alongside creeks and in estuaries, where stands may be more extensive. It occurs in suitable sites on all coasts of the British Isles.

Reedbed

To the north of the northern inlet the swamp vegetation type changes abruptly to one dominated by common reed, which continues to the northern extent of the NVC site. S4 *Phragmites australis* swamp and reed-beds communities occur in a wide range of permanently wet or periodically waterlogged habitats of differing trophic state and with a wide variety of substrates, in both fresh and brackish water throughout the lowlands of the British Isles. Common reed appeared to be the sole constant, which would define the sub community as (a) *Phragmites australis* sub-community.

Table 11F.2 NVC site 2: Foyle & Tributaries SAC~community summary

Habitat	Community type	NVC code
Sea club-rush	*Bolboschoenus maritimus* swamp-*Bolboschoenus maritimus*-dominated sub-community	S21a
Reed bed	*Phragmites australis* swamp and reed-beds- *Phragmites australis* sub-community	S4a

NVC site 3: McKean's Moss ASSI

McKean's Moss Area of Special Scientific Interest (ASSI) consists of a raised bog surrounded by birch dominated woodland, with smaller areas of scrub, rush pasture and grassland towards the edge of the site. Vegetation types target notes are shown in the floristic tables below. The surrounding landscape is predominantly improved grassland.

Raised bog

The floristics for the raised bog in the centre of the site are presented in the floristic tables below. Analysis of the data using MATCH gives a high (62%) similarity co-efficient for M18a *Erica tetralix-Sphagnum papillosum* raised and blanket mire-*Sphagnum magellanicum-Andromeda polifolia* sub-community, with the sub-community being characterised by abundant *Sphagnum magellanicum.* Within this sub-community, the dwarf shrub bog-rosemary *Andromeda polifolia* can also be frequent but does not occur at McKean's Moss. This species has a limited distribution and is not known from north-west Ireland, with its occurrence being mostly around the Irish midlands (Preston *et al.* 2002).

Birch woodland

The woodland surrounding the bog is extensive and comprises approximately two thirds of the site. It is dominated by downy birch *Betula pubescens* with one small section of willow. Within the birch woodland it is possible to discern changes in the ground flora and therefore sampling was undertaken in three different variants of the community. Quadrats were surveyed in woodland with broad buckler-fern *Dryopteris dilatata* and bramble *Rubus fruticosus* agg. as the dominant ground layer species, areas with extensive and dominant bryophyte coverage and areas dominated by purple moor-grass *Molinia caerulea.* The analysis of the data showed that these three different looking areas can be classified within two different sub-communities of W4 *Betula pubescens-Molinia caerulea* woodland. The drier areas with frequent ferns are closest to the *Dryopteris dilatata-Rubus fruticosus* (a) sub-community. This sub-community is mostly distributed around the south-east of the site, with wetter woodland directly adjacent to and north of the bog. The wetter woodland, including the bryophyte and purple moor-grass dominated areas both appear to be referable to the *Sphagnum* spp. (c) sub-community, with the purple moor-grass dominated areas being a species-poor variant of this sub-community.

Willow woodland

There is a small section of willow dominated woodland to the north-west of the site. It consists mostly of grey willow *Salix cinerea,* with lesser amonts of downy birch. When the floristic data for this area was run through MATCH the highest co-efficient (32.7%) was achieved for the W4 S*phagnum* (C) sub-community. Given the dominance of grey willow within this small area it was

© Mouchel 2016

felt that this was not an accurate classification of the vegetation type. Using the key to woodland and scrub within *British Plant Communities* volume 1 (Rodwell *et al.* 1991a) a better fit for the vegetation type was W1 *Salix cinerea-Galium palustre* woodland, which although quite variable always maintains grey willow as a constant, with occasional downy birch.

Scrub / grassland

The results of the quadrats located within a small area of grassland and scrub on the eastern edge of the site can be found in the floristic tables below. The highest co-efficients given for this area are for W23 *Ulex europaeus-Rubus fruticosus* scrub communities. This clearly does not accurately describe the community present, from which common gorse *Ulex europaeus* is completely absent. Small areas of grassland / scrub mosaics are very difficult to classify as they represent intermediate successional stages between grassland and woodland communities. Therefore an NVC type is not applied to this area.

Rush pasture

Areas of rush pasture are present at the north, east and west of the site. Samples from an area of rush pasture at the north of the site and east of the site are shown in the floristic tables.

This area to the east is dominated by soft rush *Juncus effusus* and is referable to the M23b *Juncus effusus / acutiflorus-Galium palustre* rush pasture community-*Juncus effusus* sub-community. This area also includes four species of *Sphagnum*.

The rush pastures to the west and north of the site contains constant *Filipendula ulmaria*, *Holcus lanatus* and *Juncus acutiflorus.* These areas are referable to M27c *Filipendula ulmaria – Angelica sylvestris* mire *Juncus effusus – Holcus lanatus* sub-community.

Table 11F.3 NVC site 3: McKean's Moss ASSI~community summary

Habitat	Community type	NVC code

NVC site 4: Foyle Floodplain

© Mouchel 2016

NVC site 4 is located directly to the east of the River Foyle and consists of a mixture of rush pasture, semi-improved grassland and a large area of unclassifiable mire habitat, with improved grassland to the east of the site. Access was not permitted to this area during the survey period. The habitat was viewed from a distance and appears to have not been subject to significant modification since the 2009 study.

Table 11F.4 NVC site 4: Foyle Floodplain~community summary

Habitat	Community type	NVC code
Rush pasture	*Holcus lanatus-Juncus effusus* rush-pasture-Typical sub-community	MG10a
Semi-improved grassland	*Lolium perenne-Cynosurus cristatus* grassland-*Anthoxanthum odoratum* sub-community	MG6b
Mire habitat	Unclassified	-

NVC site 5: Strabane Nature Reserve

NVC site 5 near Strabane is the site of a local wildlife site, situated directly to the east of the River Finn. The reserve consists predominantly of dense willow scrub with areas of standing water and ponds, with swamp vegetation beneath much of the canopy. The swamp vegetation also consists of some more open areas with dominant bulrush *Typha latifolia* and water horsetail *Equisetum fluviatile.* There is a pond towards the north of the site with abundant submerged macrophytes including broad-leaved pondweed *Potamogeton natans.*

To the east of the site there is an open grassland area, just north of an area of hard standing which has been used until recently as a caravan site. A track runs along the eastern edge of the site with grassland vegetation and scattered scrub and small trees. The two areas subject to NVC quadrat sampling were the main body of willow scrub in the centre of the site and the grassland to the east. The track was not sampled using NVC methodology due to the heterogeneous nature of the vegetation, although a full species list for this area was complied.

Grassland

The three highest community similarity co-efficients for this grassland area were all OV21 *Poa annua - Plantago major* open habitat community or a sub-community. This habitat is ubiquitous in the lowlands and upland fringes of Northern Ireland and is characteristic of gateways and tracksides.

Willow scrub

The majority of this site is covered in dense grey willow *Salix cinerea* scrub, predominantly with standing water beneath the canopy but there is also a drier area of willow scrub at the far north of the site. All quadrats were located within the wetter central area of scrub. Using MATCH analysis, the closest communities to the scrub areas are all swamp communities with S27a *Carex rostrata-Potentilla palustris* tall-herb fen-*Carex rostrata-Equisetum fluviatile* sub-community scoring the highest percentage match. None of the swamp communities sufficiently match the sampled vegetation and the vegetation present is therefore classed as willow scrub. It appears that the

© Mouchel 2016

swamp communities present are gradually undergoing a process of succession towards woodland communities.

Table 11F.5 NVC site 5: Strabane Nature Reserve~community summary

Habitat	Community Type	NVC code
Grassland	*Poa annua - Plantago major* open habitat community	OV21
Willow scrub	Unclassified	-

NVC site 6: River Finn Floodplain

NVC site 6 consists of several areas of woodland, improved grassland, a small pond, a discontinuous line of trees along the river and rush pasture to the south of the River Finn. Target notes are presented in the floristic tables.

Pond

The pond is located approximately 40 m north-west of the footprint of the Preferred Scheme, within an area of rush-pasture at grid reference H32509673. A list of species can be found in the floristic tables.

Woodland

The woodland at target note 2 is currently used for grazing horses. This section is more akin to parkland, with large, widely spaced, mature beech *Fagus sylvatica* dominant, with a species-poor ground layer due to grazing and areas of poaching. Due to the nature of the habitat, with many planted, non-native tree species it was felt that the community would not match any NVC communities and therefore the results are presented in the floristic tables in the form of a species list with DAFOR Scale **(D** = Dominant; **A** = Abundant, **F** = Frequent, **O** = Occasional, **R** = Rare) indicating relative species abundance.

The woodland at Target Note 3 consists of scattered trees, over amenity and improved grassland within an equestrian centre. This section also contains a large non-native component and therefore no NVC classification was attempted but a species list indicating abundance is shown in the floristic tables below.

The woodland at Target Note 4 consists of a narrow band of woodland along the south of Urney Road.

Vegetation along river banks

To the west of the area there is a steep embankment leading down to the river from an area of MG10a *Holcus lanatus-Juncus effusus* rush pasture-typical sub-community. This field extends to the western boundary of the refuse dump. It is currently grazed by sheep, with all grasses and forbs closely cropped and a very dense coverage of soft rush which dominates throughout. The embankment was not accessed directly due to the steepness of the bank presenting a health and safety hazard. The western section of the embankment is dominated by tall herbaceous vegetation with occasional scattered willow and alder, whilst the eastern section is mixed plantation woodland including a number of non-native coniferous tree species. There is alder buckthorn *Frangula alnus*

© Mouchel 2016

growing within the plantation near the top of the slope at grid reference H32489685. This species is a NI priority species, but given the surrounding planting and location it is likely that it has been recently introduced.

From the east of the refuse dump the ground is more level, with a discontinuous line of trees along the river bank, predominantly grey willow *Salix cinerea* and occasional alder. The trees appear to be subject to periodic inundation, with lower branches and trunks encrusted with river silt. Several trees were found to have abundant cushions of the NI / UK BAP Priority / Irish Red Data Book (Vulnerable) species Spruce's bristle-moss *Orthotrichum sprucei.* This species is listed under Schedule 8 of the Wildlife and Natural Environment Act (NI) 2011. Further information concerning the distribution and status of this species within NI is incorporated within the accompanying Bryophyte Appendix 11D.

Eastern rush pasture
This area of rush pasture appears to be more species-rich than the grazed area to the west of the refuse dump, although the dominant species is still soft rush, with MATCH returning a high (63.1%) similarity co-efficient for MG10a *Holcus lanatus-Juncus effusus* rush pasture-Typical sub-community.

Table 11F.6 NVC site 6: River Finn Floodplain~community summary

Habitat	Community type	NVC code
Pond	Unclassified	-
Woodland	Unclassified	-
River bank vegetation	Unclassified	-
Rush pasture	*Holcus lanatus-Juncus effusus* rush pasture-Typical sub-community	MG10a

NVC site 7: River Derg (Foyle & Tributaries SAC)

NVC site 7 consists predominantly of improved grassland, with narrow bands of woodland along the northern bank of the River Derg. Vegetation types target notes are shown in the floristic tables. Towards the east of the NVC Area there is a larger section of woodland which was surveyed using NVC methodology. The improved grassland in the bend of the river is currently used for grazing horses and was not subject to an NVC survey although a comprehensive species list was compiled for the field. Lines of trees and other vegetation features were noted.

Broad-leaved woodland
The woodland at the east of the NVC site is heavily poached by cattle at the western end with a resulting species-poor ground-layer. It was defined by the MATCH program as Ash *Fraxinus excelsior* woodland, with the highest community similarity co-efficient being for W9a *Fraxinus excelsior-Sorbus aucuparia-Mercurialis perennis* woodland-typical sub-community. The four highest co-efficients also contained W8 *Fraxinus excelsior-Acer campestre-Mercurialis perennis* woodland communities.

© Mouchel 2016

All similarity co-efficients were low (≤33.0%) and many of the constant ground layer species for W9 woodland are missing from NVC Area 7 such as common feather-moss *Kindbergeria praelonga* and common tamarisk-moss *Thuidium tamariscinum.* Dog's Mercury *Mercurialis perennis,* another community constant, is also absent although NVC communities are defined using a dataset collected from Great Britain, with this species being scarce throughout Ireland and absent from western Tyrone. The most abundant canopy layer species in this woodland was hawthorn *Cretaegus monogyna*, which although a component of W8 and W9 woodlands, is always sub-ordinate to ash. This small area of woodland was therefore not felt to be referable to an NVC community.

Improved grassland
The species list, with DAFOR scores, for the horse grazed improved grassland is presented in the floristic tables. All species are widespread and common although corn spurrey *Spergula arvensis,* which was locally frequent on bare ground to the north of the pasture, is currently classified as vulnerable within Great Britain (Cheffings & Farrell, 2005) due to a dramatic recent decline due to agricultural intensification and the loss of arable land in the uplands. A similar decline has occurred throughout Ireland. This species was also frequent on bare ground on the steep woodland bank.

Lines of trees
To the west of the woodland area surveyed, there is a single line of trees, with shrubby understorey along the northern bank of the Derg which extends to the sharp bend in the river. Species present include ash, sycamore *Acer pseudoplatanus,* holly *Ilex aquifolium,* hawthorn *Crataegus monogyna,* blackthorn *Prunus spinosa,* elder *Sambucus nigra,* guelder rose *Viburnum opulus* and ivy *Hedera helix.* Within this line of trees / scrub there are several patches of Japanese knotweed *Fallopia japonica.*

Steep woodland bank
To the west of the bend in the river, there is a steep wooded bank leading to the northern bank of the river. This area was not accessed due to the hazardous nature of the bank although the predominant species within the area could be observed from the top of the bank and included hazel *Corylus avellana*, elder and alder *Alnus glutinosa.*

Vegetation within River Derg
Within the river, along the southern bank, opposite the steep woodland bank there is an area of swamp vegetation dominated by reed canary-grass *Phalaris arundinacea.* It was not possible to access this area from the northern bank so an NVC survey of this vegetation was not possible. This stretch of the Derg also contains abundant stream water-crowfoot *Ranunculus penicillatus* ssp*. penicillatus.*

NVC sites 8 & 9: Old Deer Park Wood

The NVC sites within Old Deer Park Wood consist predominantly of coniferous plantation edged with small areas of beech woodland. The beech woodland comprises narrow strips, with some sections only one tree wide. NVC analysis was therefore not undertaken for Old Deer Park Wood but a ground layer species list is given in the floristic tables.

Table 11F.8 NVC Areas 8 & 9: Old Deer Park Wood~community summary

Habitat	Community type	NVC code
Mixed woodland	Unclassified	-

NVC site 10: Woodland near Strule

The woodland at NVC site 10 consists predominantly of hazel coppice. Throughout the area there are disturbed areas with a greater degree of scrub encroachment including patches of willow, blackthorn and elder. Towards the east of the site there is a more open area (Target Note 1) with greater grass coverage, predominantly sweet vernal-grass, and less scrub growth. NVC sampling was undertaken within the woodland / coppice area, with the quadrat data shown in the floristic tables.

Analysis of the data using MATCH resulted in the highest community similarity co-efficient (36.3%) being for W10e *Quercus robur – Pteridium aquilinum –Rubus fruticosus - Acer pseudoplatanus – Oxalis acetosella sub-community* woodland, with dog's mercury a notable absence, due to its scarcity in Ireland. The ground flora is more typical of W9 woodland due to the constant *Eurhynchium striatum* which is rare in the more acidic W10 communities. Ash is present at a low frequency but this is probably due to previous management, with coppiced hazel constant, as it is in both W9 sub-communities. The sub-community here is closest to the typical (a) sub-community but due to the relatively low community similarity co-efficient this woodland is unclassified.

© Mouchel 2016

Table 11F.9 NVC site 10: woodland near Strule~community summary.

Habitat	Community type	NVC code
Broad-leaved woodland	Unclassified	-

NVC site 11: Tully Bog SAC

Tully Bog Special Area of Conservation (SAC) consists of an area of raised bog surrounded by birch woodland, with a small area of marshy grassland. Vegetation types target notes are shown in the floristic tables. The surrounding landscape is predominantly improved grassland.

Raised bog
Tully Bog possesses sections within the bog surface which exhibit slightly different floristic characteristics; with the southern section of the bog appearing drier and having less extensive *Sphagnum* coverage than the central and uncut northern sections. The drier southern section identified as M19a *Calluna vulgaris-Eriophorum vaginatum* blanket mire-*Erica tetralix* sub-community to the south east of the site in 2009 is now subsumed under the broader sampling compartment previously identified as M18 *Erica tetralix-Sphagnum papillosum* raised and blanket mire in 2009. These two previously separate sampling compartments are now considered to be homogenous in appearance and species composition.

The highest similarity co-efficient (58.7 %) for the central section is for M18a *Erica tetralix-Sphagnum papillosum* raised and blanket mire-*Sphagnum magellanicum-Andromeda polifolia* sub-community. The second highest match (57.8 %) is for M17a *Scirpus cespitosus – Eriophorum vaginatum* blanket mire *Drosera rotundifolia – Sphagnum spp. sub-community*. Small changes in sub-community type are common when undertaking quadrat sampling across extended periods. The central and northern section assigned as simply M18 *Erica tetralix-Sphagnum papillosum* raised and blanket mire in 2009 is now assigned M18a *Erica tetralix-Sphagnum papillosum* raised and blanket mire-*Sphagnum magellanicum-Andromeda polifolia* sub-community.

As in the 2009 study *Sphagnum magellanicum* was found to be absent from the quadrats sampled from the raised bog, although this species is present at Tully Bog, but in far smaller amounts than at McKean's Moss. Other *Sphagnum* species are constants throughout this area including S. *papillosum*, *S. subnitens, S. tenellum* and *S. capillifolium*. The citation for the SAC states that the notable *Sphagnum* species *S. fuscum* and *S. imbricatum* (now separated into two taxa-*S. affine* and *S. austinii)* are known to occur on the bog. Four hummocks of *S. fuscum* and two hummocks of *S. austinii* were recorded in 2009. *Sphagnum fuscum* was still found to be present around the same area of the bog surface as in 2009 (towards the eastern edge of bog, to the north of the power lines which cross near the centre of the bog).

Another notable species *Sphagnum austinii* was also found around the same location as *S. fuscum.* This species was not found in 2009 but was known to have been recorded at Tully Bog as it is listed (as *S. imbricatum*) in the SAC and ASSI declarations. This species was also recorded as an incidental by P. Hanson on 24/06/10. Both of these species are indicators of areas of

© Mouchel 2016

undamaged bog habitat and are often found in association. They have not been found on any other areas of Tully Bog.

The wetter northern section of the bog is closest to M19a *Calluna vulgaris-Eriophorum vaginatum* blanket mire-*Erica tetralix* sub-community. This sub-community develops a greater abundance of *Sphagnum* species than other M19 comunities and shows a number of floristic features transitional to M18 mires, with *S. capillifolium* being quite commonly accompanied by *S. papillosum* and sometimes by *S. tenellum* as is the case at Tully Bog. Overall though the Sphagnum coverage is not so rich or dense as in M18 mires. A small cut area to the south of the car park also most closely matches M19a *Calluna vulgaris-Eriophorum vaginatum* blanket mire-*Erica tetralix* sub-community.

Birch woodland
The lagg surrounding the bog has been cut for peat, with the oldest cuttings at the outer edge of the area dominated by downy birch woodland. A small area of birch woodland has also developed to the south of the central area of the bog. The floristic tables show the quadrat results for the birch woodland, with the woodland being referable to the W4 *Betula pubescens-Molinia caerulea* woodland.

Marshy grassland
The quadrat results for the small area of marshy grassland adjacent to the pond in the north-west of the site are shown in the floristic tables. The MATCH program gives M27c *Filipendula ulmaria-Angelica sylvestris-Juncus effusus-Holcus lanatus* sub-community as the most appropriate community type but the only M27 constant species *Filipendula ulmaria* is absent from all quadrat samples.

NVC site 12: Burnt Bog near Tattykeel

This is a small remnant of bog habitat, surrounded by grassland to the north and west, with a narrow band of birch woodland along the eastern and southern boundaries. The bog has been subject to extensive burning in the last 4 years, which has resulted in three distinct areas of varying degrees of degradation.

The majority of the southern section of the bog has had the surface vegetation completely destroyed, whilst the northern third is largely intact. There is also an area of intermediate

© Mouchel 2016

degradation to the east of the centre of the site. This area is lower than the surrounding area of badly burnt bog and appears to have previously been subject to small-scale peat cutting. This has resulted in the fire damaging but not completely destroying the vegetation in this section. NVC sampling methodology was undertaken within the less damaged areas, with a species list being compiled for the most damaged area, which still consists of large areas of bare ground.

Unburnt section
Within this area mature growth-stage heather is unaffected by the fire and *Sphagnum* coverage is constant, with very little common deergrass present. Analysis of the quadrat data or this section of the bog gives the highest similarity co-efficient (67.2%) for M18a *Erica tetralix-Sphagnum papillosum* raised and blanket mire-*Sphagnum magellanicum-Andromeda polifolia* sub-community. M18 *Erica tetralix-Sphagnum papillosum* raised and blanket mire is given the second highest similarity co-efficient (65.4%). *Erica tetralix, Sphagnum tenellum* and *Sphagnum capillifolium* are constants, with varying coverage values, with *Sphagnum magellanicum* also present. Although the companion species *Drosera rotundifolia* and *Narthecium ossifragum,* along with the preferentials *Vaccinium oxycoccos and Andromeda polifolia,* are absent it is felt that the community best fits the description of M18a. This area is typical of undamaged bog habitat with high coverage values of *Sphagnum capillifolium* and a total of six *Sphagnum* species, including *Sphagnum tenellum.*

Partially-burnt section
The floristic table for this section of the bog is shown in the floristic tables. Within the partially-burnt section the majority of mature growth-stage heather has been killed by the fire but there is some re-generation from the basal parts of plants whose tops have been destroyed. The overall majority of heather growth though is predominantly pioneer growth-stage vegetation which is regenerating from seed. Sphagnum coverage is present at lower values than in the unburnt section and deergrass is present. The highest match for community type (56.8%) is M17 Trichophorum germanicum-Eriophorum vaginatum blanket mire.

Completely-burnt section
The floristic table for this section of the bog is shown in the floristic tables. Within the burnt section the majority of mature growth-stage heather previously killed by the fire has restablished and is dominant however large patches of bare ground are present which has been colonised by the non-native *Campylopus introflexus*. *Erica tetralix, Eriophorum vaginatum* and *Eriophorum angustifolium* are constants but at a lower frequency than *Calluna vulgaris*. Sphagnum coverage is present at lower values than in the unburnt section with *Sphagnum tenellum, S. capillifolium* and *S. subnitens* present. The highest match for community type (51.7%) is M19a *Calluna vulgaris – Eriophorum vaginatum* blanket mire - *Erica tetralix* sub-community.

Birch woodland
Two areas of birch woodland have also developed along the eastern edge of the bog. The floristic tables show the quadrat results for these birch woodlands. The woodland along the north eastern edge of the bog is referable to the W4 *Betula pubescens-Molinia caerulea* woodland typical community. This woodland contains constant *Betula pendula* and *Salix cinerea*. The woodland understorey is dominated by *Molinea caerulea.*

The woodland along the south eastern edge is unclassified as the highest similiarity co-efficient is less than 37%. This woodland is dominated by *Betula pendula* and the woodland understorey is

© Mouchel 2016

again dominated by *Molinea caerulea.* This woodland also contains three Sphagnum species; *S. fimbriatum S. palustre* and *S. capillifolium* as well as *Erica tetralix.* This area is significantly wetter than the woodland to the north.

Table 11F.11 NVC site 12: Burnt Bog near Tattykeel~community summary

Habitat	Community type	NVC code
Unburnt bog	*Erica tetralix-Sphagnum papillosum* raised and blanket mire-*Sphagnum magellanicum-Andromeda polifolia* sub-community	M18a
Partially-burnt bog	*Trichophorum germanicum-Eriophorum vaginatum* blanket mire	M17
Previosuly completely-burnt bog	*Calluna vulgaris – Eriophorum vaginatum* blanket mire - *Erica tetralix* sub-community	M19a
Birch woodland north east	*Betula pubescens - Molinia caerulea* woodland typical community	W4
Birch woodland south east	Unclassified	-

NVC site 13: Routing Burn

NVC site 13 consists of the Routing Burn riparian corridor which is lined with predominantly ash and hazel coppice woodland with areas of scrub and small patches of unimproved grassland on open areas of the stream bank. The surrounding fields are predominantly improved grassland, although vegetation was sampled using DAFOR scoring in a semi-improved grassland field and a single quadrat was placed within an area of open bank-side unimproved grassland near the western extent of the area. A full woodland and streamside species list with target notes is presented in the floristic tables.

Woodland

The quadrat data for the streamside woodland is presented in the floristic tables with MATCH analysis providing the highest similarity co-efficient (39.2%) for W9 *Fraxinus excelsior-Sorbus aucuparia-Mercurialis perennis* woodland. Ash is frequent with hazel constant. Despite the lower than normal frequency of ash the ground layer retains most of the characteristic W9 species, with a greater affinity to the W9a-Typical sub-community in which ferns such as broad-buckler and male fern show a greater prominence.

Scrub

Scrub is locally frequent near the edges of the woodland with an area of hawthorn / blackthorn near the eastern end which links the ash / hazel woodland inside a sharp bend in the burn. Along the entire length of NVC site 13 there are scattered patches of gorse scrub, particularly at the western end where the scrub replaces the ash / hazel woodland.

© Mouchel 2016

Semi-improved grassland

A species list for the semi-improved neutral grassland field is shown in the floristic tables. Although NVC analysis is not possible without multiple quadrat data, the species composition of the field clearly indicates a community with strong MG6 *Lolium perenne-Cynosurus cristatus* grassland affinities with abundant perennial rye-grass and crested dog's tail. There does, however, seem to be a set of species present at lower levels of abundance which would indicate wetter areas within the field. Such species include marsh foxtail *Alopecurus geniculatus,* cuckooflower *Cardamine pratensis,* brown sedge *Carex disticha,* marsh thistle *Cirsium palustre,* bristle club rush *Isolepis setacea* and soft rush *Juncus effusus* which may be indicative of succession toward MG10 *Holcus lanatus-Juncus effusus* rush pasture.

Unimproved grassland

Again it is not possible to determine community type using a single quadrat, but the species present seem to be consistent with those present in MG5 *Cynosurus cristatus-Centaurea nigra* grassland, with 8 of the 11 species listed as constants being present within the quadrat, including red fescue, crested dog's-tail, ribwort plantain *Plantago lanceolata* and common knapweed *Centaurea nigra.* The MG5 community is closely related to MG6 grassland and agricultural improvement can lead to a gradual succession from MG5 to MG6.

Table 11F.12 NVC site 13: Routing Burn~community summary

Habitat	Community type	NVC code

Semi-improved grassland	Unclassified	-
Unimproved grassland	Unclassified	-

NVC site 14: Knockmany Forest

NVC site 14 consists of an area of improved grassland to the south, with an area of cleared woodland to the north. The area was therefore not subject to attempted NVC classification.

Table 11F.13 NVC site 14: Knockmany Forest~community summary

Habitat	Community type	NVC code
Improved grassland	Unclassified	-
Broad-leaved woodland	Unclassified	-

© Mouchel 2016

NVC site 15: Knockmany Forest

NVC site 15 contains a mosaic of habitat types, with areas of improved grassland, woodland, modified bog, parkland and an extensive patch of bracken surrounded by woodland. The land to the west, north and east of the site is predominantly improved grassland with a large conifer plantation to the south.

Modified bog

An area of modified bog is situated to the north-east of the site, with quadrat data shown in the floristic tables below. The highest community co-efficient (50.0%) for the samples analysed was for M15d *Scirpus cespitosus – Erica tetralix* wet heath *Vaccinium myrtillus* sub-community. *Scirpus cespitosus* and *Erica tetralix* are absent from the sample quadrats but this is not unusual for this community. *Molinea caerulea* and *Calluna vulgaris* can also be dominant, which is evident for this area. Within this community, however, Sphagnum species are infrequent whereas in the NVC site 15 bog *Sphagnum fallax* and *Sphagnum capillifolium* are constant, with frequent *Sphagnum palustre,* and occasional *Sphagnum papillosum*.

The second highest community co-efficient (48.5%) was for U2b *Deschampsia flexuosa* grassland - *Vaccinium myrtillus* sub-community. *Deschampsia flexuosa* and *Vaccinium myrtillus* are constants within this area.

The third highest community co-efficiant (46.2%) was for 19a *Calluna vulgaris-Eriophorum vaginatum* blanket mire-*Erica tetralix* sub-community. Heather and hare's-tail cottongrass are constant throughout the sampling, although cross-leaved heath *Erica tetralix* is absent. Purple moor-grass *Molinia caerulea* and common haircap *Polytrichum commune* var. *commune* are more widespread than is usual for this community type.

M15 communities can be very variable but *Molinia* is the most consistent species. *Molinia* is constant in the sampled quadrats as is bilberry which defines M15d sub-community. *Deschampsia flexuosa* is also constant which is characteristic of the U2b sub-community. The modified bog can be classified as a mosaic of M15d and U2b, with Deschampsia dominating the drier sections. The change in classification of this area is indicative of an increase in the desiccation of the modified bog.

Main woodland

The majority of the woodland area is dominated by pedunculate oak with smaller amounts of ash and a hazel understorey. The floristics table show that the ground layer is dominated by bramble, with frequent broad buckler-fern. The acidic nature of the soil is evidenced by the presence of calcifuges such as bank haircap *Polytrichastrum formosum* and hard fern *Blechnum spicant.* This area is referable to the W10 *Quercus robur-Pteridium aquilinum-Rubus fruticosus* woodland community. Along Newtownsaville Road, to the south of a large bracken patch (Target Note 2), there is an area of the main woodland which has been subject to hazel coppicing (Target Note 3), with this section being dominated by hazel, which forms a shrub layer throughout the main body of the woodland.

© Mouchel 2016

Ash dominated woodland

Towards the east of the woodland, there is an area with ash constituting the most frequent tree species (Target Note 4). The species list for this area is shown is shown in the floristic tables below. This area was too small to sample using multiple quadrats and therefore no NVC analysis has been undertaken.

Alder dominated woodland

No NVC analysis was undertaken on three separate small areas of alder dominated woodland, but species lists are presented in the floristic tables below. Although quadrat data was not collected the species lists seem to indicate the presence of W7 *Alnus glutinosa-Fraxinus excelsior-Lysimachia nemorum* woodland. In this community alder is the only woody constant throughout, with a variable field layer with frequent species including yellow pimpernel *Lysimachia nemorum,* opposite-leaved golden saxifrage *Chrysosplenium oppositifolium* and lady-fern *Athyrium filix-femina,* all of which are present in the species lists and whose frequent occurrence separates W7 woodland from another alder dominated community, W6 *Alnus glutinosa-Urtica dioica* woodland. Stands of this woodland type are often found in small flushes on slopes and the proportions of the canopy layer and shrub layer species can be quite variable.

Table 11F.14 NVC site 15: Knockmany Forest~community summary

Habitat	Community type	NVC code
Modified bog	*Scirpus cespitosus – Erica tetralix* wet heath *Vaccinium myrtillus* sub-community / *Deschampsia flexuosa* grassland - *Vaccinium myrtillus* sub-community	M15d / U2b
Main woodland	*Quercus robur-Pteridium aquilinum-Rubus fruticosus* woodland community	W10
Ash woodland	Unclassified	-
Alder woodland	*Alnus glutinosa-Fraxinus excelsior-Lysimachia nemorum* woodland	W7

NVC site 16: Knockmany Forest

Within NVC site 16 there are areas of wet and dry woodland, disturbed acid grassland and marshy grassland. The grassland to the south of the site (Target Note 8) was not surveyed due to the heterogeneous nature of the habitat making it unsuitable for NVC survey methodology. NVC surveys were undertaken within the marshy grassland and wet woodland and target notes are presented in the floristic tables below.

Marshy grassland

The marshy grassland is located at the edge of a field, just to the north of the wet woodland. Quadrat data is presented in the floristic tables below. The vegetation community most closely matching this area is M23a *Juncus effusus / acutiflorus-Galium palustre* rush pasture-*Juncus acutiflorus* sub-community. This sub-community still possesses frequent soft rush but it is typically accompanied and usually exceeded by sharp-flowered rush *Juncus acutiflorus.*

© Mouchel 2016

Wet woodland

Floristic data for the wet woodland within NVC site 16 is given in the floristic tables below. The woodland canopy has silver birch and grey willow as constants, with grey willow being more frequent. The two top matches for vegetation communities are both for W7 *Alnus glutinosa – Fraxinus excelsior – Lysimachia nemorum* woodland with the highest similarity co-efficient (31.8%) being for the W7b *Carex remota – Cirsium palustre* sub-community. This match is problematical as the constant canopy species for the community (alder and ash) and constants for the sub-community (marsh thistle and remote sedge) are all absent within the sampled quadrats. However the dominant shrub for this sub-community (*Salix cinerea*) is constant. Sections of the woodland are very wet, with floating mats of vegetation and many species more characteristic of mire habitats such as water horsetail *Equisetum fluviatile*. W7b sub-community is associated with very wet habitats but it is felt that this habitat cannot be assigned to an NVC community and is simply mapped as unclassified woodland.

Dry woodland

The majority of woodland within NVC site 16 is wet woodland but a separate species list was compiled for the small area of drier woodland to the north of the site.

Table 11F.15 NVC site 16: Knockmany Forest~community summary

Habitat	Community type	NVC code
Marshy grassland	*Juncus effusus / acutiflorus-Galium palustre* rush pasture-*Juncus acutiflorus* sub-community	M23a
Wet woodland	Unclassified	-
Dry woodland	Unclassified	-

NVC site 17: woodland near Glack

This area could not be accessed during the survey due to access not being agreed. The area could be seen from a distance and appears to have not undergone any significant change since the 2009 survey and the current NVC classification is considered to be analogous with the NVC classification from 2009. The following three paragraphs and associated table (Table 11F. 16) are an extract from the 2009 survey.

NVC site 17 consists of an area of woodland-lined riparian corridor. There are two main blocks of woodland, one to the north and the other to the south of the NVC site. The surrounding land is predominantly improved grassland with a coniferous plantation directly to the east of the southern woodland block. Only the northern block of woodland was surveyed due to access not being agreed to the southern section.

The northern section contains a mixture of vegetation types with trees along the top of the banks, in places only one tree wide. There are sections of tall herbaceous vegetation along the sides, with frequent nettle, hogweed and cow parsley and open sections of marshy grassland with frequent creeping buttercup and floating sweet-grass. Due to the heterogeneous nature of the bankside vegetation no NVC sampling was undertaken along the majority of the riparian corridor but a species list, with DAFOR scores was compiled for the stream banks. The only homogenous

© Mouchel 2016

section is an area of ash / hazel woodland along part of the eastern bank which was subject to NVC survey.

Ash / hazel woodland
The homogeneous woodland section possesses a canopy dominated by ash and a shrub layer with dominant hazel. Using MATCH analysis the closest community (32.0%) to this woodland area is W9 *Fraxinus excelsior-Sorbus aucuparia-Mercurialis perennis* woodland. Although the percentage similarity co-efficient is low the community present within this section of NVC Area 40 does provide a close approximation to the W9 community type. The dominant W9 canopy (ash) and shrub layer (hazel) species are both constant with high coverage values and five of the eight ground layer community constants are present.

Table 11F.16 NVC site 17: Woodland near Glack~community summary

Habitat	Community type	NVC code
Bankside vegetation	Unclassified	-
Ash / hazel woodland	*Fraxinus excelsior-Sorbus aucuparia-Mercurialis perennis* woodland	W9

NVC site 18: Woodland near Glack (EID Area 9K)

NVC site 18 is predominantly improved grassland with a central block of woodland and small areas of marshy grassland, with an area of unimproved meadow near the north of the NVC site.

Marshy grassland
The three highest community co-efficients for the areas of marshy grassland were all MG10 *Holcus lanatus - Juncus effusus* rush-pasture or a sub-community. The joint highest community similarity co-efficient was for MG10 and MG10a (52.8%). This habitat is very common in Northern Ireland and is associated with poorly drained permanent pastures.

A second marshy grassland, within the north east extent of the NVC site, was also surveyed. The highest community similarity co-efficient (51.6%) for this area was M23a *Juncus effusus/acutiflorus - Galium palustre* rush-pasture - *Juncus acutiflorus* sub-community.

Meadow
The meadow area is enclosed by woodland and scrub and free from stock and other disturbance. The grassland towards the eastern edge becomes less diverse and shows signs of some nutrient enrichment. The floristics table for the meadow is shown in the floristic tables. The highest community similarity co-efficient was for MG9 *Holcus lanatus - Deschampsia cespitosa* grassland. This habitat is fairly common in lowland Britain and is associated with poorly drained permanent pastures.

Woodland
The main woodland block consists of semi-mature ash high woodland (trees <50 years old) intermixed with mature goat willow with one or two large ash standards that have historically been coppiced. The woodland is heavily disturbed at the base and the top of the north-west aspect

© Mouchel 2016

slope. There are few ancient woodland indicators but the site was probably historically wooded and was previously clear felled. Some sections are dominated by competitive tall ruderal species. The top five highest community co-efficients were all either W8 or W9 typical or sub-communities. The highest community similarity co-efficient (36.6%) was for W8e *Fraxinus excelsior – Acer campestre – Mercurialis perennis* woodland - *Geranium* robertianum sub-community. Due to the low community similarity co-efficients it is felt that this habitat cannot be assigned to an NVC community and is simply mapped as unclassified woodland.

Table 11F.17 NVC site 18: Woodland near Glack~community summary

Habitat	Community type	NVC code
Marshy grassland	*Holcus lanatus-Juncus effusus* rush-pasture- *Juncus inflexus* sub-community	MG10b
Marshy grassland north east of area	*Juncus effusus/acutiflorus - Galium palustre* rush-pasture - *Juncus acutiflorus* sub-community	M23a
Meadow	*Holcus lanatus - Deschampsia cespitosa* grassland	MG9
Woodland	Unclassified	-

NVC site 19: Woodland near Glack

NVC site 19 is composed entirely of woodland, surrounded by improved grassland. The constant tree species present are pedunculate oak, beech *Fraxinus excelsior* and ash, with hornbeam *Carpinus betulus* frequent. The quadrat data is presented in the floristic tables.

The community most closely matching the woodland vegetation is W8b *Fraxinus excelsior-Acer campestre-Mercurialis perennis* woodland-*Anemone nemorosa* sub-community. Despite two of the nominate W8 community constants being absent from the samples, the species present and their frequencies provide a good approximation of W8b floristics. As stated earlier in the report dog's mercury is very scarce in Ireland but is an important component of the community in Great Britain, where data was collected when the NVC system was devised. No samples were collected from Ireland. Similarly field maple *Acer campestre* is not native to Ireland and although frequently planted is not widespread as a naturalised species.

Within W8 communities, ash is usually the most frequent canopy species but pedunculate oak, hornbeam and sycamore may also attain prominence. Beech is usually present in smaller amounts but much of the beech present appears to have been planted, originally as field boundaries. Within the W8b sub-community hawthorn and hazel are both constant as they are in NVC site 19.

The most distinctive feature of the W8b sub-community however is the abundance of wood anemone *Anemone nemorosa* and lesser celandine *Ficaria verna,* compared to other W8 sub-communities, both of which are constant within the NVC site 19 samples.

© Mouchel 2016

Habitat	Community type	NVC code
Broad-leaved woodland	*Fraxinus excelsior-Acer campestre-Mercurialis perennis* woodland-*Anemone nemorosa* sub-community	W8b

NVC site 20: River Blackwater

NVC site 20 consists of improved grassland directly to the north of the River Blackwater, which was closely mown during the time of the survey. Within the pasture there are several hedge / tree lines with mature trees and shrubs, including some very large ash trees. No mapping or NVC survey results are provided but lists of the species present with indications of abundance are indicated in the floristic tables.

Table 11F.19 NVC site 20: River Blackwater~community summary

Habitat	Community type	NVC code
Improved grassland	Unclassified	N/A

NVC site 21: Woodland near Glencull

NVC site 21 consists of a block of woodland at the western extent with an area of marshy grassland to the east.

Woodland

The community most closely matching the woodland vegetation is W8b *Fraxinus excelsior-Acer campestre-Mercurialis perennis* woodland - *Anemone nemorosa* sub-community. Despite two of the nominate W8 community constants being absent from the samples, the species present and their frequencies provide a good approximation of W8b floristics. As stated earlier in the report dog's mercury is very scarce in Ireland but is an important component of the community in Great Britain, where data was collected when the NVC system was devised. No samples were collected from Ireland. Similarly field maple *Acer campestre* is not native to Ireland and although frequently planted is not widespread as a naturalised species.

Within W8 communities, ash is usually the most frequent canopy species but pedunculate oak, hornbeam and sycamore may also attain prominence. Beech is usually present in smaller amounts but much of the beech present appears to have been planted, originally as field boundaries. Within the W8b sub-community hawthorn and hazel are both constant as they are in NVC site 21.

The most distinctive feature of the W8b sub-community however is the abundance of wood anemone *Anemone nemorosa* and lesser celandine *Ficaria verna*, compared to other W8 sub-communities, both of which are constant within the NVC site 21 samples.

© Mouchel 2016

Marshy grassland

An area of rush pasture is present at the east of the site. Samples from this area are shown in the floristic tables. This area contains a species assemblage referable to the M23 *Juncus effusus / acutiflorus-Galium palustre* rush pasture typical community, with constant soft rush *Juncus effusus* and *Holcus lanatus* and frequent sharp-flowered rush *Juncus acutiflorus*. In the lower tier of vegetation, *Mentha aquatica, Cardamine pratensis, Ranunculus flammula* and *R. repens* are frequent. This area contains four species of Juncus; *J. effusus, J. acutiflorus, J. bulbosus* and *J. conglomerate* as well as five species of Carex; *C. nigra, C. ovalis, C. echinata, C. demissa* and *C. panicea.* The area also contains *Molinea caerulea* and a single small stand of *Sphagnum palustre.*

Table 11F.28 McKean's Moss ASSI (NVC site 3) target notes

Target note	Description
1	*Sphagnum* communities present within drains/cuttings in the woodland with *S. fimbriatum* abundant, *S. fallax* abundant, *S. palustre* var. *palustre* occasional, *Polytrichum commune* var. *commune* frequent and broad buckler-fern rare.
2	Bog myrtle *Myrica gale* frequent with small cuttings around the edge of the bog supporting *Sphagnum capillifolium* on hummocks and *S. cuspidatum* in hollows.
3	Soft rush and water horsetail *Equisetum fluviatile* frequent within old drain/cutting.
4	Cuttings with *Sphagnum squarrosum.*
5	Area of M27c rush pasture with scattered willow and birch scrub. Also present were marsh cinquefoil *Potentilla palustris* and devil's-bit scabious *Succisa pratensis.*

APPENDIX 11G – SPECIES RICH HEDGEROWS AND VETERAN TREES

Species rich hedgerows and veteran trees are significant nature conservation factors for the Proposed Scheme as although species poor hedges are ubiquitous within Northern Ireland (NI) species rich hedgerows are relatively rare; hedgerow and tree conservation are part of the Roads Service Biodiversity Implementation Plan, NI Biodiversity Strategy and associated Plans and UK BAP; under Planning Policy Statement (PPS) 2 - Planning and Nature Conservation the Department seek to protect trees, groups of trees, and woodland areas of particular importance because of their nature conservation value.

Northern Ireland has limited woodland cover and its ancient woodland is a finite resource, covering 0.08 per cent of the landscape.

Legislation

There is no legal protection for species rich hedgerows and veteran trees in Northern Ireland (NI) unless they have been protected under a Tree Protection Order (TPO). However they do receive some legal protection as the habitat they create supports numerous legally protected species. The most likely to be of relevance to the Proposed Scheme are the protections afforded to wild bird nests and the protection afforded to bat roosts.

Nevertheless, Article 10 of Council Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora ("the Habitats Directive") requires member states to encourage the management of hedges (and other linear features) in their land use planning and development policies and, in particular, with a view to improving the ecological coherence of candidate Special Areas of Conservation (cSAC) and Special Protection Areas (SPA). This is reflected in The Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended) which recognises that such linear features are essential for the migration, dispersal and genetic exchange of wild species.

Conservation status of species rich hedgerows in Northern Ireland

Overview and definition

In order to be considered species rich, a hedge must have at least five native woody species in an average 30m stretch or contain less woody species but have a rich ground flora. Published information for hedges in Northern Ireland suggests that over half are species-poor, dominated by hawthorn *Crataegus monogyna* and ash *Fraxinus excelsior* (Hegarty, 1992). The Northern Ireland Countryside Survey (NICS) report gathered a large amount of information on hedgerows and estimated that 37% (44,000 km) of NI hedges are species-rich (Cooper & McCann, 2001). Often the best examples are found alongside sunken roads and old tracks where they are likely to be of more ancient origin than those between fields (EHS, 2003). This data represents the entire of NI however, and it is not known whether it is representative of conditions within all parts of the country.

© Mouchel 2016

Intrinsic value

The NICS report (Cooper & McCann, 2001) indicates there was a 4% loss of hedgerows from 1991-1998. The Northern Ireland Landscape Character Area Assessment Series identified neglect and hedge removal as widespread issues across NI (Environmental Resources Management, 1999). However the hedgerow network is recognised as being denser and the overall decline is not as significant, than many other areas of the UK. It is also recognised that hedges in NI are not a historic feature of the landscape and most were planted within the past few hundred years (NIEA 2009).

Some of the most valuable species rich hedgerows may however derive from earlier planting or woodland clearance. Hence they may also retain ancient woodland indicator species such as wood anemone, *Anemone nemorosa* and primrose *Primula vulgaris*. Others may have escaped the general grassland improvement and may contain remnants of more natural grassland communities in their basal vegetation. Hegarty (1992) recorded over 170 species of trees, shrubs and wildflowers in hedgerows in NI.

Supporting value

In addition to their intrinsic flora components hedges can be of value to a variety of fauna. In this respect flora diversity and structural diversity can be equally important. Generally thicker, taller, less intensively managed hedges are better for wildlife as they afford more varied habitats and provide more shelter.

Hedgerows provide valuable nesting habitat and song posts for breeding birds. In NI 36 bird species regularly rely on hedgerows for breeding, shelter and feeding purposes, approximately another ten occasionally use hedges amongst other habitats for various purposes. Many of these are listed as UK Birds of Conservation Concern (Gregory et al, 2002).

Hedgerows over 1m in height are important habitats for most bat species, especially where they create a double linear feature with hedgerow, treeline or woodland (Russ, 1999). Loss of good quality hedgerows would be detrimental to a number of protected mammal species such as red squirrel *Sciurus vulgaris*, pine martin *Martes martes* and badger *Meles meles*. Loss of hedgerows is also cited in the Irish hare NI BAP as a probable factor causing decline in the population (Mouchel, 2009). Relevant baseline reports have been produced by Mouchel (2009) that will assess the requirements of these UK BAP species where necessary.

Butterfly diversity also tends to be greatest along hedgerows that are high and wide, as well as being rich in plant species (Wolton, 1999). Consequently hedgerows support a wide range of species. Hedgerows also act as wildlife corridors for many species, allowing dispersal and movement between other habitats. Several NI BAP habitats are also associated with hedgerows.

© Mouchel 2016

Conservation status of veteran trees and mature trees

Overview and definition

Veteran trees are those in the late stages of maturity or with obvious heritage or aesthetic appeal. This includes those trees that are over 1m diameter at 1.3m height, generally with several additional features such as decay holes, bark loss, epiphytic plants and fungal growth (Woodland Trust 2007). Veteran trees are valuable for several reasons:

- They may be remnants of ancient woodland;
- Their supporting value for many plant and animal species; and
- Their landscape and aesthetic qualities.

Intrinsic value

Veteran trees are of great conservation value as individual trees and are important because of their great size, age or condition; they are recognised throughout the UK as an important habitat with the UK supporting 80% of the European total. They are also included as an integral part of the Parklands BAP where they are noted to be prevalent in former estate gardens. However, it is noted that they are less common in NI than in the rest of the UK. Their conservation status is not specifically known, but factors revolving around poor land management appear to be having adverse effects (NI BAP accessed 21st November 2014.

The previous Mouchel field surveys (Mouchel 2009) recording the baseline habitats and scoping for trees suitable to support bat roosts found comparatively few mature trees within the survey area and the wider landscape of Co. Tyrone.

Supporting value

Veteran trees should be regarded as significant for wildlife as are valuable habitats for a range of species such as lichens, fungi, invertebrates and bats (Roads Service, 1998).

Policies and guidance notes

There are 7 policy and guidance documents which have been created to help conserve and protect ecologically important hedgerows and trees within NI and the study area:

- Planning Policy Statement 2;
- Policy ENV1.1 in Section 12 of the Regional Development Strategy 2025 “Caring for the Environment”;
- Shaping Our Future, Chapter 12, Caring for the Environment;
- Northern Ireland Biodiversity Strategy and associated Plans;

© Mouchel 2016

- UK Biodiversity Action Plans;
- Roads Service Biodiversity Implementation Plan; and
- Local Biodiversity Action Plans.

Baseline data collection

The following tasks have been undertaken to inform the identification and description of the baseline environment relating to species rich hedgerows and veteran trees:

- Consultation with NIEA, CEDaR, The Woodland Trust and DARD to identify the location and details of all statutory and non-statutory designated sites within 1km of the Proposed Scheme (the study area) that have been notified for their species rich hedgerows and veteran trees, and for records of species rich hedgerows and veteran trees.
- A review of habitats within 250m of the Proposed Scheme to determine their suitability to support species rich hedgerows and identify the location of veteran trees. This involved consideration of studies undertaken in 2008 and 2009 during the preliminary planning, selection of a preferred route and assessment of the scheme proposed in the A5WTC ES 2010.
- A review of the Phase 1 Habitat surveys data undertaken in March 2014 to determine areas which contain species rich hedgerows and veteran trees.

Field survey

The data from previous studies (collected by Mouchel in 2008 and 2009) were used to identify where species rich hedgerow habitats and veteran trees were located and this was used to establish a survey area for the 2014 Hedgerow and Veteran Tree Surveys.

The methodology used for the hedgerow and veteran tree field surveys was informed by the Hedgerow Survey Handbook 2nd Ed. (DEFRA, 2007). The veteran tree assessment informed by the Veteran Tree initiative Specialist Survey Form (Treework 1996). Species rich hedgerows are defined following the NI habitat Action Plan Species-Rich Hedgerows Final Draft (2003).

Due to the time it takes for a veteran tree and species rich hedgerow to develop only areas which had been previously identified in the extensive 2009 Phase 1 report undertaken by Mouchel were examined. A hedgerow which was initially deemed species rich would not become species poor within five years, therefore, the main objective for this follow up survey was to note if the individual initially identified was present or absent.

Field surveys were undertaken during April to June 2014. The species rich hedgerows or veteran tree had been previously recorded during 2008 and 2009 and are indicated in Figures 11G.1 to 11G.6.

Results

Designated sites

No designated sites were identified within the study area.

Existing Records

Species rich hedgerows

The survey undertaken in 2008 and 2009 identified 43 individual species rich hedgerows. The far south of the study area contained the largest number of species rich hedgerows with higher than average concentrations north and west around Aughnacloy. These areas also contain higher than average, wider and less intensively managed networks which are therefore likely to be of greater supporting value for a variety of fauna.

Veteran and mature trees

The survey undertaken in 2008 and 2009 found that mature trees greater than 100 years old were found to be relatively rare within the study area. Mature trees are most commonly found within woodlands, alongside streams or rivers, and infrequently along hedgerows. The most commonly found veteran tree species was beech *Fagus sylvatica*, ash *Fraxinus excelsior* and oak *Quercus sp.,* with particularly good examples alongside the Mourne and Strule. There was also a ring of mature beech around the perimeter of Old Deerpark Wood. Table 11G.1 provides a summary of the significant clusters of mature trees present within the study area.

Table 11G.1 Summary of significant clusters of mature trees

Name (if applicable)	Other info
Close to Carricklee	Many non-native tree species.
Alongside River Mourne	Multiple mature oak, ash and beech
Alongside River Strule	Multiple mature oak, ash and beech
Old Deerpark Wood	Fringe of mature beech, although interior is conifer plantation

Field survey

Species rich hedgerow survey results

43 individual species rich hedgerows were derived from the previous 2009 study. 5 species rich hedgerows could not be surveyed as the access by land owners was not granted (hedgerow numbers: 7, 10, 11, 35, and 36) see Figure 11G.1-12.

A summary of the 2014 results are shown in Table 11G.2 and on Figures 11G.1-12. Significant networks of species rich hedgerows were found close to Sion Mills and in three areas around Aughnacloy. Several hedgerows had woodland ground flora species, such as a diversity of ferns, grasses and other flowering species. However, the majority had improved grassland species as the dominant ground flora. From the 38 hedgerows surveyed all were found to be present, however six hedgerows (hedgerow numbers: 4, 5, 17, 22, 39, 42) were found to be partially removed or defunct.

Hedgerow species	Total number of hedgerows in which species were found in 2014 field surveys
Oak, sessile *Quercus petraea*	1
Rose *Rosa sp.*	1
Rowan *Sorbus aucuparia*	8
Sycamore *Acer pseudoplatanus*	27
Willow *Salix sp.*	4

Ground flora

The most abundant 'woodland' ground flora species was herb robert *Geranium robertianum* it was found throughout the survey area. Other common woodland species found included: primrose and violets *Viola sp*. Typical hedgerow ground flora include fern species, umbellifers, vetches/vetchlings, common nettle *Urtica diocia* and fine grasses. Himalayan balsam *Impatiens glandulifera* was located in 4 of the hedgerows (4, 18, 19, and 43) see Figure 11G.1-12; this is a schedule 9 plant and is known as a highly invasive species.

Veteran tree survey results

Overview
Nine veteran trees were recorded during the field surveys. Six of the nine have trunk diameters of an extent to indicate that they are 'truly ancient', following the survey methodology. They have two to six additional features; the most commonly found are:

- an average of 7% dead wood in the canopy;
- dead wood attached to the tree at least 1m by 8cm diameter;
- tears, splits, scars or lighting strikes more than 30cm long;
- hollow trunks or hollow major limbs; and
- major rot sites, any more than 15cm across.

Five veteran trees were found within hedgerows, both species rich and species poor. Three trees are within or adjacent to woodland including semi-natural broadleaved woodland. Two of the trees are adjacent or close to a river. A summary of the field survey data is shown in Table 11G.4.

© Mouchel 2016

Table11G.4 Summary of results per veteran tree from the 13 target areas surveyed.

Veteran tree number and site location (H)	Tree species	Assigned value (from diameter at 1.3m height)	Number of additional features	Surrounding habitat
4, H2	Willow	Potentially interesting	5	5 Species rich hedge
5, H5	Oak	Truly ancient	2	Adjacent to species poor hedge
6, H5	Beech	Truly ancient	5	Mature tree line, adjacent to dense scrub
7, H5	Ash	Truly ancient	4	Species poor hedge
8, H8	Beech	Potentially interesting	4	Semi-natural broadleaved woodland, adjacent to river
9, H11	Ash	Truly ancient	4	Species poor hedge, close to semi-natural broadleaved woodland
10, H13	Willow	Truly ancient	6	Species rich hedge, close to river
11, H10	Beech	Valuable	6	Rath
12, H1	Beech	Valuable	4	Semi-natural mixed woodland
Typical features	Beech	Truly ancient	4	Hedgerow (species rich or poor)

Locations of clusters of veteran trees

The highest concentration of veteran trees was found at site location H5. This area includes important adjacent habitat features such as a mature tree line, dense scrub and species poor hedgerows. No other significant clusters of mature/veteran trees were found in the field surveys.

© Mouchel 2016

APPENDIX 11H OTTER *LUTRA LUTRA*

Legislation

Otters are fully protected in NI under the Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended). Under this legislation they are given the status of a European Protected Species (EPS).

The Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended) make it an offence to deliberately:

- Capture, injure or kill an otter;
- Disturb an otter while it is occupying a structure or place which it uses for shelter or protection;
- Disturb an otter in such a way as to be likely to:

  (i) Affect the local distribution or abundance of otter;

  (ii) Impair its ability to survive, breed or reproduce, or rear or care for its young; or

  (iii) Impair its ability to hibernate or migrate;
- Obstruct access to a breeding site or resting place of such an animal; or
- Damage or destroy a breeding site or resting place of such an animal.

It may be possible to obtain a licence from Northern Ireland Environment Agency (NEIA) to allow activities that would otherwise be an offence under these Regulations, providing that (a) there is no satisfactory alternative, and (b) that the action authorised will not be detrimental to the maintenance of the population of the species concerned at a favourable conservation status in their natural range. In addition, it is an offence to breach a licence condition.

Otter are listed on Appendix II of the Bern Convention on the Conservation of Wildlife and Natural Habitats. In addition, otters are included on Annex II and IV to Council Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora ("the Habitats Directive"). Annex II species should be considered with respect to Part II of the Conservation (Natural Habitats, &c.) Regulations (Northern Ireland) 1995 (as amended). While this does not confer any direct legal protection, locations supporting significant populations of otter can be designated as SAC. Annex IV species are those considered in need of strict protection.

Conservation status

The otter (Eurasian otter *Lutra lutra*) is found in Europe, Asia and Africa (north of the Sahara). It is found throughout Ireland, in riparian and coastal habitats (Harris and Yalden, 2008). In many parts of its range it is in decline or extinct. In the 1960s and 1970s otter populations declined throughout

© Mouchel 2016

Europe including in Great Britain (EHSNI, 2008). However, no decline was detected in Ireland. The first national surveys were undertaken in the 1970s and 1980s and otters were found at 78% of sites searched (compared to 6% in England). However, the 2001-2002 survey of Northern Ireland revealed a decline of approximately 10% in the proportion of positive sites surveyed (Preston *et al.,* 2006). The population within Ireland is considered to be the densest population of otters in Western Europe and is of international importance (EHSNI, 2008). The 2001-2002 NI survey revealed that the Foyle catchment had 75% positive sites, and it was commented that rivers associated with Lough Foyle had the highest proportion of positive sites in NI (Preston *et al.,* 2006).

Internationally the otter is listed as being Near Threatened on the International Union for Conservation of Nature and Natural Resources (IUCN) Red List. This means that it is close to qualifying or likely to qualify for a threatened category in the near future (e.g. critically endangered, endangered or vulnerable). The otter has been listed as Near Threatened due to its ongoing population decline, although in Western Europe there is evidence of the population recovering. In addition, there is a lack of information on the otters' status from many parts of its international range, as well as past declines and the species sensitivity to sudden changes in threats. It is also noted that conservation actions need to be sustained, even where the population has recovered (IUCN, 2008).

The otter has been identified as a priority species in Northern Ireland and is listed on its Biodiversity Action Plan (BAP). BAP listed species are those that the UK Central and Local Governments have a particular responsibility to conserve for the good of international biodiversity conservation, as agreed at The United Nations Conference on Environment and Development (UNCED). Such species lists do not necessarily overlap completely with rarity or threat lists. A species is listed as a priority species on the NI BAP when it is under threat and requires conservation action. For some NI BAP priority species, only the UK species action plans (SAP) are used. However, for the otter one other action plan exists: the NI Species Action Plan Otter (EHSNI, 2008). The aim of the NI SAP was to maintain the current distribution of the otter throughout NI, and expand the range of otters by eight 10km^2 by 2010 and by a further five 10km^2 by 2015. The UK SAP otter action plan aimed to maintain and enhance the existing population of the otter and by 2010 restore breeding otters to all catchments and coastal areas where they have been recorded since 1960 (Joint Nature Conservation Committee (JNCC)).

Policies and guidance notes

The following policies and guidance documents aim to help conserve and protect the otter within NI and the study area:

- Planning Policy Statement (PPS) 2 - Natural Heritage;
- RG11 in Regional Development Strategy 2035: Building a Better Future, Chapter 3, Environment;
- Northern Ireland Biodiversity Strategy and associated Plans;
- UK Biodiversity Action Plans (BAPs);

© Mouchel 2016

- Roads Service (TransportNI) Biodiversity Implementation Plan;
- Londonderry Local BAP; and
- Omagh Local BAP.

Baseline data collection

DMRB Volume 10, Section 4, Nature Conservation, Part 4 HA 81/99, Nature Conservation Advice in relation to Otters provides guidance on survey methods for this species. The recommended methods in known otter areas are primarily to determine the extent of otter presence, and it is recommended that 2km either side of the Proposed Scheme should be surveyed on all water courses that may be affected by the scheme, and spot checks on bridges up to 5km from the scheme. All locations and densities of spraints, holts, couches and other field signs should be mapped. However, for the current scheme, where otters are widely distributed throughout the study area and must be considered to be present on all watercourses that cross or may be affected by the Proposed Scheme, surveys concentrated on finding potential breeding sites close to the scheme and finding potential resting places that would be affected by the scheme.

The DMRB also recommends that detailed surveys should be repeated on a regular basis before and during construction. However, repeat surveys would not reveal any additional information, except where otter holts have been found, and these will be re-surveyed.

NIEA requirements

The NIEA provides guidelines for otter surveys prior to developments (NIEA 2013[1]), specifically that surveys should be undertaken by an experienced otter surveyor and that surveys should determine whether otters have established holts (active or inactive) and if they are used for breeding and/or if otters forage within the development area. The guidelines do not provide any specific guidance on survey methodology.

Desk study

A desk study was undertaken to inform the identification of habitats within the study area which may support otter. A review of any relevant literature was also undertaken.

Otter records

Records of otters from within the study area were requested/obtained from a number of sources:

- Centre for Environmental Data Recording (CEDaR);
- NIEA;

[1] Otter Surveys NIEA Specific Requirements January 2013

© Mouchel 2016

- Ulster Wildlife Trust; and
- A5WTC ES 2010.

Selection of field survey sites

Breeding sites

A strategy was adopted, on the basis of Liles review (2003), of using information available from existing habitat records in combination with aerial photographs to identify potential breeding sites.

The following criteria were used to select suitable sites for survey in ArcView:

- Any single area of woodland or scrub which is greater than 1ha in size and within 100m of a water course.
- Any combination of areas of woodland or scrub which are within 100m of one another, total at least 1ha and are within 100m of a water course.

This information was supplemented by an inspection of aerial photographs of the corridor from which other sites of a suitable size, close to water, which appeared to provide concealing habitat were identified.

From this desk-top study 50 sites were identified within the study area. Each of these was visited during a subsequent field survey to assess their suitability and the need for a full field survey of the site. Of the 50 sites provisionally selected, several were considered to be unsuitable. The main reasons for this were either that the habitat did not provide sufficient concealment for otters (for example one site had recently been clear-felled) or that the site was considered to be too far from good feeding areas (generally >3km from waterways which are >3m wide and >300mm deep).

Following the previous field survey one site was split into two and two others combined. After these changes and the rejection of unsuitable sites, the number considered suitable for further survey within the 3km study area was 39. This number was reduced further for the 2009-10 surveys, with only those otter ID areas within 500m of the scheme searched for evidence of otter breeding; a total of 19 sites. The distance of 500m was chosen as it was considered otters over 500m away would not be disturbed by the development. A list of all 19 sites, together with brief notes on each is included in Table 11H.3.

Resting places

River Habitat Surveys and an otter survey were previously undertaken in 2009-2010 on all rivers within the study area. The watercourses that were crossed by the Proposed Scheme were identified from engineering drawings. These were then subject to a field survey with a survey area of 250m upstream and downstream from the crossing point, resulting in a survey length of a minimum of 500m, more where the river meandered. The objective of this study was to determine the extent, and likely presence, of otters in watercourses that cross or may be affected by the Proposed Scheme. A total of 96 sites were identified to be surveyed.

Field survey

The surveys were undertaken between the 15th and 26th July 2013 and the 2nd and 6th September 2013. Each survey site was surveyed by two or three experienced surveyors. At all survey sites, both banks of the watercourse were searched for any evidence of otter breeding and resting places. Searches were undertaken for potential holts, runs leading away from the water and otter spraints. Transects were also walked where practical, parallel to the waterways, to detect any potential otter runs which lead to den sites. Any potential runs were followed and searched for evidence of use by otter in the form of footprints and spraints.

Measurements taken comprised:

- Width and depth of the watercourse where relevant,
- Potential otter resting places such as trees, boulders, man made structures such as bridges and culverts and scrub/ bankside cover,
- Actual otter resting places including the number and co-ordinates of holts and couches,
- The number of spraints including details of the numbers that were not yet dry, dry intact and dry fragmented to give an indication of how recent and frequent the otter activity had been,
- Whether footprints were present and the size of any under 50mm to give an indication of the age of otters present on the watercourse,
- Whether there were any runs away from the water to indicate potential otter holts or dens away from the watercourse,
- Additional comments on the watercourse characteristics were also recorded where relevant.

The measurements taken could then be used to undertake an evaluation of the river habitat suitability for otter breeding and resting and give an indication of the presence and density of otter breeding and resting activity in the survey area.

As all watercourses in Northern Ireland should be treated as having otter present on them the otter survey sites could be classified in to those with potential for otter resting places, those with actual otter resting places and those with otter activity within the survey area. For the purposes of this study the sites are classified as having otter evidence present or absent and the location of any actual otter resting places that may be affected by the Proposed Scheme identified.

Limitations

Not all of the survey sites could be accessed due to landowner restrictions. Where access was only granted to one side of a watercourse observations were generally taken where access was granted without entering the water.

© Mouchel 2016

In some instances where access was not granted to survey the full length of the watercourse, observations of the watercourse were taken at those locations where access was granted in order to meet the survey objectives in those areas only and did not include any searches in land with no access permission. In certain areas some sites had only partial access but this did not limit the scope of the survey and the aims of the survey were met from observations from the land with access. Additionally some sites that had been granted access were isolated by land to which access had been refused; these sites could not be surveyed.

Otter survey sites 4, 5, 18, 19, 20, 25, 40, 42, 43 70, 74 and 76 were not surveyed due to access restrictions.

Site 38 was not a watercourse but believed to be an underground drain.

Otter survey sites 14, 15, 35, 45, 50, 53, 58, 59, 65, 67, 68, 73, 75, 77, 79, 80 and 83 were not completed due to partial access restrictions.

Designated sites

Three Special Areas of Conservation (SAC) within the study area have otter as a qualifying reason for designation, see Table 11H.1. A map of the SAC is provided on Figure 11.36 in Volume 2.

Table 11H.2 SAC within the study area that otters are a qualifying reason for designation

SAC	SAC code	Grid reference of centre of SAC	Approximate distance from Proposed Scheme (km) or grid reference of crossing point
River Foyle and tributaries	UK0030320	H353876	Crosses Mourne River at H338980, Crosses River Derg at H362875.
Owenkillew River	UK0030233	H559870	1.7
River Finn and tributaries	IE002301	H223944	Adjacent

There were no other designated sites, statutory and non-statutory, identified that were designated for or noted the presence of otter within the study area.

Potential breeding sites

At each otter ID area, a search was undertaken for any evidence that otter breeding had taken place. Searches were undertaken for potential holts, runs leading away from the water and large collections of otter spraints. Transects were also walked where practical, parallel to the waterways, to detect any potential otter runs which lead to den sites. Any potential runs were followed and searched for evidence of use by otter in the form of footprints and spraints.

In addition, the quality of the site as a potential area for otter breeding was assessed as either high (5), good (4), moderate (3), low (2) or poor (1). This was taken from assessing the level of

© Mouchel 2016

vegetation cover at ground level (see Table 11H.3) at a site and other factors such as distance from substantial food supply.

Table 11H.4 Criteria for Assessing the Level of Cover at an Otter ID Area

High	Dense impenetrable cover over > 50% of the area, immediately adjacent to the river bank. Or Presence of features with potential to conceal a breeding den such as fallen hollow trees, very large trees with spreading roots on river bank, small dense thickets of impenetrable vegetation, piles of boulders or other debris with space for a den beneath which are immediately adjacent to a waterway or connect to it by concealing routes.
Medium	Dense impenetrable cover over < 50%, >20% of the area, immediately adjacent to the river bank. Or dense impenetrable cover over < 50% of the area within 50m of the river with concealing routes between the bank and the area of dense cover. Or Presence of features with potential to conceal a breeding den such as fallen hollow trees, small dense thickets of impenetrable vegetation, piles of boulders or other debris which are not adjacent to a waterway or connected to it by concealing routes.
Low	Dense impenetrable cover over < 20% of the area. No features with potential to conceal a breeding den
None	No dense impenetrable cover

The results from the surveys of breeding sites within 500m of the proposed scheme revealed two sites which were assessed as high (although one varies from high to low over 5km), a single site was assessed as good, two as moderate, three as low and eleven sites as poor, see Table 11H.53 and Figure 11.36. The raw data from all 19 sites is included in Table 11H.75.

Table 11H.5 Summary of Assessment of Otter ID Areas for Otter Breeding

Otter ID Area Ref No.	Name / location	Grid reference	Distance from edge of Proposed Scheme (km)	Score	Assessment / status
4	Strabane Canal	H353999		4	Good
5	Strabane Nature Reserve	H340985		5	High
6	Strabane Glen ASSI	H360988		1	Poor
9	North-east of Sion Mills	H332938		1	Poor
10	Mourne River and River Strule/ Derg Confluence	H339938 to H365916		5	High*

50	South of Lissenderry	H634592		1	Poor
*but varying down to low in some areas of the 5km within 500m of the scheme.					

Previous survey data (2009-10)

Previously evidence of otter was found at thirty-seven sites, actual otter holts were found at three sites and a potential resting site was found at two sites. Records are shown on Figure 11.36 in Volume 2.

2013 Otter Survey Results

The results of the field survey for otter evidence and available access at each survey site are given in Table 11H.4. Records are shown on figure 11.36 in Volume 2.

Where the evidence of otters is marked with an asterisk this indicates sites where only partial access was available at the time of the survey and so the survey could not be completed to a sufficient level to determine that no evidence of otter was present within the survey area. Similarly those sites where otter evidence was found but where only partial access was available at the time of the survey, additional survey of the land with no access could potentially offer more evidence of otters, including resting sites.

© Mouchel 2016

Otters were confirmed to be present at 17 otter survey sites. A confirmed otter resting place in the form of a couch, was recorded at site number 51, and a possible otter resting place in the form of a couch was recorded at site number 77 where access was restricted.

89d	Y	25	No	No	No							Yes	Unknown depth, suitable for otter

© Mouchel 2016

The presence of otters was confirmed throughout the survey area, including on very small streams as well as on the larger rivers. These findings are broadly comparable to the 2001-2002 NI otter survey and 2009-2010 Mouchel survey results.

These watercourses and the surrounding habitat will be used for breeding, resting, foraging and commuting.

© Mouchel 2016

Table 11H.7 Raw Data from Otter Breeding Site Survey

Otter ID Area Ref No.	Spraints			Footprints present (size if <50mm)	Otter signs present	Habitat score	Overall score *	General comments on site	Assessment**
	Not yet dry	Dry intact	Dry fragmented						
4				None	No	5	4	Stream nearly dry (but tidal) and canal bed dry. Good cover of reeds and scrub. No signs.	**Good**. Plenty of cover. C 500m from River Foyle.
5	1			Yes	Yes	5	5	Extensive wetland, ponds reeds and bull rushes. Dense cover. Local nature reserve. Culvert from River Foyle under old line of Donegal railway has run on landward side going to pond. Footprints on the River Foyle side. Fresh spraint a few metres downstream.	**High**. Close to Foyle, dense impenetrable cover, pond with possible fish, certainly frogs in season. Disturbance likely to be low.
6	-	-	-	-	-	-	1	Strabane Glen ASSI supports woodland that would be suitable for otter breeding. Downstream of Strabane Glen is a long culvert (300m) under road and farm buildings. At eastern end there is a grill of 100-125mm at the top of a steep weir of >1m at angle between 45 and 60 degrees.	**Poor**. Site inaccessible to otter due to long culvert and weir.
9					No	2	1	Small stream 1m wide flows through plantation on east side. No cover on that bank, some on west bank. Runs into small pond close to golf	**Poor**, isolated, disturbed little cover.

APPENDIX 11I BATS

Introduction

Bats are significant nature conservation receptors for the Proposed Scheme as all bats in Northern Ireland (NI) are afforded legal protection; the presence of roosting bats will have licensing implications which represent an additional form of development control. Any species which may affect a European Protected Species must show that reasonable alternatives were assessed and an appropriate mitigation, compensation and enhancement strategy is proposed to maintain the favourable conservation status of bat species prior to any licence consent; and all bat species potentially present within the study area are subject to either National and/or Local Biodiversity Action Plans (BAPs) aimed at improving their conservation status.

Legislation

Bats are fully protected in NI through inclusion within the Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended). Under this legislation they are given the status of a European Protected Species (EPS).

The Habitat Regulations make it an offence to deliberately:

- Capture, injure or kill a bat;
- Disturb an bat while it is occupying a structure or place which it uses for shelter or protection;
- Disturb a bat in such a way as to be likely to:

  (i) Affect the local distribution or abundance of a bat species;

  (ii) Impair its ability to survive, breed or reproduce, or rear or care for its young; or

  (iii) Impair its ability to hibernate or migrate;
- Obstruct access to a breeding site or resting place of such an animal; or
- Damage or destroy a breeding site or resting place of such an animal.

It may be possible for Northern Ireland Environment Agency (NEIA) to grant a licence to allow activities that would otherwise be an offence under these Regulations, providing that (a) there is no satisfactory alternative, and (b) that the action authorised will not be detrimental to the maintenance of the population of the species concerned at a favourable conservation status in their natural range. In addition, it is an offence to breach a licence condition.

© Mouchel 2016

Conservation status

There are 8 species of bat commonly found in NI. Bat populations have historically undergone severe declines in the UK and are considered vulnerable (BCT, 2013, Mitchell-Jones, 2004).There is some recent evidence, since the 1990s, that over the whole of the UK some bat species populations are increasing or stable. However, this research had insufficient NI data to estimate population trends within NI. Species reported to be increasing include common pipistrelle *pipistrellus pipistrellus*, Daubenton's bat *Myotis daubentonii* and Natterer's bat *Myotis nattereri*. Stable populations include: soprano pipistrelle *Pistrellus pygmaeus*, brown long-eared bat *Plecotus auritus* and whiskered bat *Myotis mystacinus*. There is deficient data to estimate the population trend for Leisler's bat *Nyctalus leisleri* or Nathusius' pipistrelle *Pipistrellus nathusii*. Recent increases, however, are not yet considered sufficient to counter the previous severe declines in populations (BCT, 2013).

Brown long-eared bat, Nathusius' pipistrelle and soprano pipistrelle are listed as NI priority species and all NI bat species are listed within the All Ireland Species Action Plan (EHS/NPWS, 2008). The eight bat species are listed as priority species on Londonderry's Local Biodiversity Action Plan (2008) and the Daubenton's bat is listed as a priority species on the Omagh District Biodiversity Action Plan (2008). Bap listed species are those that the UK Central and Local Governments have a particular responsibility to conserve for the good of the international biodiversity conservation, as agreed at The United Nations Conference on Environment and Development (UNCED). Such species lists do not necessarily overlap completely with rarity or threat lists.

The 2009 Mammal Red List for Ireland includes all eight species of bats present in NI. Leisler's bat is listed as being Near Threatened in Ireland, but not on a European or global level, this is partly a reflection of Ireland being a world stronghold for this species. The Leisler's bat population is considered to be stable. The seven other species are listed as least concern, all with stable populations except for Nathusius' pipistrelle, which is believed to be declining (Marnell *et al.,* 2009).

A summary of the status of bats in NI is shown in Table 11I.1.

Table 11I.1: Summary of bat species NI status (Marnell et al., 2009 and Russ, 2008).

	Distribution	Population trend	Rarity
Daubenton's bat	Widespread	Stable	Frequent
Natterer's bat	Widespread	Stable	Scarce
Whiskered bat	Widespread	Stable	Scarce
Common pipistrelle	Widespread	Stable	Common
Soprano pipistrelle	Widespread	Stable	Common
Nathusius' pipistrelle	Restricted	Declining	Rare
Leisler's bat	Widespread	Stable	Frequent
Brown long-eared bat	Widespread	Stable	Frequent

© Mouchel 2016

Baseline data collection

The collection of baseline data for the A5WTC for bats comprised a desk study and field surveys including activity surveys (walked and driven transects and static detector surveys) and roost surveys of buildings, structures and trees.

The desk study and all field survey techniques, timing, effort and design were selected with comprehensive consideration of the guidance provided in the Bat Conservation Trust (BCT) Bat Surveys Good Practice Guidelines (2012). With particular attention on the guidance provided for surveying major Infrastructure projects to allow the collection of sufficient data proportionate to the Proposed Scheme.

The A5WTC project incorporates a corridor ~85km long through the Northern Irish landscape. To survey this corridor for bats and establish the species present, their distribution, and the location of key habitat features such as roosts, a variety of survey techniques were employed to make the most effective use of time and resources. It was not possible to survey every parcel of land within the Proposed Scheme corridor, but the techniques used allowed conclusions to be made with a high degree of confidence.

The species of bat present and their distribution, as well as key habitat features used for foraging and commuting, were identified by a combination of walked and driven transects and static bat surveys using automated bat detectors. Potential roost sites were also visited and assessed for their suitability to support roosting bats.

The study aimed to provide a robust set of data describing bat populations within the A5WTC and allow recommendations for appropriate mitigation, compensation and enhancement measures for bats.

Previous survey work

Surveys were undertaken with consideration of previous field survey work undertaken between 2009 and 2013. This included:

- 45 dusk walked surveys at key sites throughout the A5WTC undertaken in May and July 2009;
- 5 dusk driven surveys covering the wider landscape within the A5WTC corridor, each section was surveyed in April and July 2009;
- 32 static surveys using automated bat detectors located close to features of potential value to bats and left in-situ for ~2 weeks each, undertaken in June and July/August 2009;
- Scoping surveys of structures and trees /woodland to identify potential roost sites which fall within or immediately adjacent to the A5WTC route undertaken in 2010;
- Surveys of structures (buildings and bridges) with high potential to support roosting bats in June and July 2010;

© Mouchel 2016

- Surveys of trees with high or moderate potential to support roosting bats within the proposed works area of the A5WTC between New Buildings and Strabane and Omagh to Ballygawley in 2012; and,
- Surveys of known bat roosts and structures with high or moderate potential to support roosting bats within the proposed works area of the A5WTC between New Buildings and Strabane and Omagh to Ballygawley in 2012 and 2013.

Desk study

The following sources were used to collate historical biological records (since 2004) of bats:

- Centre for Environmental Data and Recording (CEDaR) within 1km of A5WTC; and,
- The Northern Ireland Bat Group within 2km of A5WTC.
- *Activity surveys*

Study areas

The study areas for each of the field surveys undertaken were:

Walked transects	Land within the proposed vesting line and a 500m buffer to either side
Driven transects	Land within the proposed vesting line and a 500m buffer to either side
Static detector surveys	Land within the proposed vesting line and a 500m buffer to either side
Roost surveys	Land within the proposed vesting line and a 100m buffer to either side

Walked transects
Thirty-two sites within the study area were surveyed for bats using walked transects (See Table 11I.12 for locations). Field survey sites for the A5WTC ES 2010 were selected for habitats and features of value to foraging and commuting bats and to provide a representative coverage geographically of the Proposed Scheme. Survey sites for the 2014 surveys were selected using this information and a review of the phase 1 habitat survey data from 2014. Many of the transect sites remained unaltered from the 2009 surveys, although shorter transects were amalgamated to give consistency of survey effort across transects, and several transects from the 2009 surveys were not revisited due to their distance from the Proposed Scheme.

Anabats SD1 detectors linked to GPS units were used to accurately record the locations of calls made by passing bats. These data were augmented by surveyor observations and recordings made from BatBox Duet bat detectors.

© Mouchel 2016

Each site was surveyed once a month between May and September 2014 with a dusk transect undertaken starting 15 minutes before sunset and lasting up to 3 hours after. Once between May and August, the dusk survey at each site was followed by a dawn survey within the same 24 hours. The dawn started 3 hours before sunrise and lasted to sunrise. The direction each transect was walked was reversed on alternate months to allow for differing emergence times of bats and to provide a more comprehensive overview of bat activity on site.

Recorded data form the Anabats were analysed using Analook, and where required this was augmented by analysing data recorded from the BatBox Duet bat detectors using BatSound. Weather data was recorded for each survey to ensure conditions were appropriate for bat activity.

32	3	90000	267733, 352909

Driven transects

Driven transects surveyed the wider landscape within the study area using vehicle mounted Anabat SD1 detectors. The study area corridor was split into four sections:

- Driven Transect 1: New Buildings to Knockroe, south of Strabane;
- Driven Transect 2: Knockroe, south of Strabane to Mountjoy;
- Driven Transect 3: Mountjoy to Tullanafoile; and,
- Driven Transect 4: Tullanafoile to Auchnacloy.

The survey commenced 15 minutes before sunset and ended 2-3 hours after sunset.

Anabat detectors linked to GPS units were used to record the location of bat calls. Two detectors were mounted on a vehicle with the first sited facing out of the front passenger side window. The second was linked to a microphone mounted on the top of the vehicle which used the roof as a reflector. Bats calls hit the roof and are reflected back into the microphone and are logged on the detector. The vehicle was driven at a steady speed of 15mph.

Each driven route was surveyed once a month between April and September 2014. On every other survey each transect was driven in the opposite direction. Recorded data was analysed using Analook.

Static automated surveys

Thirty-two sites all located close to features of potential value to bats spread across the study area to provide representative coverage geographically of the Proposed Scheme were chosen to be surveyed using automated SM2 detectors placed in-situ (See Table 11I.13 for locations). The sites

© Mouchel 2016

were selected with consideration of the sites surveyed in 2009, with sites re-surveyed unless access was no longer permitted.

Each site was surveyed once a month between May and September 2014 for at least five days. Recorded data was analysed using Analook for five consecutive dusk and dawns for each site per month. The dusk survey length was half an hour before sunset to 3 hours after and for dawn was 3 hours before sunrise to sunrise.

*The detectors at three locations were re-positioned during the survey season due to access no longer being permitted at the initial survey locations. Detectors were re-located as close to the original position as possible in suitable locations.

Roost surveys

Preliminary roost assessment: buildings and structures

Scoping of buildings and structures identified potential roost sites within the study area. Surveyors visited each building and structure and assessed it for bat roosting potential using the criteria in Table 11I.4.

Table 11I.4: Bat roosting potential criteria for assessing buildings and structures

Likelihood of roost presence	Criteria
Negligible	No features thought to be of use to bats on the building/structure and little or no possibility of its use as a bat roost. **Examples**: modern build structures in good condition with no cracks in soffit boxes, loose tiles or access to internal spaces which may provide roosting habitat; bridges and tunnels sealed completely with no cracks in mortar or made of steel/concrete; other structures with no internal spaces or cracks/access points.

© Mouchel 2016

Likelihood of roost presence	Criteria
Low	Some minor features which may support individual roosting bats on occasion, but unlikely to be used regularly and/or by significant numbers of bats. Roosting is unlikely in these sites. **Examples**: Modern buildings with some cracks in brickwork, loose tiles or other features which could support individual bats; farm buildings with corrugated iron roofs which are mostly unsuitable as roosts; modern bridges with cracks in brickwork or concrete; structures with features which could be used as roosts but with poor connectivity to habitats in the wider landscape.
Moderate	Buildings/structures which a number of features which could be used by roosting bats either individually or in groups, but are unlikely to be used by large numbers of bats or by breeding females. Roosting is possible in these sites. **Examples**: Modern buildings with access to soffit boxes and loose tiles which could allow access to roof voids; tunnels with shallow entrances which may be exposed to the weather (i.e. which are unsuitable for hibernation but may be used in the summer), old buildings recently renovated to remove access points or roosting sites (e.g. converted barns); structures with connectivity to habitats in the wider landscape.
High	Buildings/structures with many access points, often to internal spaces which could support maternity colonies and linked to foraging habitats within the wider landscape. Evidence of roosting obvious. Roosting is highly likely in these sites. **Examples**: Old buildings with many access points to internal spaces (soffit boxes, roof voids etc) which could be used by many bats; tunnels which are sheltered and may be used as hibernation sites, buildings obviously used by bats and linked to high quality habitat features in the wider countryside.

Preliminary roost assessment: trees and woodland

Scoping of trees and woodland was undertaken to identify those which could potentially support roosting bats within the study area. Surveyors walked the study area and identified trees/woodland areas with bat roosting potential using the criteria in Table 11I.5.

Table 11I.5: Bat roosting potential criteria for assessing trees

Likelihood of roost presence	Criteria
Negligible	No features suitable to support roosting bats. **Examples**: Scrub, saplings and young trees with no potential as roosts; individual coniferous trees in good condition and no splits, cracks of features which could be used by bats.
Low	Trees singly or as part of woodland with limited features that may have limited potential to support bats.

© Mouchel 2016

Likelihood of roost presence	Criteria
	Examples: Young trees with loose bark, confer plantations, tree isolated from suitable habitat in the wider landscape (e.g. within open fields unlinked by hedgerows).
Moderate	Trees singly or as part of woodland with features capable of supporting individual roosting bats. **Examples**: Trees with splits, cracks, loose bark, ivy, woodpecker holes or other features which could be used for roosting; trees with roosting opportunities close to water courses/ponds/lakes or other favoured feeding sites.
High	Important roosting sites in trees or trees forming woodlands, either where a bat roost is known to be present or evident from field signs, or where significant opportunities for roosting exist (e.g. where breeding colonies could be found). **Examples**: Trees with obvious staining around entry points indicating use; woodlands with many trees which are suitable roosts; trees with many suitable roosting opportunities including old trees; old trees with many roosting opportunities close to water courses/ponds/lakes or other favoured feeding sites.

Surveys of known and potential bat roosts

Within the study area bat roosts identified from previous surveys and buildings, structures and trees identified as having potential to support roosting bats were subject to a series of dusk emergence and dawn re-entry surveys between May and September as detailed in Table 11I.6.

Table 11I.6: Survey effort for known and potential bat roosts

Roost likelihood	Number of surveys
Known roost	1 dusk and dawn survey (within 24 hours) and 2 dusk or dawn surveys
Buildings and structures	
High roost potential	1 dusk and dawn survey (within 24 hours) and 2 dusk or dawn surveys
Moderate roost potential	1 dusk and dawn survey (within 24 hours) and 1 dusk or dawn survey
Low roost potential	1 dusk and dawn survey (within 24 hours)
Trees	
High roost potential	1 dusk and dawn survey (within 24 hours) and 2 dusk or dawn surveys during May to September

© Mouchel 2016

Roost likelihood	Number of surveys
Moderate roost potential	1 dusk and dawn survey (within 24 hours) and 1 dusk or dawn survey during May to September
Low roost potential	No surveys undertaken at this stage.

Dusk surveys, to count bats emerging from a roost, commenced 30 minutes before sunset until 2 hours after sunset. Dawn surveys, to count bats returning to a roost, started 2 hours before sunrise and lasted until sunrise. Surveys were undertaken in suitable weather conditions. Surveyors were positioned so that all possible emerging/re-entering bats could be identified. All bat sightings were recorded (species / activity / time). BatBox Duet detectors connected to recorders and/or Anabat SD1 detectors were used by surveyors. Sound analysis was undertaken of the MP3 and Anabat recordings.

Limitations

Access was not permitted to certain land parcels crossed by the Proposed Scheme. These areas were not subject to survey. Where possible visual surveys from adjacent accessible land or roads were used to identify potential bat roosts.

In 2012 permission was granted to undertake some pre-construction vegetation clearance for the scheme. At this time the construction of part of Section 1 and 3 of the A5WTC was due to commence in 2013. Some sections of hedgerows bisected by the Proposed Scheme, where access was permitted and those not adjacent to roads were removed between New Buildings and just North of Strabane in Section 1 and from just south of Omagh to Ballygawley in Section 3. In case this pre-clearance of vegetation has affected the movement of bats in the areas affected, all walked transects in these areas covered sufficient undisturbed adjoining hedgerows to enable adequate baseline data to be collected.

Due to technical issues, there was no survey data from walked transects in August for Transects 35, 36 and 37, Driven Transects 1 and 2 in August and Static Surveys 27, 28 and 32 in May. Due to the comprehensive and high number of surveys undertaken throughout the survey season this represents less than 2% of the total survey effort.

Surveys of a row of three trees with bat roosting potential were not undertaken due to the presence of cattle within the fields surrounding the trees. Requests to the landowner to see if it was possible to move the cattle were declined.

It was not possible to identify bat species of the genus *Myotis* using Analook, as the calls of individual species are extremely difficult to differentiate (Russ, 2013). This included data from the driven transects and static surveys. *Myotid* calls from the walked transects were identified to species level where possible.

© Mouchel 2016

Bat atlas

Results of all surveys were collated into a single database of records covering Proposed Scheme. Each record included information about the bat species identified, the location of the identification and whether feeding or social calls were recorded. A series of 2km grid squares (tetrads) covering the Proposed Scheme were mapped using ArcGIS and for each species the presence of bat records in each grid square was determined, with the final results mapped to show where each species was found throughout the Proposed Scheme.

Bat activity index

A bat activity index was calculated for each of the walked transects, driven transects and static surveys. The activity index is a count of the number of bat passes of each species per survey. From this data is was possible to analyse how bat activity totalled for all species and for each species over the whole survey season varied over the Proposed Scheme geographically and seasonally.

Desk study results

Data from the Northern Ireland Bat Group returned a number of records from within 2km of the Proposed Scheme, see Table 11I.7[1]. No records were within the Proposed Scheme footprint, with the nearest roost 100m from the Proposed Scheme. The locations of roosts are shown on Figures 11.37 – 11.43. No additional records were received from CEDaR.

Table 11I.7: Bat records from within the study area from the Northern Ireland bat group.

Species	Date	Location	Distance from Scheme (km)	Details
Brown long-eared bat?	25.08.08	242100, 414500	1.8	Roost ~10

Field survey results

Bat atlas

Six species of bats; common pipistrelle, soprano pipistrelle, Nathusius' pipistrelle, brown long-eared bat, Leisler's bat and (from the walked transects only) Daubenton's bat were identified during surveys. In addition, bats of the genus *Myotis* were also identified but the specific species remains unknown (see limitations in Baseline data collection section).

The presence of bat records in each tetrad covering the Proposed Scheme are shown in Figures 11.37 – 11.43. The details of results for each species are described below. Information regarding distribution, conservation status and biology/ecology of records species is taken from Battersby (2005), Altringham (2003) and BCT (2012), Russ (2008) and Marnell *et al., (*2009).

Common pipistrelle
Common pipistrelle are common and widespread within both NI and the UK as a whole. This species is a generalist in terms of its ecological requirements, and uses a wide variety of roosting sites and foraging habitats, readily occupying buildings with suitable cracks/crevices or accessible spaces and feeding over gardens or parks, as well as more natural habitats. It is often found foraging or roosting in disturbed environments in urban or suburban areas.

This species was identified throughout the survey area with records of common pipistrelle identified in almost every tetrad within the study, covering 91% of the Proposed Scheme. There does not appear to be any geographical trend across the Proposed Scheme with sites with the least and most common pipistrelle bat passes scattered across the A5WTC. Confirming that this is a species with a widespread distribution in the study area.

The field survey identified three common pipistrelle and two pipistrelle sp. roosts within the vesting line at Ch. 3300, Ch. 13420 and Ch. 14900 and Ch. 56000 and Ch. 73770 respectively and a

© Mouchel 2016

further two within 100m at Ch. 41100 and Ch.71500. The desk study revealed one common pipistrelle and nine pipistrelle sp. roosts within 2km of the A5WTC.

Soprano pipistrelle
This species is also common and widespread in NI and the UK as a whole. Soprano pipistrelles are generalists in terms of their ecological requirements which are similar to those listed for common pipistrelle but shows a tendency to roost and forage close to water in preference to other habitats.

Soprano pipistrelle was recorded in almost every tetrad within the study, covering 89% of the Proposed Scheme. There does not appear to be any geographical trend across the Proposed Scheme with sites with the least and most soprano pipistrelle bat passes scattered across the A5WTC. Confirming that this is a species with a widespread distribution in the study area.

The field survey data revealed two soprano pipistrelle and two pipistrelle sp. roosts within the A5WTC at Ch. 13420 and Ch. 56000 and Ch. 56000 and Ch. 73770 respectively and a further one within 100m at Ch. 34000. The desk study revealed nine pipistrelle sp. roosts within 2km of the A5WTC, and it is likely these included some soprano pipistrelle roosts.

Nathusius' pipistrelle
This species is relatively rare in the UK as a whole with the largest populations found in NI, making NI important for maintaining the conservation status of the species at a UK level. It still has a restricted distribution in NI. When compared to common and soprano pipistrelle, Nathusius' pipistrelle roosts and forages in relatively open semi-natural habitats and is not generally associated with suburban development. It primarily roosts in trees but is known to use buildings on occasion.

Nathusius' pipistrelle, were recorded in five tetrads, covering approximately 7% of the Proposed Scheme, one tetrad north of Victora Bridge and one south of Newtownstewart and three between Ballygawley and Auchnacloy. Confirming that this is a species with a restricted distribution in the study area. No roosts were identified for this species.

Leisler's bat
This species is common and widespread in Northern Ireland. Leisler's bat forages in open environments, flying high and catching large prey. They are often seen hawking over open fields, lakes and open spaces in urban/suburban areas. This species is highly mobile and can forage 14km from its roost. Leisler's bat frequently roost in buildings.

Leisler's bat were recorded throughout the survey area with records of Leisler's bat covering 83% of the Proposed Scheme. There does not appear to be any geographical trend across the Proposed Scheme with sites with the least and most Leisler's bat passes scattered across the A5WTC. Confirming that this is a species with a widespread distribution in the study area. No roosts were identified for this species.

© Mouchel 2016

Myotis Spp.
Three species of *Myotis* bat are known from NI: Whiskered Bat, Natterer's bat and Daubenton's bat, with the two former species relatively scarce and the latter species relatively common. Whiskered bats forage and roost in a wide range of habitats including woodland, water and suburban gardens. Natterer's bats favour woodland and river corridors. Daubenton's bats show a tendency to roost and forage close to water in preference to other habitats.

It was not possible to distinguish between species within the genus *Myotis* during the driven transects and static surveys. However, it was possible to identify a limited number (12 out of 111) of the *Myotid* calls from the walked transects as Daubenton's bats. No other *Myotid* bats were identified to species level.

Myotid bats were recorded throughout the survey area. However, records were more scattered and only covered 51% of the Proposed Scheme. Five tetrads, covering 7% of the Propose Scheme were confirmed as having records of Daubenton's bats, these were all concentrated between Sion Mills and Mountjoy in Section 2 of the Proposed Scheme and are likely to be associated with the Mourne River and Strule River. A single *Myotis* sp. roost was identified during the field surveys just south of Omagh.

Brown long-eared bat
This species is also common and widespread in NI and the UK as a whole, and is believed to be one of the most abundant species after the common and soprano pipistrelles. Brown long-eared bats have a preference for woodland and open parkland habitat.

Brown long-eared bats were recorded in two tetrads covering 3% of the Proposed Scheme, one north of Victoria Bridge and one near Mountjoy. This lack of records is likely to be a survey bias rather than a true reflection of their distribution, as this species has very low intensity calls, they are rarely recorded on bat detectors. The desk study revealed one roost for this species just to the north of New Buildings.

Bat activity index

Table 11.I8 shows the total bat activity index for all surveys per species. In addition, two summary graphs are shown below for each of the walked and driven transect and static surveys (Figures 11I.1-11I.6). The first graph shows total bat passes recorded at each transect over the entire 2014 survey season and the second graph shows total bat passes per species for each transect. Graphs detailing the data recorded from individual transects and the species recorded each month are shown in Figures 11I.7-11I.8.

Table 11I.8: Total bat species activity index for all survey types

Species	Walked transect	Driven transect	Static Survey	Total
Common pipistrelle	2895	775	18267	21937
Soprano pipistrelle	2263	398	24929	27590

© Mouchel 2016

Species	Walked transect	Driven transect	Static Survey	Total
Nathusius' pipistrelle	2	0	21	23
Pipistrelle sp.	341	130	341	812
Leisler's bat	625	197	5572	6394
Myotis sp.	99	5	582	686
Daubenton's bat	12	n/a	n/a	12
Brown long-eared bat	6	0	1	7

Species overview
Common and soprano pipistrelles have the highest bat activity index overall in all three survey types over the entire survey season. They are also consistently almost always the two most recorded species at each transect or static site survey each month. Common and soprano pipistrelle records came from every walked and driven transect and static survey site.

Leisler's bat was the third most recorded species across the surveys, although not as frequently as the common and soprano pipistrelle. This species was recorded at every walked and driven transect and static survey site.

Myotis sp. records were recorded less frequently than common and soprano pipistrelle and Leisler's bat. They were not recorded at 5 static sites, in 14 walked transects and 1 driven transect. Generally only a low number (>60) of passes were recorded at each transect or static site, with the exception of one static site adjacent to the Drumreagh River. Daubenton's bat were identified from the walked transect data twelve times and were usually restricted to single passes.

Nathusius' pipistrelle was rarely recorded only 23 records for all of 2014 across all surveys and were usually restricted to single passes. The species was mainly recorded during the static surveys when nine surveys revealed a low number of passes (>5) each. Single passes were also recorded in two walked transects.

Brown long-eared bat was very rarely recorded with only 7 passes in all surveys in 2014 and these were limited to single passes. As detailed in the bat atlas section above this is likely to be a survey bias.

Walked Transects – Figures 11I.1, 11I.2 and 11I.7.
Six bat identified to species level (common, soprano and Nathusius' pipistrelle, brown long-eared bat, Leisler's bat and Daubenton's bat) and bats from the genus *Myotis* were recorded during the walked transects. The overall results of the walked transects for all bat species over all 32 transects showed relativity limited variation over the survey area. With transects varying from approximately 50 bat passes up to 400. The transects with the least bat activity were 19, 23 and 30

© Mouchel 2016

and with the most bat activity recorded at Transects 3, 8, 10, 18, 25 and 27, with Transect 25 having the peak activity of 378 passes.

During the walked transects common pipistrelle was the most recorded species, followed by soprano pipistrelle and then Leisler's bat. The transects with the highest common pipistrelle activity were Transects 3, 10, 25, 27 and 29, with Transect 25 peaking at 284 passes and the highest soprano pipistrelle activity were Transects 3 and 10, with Transect 3 peaking at 150 passes. Leisler's bat, Transects 7, 8 and 18 had the highest activity peaking at 102 passes for Transect 8 and for *Myotis* sp. it was 14 and 15, peaking at 25 passes for Transect 14. All other species, Nathusius' pipistrelle, brown long-eared bat and Daubenton's bat were only recorded in very low numbers as occasional passes.

Driven Transects - Figures 11I.3, 11I.4 and 11I.8.
Three bats identified to species level (common and soprano pipistrelle and Leisler's bat) and bats from the genus *Myotis* were recorded during the driven transects. The overall results of the driven transects for all bat species over the 4 transects showed relativity limited variation over the survey area. With transects varying from approximately 250 to 450 bat passes.

Common pipistrelle was the most recorded species, followed by soprano pipistrelle and then Leisler's bat. Transects 3 and 4 both had the highest activity peak for common pipistrelle with over 250 passes compared to just over 100 passes in Transects 1 and 2. All other species, showed limited variation between transects (soprano pipistrelle ranged from 68 to 115 passes, Leisler's bat ranged from 35 to 60 passes and Myotis sp. from 0 to 3 passes).

There was no obvious common trend over the survey season across the driven transect sites where more or less bat activity was recorded.

Static Surveys - Figures 11I.5, 11I.6 and 11I.9.
Five bats identified to species level (common, soprano, and Nathusius' pipistrelle, brown long-eared bat and Leisler's bat) and bats from the genus *Myotis* were recorded during the static surveys. The overall results of the static surveys for all bat species over the 32 sites showed a large variation over the survey area. With sites varying from approximately 100 bat passes up to almost 8000 over the survey season. The site with the least bat activity were 4, 20 and 28 and with the most bat activity recorded at Static 2, 14 and 24, with Static 2 having the peak activity of 7973 passes.

Soprano pipistrelle was the most recorded species, followed by common pipistrelle and then Leisler's bat. The static detectors with the greatest number of common pipistrelle passes were Static 2 and 15, with Static 2 peaking at 3181 passes. The greatest number of soprano pipistrelle passes were Static 2, 12 and 24, with Static 24 peaking at 5679 passes. For Leisler's bat, Static 14 and 17 had the highest activity peaking at 2007 passes for Static 14. For *Myotis* sp. bats it was Static 24, peaking at 198 passes. All other species were recorded in very low numbers as occasional passes.

© Mouchel 2016

There was no obvious common trend over the survey season across the static surveys sites where more or less bat activity was recorded.

Important habitat features

The activity surveys identified features in the landscape that supported higher concentrations of bats than in other areas. While it is not possible to state that they are used by large populations it is possible to conclude that there is likely to be more activity at these locations than at others and that they are of higher value for bats. Table 11I.9 summarises this data.

Table 11I.9: Summary of features supporting higher concentrations of bat activity which are bisected by the Proposed Scheme

Section	Chainage	Bat activity and features of importance
1	1350	Common and soprano pipistrelles commuting and foraging along hedgerow and watercourse.
1	3050	Common and soprano pipistrelles commuting, foraging and social calls along hedgerow and watercourse.
1	3375	Common and soprano pipistrelles commuting, foraging and social calls along hedgerow and watercourse.
1	3950	Static survey 1 recorded a high number of common and soprano pipistrelles on edge of vesting line directly connected to hedgerow.
1	5600	Common and soprano pipistrelles commuting and foraging along hedgerow. This hedgerow directly connects to Static survey 2 which recorded the highest activity of soprano and common pipistelles during the surveys.
1	7900	Dense common pipistrelle activity along Donagheady Road.
1	8800	Dense common and soprano pipistrelle activity along tree lined Willow Road.
1	9100	Dense common and soprano pipistrelle and Leisler's bat activity along the tree lined existing A5.
1	10980	Dense common and soprano pipistrelle activity along hedgerow.
1	11650	Static survey 6 recorded a high number of common and soprano pipistrelles on edge of vesting line directly connected to tree line.
1	12200	Dense activity of common and soprano pipistrelles, Leisler's bat and *Myotis* sp. commuting and foraging along woodland strip.
1	12700	Static survey 7 recorded a high number of soprano pipistrelles along watercourse.
1	13000	Dense common and soprano pipistrelle and Leisler's bat activity along Greenlaw Road.

Roost surveys

Pre-construction clearance

In 2012 permission was granted to undertake some pre-construction vegetation clearance for the scheme. At this time the construction of part of Section 1 and 3 of the A5WTC was due to commence in 2013. Under an EPS development licence, a number of specified trees that had been identified as having moderate bat roosting potential, were subject to a detailed inspection for bats before being felled. Two trees were found to support roosting bats: an ash tree at Ch. 4900 supported a single common pipistrelle; and a sycamore tree at Ch. 11200 supported two common pipistrelle bats. Two bat boxes for each roost were installed nearby to compensate for the loss of the roosts and both trees were re-inspected over a week later. At this time no roosting bats were found and the features suitable for roosting bats were removed, with the trees due to be felled at a later date.

Presence/absence surveys

Buildings, structures and trees identified as having potential to support bats were subject to presence/absence surveys. One building, one bridge and five trees were confirmed as supporting roosting bats within the proposed works area, and three other bats roosts within buildings were found within 100m of the A5WTC. There is also a further unconfirmed bridge roost within the A5WTC. The results are summarised in Tables 11I.10-11I.12.

Buildings

Four bat roosts within buildings were identified during the 2013/2014 surveys, only one is within the proposed works area. The first is a common pipistrelle day roost used by a small number of bats this is within the proposed works area. The second roost, just outside the proposed works area, is used by a small number of soprano pipistrelles as a day roost. The third and fourth roosts are both common pipistrelle day roosts just outside the Proposed Scheme area.

Structures

One bridge within the proposed work area was confirmed as being a bat roost. The bridge was found to support a pipistrelle sp. day roost with just a single bat recorded emerging from ivy on one occasion, the rest of the bridge has limited bat potential with only a few shallow gaps where mortar is missing. A second bridge has an unconfirmed bat roost which was identified by a nearby landowner, but access was not permitted to survey the bridge to confirm the roost. Therefore the status of the bat roost is currently unknown.

Conclusion

Bat habitat

The Proposed Scheme primarily crosses agricultural land with residential and commercial development centred around Strabane and Omagh. This landscape has abundant man made features: hedgerows; tree lines; and country lanes which could provide commuting routes for bats. Semi-natural habitats within the Proposed Scheme land take are limited to rivers and streams, which are frequently found, small blocks of deciduous and coniferous woodland (most less than 1 ha in size), and patches of bog. Residential properties, agricultural barns and other buildings are also scattered throughout the landscape which could provide roosting sites.

The overall balance of available habitat favours bats with generalist habitat requirements such as the common and soprano pipistrelle and Leisler's bat. Concentrations of these species were widely distributed throughout the entire survey area. These species were particularly recorded where the scheme passes through or near to woodland and watercourses. The distribution of *Myotis* sp. is more scattered and they were less frequently recorded, this is likely to be explained by their more specialist habitat requirements. This also applies to Nathusius' pipistrelle which had a very scattered distribution and was recorded in low numbers. Records of brown long-eared bats were most restricted but this is likely to be a survey bias as they are very hard to detect due to their quiet calls.

Bat roosts

Seven roosts were confirmed within buildings, structures and trees under the Proposed Scheme and one unconfirmed bridge roost, a further three building roosts were identified within 100m. All supported individual or low numbers of bats, and all but one *Myotis* sp. roost supported either common or soprano pipistrelle bats.

© Mouchel 2016

APPENDIX 11J – RED SQUIRREL *SCIURUS VULGARIS*

Legislation

Red squirrel are listed under Schedules 5, 6 & 7 of the Wildlife (Northern Ireland) Order 1985 (as amended). The red squirrel receives full protection in NI from:

(i) intentional killing, injuring, taking or possession;

(ii) intentional damage, destruction or obstruction of access to any structure or place used for shelter or protection;

(iii) intentional damage or destruction to anything which conceals or protects any such structure; and

(iv) intentional disturbance while occupying structures or places used for shelter or protection. The red squirrel is also listed on Appendix III to the Convention on the Conservation of European Wildlife and Natural Habitats (the Bern Convention).

Under the Wildlife (Northern Ireland) Order 1985 (as amended) there is no provision for licensing the killing or injuring of squirrels or the destruction of places used for shelter or protection for the purpose of development.

The red squirrel is listed as a priority species in Northern Ireland, requiring a Species Action Plan (SAP), and is a UK BAP priority species. Priority species are those that the UK Central and Local Governments have a particular responsibility to conserve for the good of international biodiversity conservation, as agreed at the United Nations Conference on Environment and Development (UNCED). Such species lists do not necessarily overlap completely with rarity or threat lists; a species is listed when it is under threat and requires conservation action. For some NI BAP priority species, only the UK species action plans are used. However, for red squirrels two other action plans exist:

- UK Strategy for Red Squirrel Conservation – Action Plan for Northern Ireland; and (EHSNI, 2000); and

- All-Ireland Species Action Plan Red Squirrel (EHSNI, 2008).

The aim of the Northern Ireland Species Action Plan is to ensure the survival of the remaining red squirrel populations in Northern Ireland. The aims of the All-Ireland Species Action Plan is to restrict the contraction in range of the red squirrels to a minimum, extend the red squirrel range to areas of favourable habitat not currently occupied by squirrels and increase the population density of red squirrels in Red Squirrel Conservation Areas (yet to be formalised). The Northern Ireland Squirrel Forum (NISF) has been established to bring together statutory and non-statutory organisations as well as representatives of country parks and local volunteer organisations dedicated to accomplishing these aims.

© Mouchel 2016

Conservation status

This species was once ubiquitous in Ireland, however by the early 18th Century it had become extinct, this being attributed to habitat loss. It was reintroduced from England in the mid 19th century and had once again become abundant and widespread by the start of the 20th Century (Harris *et al.* 2008). However, in the last fifty years the population has declined and the species now has a fragmented distribution in Ireland. This decline coincided with the introduction of the grey squirrel *Sciurus carolinensis.* The grey squirrel is now more widespread than the red in Northern Ireland (EHSNI, 2008).

The decline of red squirrels has been attributed to various factors including interspecific competition between grey and red squirrels, red squirrels being subject to disease spread by grey squirrels, and habitat destruction and fragmentation (Harris *et al.* 2008, O'Neil *et al*. 2003).

Research has shown that it may take from six years to several decades for grey squirrels to displace red squirrels. Coexistence of the two species has been found to extend for longer periods in areas of extensive coniferous woodlands, where red squirrels are likely to compete more successfully: *'It is likely that the red squirrel will ultimately be restricted to areas that grey squirrels are unable to colonise, have yet to colonise or contain habitat that maintains the red squirrel's competitive advantage over the grey squirrel'* (O'Neil *et al*. 2003).

The current status of the red squirrel population in NI is under review by the NIEA.

Policies and guidance notes

The following policies and guidance documents aim to help conserve and protect the red squirrel within NI and the study area:

- Specific Survey Requirements – NIEA (updated October 2011)
- Planning Policy Statement (PPS) 2 - Planning and Nature Conservation;
- ENV1.1 in The Regional Development Strategy for Northern Ireland 2025: Shaping Our Future, Chapter 12, Caring for the Environment;
- Northern Ireland Biodiversity Strategy and associated Plans;
- UK Biodiversity Action Plans (BAPs);
- UK Strategy for Red Squirrel Conservation – Action Plan for Northern Ireland;
- All-Ireland Species Action Plan Red Squirrel;
- Londonderry, Derry and Fermanagh Local BAP; and
- Roads Service Biodiversity Implementation Plan.

© Mouchel 2016

Baseline data collection

The following tasks have been undertaken to inform the identification and description of the baseline environment relating to red squirrel:

- Consultation with NIEA and CEDaR and reference to the North West Red Squirrel Group website to identify the location and details of all statutory and non-statutory designated sites within 1km of the Proposed Scheme (the study area) that have been notified for their value to red squirrel and of records of red squirrel sightings over the past 10 years.

- A review of habitats within the vicinity of the Proposed Scheme to determine their suitability to support red squirrel. This involved consideration of studies undertaken in 2008 and 2009 during the preliminary planning, selection of a preferred route and assessment of the scheme proposed in the A5WTC ES 2010. The review was informed by the guidance provided relating to habitat requirements provided in 'UK BAP Mammals: Interim Guidance for Survey Methodologies, Impact Assessment and Mitigation' (Cresswell *et al.* 2013).

- Completion of detailed field surveys, comprising walked transect surveys and camera trap surveys, to investigate the presence of red squirrel at locations identified by the review of habitat suitability.

- The criteria for the selection of field survey sites and survey methods for the site surveys were developed in collaboration with ecologists from the Quercus division of the Department of Biological Sciences at the University of Belfast.

Selection of field survey sites

Survey locations were chosen based on red squirrel habitat requirements and distance to the Proposed Scheme: It is considered the core home range of an adult red squirrel is related to habitat quality and food availability, where daily movements of males may range between 0.2 and 1.8km in optimal woodland habitat (Bryce *et al.* 2005). Most young squirrels disperse within 1km (perhaps closer to 600m) when corridors between patches are absent in a matrix of cultivated fields (Rodriguez *et al.* 1999). Female home range size has been found to be about 4ha both in forest and farmland dominated landscapes (Rodriguez *et al.* 1999). The landscape within which the Proposed Scheme is located contains a mixture of coniferous plantations and relatively small areas of deciduous broadleaved woodland in a landscape dominated by farmland. In discontinuous habitats, linear features such as established hedgerows and small stands of woodland should not be disregarded as important foraging habitat (Cresswell *et al.* 2013). The survey effort was focused in areas along the A5WTC which bisect, for example, two larger stands of woodland, to determine the use by this species in order to avoid fragmentation of populations and identify likely hazardous crossing points for these mammals.

Based on the above, the following criteria for selecting survey sites was adopted:

- Woodland > 5ha in area: and

© Mouchel 2016

- Smaller woodlands >1ha in area, within 100m of other woodland (connected via linear habitat features) which aggregate to 5ha or more.

Sites within 1km of the Proposed Scheme were selected for survey. A total of 19 potential survey sites were identified. The 19 sites are indicated in Figures 11.44 – 11.58 in Volume 2. Their size, distance from the land take boundary for the Proposed Scheme and type of woodland found at each is detailed in Table 11J.1.

Walked transects

Walked transect surveys were undertaken during June and July 2014 at 14 of the 19 sites, access to the other 5 being refused. The sites were surveys were undertaken are indicated In Figures 11.44 – 11.58. The sites were access was not permitted were Victoria Road, Rash House, Kilgreen, Blimeys Hill and Cottage Hill.

The survey methodology described by Gurnell *et al.* (2009) was adapted following the guidelines for specific survey requirements set out by NIEA.

The walked transects were repeated five times over a consecutive two week period during June and July 2014. Routes were planned from aerial photographs to cover as much of the woodland as possible. Surveyors would quietly walk transect lines of 500m to 1000m, stopping at intervals of approximately 100m for 2-5 minutes, taking about 5 minutes to walk the intervening 100m, all the time visually searching the surrounding woodland for squirrels and squirrel evidence.

Each time a positive sighting of red squirrel was made the survey ended. If a grey squirrel was seen the surveyor noted the location and the survey continued. A GPS position was taken of dreys and feeding remains encountered.

Field Survey- Camera Trapping

Camera trap surveys were undertaken between July and September 2014 at 9 of the 19 sites, permission to install equipment being refused for the other 10 sites. The sites were surveys were undertaken are indicated In Figures 11.44 – 11.58. Suitable locations for camera placement were chosen, such as fruiting trees or glade junctions away from public access at locations where the squirrel activity was most evident from the walked transects (e.g. close to dreys or feeding piles at the base of trees). Cameras were set up in the trees facing a peanut feeder and left in situ for a minimum of 14 days, before being moved to a second location within the same woodland for a minimum of 14 days. Feeders were mounted 2-3m up, where food would be more visible from the trees, increasing the chances of detection by this species (Cresswell *et al*, 2013).

Limitations

Dreys, tracks and feeding remains are not characteristic of either species. Conclusions on which species is present based on this evidence alone cannot be made. This was the case at 4 survey locations where transects and camera trapping did not provide the additional evidence required to determine the species.

Results

Designated sites

There are no designated sites for red squirrel within the study area.

Existing records

The CEDaR search results combined with data from the North West Red Squirrel Group website provided a total of 5 red squirrel records since 2004 from within the study area (Table 11J.2).

© Mouchel 2016

During a site visit to the Baronscourt Estate during the 2014 surveys Mouchel staff were informed by the land agent that the parkland is actively managed for control of grey squirrel and both red squirrels and pine marten are seen regularly, both by the land management team and a landowner who stated both species regularly visit his bird feeding table.

Field surveys

The results of the walked transects and camera trap surveys are presented in Tables 11J.4 and 11J.5 respectively. Sightings of red and grey squirrel and evidence of squirrel presence are also indicated in Figures 11.44 to 11.58. The results have confirmed:

- The presence of red squirrel in woodland at survey area Q – Rattling Ford by virtue of the sighting of a single squirrel during the walked transect surveys. The sighting was at a point 160m from the land take boundary for the Proposed Scheme.

- The presence of red squirrels was also confirmed at Seskinore Forest and east of Aughnacloy (including Favour Royal Forest) through incidental sightings and desk study records.

- Grey squirrel presence was confirmed at 8 survey sites (Sixpenny Hill, Strabane Glen ASSI, Wood Hills, Baronscourt, Mourne River Woodland, Grange Wood ASSI, Ballykeel and Routing Burn).

- Species confirmation was inconclusive at 4 survey sites (Black Hill, Errigall, Rarogan and Glencull).

Squirrel evidence was found in 12 of the 14 survey sites where access was permitted, no records were found at 2 of the survey sites (Glenmornan Bog and Crockayanny). Feeding signs such as piles of conifer ‘cores’ were frequently encountered in the plantations (where piles of stripped scales can be found by the base of trees). Other signs observed included digging, split hazelnut cases and ‘bark ringing’. Examples of the squirrel evidence found are shown on Photos 11J.1-11J.4.

It has been concluded that there are four main areas of red squirrel activity within 2km of the Proposed Scheme, these are; New Buildings, East of Aughnacloy (including Favour Royal Forest), Seskinore Forest and Rattling Ford**.**

Baronscourt forest is actively managed for red squirrels with a grey squirrel control programme in an effort to conserve the red squirrel population. However, the most recent biological record centre evidence of a sighting is from 2009. Although the survey results combined with the official data records from CEDaR allude to the absence of red squirrels from the area, landowners and estate staff confirm their presence.

Two other records, one at Strabane Glen ASSI (2006) and at New Bridge on the River Derg (2009) were provided from CEDaR. The 2014 surveys confirmed grey squirrel presence but did not confirm red squirrel presence.

Conclusion

This study has confirmed that both red squirrels and grey squirrels are present within the study area. It is not currently known if red squirrel populations are still in decline in NI; the current conservation status is under review by the NIEA, what is known is that where both species are present, grey squirrels can displace red squirrels within 15 years. It is also known that coniferous woodland habitat provides red squirrels with a competitive advantage over the grey squirrel and this habitat is thought to be critical to the species survival in NI, as is the case in Great Britain (O'Neil et al. 2003, Bryce et al. 2005).

APPENDIX 11K PINE MARTEN MARTES MARTES

Legislation

The pine marten is listed under the following pieces of legislation;

- Schedule 5 to The Wildlife (Northern Ireland) Order 1985 (as amended).

Therefore the pine marten receives full protection in NI from the following offences: (i) intentional killing, injuring, taking or possession; (ii) intentional damage, destruction or obstruction of access to any structure or place used for shelter or protection; and, (iii) intentional disturbance of anything concealing a place used for shelter or protection (iv) intentional disturbance while occupying structures or places used for shelter or protection.

- Annex III of the Convention on the Conservation of European Wildlife and Natural Habitats (Bern Convention)

- Annex V (Animal and Plant Species of Community Interest in Need of Strict Protection) of the EC Habitats Directive

- Schedule 3 of The Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended)

Conservation status

The pine marten is widespread in forests throughout Europe and was once common and widespread in Ireland, however, as in Great Britain, the population has declined as a result of loss and fragmentation of woodland, predator control programmes and persecution (Harris *et al.* (2008), O'Mahony *et al*. (2005)).

Internationally the pine marten is listed as being of Least Concern on the International Union for Conservation of Nature and Natural Resources (IUCN) Red List. The population trend is given as stable (IUCN, 2008). Nevertheless, the pine marten has been listed as a priority Biodiversity Action Plan (BAP) species in the UK since 2007. BAP listed species are those that the UK central and Local Governments have a particular responsibility to conserve for the good of international biodiversity conservation and, as such, do not necessarily overlap completely with rarity or threat lists.

The current population in NI is unknown (JNCC, 2012). In NI, the west, including Co. Fermanagh and South Tyrone, is the most important region for pine marten, with populations also found in County Armagh and County Down to the east. In the Republic of Ireland a national survey undertaken in 2005 found the distribution of pine martens is increasing, mainly from core populations in the mid west, south east and south west (O'Mahony *et al*. 2005).

A conservation status assessment for pine marten in 2012 (UK) found that the species status (based on expert opinion) is favourable, with an increasing range, population and favourable future

© Mouchel 2016

prospects. Recommended actions have been suggested such as the promotion of strategic reforestation and increasing above-ground den sties. No UK species action plan (SAP) has been published to date (JNCC, 2012).

The pine marten is not currently listed as a Species of Conservation Concern (SoCC) in NI and therefore, to date, no NI Species Action Plan SAP has been published. A study is currently being undertaken by NIEA to establish the current conservation status of the pine marten across NI.

Policies and guidance notes

The following policy and guidance documents aim to help conserve and protect the pine marten within NI and the study area:

- Planning Policy Statement (PPS) 2 - Planning and Nature Conservation;
- ENV1.1 in The Regional Development Strategy for Northern Ireland 2025: Shaping Our Future, Chapter 12, Caring for the Environment;
- Northern Ireland Biodiversity Strategy and associated Plans;
- UK Biodiversity Action Plan (UK BAP); and
- Roads Service Biodiversity Implementation Plan.

Baseline data collection

The following tasks have been undertaken to inform the identification and description of the baseline environment relating to pine marten:

- Consultation with NIEA and CEDaR to identify the location and details of all statutory and non-statutory designated sites within 1km of the Proposed Scheme (the study area) that have been notified for their value to pine marten, and all records of pine marten sightings over the past 10 years.
- A review of habitats within the vicinity of the Proposed Scheme to determine their suitability to support pine marten. This involved consideration of studies undertaken in 2008 and 2009 during the preliminary planning, selection of a preferred route and assessment of the scheme proposed in the A5WTC ES 2010. The review was informed by the guidance provided relating to habitat requirements provided in 'UK BAP Mammals: Interim Guidance for Survey Methodologies, Impact Assessment and Mitigation' (Cresswell *et al.* 2013).
- Completion of detailed field surveys, comprising walked transect surveys and camera trap surveys, to investigate the presence of pine marten at locations identified by the review of habitat suitability.
- The criteria for the selection of field survey sites and survey methods for the site surveys were developed in collaboration with ecologists from the Quercus division of the Department of Biological Sciences at the University of Belfast.

© Mouchel 2016

Selection of field survey sites

Survey locations were chosen based on their distance to the Proposed Scheme and pine marten habitat requirements. A pine marten's home range can vary considerably depending on availability of contiguous habitat, food resources, sex and season, with data suggesting home ranges can be as little as 0.2km² in lowland woodland of Northern Ireland (Vincent Wildlife Trust), up to 9km² in commercial mixed conifer plantations (Cresswell *et al.* 2013) and that animals may travel several kilometres during activity bouts. In discontinuous habitats, linear features such as established hedgerows, roads and small stands of woodland may be important features as links between foraging areas (Cresswell *et al.* 2013). The landscape within which the Proposed Scheme is located is dominated by farmland with a mixture of coniferous plantations and relatively small areas of young deciduous broadleaved woodland. Considering the quality and size of habitats available within the landscape of the Scheme corridor, it is likely that resident pine martens may be foraging further, using said linear features, and occur at low densities.

The habitat corridor along the route of the Proposed Scheme includes very few large woodland sites. Therefore, the sampling method used was adjusted from the 10 km² recommended by O'Mahony *et al*. (2005) as follows:

- All blocks of woodland >1 km² together with smaller patches of woodland which aggregated to 5km² and were within 1 km of each other were surveyed;
- Riparian woodland >10 m wide which extended for >5 km or which was located within 1 km of other habitat totaling 5 km in length or 5 km² in area was surveyed.

A total of 14 areas of woodland that conformed to the above criteria within the study area were identified. These were then grouped into 6 survey sites (labelled A-F), based on the quality of the connectivity between areas. Figure 11.44 in Volume 2 shows the locations of the survey sites, with the details of each area given in Table 11K.1. None of these sites were present within Section 1 of the Proposed Scheme.

Field survey

Walked transects

Transect surveys were undertaken by experienced mammal ecologists at each survey site throughout June and July 2014 when this species is most active. The routes of each transect were planned using aerial photographs so as to cover as much of the woodland area as possible. Surveys were undertaken by a minimum of two surveyors per survey site, walking transect lines of a minimum distance of 5km along woodland rides, mammal tracks and other linear features. Surveyors searched for scat, footprints, potential den sites and direct sightings of pine marten.

Prominent habitat features located near transects, such as tree stumps, dead logs and stones, were searched for evidence, as pine marten have a tendency to use these marker posts to deposit scats. All scats found were collected in plastic zip-lock bags, clearly labelled with a reference number, and sent for DNA analysis to the Waterford Institute of Technology to confirm the species. Any pine marten evidence found during the transects including likely den sites (owl nest boxes, tree hollows, rabbit burrows, rock crevices etc) as described in Birks *et al.* (2005) or prints were photographed and their GPS position recorded.

Camera traps

Where pine martens occur at low densities (for example, in areas where the quality of the habitat is poor) it is less likely that their presence can be confirmed from evidence found during survey (Cresswell *et al.* 2013). An additional survey method of camera trapping was therefore incorporated within the 2014 surveys. Suitable locations for camera placement were chosen, such as fruiting trees or glade junctions away from public access. Cameras were set up in the trees facing a peanut feeder (baited with peanuts and jam) and left in situ for a minimum of 14 days, before being moved to a second location within the same woodland for a minimum of 14 days.

Limitations

Land access was a limitation for the walked transect and camera trapping surveys. Of the 6 survey sites chosen for the study, only one had been given consent for full access and both the survey methods. The other 5 survey sites were partially accessible, though some land owners agreed only to the walked transects and not the camera trapping survey. Whilst this reduced the number of woodlands available for the survey, the scope of the surveys across the study area was otherwise comprehensive and sound conclusions can be drawn from the data gathered.

Results

Designated sites

There are no designated sites for pine marten within the study area.

Existing species records

The data received from CeDAR includes 3 records in the past 10 years of pine marten from within the study area as shown in Table 11K.2. During the 2014 surveys anecdotal evidence was provided that the Baronscourt Estate parkland is actively managed for control of grey squirrel and both red squirrels and pine marten are seen regularly, both by the land management team.

Table 11K.2 Pine marten records showing distance from the Proposed Scheme

Location	Approximate Irish grid reference	Date	Pine marten sign	Distance from A5 scheme vesting line (km)
River Finn (unlocalised)	232000 397000	October 2010	Unspecified	0.5
Woodland at Tattynure	243000 380000	2007	Unspecified	1
Edenderry	249000 370000	October 2005	Unspecified	1.7

Evidence of pine marten was recorded by Mouchel during 2008 and 2009 within the extended study area, as shown in Table 11K.3.

Table 11K.3 Pine marten records from Mouchel in 2008 and 2009

Location	Approximate grid reference	Date	Pine marten sign	Distance from A5 scheme vesting line (km)
Largybeg Wood	235000 383000	15/10/09	Footprint	3.5
Ravellea Wood	265400 351700	11/03/09	Scat, DNA tested positive	1
Favour Royal Forest	262240 353350	23/08/09	Photograph	2

Walked transects

No direct sightings of pine marten or signs such as footprints were found during the field surveys. Scratch marks observed on several tree stumps and rocks close to mammal paths indicate possible use by pine marten, although it is very difficult to confirm species from this evidence alone. Mammal scats were found and collected for DNA testing at all survey sites except A and D. The results of the DNA testing are shown in Table 11K.4 below.

Suitable den site locations are presented with the full survey findings in Table 11K.6. There are no suitable den locations within the Proposed Scheme.

Evidence from the desk study data combined with the DNA test results from 2014 indicates that there are two main populations of pine marten within 2km of the Proposed Scheme, these are; in the woodlands west and south of Newtonstewart and in the woodlands west of Ballygawley**.**

The data received from CEDaR indicates that pine marten are present within the wider landscape, with records from along the River Finn near Strabane, along the River Strule and Edenderry Road 3km south east of Omagh.

APPENDIX 11M IRISH HARE LEPUS *TIMIDUS HIBERNICUS*

Legislation

Irish hare receive protection against certain methods of killing and capture under the Wildlife Order but they are not listed under Schedule 5. Irish hare are also a Northern Ireland Priority Species (formally Biodiversity Action Plan (BAP) Species) and are the subject of an All-Ireland BAP.

Conservation status

The mountain hare species *Lepus timidus*, which includes the Irish hare as a sub-species (*Lepus timidus hibernicus*), is listed as being of Least Concern on the International Union for Conservation of Nature and Natural Resources (IUCN) Red List. The overall population trend is unknown for this species, however it is noted that the records indicate hare abundance in NI has undergone a substantial decline (IUCN, 2014).

The Irish hare is a sub-species of the mountain hare and is endemic to Ireland. It is widespread throughout Ireland, and was once common. Evidence indicates that the Irish hare population declined from the early 1900s until the mid-1990s, in the last ten years the population now appears to have stabilised at low densities. In the short term, the population of Irish hare has been found to vary substantially and undergoes multi-annual variations (Reid *et al*., 2007). A number of potential factors have been linked to the decline of Irish hare including agricultural intensification and an increase in predation pressure. Agricultural intensification has reduced diurnal refuge areas required to protect hare from adverse weather and predators, it has also reduced the variety of grass species available for foraging and stocking levels have also increased with hare avoiding fields with high stock densities. Mortality may also have increased from increased mechanization (Dingerkus & Montgomery, 2002).

The most recent estimate of hare abundance in NI was 67,400 from the 2010 Irish hare survey by Quercus (Reid *et al*., 2010), with an estimated density of 4.76 hare/km^2. The Counties of Londonderry and Tyrone recorded a lower density and abundance than that found overall nationally. Londonderry and Tyrone have the lowest hare densities (density: 0.78 and 1.10 hare/km^2 respectively; abundance: 1600 and 3600 hare respectively) of the six counties surveyed.

The Irish hare has been identified as a priority species in Northern Ireland, requiring a Species Action Plan (SAP) under the NI Biodiversity Strategy and UK Priority Species (formally known as BAP Species). Priority Species are those that the UK Central and Local Governments have a particular responsibility to conserve for the good of international biodiversity conservation, as agreed at the 1992 The United Nations Conference on Environment and Development (UNCED). Such species lists do not necessarily overlap completely with rarity or threat lists. The Irish hare has two species action plans:

- NI Species Action Plan Irish Hare (EHSNI, 2000); and
- All-Ireland Species Action Plan Irish Hare (EHSNI, 2008).

The NI Species Action Plan and All-Ireland Species Action Plan have virtually the same aim to maintain the existing range of the Irish hare and increase its population and to maintain and increase the area and quality of suitable hare habitat. The Irish hare is also listed as a NI Species

© Mouchel 2016

of Conservation Concern (SoCC) by the NI Biodiversity Group. All Priority Species are included on this list. The Irish hare is also listed as an internationally important species in the Irish Red Data Book (Whilde, 1993).

It should also be noted that the brown hare *Lepus europaeus* is also found in NI, including in Tyrone. The brown hare is a UK Priority Species within Great Britain, however, due to its recent introduction in the nineteenth century it is not regarded as a species of particular conservation importance in NI (EHSNI, 2008).

Policies and guidance notes

The following policies and guidance documents aim to help conserve and protect Irish hare within NI and the study area:

- ENV1.1 in The Regional Development Strategy for Northern Ireland 2025: Shaping Our Future, Chapter 12, Caring for the Environment;
- NI Biodiversity Strategy and associated Plans;
- All-Ireland Species Action Plan Irish hare; and
- Roads Service Biodiversity Implementation Plan.

Baseline data collection

The following tasks have been undertaken to inform the identification and description of the baseline environment relating to Irish hare:

- Collation of information from desk-based sources including records relating to the presence of Irish hare in Northern Ireland and, where possible, potential distribution and habitat preference; and
- Incidental sightings were recorded during the wider habitat and species surveys.

The above information was used to determine the presence/likely absence of Irish hare within the vicinity of the Proposed Scheme.

Desk study

Records of Irish hare within the study area were obtained from the Centre for Environmental Data and Recording (CeDAR).

Limitations

The recording of incidental sightings of Irish hare were often limited because they are an elusive mainly nocturnal species.

© Mouchel 2016

Results

Existing species records

The CEDaR data revealed twelve Irish hare records since 2004 within the study area (Table 11M.2). These included a number of incidental records of Irish hare recorded by Mouchel during 2009 within the study area. Two brown hare were also recorded on 11th June 2009 near Magheramason at grid reference IC 399 092 which is 1.3km from the Proposed Scheme.

Table 11M.1: Records of Irish hare within study area from CEDaR

© Mouchel 2016

Incidental hare sightings

Fourteen Irish hare were recorded within the study area by Mouchel staff between mid-March and mid-September 2014 (Table 11M.3).

Table 11M.2: Records of Irish hare from Mouchel collated between mid-March and mid-September 2014.

Grid reference/location	Sighting	Date	Approximate distance from Proposed Scheme (km)
234616 390715 Outside of Victoria Bridge	2x hare spotted on route to site	22/04/2014	0.43
237764 403736 Outside of Cloughcor	7x hare (adults and juveniles) spotted during collection of SM2	28/05/2014	4.35
237173 403790 North of Ballymagorry	1x hare spotted during walked transect bat survey	04/06/2014	0.01
253040 361569 North of Eskra	1x hare spotted during driven transect bat survey	17/06/2014	0.34
252755 361170 North of Eskra	1x hare spotted during newt surveys	26/06/2014	0.04
232574 390923 Outside of Sion Mills	1x juvenile hare spotted during driven transect bat survey	15/09/2014	0.8
236514 403160 North of Ballymagorry	1x hare spotted during breeding bird survey	04/12/2014	0.35

Conclusion

Irish hare have been recorded throughout the study area and could utilise most of the habitats within and surrounding the study area for foraging, resting and breeding. The generalist habitat requirements of the Irish hare mean the Proposed Scheme is not located within habitats that are any more or less suitable for use by this species than those within the wider surrounding area. The latest Irish hare survey in 2010 by Quercus (Reid *et al.,* 2010) found that the density of hare in Tyrone and Londonderry is lower than other counties in NI, and therefore represents a lower proportion of the national estimated population. Therefore, land within the study area is likely to be used by a relatively small number of Irish hare and of these individuals it is also likely to only comprise a small proportion of their total territory (mean territory size for Irish hare is c. 14ha).

© Mouchel 2016

APPENDIX 11N DEER

Legislation

All deer species in Northern Ireland are protected in relation to the times of year they may be hunted and the methods by which they may be killed.

Conservation status

There are three species of deer occurring within NI; red deer *Cervus elaphus*, fallow deer *Dama dama* and sika deer *Cervus nippon*.

Deer are wide ranging mammals, whose populations continue to expand within NI (Chanin 2008). In the last 10 years the spread of deer throughout NI has increased rapidly when compared with their slow and gradual advance over the previous forty years. This appears to be due in part to the expansion of suitable habitats such as NI Forest Service land, since the 1960s.

Other factors contributing to their increase are escapees from deer farms, deliberate release of deer into new areas and pressure arising from deer stalkers which cause deer to spread into new areas (McCurdy, 2002).

With the absence of natural predators within NI, the main threats to deer is from road traffic accidents and human culling; however some culling needs to take place in order to keep populations at sustainable levels (Forest Service, 2007). Damage to plantations and woodlands by deer can be significant (such as from browsing and bark-stripping), if population numbers are allowed to go unchecked (Staines & Welch, 1981).

Red deer is the only species native to Northern Ireland. Red deer are widespread and locally common. Fallow deer and sika deer are both locally abundant and are increasing their range throughout the UK, see Table 11N.1. The average deer home range is 5km. Habitat preference for all the deer species is broadleaved and/or coniferous woodland. Other habitats are also used; red deer and sika use heathland and fallow deer generally use agricultural land (The British Deer Society, 2010).

Table 11N.1 Status, range and habitat preference of red, fallow and sika deer within Northern Ireland (The British Deer Society, 2010; Forest Service, 2007).

Deer species	Status and distribution	Range	Habitat Preference
Red deer ***Cervus elaphus***	Native but re-introduced to NI. Widespread and locally common.	Females – 5km. Males up to 40km.	Woodlands and forests but can adapt to open moor and hills (i.e. dwarf shrubs).
Fallow deer ***Dama dama***	Non-native but considered naturalised. Locally abundant and increasing.	Can roam over large areas.	Mature broad leaved Woodland with understory, open coniferous woodland, open agricultural land.

© Mouchel 2016

Deer species	Status and distribution	Range	Habitat Preference
Sika deer ***Cervus Nippon***	Introduced. Locally abundant and increasing. Patchy distribution in NI (Co. Fermanagh and Co. Tyrone).	5km for individuals. Males can travel further.	Coniferous woodland and heaths on acid soils.

Policies and guidance notes

Deer species occurring in NI are not currently threatened or rare enough to warrant listing as a UK or Northern Irish Species of Conservation Concern (SoCC) or Biodiversity Action Plan (BAP) species. They are not listed within the Londonderry or Omagh local BAP.

The following policies and guidance documents aim to help conserve and protect deer within NI and the study area:

- Roads Service Biodiversity Implementation Plan; and
- Roads Service Environmental Handbook.

Roads Service Biodiversity Implementation Plan highlights the need to assess local deer populations and provide wildlife crossings. The Environmental Handbook includes advice on mitigation for deer crossings; see Table 11N.2 for further details.

Table 11N.2 Policy framework and guidance notes relating to deer (Roads Service, 2008; and Roads Service, 1998).

Policy Framework/ Guidance Notes	Action	Supporting information
Biodiversity Implementation Plan	Carry out studies on local wildlife such as deer and provide measures for safe passage across roads.	All structures shall be designed and located so as to maximise the opportunity for wildlife crossing whilst not impairing the function of the structure. All opportunities shall be taken for locating dedicated wildlife structures as close as practicable to existing crossing points.
Environmental handbook	Roads Service to consult appropriate experts on wildlife issues such as deer.	Guidance for mitigation in relation to deer is given, such as deer warning signs and roadside reflectors.

© Mouchel 2016

Baseline data collection

The following tasks have been undertaken to inform the identification and description of the baseline environment relating to deer:

- Collating information from desk-based sources (Centre for Environmental Data and Recording (CEDaR) and Forest Service) relating to the presence of deer in the study area; and,
- Completing detailed field surveys to determine the presence/likely absence of deer within the vicinity of the Proposed Scheme.

Field survey

A field survey of all land within the vesting line of the Proposed Scheme and a surrounding 25m buffer was undertaken between the 9th and 13th June 2014. The survey area was driven looking for deer presence. Habitats particularly suitable for deer such as woodlands and areas where evidence of deer was likely to be found such as muddy areas of fields (footprints) were walked looking for field signs of deer. Any signs of deer, footprints, hairs, dung or shed antlers were recorded and their locations marked with GPS equipment.

Incidental records

In addition, any incidental sightings of deer or field signs during other ecological field surveys were recorded.

Results

Centre for Environmental Data and Recording (CEDaR)

No deer records were provided by CEDaR.

Forest Service

Data from the Forest Service only identified one Forest Service area: Baronscourt Forest, within the study area as containing wild deer (unknown species). This woodland is approximately 1km to the west of the Proposed Scheme at Newtownstewart.

A5WTC ES 2010 incidental records

Records were taken from the A5WTC ES 2010, see Table 11N.3. Deer were only recorded from incidental sightings during other species surveys. Sika and fallow deer were noted but no red deer.

© Mouchel 2016

Table 11N.3 Deer records from Mouchel 2010 report within the study area obtained from incidental records showing distances from the scheme.

Species	Grid reference	Location	Distance from vesting line	Date of record
Sika	X: 242800 Y: 371900	West of Omagh	Approx. within 250m of scheme	27/05/2009
Fallow	X: 241700 Y: 378000	Mountjoy	Approx. within 500m of scheme	19/05/2009
Deer species unknown	X: 240700 Y: 380900	North of Mountjoy	Approx. within 500m of scheme	05/2009

Field survey

No deer were seen or evidence of deer found during the field survey in June 2014.

2014 incidental records

All records found in 2014 were sightings or recorded on camera traps during A5WTC ecological surveys in 2014, see Table 11N.4.

Table 11N.4 Deer records within the study area obtained from incidental records showing distances from the Proposed Scheme.

Species	Location	Distance from vesting line	Date of record	Comments
Deer species unknown	Near Ballymagorry	Approx. 300m from the scheme	27/06/14	Sighting
Sika deer	Errigal conifer plantation	Approx. 1.4km from the scheme	02/07/14	Recorded on camera trap
Suspected Red Deer	Tully Bog	Approx. 300m from the scheme	11/04/14	Sighting
Sika Deer	Garvaghey	Approx. 500m from the scheme	24/06/14	Recorded on camera trap
Red Deer	Adjacent Aughnacloy	Approx. 250m from the scheme	26/06/14	Sighting
Red Deer	Aughnacloy	Approx. 250m from the scheme	01/08/14	Sighting
Sika deer	Grange Wood	Approx. 800m from the scheme	02/08/14	Recorded on camera trap
Red Deer	Errigal Road	Approx. 1.5km from the scheme	10/08/14	Sighting
Deer species unknown	Coolaghy, Newtonstewart	Approx. 1.8km from the scheme	21/08/14	Recorded on camera trap

Conclusion

No deer species occurring within NI are protected by legislation relating to their conservation status and are not included within the NI Biodiversity Strategy and associated Plans and UK BAPs.

The results found that all three species were present within and around the survey area (Table 11N.4) suggesting that deer use corridors around the Proposed Scheme. This conclusion is supported by the 2010 Mouchel report which noted sika and fallow deer on the survey sites (Table

© Mouchel 2016

11N.3). All sightings/signs from these surveys were seen within the average deer home range of 5km. Red deer were seen closest to the footprint of the road (within 250m). Official figures for population numbers are unavailable, but the studies carried out and incidental records gathered during three years of field surveys indicate low populations.

© Mouchel 2016

APPENDIX 11O –WINTERING SWAN AND GOOSE

Legislation

The following legislation is the most relevant to whooper swan C*ygnus cygnus* and greylag geese *Anser anser* within the study area.

- *The Conservation (Nature Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended).* These Regulations implement, in NI, Council Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora ("the Habitats Directive"), one of the main initiatives of which is the creation of a European network of wildlife sites known as 'Natura 2000' for the protection of certain wild animals and plants;

- *The Nature Conservation and Amenity Lands (Northern Ireland) Order 1985 (as amended.* The Order affords protection to all nationally designated sites such as Areas of Special Scientific Interest (ASSI). It also strengthens protection of bird species within and adjacent to 'nature reserves'; and

- *The Environmental Liability (Prevention and Remediation) Regulations (Northern Ireland) 2009.* These regulations implement, in Northern Ireland, Directive 2004/35/EC on environmental liability with regard to the prevention and remedying of environmental damage (the Environmental Liability Directive).

Republic of Ireland legislation

- The European Communities (Natural Habitats) Regulations, 1997 (as amended) – which give effect to Council Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora (the Habitats Directive) which enable the designation of special areas of conservation (endangered species and habitats of endangered species) as a contribution to an EU Community network known as NATURA 2000.

The following EC Directives and international conventions are applied by some of the above NI Acts and Regulations:

- Directive 2009/147/EC on the conservation of wild birds (codified version) ("the Birds Directive");

- Convention on the Conservation of European Wildlife and Natural Habitats (the Bern Convention) (1979); and

- Convention on the Conservation of Migratory Species of Wild Animals (the Bonn Convention) (1979).

© Mouchel 2016

Statutory protected sites

Special Protection Areas (SPA)

Ninety three species are listed upon Annex I of the Birds Directive, of which approximately 30 are regularly recorded in NI (although many of these occur solely as summering migrant populations, passage migrants or scarce visitors). The presence of important populations of Annex I bird species, or non-Annex I migratory birds, is a primary consideration in the identification of SPA which are part of the Natura 2000 site network.

SPA receive full protection under the EC Birds Directive and are areas of the most important habitat for rare (listed on Annex I to the Birds Directive), vulnerable, and migratory birds within the European Union. SPA form part of the Natura 2000 network, and are therefore protected under The Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended). All NI SPA are also designated as ASSIs and therefore receive additional protection under The Nature Conservation and Amenity Lands (Northern Ireland) Order 1985 (as amended) and the Wildlife (Northern Ireland) Order 1985 (as amended). Any development likely to have significant impacts upon a Natura 2000 site will have to be assessed for its implications on the site's conservation status, an obligation under the aforementioned Regulations.

Ramsar sites

Ramsar sites are designated under the Convention on Wetlands of International Importance, agreed in Ramsar, Iran, in 1971. They were originally intended to protect sites of importance, especially as waterfowl habitat. However, the Convention has broadened its scope over the years to cover all aspects of wetland conservation and wise use, recognising wetlands as ecosystems that are extremely important for biodiversity conservation in general and for the well-being of human communities. Ramsar sites are not legislated under European legislation, although Planning Policy Statement (PPS) 2 – *Planning and Nature Conservation* recommends they should be afforded the same level of consideration and protection as Natura 2000 sites.

Conservation status

A diverse assemblage of bird species winter within the array of semi-natural habitats present in NI. Sixteen SPA have been defined in NI that support rare or vulnerable European bird species listed upon Annex I of the Birds Directive. The majority of these birds are either species of wader, wildfowl, raptor, or seabird, with the SPA themselves consisting predominantly of loughs, coastal islands, and upland bog and moorland areas.

In addition to those species listed upon Annex I of the Birds Directive, a large number of other bird species within NI/ROI have suffered population declines over recent decades. The proximate causes of these declines vary from species to species, but include agricultural intensification, destruction of bogs and upland afforestation, and anthropogenic persecution.

This has informed the creation of a list of NI Species of Conservation Concern (SoCC) by the Northern Ireland Biodiversity Group, which includes 117 bird species. This list identifies species which require monitoring, as it is possible that they will require conservation action in the future. A

© Mouchel 2016

further 29 of the bird species included in this total are identified as NI Priority SoCC (PSoCC), indicating that they require current conservation action in order to safeguard their populations. It should be noted however that not all of the species listed occur within NI as wintering species, with many occurring solely as passage migrants or summer visitors.

Policies and guidance notes

The following policies and guidance documents aim to help conserve and protect wintering swan and geese populations within NI and the study area:

- *Roads Service Biodiversity Implementation Plan (2008);*
- *PPS 2: Planning and Nature Conservation* - Outlines the need to consider both SPA and wild birds during the planning process within NI;
- *Northern Ireland Biodiversity Strategy (2002)* - Outlines the requirement to identify SoCC and PSoCC and the delivery of Species and Habitat Biodiversity Action Plans; and
- *Local Development Plans* - The West Tyrone, Dungannon and South Tyrone, and Londonderry Area Plans all highlight the need to maintain existing levels of biodiversity within their jurisdictions.

Baseline data collection

Published data shows that wintering wildfowl (primarily whooper swans and greylag geese) within the Lough Foyle/Lough Swilly SPA complex utilise geographically disparate feeding, roosting and staging areas across an international expanse of territory as the winter and spring progress (Robinson et al, 2004). In addition, birds have been known to move between these SPA and Lough Neagh & Lough Beg SPA.

Birds originating from the three SPA under particular consideration may utilise an area encompassing approximately 1100km^2 of estuarine, riverine and agricultural habitats (located within both NI and ROI) as the winter progresses (Robinson *et al*, 2004).

The location of these three separate SPA, each designated (in part) for their wintering whooper swan and greylag goose populations, within 30km of the Proposed Scheme was therefore a consideration when determining an appropriate geographical scale of study.

Survey area

The floodplain/arable habitats incorporated within the survey area on the Foyle floodplain were identified as exhibiting potential (through both historical records and habitat suitability) to support wintering swan and goose populations which fall within the zone of influence of the Proposed Scheme. This followed extensive correspondence with statutory and non-statutory nature conservation organisations including the NIEA, RSPB and BTO.

© Mouchel 2016

This initial survey area was extended to include several field systems on the western side of the Foyle (Co. Donegal within the ROI) following observance of several large wildfowl flocks utilising them during vantage point surveys (see Figure 11.67 - 11.67).

The methods used to collect information regarding wintering birds included:

- Obtaining up-to-date details of the location and nature of all statutory and non-statutory designated sites, notified for their value to wintering swans and geese, within the study area from the Northern Ireland Environment Agency (NIEA) and ROI National Parks and Wildlife Service (NPWS);

- Collation of information from desk-based sources relating to the presence of wintering swans and geese in NI and ROI and, where possible, potential distribution and habitat preference, reviewing the results of obtained for the A5WTC ES 2010; and

- Completion of detailed field surveys to identify the distribution and movements of wintering swans and geese within the vicinity of the Proposed Scheme.

Field survey

These were undertaken between October 2013 and April 2014 using a methodology informed by McElwaine & Spouncer (2006). All surveys were undertaken from within vehicles or from public rights of way to avoid causing undue disturbance to wintering bird populations or livestock. Surveys were grouped into two categories:

- Fortnightly surveys undertaken to provide a near instantaneous assessment of swan and geese herd/flock distribution on a single visit; and

- Monthly surveys undertaken to establish the herds'/flocks' usage of (and movement within) the survey area at regular intervals throughout a single survey day (in addition to locating any nearby roost sites).

To improve the accuracy of the distributional data collected, all fields within the survey area (with the exception of those within the ROI) were afforded an individual identification number (reproduced on all associated figures).

Two vantage points (VP) were identified on high ground to the east of the existing A5; one facing south-west, the other facing north-west (see Figure 11.67 - 11.67). These allowed unobscured views of the entirety of survey area (including into the ROI) although the views obtained from each VP only slightly overlapped and it was therefore necessary to man them both at dawn and dusk. This allowed uninterrupted monitoring of crepuscular wildfowl movements within the survey area during monthly surveys.

© Mouchel 2016

Fortnightly surveys

These surveys were carried out at fortnightly intervals during daylight hours at varying times of day. The following data was collected on recording forms during these surveys:

- *Flock composition* (comprising number of adult/1st year swans and geese present and family party sizes where possible);
- *Distance from existing A5* (estimated within fields bordering the existing route only);
- *Flooding* (a percentage cover estimate of the amount of standing water present in each field wherever possible);
- *Livestock numbers* (type and number of livestock present in each field);
- *Other species* (the species and number of any other birds present, especially wintering wildfowl, waders and raptors; this data is reproduced separately in the Appendix 11Q);
- *Activity and disturbance type/level* (whether apparently impacting the birds or not);
- *Details of ringed birds* (to inform the understanding of movements of birds between fields/roost sites); and
- *Observations on flock movements* (particularly where this may affect the accuracy of field usage counts).

Monthly surveys

These surveys were carried out each month on a single day from dawn until dusk throughout the survey period. The following data was collected during these surveys:

- *Movements to/from roosts* (undertaken from the two VP) at dawn and again prior to dusk. Records were made of the source, number and destination of any swans/geese noted, with observation ceasing once movements to/from the site had either apparently ceased or it became too dark to see; and
- *Counts* - repeat counts made throughout the day, including flock composition, to determine movement between/usage of different fields. Extra time was spent on attempts to accurately identify any ringed birds present.

Incidental recording

Any incidental swan/goose counts made within the survey area during the undertaking of other ecological surveys allied to the Proposed Scheme were noted separately.

© Mouchel 2016

Limitations

Difficulties were encountered in the accurate location of likely swan/goose roost sites within the survey area due to the continued activity of birds under low light levels during dawn and dusk.

Designated sites

The following designated sites (incorporating whooper swan and/or greylag goose within their qualifying features) were identified, through consultation with NIEA and RSPB, as having whooper swan and greylag goose populations which use the Foyle floodplain as a foraging, roosting and/or staging area.

Lough Foyle SPA (Site Code UK9020031)

Lough Foyle lies on the north-west coast of NI and straddles the international border with the ROI. The site comprises a large (2204.36 ha) shallow sea lough that includes the estuaries of the rivers Foyle, Faughan and Roe. The site contains extensive intertidal mud-flats and sand-flats (with mussel *Mytilus edulis* beds), saltmarsh and associated brackish ditches. The diversity of coastal habitats has resulted in the lough being of major importance for a diverse assemblage of waterbirds both during the spring and autumn migration periods, and in winter (JNCC website[1]).

The site supports populations of European importance of bar-tailed godwit *Limosa lapponica* (1,896 individuals, representing 10.8% of the wintering population in Ireland (5 year peak mean 1991/2 - 1995/6)), Bewick's swan *Cygnus columbianus bewickii* (78 individuals, representing 3.1% of the wintering population in Ireland (5 year peak mean 1991/2 - 1995/6)), golden plover *Pluvialis apricaria* (4,891 individuals, representing 2.4% of the wintering population in Ireland (5 year peak mean 1991/2 - 1995/6)) and whooper swan *C.cygnus* (890 individuals, representing 8.9% of the wintering population in Ireland (5 year peak mean 1991/2 - 1995/6)).

The site also supports populations of European importance of the migratory light-bellied brent geese *Branta bernicla hrota* (3,730 individuals representing 18.6% of the wintering Canada/Ireland population (5 year peak mean 1991/2 - 1995/6)), in addition to regularly supporting at least 20,000 waterfowl (and thereby qualifying as a wetland of international importance) (JNCC website).

In addition, over winter the area regularly supports 37,310 individual waterfowl (5 year peak mean 1991/2 - 1995/6) including: Teal *Anas crecca*, Whooper Swan *Cygnus cygnus,* Golden Plover *Pluvialis apricaria*, Bar-tailed Godwit *Limosa lapponica*, Light-bellied Brent Goose *Branta bernicla hrota*, Great Crested Grebe *Podiceps cristatus*, Cormorant *Phalacrocorax carbo*, Greylag Goose *Anser anser,* Bewick's Swan *Cygnus columbianus bewickii*, Wigeon *Anas penelope*, Redshank *Tringa totanus*, Mallard *Anas platyrhynchos*, Eider *Somateria mollissima*, Red-breasted Merganser *Mergus serrator*, Oystercatcher *Haematopus ostralegus*, Lapwing *Vanellus vanellus*, Knot *Calidris canutus*, Dunlin *Calidris alpina alpina*, Curlew *Numenius arquata*, Shelduck *Tadorna tadorna*.

© Mouchel 2016

A section of Lough Foyle located within the ROI (between Muff and Whitecastle) is also designated as Lough Foyle SPA (site code 004087). The site synopsis document supplied by the NPWS website (http://www.npws.ie/en/SPA/004087) does however state that 'because of its small size the number of birds using the site is relatively low' and the document does not highlight the qualifying features of the site. It is therefore considered practical to consider the designated area of Lough Foyle residing within the ROI as contiguous with that (and its associated qualifying features) designated within NI.

In addition to the above, consultation with the RSPB has identified that Lough Foyle and its floodplain are likely used by migrating greylag geese populations from Lough Neagh and Lough Beg.

Lough Swilly SPA (Site Code 004075)

This site comprises the inner part of Lough Swilly and extends from just below Letterkenny to Rathmullan. Between Farsetmore and Blanket Nook a series of improved pasture and arable fields of importance to geese and swans are included. The site includes sections of the estuaries of the River Swilly, the River Leannan and the Isle Burn and the predominant habitat is a series of extensive sand and mud flats which are exposed at low tide. It incorporates Inch Lough and Levels, a reservoir holding water for drainage and an area which has been drained for agricultural use. There is some seepage of seawater back from the sea via a sluice (which allows water to exit the reservoir at low tide), thus creating brackish 'lagoonal' conditions within Inch Lough. A small sandy island is additionally located in the southern part of the lake (www.npws.ie).

The SPA supports internationally important wintering populations of Greenland white-fronted geese *Anser albifrons flavirostris* (5 year mean of winter maximum 1995/96-1999/00 of 970 individuals), whooper swans (5 year mean of winter maximum 1995/96- 1999/00 was 1,135 individuals, the largest population in the country) and greylag geese (5 year mean of winter maximum 1995/96-1999/900 was 2,020 individuals - incorporating both migratory birds of the Icelandic population and smaller numbers of feral birds) (NPWS website).

During the summer months the sandy island within the lough supports nationally important breeding populations of Sandwich *Sterna sandvicensis* and common terns *S. hirundo*, mute swans and tufted duck *Aythya fuligula*.

The site additionally supports a nationally important wintering wildfowl assemblage.

Lough Neagh & Lough Beg SPA (Site Code UK9020091)

This site in the centre of Northern Ireland and includes three eutrophic water bodies, Lough Neagh and two related loughs, Lough Beg and Portmore Lough, together with surrounding swamp, fen, wet grassland and swampy woodland. The boundary of the proposed Special Protection Area follows the boundaries of the Lough Neagh ASSI, Lough Beg ASSI and Portmore Lough ASSI and also forms part of another site which is listed as a wetland of international importance under the Ramsar Convention. The site qualifies for designation by supporting internationally important numbers of wintering birds and nationally important breeding birds. The site regularly supports

© Mouchel 2016

pochard *Aythya farina* (26,341 individuals representing 7.5% of the population (5 year peak mean 1991/92-1995/960)), tufted duck *Aythya fuligula* (22,372 individuals representing 2.2% of the population (5 year peak mean 1991/92-1995/96)), goldeneye *Bucephala clangula* (10,776 individuals representing 3.6% of the population (5 year peak mean 1991/92-1995/96)), Bewick's swan *Cygnus columbianus bewickii* (136 representing 5.4% of the all-Ireland population (5 year peak mean 1991/92-1995/96)), whooper swan *Cygnus cygnus* (1,031 individuals representing 10% of the all-Ireland population (5 year peak mean 1991/92-1995/96)) and common tern *Sterna hirundo* (185 individuals representing 6% of the all-Ireland breeding population (count, as at 1995). The site additionally qualifies as a wetland of international importance by regularly supporting over 20,000 of a variety of species of waterfowl in winter.

The site additionally supports a nationally important breeding bird assemblage.

Existing species records

The A5WTC ES 2010 showed that the River Foyle floodplain was used by both whooper swan and greylag goose, and peak counts are shown in Tables 11O.1, 11O.2 and on Figures 11.67 - 11.67. Peak counts were relatively high when compared to census values from the literature. The Wildfowl and Wetlands Trust (WWT) and Ulster Wildlife did not hold independent data concerning wildfowl movements within the survey area.

RSPB NI provided the following information outlining their understanding of wildfowl distribution and movements within the survey area:

'*The northern part of section one of the proposed route is known as the Bready/Grange floodplain...[It] is habitually used by wintering swans and geese that feed in the fields and roost on parts of the River Foyle. Although the area is not within the designated site boundary of the Lough Foyle SPA, the geese and swan species that use the area occur in significant numbers at both a national and international level.*

The core months for the swans to use the Bready/Grange area has tended to be throughout October/November/December and January, though birds are present before and after these core months… we [have] provided a map highlighting two hotspot areas within the Bready/Grange area where larger numbers of birds have tended to mass together. These areas are from Dunnalong to Thorn Hill and at Grange, however monitoring over the entire site would be required to indicate the usage of the area by field.

It is important to highlight that the Bready/Grange floodplain area is just one part of the Lough Foyle-River Foyle-Lough Swilly complex'.

Whooper swan counts for the complex are therefore calculated by summing the individual counts taken from Lough Foyle, Lough Swilly and the River Foyle. Figures are sourced from surveys undertaken as part of the International Swan Census in January 2005 (Crowe *et al*, 2005); data provided in Robinson *et al* (2004), Lough Foyle WeBS five-year winter peak counts 2004/05 to 2008/09 and also the A5WTC ES 2010. Existing whooper swan data is presented in Table 11O.1.

© Mouchel 2016

Table 11O.1 Existing whooper swan counts.

Site	Whooper swan 2005 census count (Crowe *et al*, 2005)	Whooper swan 5 year mean peak count 1995 – 2000 (Robinson *et al* 2004)	Lough Foyle WeBS whooper swan 5 Year mean peak count 2004 – 2009	A5WTC ES 2010
Lough Foyle SPA	950	917	869	-
Lough Swilly SPA	501	1673	-	-
River Foyle (incl. Grange Foyle)	444	734	-	1594
Total Foyle / Swilly complex counts	1895	3324	-	-

An indication of the levels of usage expected by whooper swan during the winter months was further provided by the recording of a single herd of more than 250 feeding in a stubble field during an October 2008 ecological scoping exercise (*pers. obs*).

Greylag counts were sourced from surveys undertaken as part of the Irish Wetland Birds Survey (Colhoun, 2001); data provided in Hearn & Mitchell (2004), Lough Foyle WeBS five-year winter peak counts 2004/05 to 2008/09, and the A5WTC ES 2010. Data from the Irish Wetland Birds Survey just gives a total Irish wintering population whilst data provided in Hearn & Mitchell (2004) gives peak counts for Lough Swilly and the River Foyle, but no count for Lough Foyle. An indication of population levels at Lough Foyle is provided by the Lough Foyle WeBS five-year mean peak count from 2004-2009. Existing greylag goose data is presented in Table 11O.2.

Table 11O.2 Existing greylag goose counts

RoI and NI combined wintering population	5269	-	-	-

From this desk study several areas of agriculturally improved wet grassland within the Foyle floodplain (located to the south of the Lough Foyle SPA boundary) were identified as likely to be important feeding and staging areas for wintering whooper swan and geese originating from, or passing through, the Lough Foyle/Lough Swilly SPA complex (Robinson *et al*, 2004, Mouchel, 2009). Two sites of particular relevance to are the Grange and Dunnalong/Thornhill areas of the eastern Foyle floodplain within Counties Londonderry and Tyrone which along with fields on the western side of the River Foyle within the Republic of Ireland, formed the field surveys area.

Field survey

The results of the whooper swan field survey are summarised in Tables 11O.3 and 11O.4. The first table presents peak population counts for Grange Foyle and north of Dunnalong Road, taken from field survey results. Within the second table the peak 2013/14 survey numbers of whooper swan using the Grange Foyle and Dunnalong Road area are then expressed as percentages of the total Foyle / Swilly complex populations, using the sets of total population figures from Table 11O.3.

Table 11O.3 Summary of Whooper Swan Data.

Chainage/Irish grid reference	Site	Peak count Grange Foyle 2013/2014 field survey data	Peak count north of Dunnalong Road 2013/2014 field survey data
Ch.4500 - 10500	Grange Foyle	873	22
36009 13265 (BTO tetrad C31R)	Donegal Flood Plain (West of the Foyle)	0	

Table 11O.4 Peak Counts for Whooper Swan as Percentage of SPA Populations.

	Whooper swan 2005 census count (1895)	Whooper swan 5 year mean peak count 1995 – 2000 (3324)
Peak count Grange Foyle 2013/2014 field survey data (873)	46.0%	26.3%
Peak count north of Dunnalong Road 2013/2014 field survey data (22)	1.2%	0.7%

© Mouchel 2016

The results of the greylag field survey are summarised in Tables 11O.5 and 11O.6. The first table presents peak population counts for Grange Foyle and north of Dunnalong Road, taken from field survey results. Within the second table the peak 2013/14 survey numbers of greylags using the Grange Foyle area are then expressed as percentages of the total Foyle / Swilly complex population (2371), using peak counts taken from 1995-2000 (Lough Swilly & River Foyle-1399) and 2004-2009 (Lough Foyle-972) and as a percentage of the total Irish wintering population. Only a single greylag was observed north of Dunnalong Road during the surveys.

Table 11O.5 Summary of Greylag Goose Results

Chainage/Irish grid reference	Site	Peak count Grange Foyle 2013/2014 field survey data	Peak count north of Dunnalong Road 2013/2014 field survey data
Ch.4500 - 10500	Grange Foyle	218	1
36009 13265 (BTO tetrad C31R)	Donegal Flood Plain	0	

Table Q11.6 Peak Counts of Greylag Goose Results as Percentage of Total SPA Populations

	Greylag 1999 Irish wintering population (5269)	Greylag 5 year mean peak count 1995 – 2000 (2371)
Peak count Grange Foyle 2013/2014 field survey data (218)	4.1%	9.2%
Peak count north of Dunnalong Road 2013/2014 field survey data (1)	<0.1%	<0.1%

Whooper swan

Surveys undertaken as part of the International Swan Census in January 2005 (Crowe *et al*, 2005) recorded 950 whooper swan utilising Lough Foyle, 501 birds at Lough Swilly and 444 birds along the River Foyle. Therefore it is considered probable that approximately 23% of whooper swan utilising the Lough Foyle/Lough Swilly SPA complex in January 2005 were present along the length of the River Foyle, although this figure is comprised of birds present within Counties Tyrone, Londonderry and Donegal; not just within the area of the eastern Foyle floodplain encompassed by the Proposed Scheme.

Field survey results from 2013/2014 showed a peak count of 873 birds present on land within the area of the eastern floodplain, at Grange Foyle, approximately 46% of the whooper swan utilising the Lough Foyle/Lough Swilly SPA complex in January 2005. A peak count of 22 birds from north of Dunnalong Road equates to approximately 1.2% of the whooper swan utilising the Lough Foyle/Lough Swilly SPA complex based upon data from 2005. This represents a change in use pattern when compared to the 2009 A5 WTC EIA study (Mouchel, 2009), with fewer birds using the area north of Dunnalong Road and more within the Grange Foyle area.

© Mouchel 2016

These approximate figures are repeated using the five year mean peak (1995/96 to 1999/2000) population data provided by Robinson *et al* (2004), whereby 1,673 birds were recorded utilising Lough Swilly, 917 birds were recorded at Lough Foyle and 734 birds on/alongside the River Foyle (combined totals for NI and the RoI). Therefore approximately 50% of the Lough Foyle/Lough Swilly SPA complex population were recorded at Lough Swilly, 28% at Lough Foyle and 22% along the River Foyle.

Field survey results from 2013/2014 (peak count of 873 birds) showed that approximately 52.2% of the whooper swan utilising the Lough Foyle/Lough Swilly SPA complex were present on land within the area of the eastern floodplain, at Grange Foyle, using the five year mean peak (1995/96 to 1999/2000) population data. The peak count of 22 birds from north of Dunnalong Road equates to approximately 1.3% of the whooper swan population utilising the Lough Foyle/Lough Swilly SPA complex based upon data from 2005.

Icelandic greylag geese

Accurately assessing the number of migratory Icelandic greylag geese utilising the SPA complex is made problematic by the presence of a re-establishing resident population of this species within both NI and the ROI. Nevertheless, data provided in Hearn & Mitchell (2004) indicates that (correcting for the number of resident birds present within mixed wintering flocks) the five year mean peak (1995/96 to 1999/2000) population of Icelandic greylag geese within the Lough Foyle/Lough Swilly SPA complex was approximately 1,399 birds. Of this number 1,218 (87%) were recorded utilising habitats within Lough Swilly, with the remaining 181 (13%) recorded along the River Foyle. No indication is given as to the species usage of Lough Foyle SPA in Hearn & Mitchell but using the Lough Foyle WeBS greylag geese 5 Year Mean Peak Count 2004 – 2009 (972) the population of Icelandic greylag geese within the Lough Foyle/Lough Swilly SPA complex would be approximately 2371 birds.

Field survey results from 2013/2014 (peak count of 218 birds) showed that approximately 9.2% of the greylag geese utilising the Lough Foyle/Lough Swilly SPA complex were present on land within the area of the eastern floodplain, at Grange Foyle based upon data from 2004 and the 2004-2009 mean peak count. The single bird observed north of Dunnalong Road represents <0.1% of the greylag geese utilising the Lough Foyle/Lough Swilly SPA complex based upon data from 2004 and the 2004-2009 mean peak count.

National census data for 1998/1999 recorded a total of 5,269 Icelandic greylag geese wintering within the ROI and NI combined (Colhoun, 2001). The Lough Swilly population for that period thereby comprises approximately 23% of the international Irish population for that period, whilst the population recorded along the River Foyle comprises approximately 3.5%, with Lough Foyle containing 18%.

Field survey results from 2013/2014 (peak count of 219 birds) showed that approximately 4.2% of the Irish wintering population of Icelandic greylag geese were present on land within the area of the eastern floodplain, at Grange Foyle based upon data from 1998/1999.

© Mouchel 2016

Conclusion

The results of this study indicate that significant proportions of the SPA whooper swan and greylag goose populations use the Foyle floodplain during winter months. Overall abundance of both species was lower than observed in 2009 however, with the lower abundance of greylag geese particularly of note. Thus it is important to see the abundance of both species in over the long term and consider previous survey results when evaluating the population. Given the numbers observed over successive years of study, it is likely the River Foyle floodplain is important to the survival and therefore the maintenance of the conservation status of both species within the surrounding designated sites.

Significant numbers of whooper swans (field survey peak count 873) and Icelandic greylag geese (field survey peak count 218) use the Grange Foyle area in winter, with whooper swans (field survey peak count 22) also using land to the north of Dunnalong Road. A single greylag goose was also observed to the north of Dunnalong Road. The peak whooper swan count during 2013/2014 equates to 52.2% of the population present within the Lough Foyle/Lough Swilly SPA complex. The peak Greylag count during 2013/2014 equates to approximately 9.2% of the population present within the Lough Foyle/Lough Swilly SPA complex and approximately 4.2% of the total Irish wintering population.

The results of a previous survey in support of the A5 WTC covering whooper swan and greylag goose numbers, Mouchel (2010), showed higher numbers of these birds using the Foyle floodplain area during winter for foraging. Consultation with the RSPB has identified that this may be because of a greater availability of food at sites in other areas (e.g. in the Republic of Ireland on the other side of the River Foyle, and/or other sites in the Foyle/Swilly complex).

© Mouchel 2016

APPENDIX 11P BREEDING BIRDS

Legislation

The Wildlife (Northern Ireland) Order 1985 (as amended) (the Wildlife Order) makes it an offence to kill, injure, or take any wild bird, or take, damage, or destroy the egg or nest of any wild bird whilst it is being built or in use. It is also an offence to disturb any wild bird whilst it is building a nest, or in, on, or near to a nest containing eggs or young. Special penalties apply to any of the rarer, or more disturbance prone, bird species listed upon Schedule 1 to the Order throughout the year, such as the kingfisher *Alcedo atthis*. The list of birds within Schedule 1 was increased in 2010 to include a further fifteen species. Additionally, the Order affords all Special Protection Areas (SPA) within NI legal protection via their additional designation as Areas of Special Scientific Interest (ASSI).

The Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended) places a duty to compile and maintain a list of European sites, including SPA, in NI. These sites are afforded protection via the Habitat Regulation Assessment (HRA) process.

The Nature Conservation and Amenity Lands (Northern Ireland) Order 1985 (as amended) affords all SPA within NI legal protection via their additional designation as ASSI. It also strengthens protection of bird species within and adjacent to 'Nature Reserves'.

The following EC Directives and international conventions are applied by some of the above NI Acts and Regulations:

- Directive 2009/147/EC on the conservation of wild birds (codified version) ("the Birds Directive");
- Convention on the Conservation of European Wildlife and Natural Habitats (the Bern Convention) (1979); and
- Convention on the Conservation of Migratory Species of Wild Animals (the Bonn Convention) (1979).

Statutory protected sites and species

Special Protection Areas (SPA)
Ninety three species are listed upon Annex I to the Birds Directive, of which approximately 30 are regularly recorded in NI (although several of which occur only as wintering populations, passage migrants or scarce visitors). The presence of important populations of Annex I bird species, or non-Annex I migratory birds, are a primary consideration in the identification of SPAs. Examples of breeding species for which SPA have been designated in NI include the following:

- Hen harrier *Circus cyaneus*;
- Merlin *Falco columbarius*; and

© Mouchel 2016

- Roseate tern *Sterna dougallii*.

SPA receive full protection under the Directive 2009/147/EC on the conservation of wild birds (codified version) ("the Birds Directive") and are areas of the most important habitat for rare (listed on Annex I to the Directive), vulnerable, and migratory birds within the European Union. SPA form part of the Natura 2000 network, and are therefore protected under The Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended). All NI SPA are also designated as ASSIs and therefore receive additional protection under The Nature Conservation and Amenity Lands (Northern Ireland) Order 1985 (as amended) and the Wildlife (Northern Ireland) Order 1985 (as amended). Any development likely to have significant impacts upon a Natura 2000 site will have to be assessed for its implications on the site's conservation status, an obligation under the aforementioned Regulations.

Schedule 1 bird species
Any offences relating to those 67 bird species listed upon Schedule 1 to the Wildlife (Northern Ireland) Order 1985 (as amended) are subject to higher penalties than those against non-listed, commoner, bird species.

It should however be noted that several of the species present on Schedule 1 are not particularly rare or threatened within NI (as can be seen by their absence from Birds of Conservation Concern Ireland and Priority Species of Conservation Concern (PSoCC) lists), but have instead suffered from decades of persecution. Examples of such include two relatively widespread raptor species; the common buzzard *Buteo buteo* and sparrowhawk *Accipiter nisus*.

Conservation Status

A diverse assemblage of bird species breed within the array of semi-natural habitats present within NI. A series of 16 SPA have been established in NI for rare or vulnerable European bird species listed upon Annex I to the Birds Directive. The majority of these birds are either species of wader, wildfowl, raptor, or seabird, with the SPA themselves consisting predominantly of loughs, coastal islands, and upland bog and moorland areas.

In addition to those species listed upon Annex 1 to the Birds Directive, a large number of other bird species within NI/ROI have been subject to population declines over recent decades. The proximate causes of these declines vary from species to species, but include agricultural intensification, destruction of bogs and upland afforestation, and anthropogenic persecution.

This has informed the creation of a list of NI Species of Conservation Concern by the Northern Ireland Biodiversity Group, which includes one hundred and seventeen bird species. This list identifies species which require monitoring, as it is considered possible that they will require conservation action in the future. A further twenty nine of the bird species included in this total are identified as NI PSoCC, indicating that they require current conservation action in order to safeguard their populations. It should be noted however that not all of the species listed occur within NI as breeding species, with many (e.g. bittern *Botaurus stellaris* and pale-bellied brent goose *Branta bernicla hrota*) occurring solely as passage migrants or winter visitors.

© Mouchel 2016

Policies and guidance notes

The following policies and guidance documents aim to help conserve and protect breeding bird species within NI and the study area:

- *Roads Service Biodiversity Implementation Plan (2008);*
- *Planning Policy Statement (PPS) 2 - Planning and Nature Conservation* - Outlines the need to consider both SPA and wild birds during the planning process within NI;
- *Northern Ireland Biodiversity Strategy (2002)* - Outlines the requirement to identify SoCC and PSoCC and the delivery of Species and Habitat Biodiversity Action Plans;
- *Local Development Plans* - The West Tyrone, Dungannon and South Tyrone, and Londonderry Area Plans all highlight the need to maintain existing levels of biodiversity within their jurisdictions;
- *NI Biodiversity Strategy and associated Plans* - Individual Species Action Plans (SAPs) exist for the following breeding species: hen harrier, lapwing *Vanellus vanellus*, redshank *Tringa totanus*, curlew *Numenius arquata*, roseate tern, barn owl *Tyto alba*, skylark *Alauda arvensis*, twite *Carduelis flavirostris* and yellowhammer *Emberiza citrinella*; and
- *Local Biodiversity Action Plans (LBAPs)* - The Londonderry LBAP lists both curlew and lapwing as Priority Species, whilst the Omagh LBAP lists cuckoo *Cuculus canorus* and breeding waders (snipe *Gallinago gallinago*, curlew, lapwing and redshank) as such.

Baseline data collection

The methods used to collect information regarding breeding birds included:

- Obtaining up-to-date details of the location and nature of all statutory and non-statutory designated sites, notified for their value to breeding birds, within the study area from the NI Environment Agency (NIEA);
- Collation of information from desk-based sources relating to the presence of breeding birds in NI and, where possible, potential distribution and habitat preference; and
- Completion of sufficient field surveys to identify the typical species of breeding birds within the vicinity of the Proposed Scheme.

Selection of field survey sites

Breeding bird survey

Twenty-nine sites within the study area were randomly selected for the A5WTC ES 2010 as representative of the habitats present within the landscape, with a total of 34 1km transects walked through these sites (larger sites had more than one transect to make sure it was adequately covered).

© Mouchel 2016

The use of a sample of survey sites, rather than blanket coverage of all habitats present within the wider study area, was undertaken due to the time constraints posed in adequately surveying such an expansive area during the BBS temporal window. The use of such a data subset in the valuation of all breeding bird habitat within the entire survey corridor is considered valid due to the wide geographic spread of survey transects within the Proposed Scheme and their inclusion of all of the broad habitat types identified as present within the scheme footprint/zone of influence.

Sites surveyed for the A5WTC ES 2010 which were more than 500m from the Proposed Scheme were scoped out of the survey due to their distance from the scheme, leaving 20 sites within the 2014 survey. Access was permitted to 14 of these sites which were then surveyed. Six sites could not be accessed due to landowner restrictions. However, habitat within the sites surveyed was comparable to those not accessible, and therefore the data from the survey is representative of the landscape in which the A5 WTC is situated.

Field survey

Transect surveys

A transect of at least 1km is length was established in each of the 14 accessible survey sites and walked once in each of the months of April, May and June 2014. Each transect was walked at a steady pace with the start and finish time accurately recorded. Weather conditions and disturbance levels were also noted (Bibby *et al*, 2000). Each survey visit commenced approximately half an hour after sunrise (to avoid the confusion of the 'dawn chorus') and was completed prior to 11am.

As each transect was walked the surrounding lands were scanned (using binoculars and/or telescope) for all bird species ('notable' and otherwise) exhibiting breeding behaviour (singing males, females with brood patches, displaying birds, adults carrying food/faecal parcels/nesting material, recently fledged young) within an approximately 100m band either side of the transect line. These were then noted on the field map with the appropriate BTO code (in addition to standard sex and behaviour notation).

Incidental recording

In addition to the transects, any sightings of notable bird species during transit to or from transect points, or outside of the 100m distance sampling bands, was noted.

Heronry surveys

Targeted surveys were undertaken using data supplied by the BTO. Additional areas identified incidentally during the breeding bird survey (BBS) (e.g. Old Deerpark Wood) were also subject to field survey. Each of the four potential heronry locations were initially visited between 9th and 13th June 2014.

During the initial survey visit all potential nest sites (predominantly tall trees) at the location were visually assessed using binoculars. Any structure constituting a potential established heron nest was identified on the field map (with viewing conditions helped by the absence of leaves at this time of year).

© Mouchel 2016

Furthermore, for those sites which exhibited problematic access, vantage point surveys were undertaken from nearby high points to establish whether herons were commuting regularly to and from the relevant woodland blocks during daylight hours (thus indicating breeding at the site).

Barn Owl Surveys – Scoping

Three sites where the A5WTC ES 2010[1] had identified barn owls could potentially breed and roost were reconsidered during the scoping of the 2014 breeding bird surveys. (A review of maps and updated aerial photography did not reveal any new sites to be included.) Two of the original three sites were no longer within 500m of the route corridor and were as such scoped out, leaving a single site off Dunnalong Road near Bready (Section 1) within the scope of the survey. This is a farm complex and all structures on site were subject to internal searches for evidence of barn owl nesting and roosting on 4th August 2014.

Data analysis

In order to assess the importance of the different habitat types present within the Proposed Scheme to breeding bird species the use of previously produced Phase 1 habitat maps of the transect lengths was necessary. The use of these maps was supplemented through the utilisation of field maps incorporating an underlying aerial photography layer thus improving the accuracy of bird registration locations.

In order to minimise any inaccuracy imposed by this method of analysis, only those species recorded as present in either the May or June survey bouts were utilised. The exclusion of those species registrations recorded in March/April sought to minimise the impact any overwintering species still present within the wider survey area at this early stage of the breeding season, with the remaining resident and summer migrant species incorporated within later data sets.

Limitations

The diurnal survey methodology applied across the majority of the survey area was unsuitable for recording the presence of certain species due to their nocturnal or cryptic behaviour, e.g. woodcock *Scolopax rusticola* and long-eared owl A*sio otus*. Additionally, certain other species (e.g. corncrake *Crex crex*) are rare enough to be considered as effectively extinct in mainland Ireland and were therefore highly unlikely to be recorded during the surveys.

[1] The scoping exercise for the A5WTC ES 2010 was undertaken using aerial photographs of the Proposed Scheme and surrounding landscape. Each structure identified from the photos as exhibiting potential to support breeding or roosting barn owls (e.g. farm buildings, ruins, isolated mature trees, etc) were subject to further visual assessment from adjacent public rights of way during February 2010 (with those not viewable from such thoroughfares remaining unassessed). Effort was also expended in identifying potential areas of higher quality surrounding foraging habitat for this species (i.e. rank grassland, rush pasture and field edges). Each structure assessed was placed into one of the following four broad potential usage categories; higher, medium, lower and negligible (dependent upon their apparent external/internal structures, level of disturbance, and surrounding land use).

© Mouchel 2016

Designated sites

No sites statutory or non-statutory designated for their breeding bird assemblage were identified within or adjacent to the study area.

Existing species records

Desk study data was obtained from the British Trust for Ornithology (BTO), Ulster Wildlife Trust (UWT), Northern Ireland Raptor Studies Group (NIRSG), and Royal Society for the Protection of Birds (RSPB), with no data being received from the Department of Agriculture and Rural Development (DARD). The locations of historic heronries, breeding raptor sites and barn owl sightings are tabulated below Table 11P.1 to 11P.3. Few of these locations are within 250m of the Proposed Scheme and those that do are discussed in the relevant sections below.

Field survey – breeding bird survey

Table 11P.4 provides a summary of the data collected during the 2014 survey. Species marked with an * are those identified as being Species of Conservation Concern (SoCC) or Biodiversity Action Plan (BAP) species, those marked with a $^{+}$ are Schedule 1 species. The numbers shown in each box represent the cumulative totals of each bird species across the three survey visits at each site, with the cumulative total across all sites given in the final column. The final row of the table lists the total number of species at each site.

Fifty-five bird species were noted either exhibiting territorial and/or other behaviours indicative of breeding or were present within suitable breeding habitat at the requisite time of year. Of this overall total, 25 of the species recorded were identified as 'notable' species.

Eleven habitat types were sampled during the BBS. The most widespread habitat type along the transect routes was improved pasture (present at every site in one form or another), with arable land, broadleaved woodland and marshy grassland also common. Species-poor hedges with and without trees were also present at every site. Buildings (both residential properties and working farm structures) were found within and adjacent to some of the site but formed only a negligible share of the land area within them. Wet modified and raised bog was rare and present at only 3 sites, and open water/running water in 1 site each. The range of habitats sampled was more

© Mouchel 2016

restricted than in the A5WTC ES 2010, mainly because the route chosen avoided areas of high value habitat such as large blocks of woodland and significant areas of bog.

Thirteen species (feral pigeon *Columba livia*, wood pigeon *Columba palumbus*, collared dove *Streptopelia decaocto*, pied wagtail *Motacilla alba*, wren *Troglodytes troglodytes*, dunnock *Prunella modularis*, robin *Erithacus Rubecula*, blackbird *Turdus merula*, song thrush *Turdus philomelos*, goldcrest *Regulus regulus*, long-tailed tit *Aegithalos caudatus*, blue tit *Cyanistes caeruleus* and great tit *Parus major*) are common and widespread birds found in a wide variety of habitats in the UK, and consequently found in most sites visited during the surveys. Dunnock however is notable as it is an amber listed bird of conservation concern as it has shown recent significant declines. Apart from this species, the remaining birds are not particularly notable and could be found in any similar habitat within the UK or more widely in northern Europe. In addition starling *Sturnus vulgaris*, an amber list species from the birds of conservation concern lists, was found in every site.

Five species of corvid (magpie *Pica pica*, jackdaw *Corvus monedula*, rook *Corvus frugilegus*, carrion crow *Corvus corone* and hooded crow *Corvus cornix*) were present and found in large numbers across all the sites. These species are scavengers (often taking scraps left from agriculture) and also feed in open fields, especially ploughed fields which are common within the study area. These are common, widespread birds that are found in similar habitats throughout the UK.

Finches and buntings are typical farmland bird species which feed on the seed plants reared on arable land and in surrounding semi-natural habitats. The 8 species observed in this group (chaffinch *Fringilla coelebs*, greenfinch *Carduelis chloris*, goldfinch *Carduelis carduelis*, linnet *Carduelis cannabina*, lesser redpoll *Acanthis cabaret*, bullfinch *Pyrrhula pyrrhula*, yellowhammer *Emberiza citrinella* and reed bunting *Emberiza schoeniclus*) were mainly associated with arable fields being prepared for cultivation. Several are birds of conservation concern due to the decline in farmland bird numbers in the past decades. Chaffinch was the most abundant of the species observed occurring in all sites, with other species occurring occasionally and in small numbers. A large flock (53 birds) of yellowhammer was the exception to this and observed at site 8. Skylark *Alauda arvensis* and meadow pipit *Anthus pratensis* are two additional species associated with farmland, and both were observed at the majority of the survey sites, sometimes in large flocks (e.g. a flock of 74 meadow pipits at site 13).

Migratory warblers (sedge warbler *Acrocephalus schoenobaenus*, whitethroat *Sylvia communis*, blackcap *Sylvia atricapilla*, chiffchaff *Phylloscopus collybita*, willow warbler *Phylloscopus trochilus*) from common and widespread species were present although not in as large numbers as resident breeding birds. The occurrence of these species followed their typical habitat preferences, with sedge warblers and willow warblers associated with lowland sites with marshy grassland and riparian woodland, mainly in sites in the north of the scheme near the Foyle. Whitethroat and blackcap were found in hedges and scrub mainly in dryer areas. Chiffchaff were fairly rare and associated with woodland habitats on sites to the middle and south of the study area. A single observation of a singing grasshopper warbler *Locustella naevia* (an uncommon breeding bird in the UK and an amber list species from the birds of conservation concern lists) was made at site 6.

Other species recorded regularly were coal tit *Periparus ater* and mistle thrush *Turdus viscivorus*, both more common in the southern part of the scheme where taller woodland is present. Both

© Mouchel 2016

these species are found throughout the UK. Common buzzard was seen at most sites and given the recovery of this species in recent decades is typical of farmland in the UK. A single sparrowhawk *Accipiter nisus* was seen at site 16 also and is likely more abundant in the area than the data indicates. Both these raptors are now common and widespread in the UK. Snipe *Gallinago gallinago* and treecreeper *Certhia familiaris* were two widespread but fairly uncommon species to be observed during the survey; the former species in a single wet arable site (12) and the latter to mature woodland blocks in site 18.

Grey heron *Ardea cinerea*, Canada goose *Branta canadensis*, mallard *Anas platyrhynchos* and moorhen*Gallinula chloropus* were birds observed flying over or straying into sites which were close to open water or near wetlands. These were sites in the north of the survey area near the Foyle and site 13 with raised bog and nearby open water.

Five species were seen only as birds flying over the survey area – lesser black-backed gull *Larus fuscus* and greater black-backed gull *Larus marinus*, swift *Apus apus*, house martin *Delichon urbicum* and swallow *Hirundo rustica*. These birds could be expected to be seen anywhere in the study area as they range widely when finding food, but only the latter three species could be found breeding on houses and in farm buildings.

House sparrow *Passer domesticus* and tree sparrow *Passer montanus* were observed feeding around farm buildings and along hedgerows and are both amber list species from the birds of conservation concern lists due to recent declines. Pheasant *Phasianus colchicus* were heard at many sites and are likely feral birds bred for nearby shoots.

None of the Schedule 1 species recorded exhibited behaviour associated with breeding, e.g. territorial display and nest building.

Heronry survey

The four sites identified as within the study area for the A5WTC ES 2010 were visited to confirm whether they were still used by breeding herons. These identified the sites by using data provided by the British Trust for Ornithology (BTO; see Table 11P.3 and the site details are listed in Table 11P.5. None of the sites were found to support breeding herons; no evidence of heron activity at any of the sites could be found.

However the RSPB indicated that they considered the heronry at Farm Hill as still active due to estimated breeding numbers received from a local resident (whilst acknowledging the access issues inherent in this boggy site). This approach has been adopted again as a precaution despite the fact no herons were seen during surveys. It is therefore considered that this site should still be considered as supporting an active heronry for the purposes of this evaluation.

Table 11P.5 Historic heronry sites identified by BTO from within Proposed Scheme

Grid reference	Location	Year of most recent record
C 376 038	Cloghcor	1977
H 340 990	Strabane Old Canal	1988
C 368 033	Farm Hill, Ballymagorry	2008
H 435 760	Rash House, Omagh	1985

Barn owl survey

All the buildings at 19 Dunnalong Road (C 369 091) were searched by an experienced ornithologist with detailed knowledge of barn owl ecology and no evidence of barn owl presence was found.

Conclusion

Breeding bird survey data

Habitats and site locations

Although the transects surveyed a representative sample of the habitats present surrounding the Proposed Scheme (mainly agriculture with blocks of woodland and occasional bog), it is important to note that the landscape through which the A5 passes is a patchwork of blocks of different habitat and the landscape is not homogeneous. However, trends can be seen as the sites in the north of the survey area towards the Foyle estuary show more wetland character (and thus associated species), whilst sites in the south of the survey area more woodland species.

The registrations noted during the 2014 BBS largely consist of singing and/or displaying male birds upon prominent song posts and thereby do not necessarily give a true indication of the importance of habitat complexes for nesting and/or feeding. For example, although yellowhammer and tree sparrow were recorded on many farms which were entirely pasture, it is important to note that most, if not all, of these registrations came from hedges alongside areas of arable (cereal) cultivation.

© Mouchel 2016

Species assemblage

As previously outlined and depicted in Table 11P.4, it is evident that the areas of woodland, hedge and scrub habitats support the largest breeding bird assemblages within the sites surveyed. Many of the commoner passerine species (notably tits and warblers) were not recorded outside of these habitat areas, and notable species were similarly range restricted. The largest species assemblages (35 species) were recorded from sites 3, 13 and 15 which combine the largest diversity of habitats within one site – agricultural land, woodland with marshy grassland and/or bog. However, most sites comprised a similar mix of habitat types as the survey area is mainly agricultural land[4], and thus a similar mix of species was found throughout the survey area; the difference between the largest species assemblage (35 species) and the most restricted (26 species) was small.

Within sites, areas of woodland recorded larger numbers of bird registrations as these are of higher value habitat to many species, and the more and larger the woodland blocks within sites the greater the effect. This can be seen in Table 11P.4 as species richness and abundance is highest in sites in the north and south of the survey area which support larger blocks of woodland than those in the middle of the survey area. In the north, willow woodland in lowland, wet soils is dominant whereas more mature mixed woodland dominates in the south. The importance of woodland is considered to lie in its often expansive size (thereby reducing fragmentation and edge effects), complex three dimensional structure and (presumed) wide array of feeding/nesting resources and consequently ecological niches.

Hedgerows, grassland and scrub were ubiquitous throughout all the survey sites and could not be tied to use by particular species, but were likely most important to common and widespread bird like wren, robin, blue/great tit and blackbird.

Buildings and residential properties (and their incorporated gardens and hedge borders) proved important for several commensal species (notably hirundines, starlings and house sparrows), in addition to a relatively large common bird assemblage. Nevertheless, this habitat is widespread within the survey areas and was incorporated to a greater or lesser extent within all the site as farm buildings or homesteads.

The remaining habitat types were either thinly spread or rare across the transect lengths walked, and mainly supported smaller breeding bird assemblages. Bog was present at only 3 sites, whilst arable habitats were recorded at 8 sites. The 2014 BBS data suggests that these two habitat types are in fact of limited value with respect to supporting a species rich assemblage of breeding species, but are associated with higher species richness when part of a complex of different habitats within a site.

Despite comprising the most widespread habitat type encountered during the BBS, the areas of improved grassland recorded fewest registration. This further indicates the relatively limited value of this type of habitat to breeding birds across large swathes of the survey area.

[4] More limited than the corridor studied for the A5WTC ES 2010, as design placed the Proposed Scheme in mainly agricultural land, and avoided much of the higher value habitat further afield.

APPENDIX 11Q – WINTERING BIRDS

Wintering birds are significant nature conservation receptors for the Proposed Scheme as all wintering birds in Northern Ireland (NI) are afforded protection through both national statute and planning guidance, with some species potentially present within the Proposed Scheme afforded higher levels of statutory protection; many wintering bird species (and assemblages) within NI have experienced marked population declines in recent decades; several of those bird species exhibiting unfavourable conservation status, and potentially present within the Proposed Scheme, are the subject of both national and local Biodiversity Action Plans (BAPs) aiming to improve their conservation status within NI; and bird species diversity and distribution is a good indicator of wider ecosystem health and biodiversity value across habitats (Gregory *et al*, 2005; Mallory *et al*, 2006).

Legislation

The legislation which is relevant to wintering birds includes:

- The Wildlife (Northern Ireland) Order 1985 (as amended) makes it an offence to kill, injure, or take any wild bird. It is also an offence to disturb bird species listed upon Schedule 1 to the Order (such as the fieldfare) at any time of the year. The list of birds within Schedule 1 was increased in 2010 to include a further fifteen species. Additionally, the Order affords all Special Protection Areas (SPA) within NI legal protection via their additional designation as Areas of Special Scientific Interest (ASSI);

- The Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended) places a duty to compile and maintain a list of European sites, including SPA, in NI. These sites are afforded protection via the Habitat Regulation Assessment (HRA) process; and

- The Nature Conservation and Amenity Lands (Northern Ireland) Order 1985 (as amended). The Order affords all SPA within NI legal protection via their additional designation as ASSI. It also strengthens protection of bird species within and adjacent to ‘nature reserves’.

The following EC Directives and international conventions are applied by some of the above NI Acts and Regulations:

- Directive 2009/147/EC on the conservation of wild birds (codified version) (“the Birds Directive”);

- Convention on the Conservation of European Wildlife and Natural Habitats (the Bern Convention) (1979); and

- Convention on the Conservation of Migratory Species of Wild Animals (the Bonn Convention) (1979).

Statutory protected sites and species

© Mouchel 2016

Special Protection Areas (SPA)

Ninety three species are listed in Annex I to the Birds Directive, of which approximately 30 are regularly recorded in NI (although several of which occur only as passage migrants or scarce visitors).

SPA receive full protection under the Directive 2009/147/EC on the conservation of wild birds (codified version) ("the Birds Directive") and are areas of the most important habitat for rare (listed on Annex I to the Directive), vulnerable, and migratory birds within the European Union. SPA form part of the Natura 2000 network, and are therefore protected under The Conservation (Natural Habitats, etc.) Regulations (Northern Ireland) 1995 (as amended). All NI SPA are also designated as ASSI and therefore receive additional protection under The Nature Conservation and Amenity Lands (Northern Ireland) Order 1985 (as amended) and the Wildlife (Northern Ireland) Order 1985 (as amended).

Any development likely to have significant impacts upon a Natura 2000 site will have to be assessed for its implications on the site's conservation status, an obligation under the aforementioned Regulations. Natura 2000 sites will be assessed separately as part of the Habitats Regulations Assessments.

Schedule 1 bird species

Any offences relating to those sixty seven bird species listed upon Schedule 1 to the Wildlife (Northern Ireland) Order 1985 (as amended) are subject to higher penalties than those against non-listed, commoner, bird species. Examples of species present on the Schedule include:

- Fieldfare *Turdus pilaris*;
- Black-tailed godwit *Limosa limosa*; and
- Dunlin *Calidris alpina*.

Several of the species listed on Schedule 1 are not particularly rare or threatened within NI (as can be seen by their absence from Birds of Conservation Concern Ireland (BoCC) and Priority Species of Conservation Concern (PSoCC) lists), but are of concern because they have suffered from decades of persecution. Examples of such include two relatively widespread raptor species; the common buzzard *Buteo buteo* and sparrowhawk *Accipiter nisus*.

Conservation status

A diverse assemblage of bird species overwinter within the array of semi-natural habitats present within NI. Sixteen SPAs have been established in NI because of their supporting rare or vulnerable European bird species listed on Annex I of the Birds Directive. The majority of these birds are either species of wader, wildfowl, raptor, or seabird, with the SPA themselves consisting predominantly of loughs, coastal islands, and upland bog and moorland areas.

In addition to those species listed on Annex I of the Birds Directive, a large number of wintering bird species within NI/ROI have suffered dramatic population declines over recent decades.

© Mouchel 2016

Examples include Bewick's swan *Cygnus columbianus*, knot *Calidris canutus* and pintail *Anas acuta (*Birdwatch Ireland/RSPB NI, 2010). The proximate causes of these declines vary from species to species, but include agricultural intensification, destruction of bogs and upland afforestation, and persecution.

This has informed the creation of a list of NI Species of Conservation Concern by the Northern Ireland Biodiversity Group, which includes 117 bird species. This list identifies species which require monitoring, as it is considered possible that they will require conservation action in the future. A further 29 of the bird species included in this total are identified as NI PSoCC.

Policies and guidance notes

The following policies and guidance documents aim to help conserve and protect wintering bird species within NI and the study area:

- *DMRB Volume 11 – Environmental Assessment* - Outlines potential impacts of road schemes on ecological receptors including wintering birds and designated sites, in addition to describing assessment and mitigation techniques*;*
- *Roads Service Biodiversity Implementation Plan (2008);*
- *Planning Policy Statement (PPS) 2 - Planning and Nature Conservation* - Outlines the need to consider both SPAs and wild birds during the planning process within NI;
- *Northern Ireland Priority Species – The Northern Ireland Biodiversity Strategy (2002)* outlined the requirement to identify SoCC and PSoCC and the delivery of Species and Habitat Biodiversity Action Plans. This document has recently been reviewed and the list of Priority Species updated;
- *Local Development Plans* - The West Tyrone, Dungannon and South Tyrone, and Londonderry Area Plans all highlight the need to maintain existing levels of biodiversity within their jurisdictions;

Derry~Londonderry & Strabane's Local Biodiversity Action Plan (2008-2013) **- This LBAP drew up Species Action Plans (SAPs) for whooper swan, lapwing and curlew. The Omagh LBAP and the Dungannon and South Tyrone LBAP have not listed any wintering birds as priority species, and, as such, no SAPs exist for this group.**

Survey area and baseline data collection

Sites comprised typical areas of habitat for wintering farmland birds (passerines such as finches, buntings, thrushes and larks) and wintering waders to be crossed by the Proposed Scheme. Seven separate sites, considered to be representative of the remaining habitats favoured by these groups, were then selected for survey.

Two wintering species (whooper swan *Cygnus cygnus* and greylag goose *Anser anser)* are qualifying features of the Lough Foyle SPA and Ramsar Site. Because of this, they were subject to

© Mouchel 2016

targeted surveys undertaken independently of the main wintering bird surveys. The results of these surveys are presented separately in the Appendix 11O.

The methods used to collect information regarding wintering birds included:

- Obtaining up-to-date details of the location and nature of all statutory and non-statutory designated sites, notified for their value to wintering birds, within the study area from the NI Environment Agency (NIEA);

- Collation of information from desk-based sources relating to the presence of wintering birds in NI and, where possible, potential distribution and habitat preference; and

- Completion of sufficient field surveys to identify the typical species of wintering birds within the vicinity of the Proposed Scheme.

Field survey

Winter farmland bird surveys
Winter farmland bird surveys followed the standard methodology provided on the BTO website. Monthly visits were made between October 2013 and March 2014 to those farmland bird survey areas (predominantly areas of winter stubble and hedgerows). All survey visits commenced no later than one hour after sunrise and were completed prior to 1300hrs. During each survey the perimeter of the land parcels identified was walked and all bird species noted upon a field map of the site (including movements between fields using standard BTO notation). Special attention was paid to stubble and along hedge lines in order to maximise the recording of wintering finch, bunting and lark flocks. The gender and age of all birds was recorded where possible.

Weather conditions, disturbance levels, and the start and completion times of each survey visit were also recorded on the field map.

Wetland bird survey
Wetland bird surveys (WeBS) were undertaken on a monthly basis between October 2013 and March 2014 in two areas (site 1; the quarry at Carricklee Hill and site 5; boggy fields at Mountjoy) supporting open water/bog. Each survey commenced at dawn and was completed prior to midday. This timing was to minimise the impact of human recreational disturbance upon any wetland birds present, and to record as accurately as possible any species utilising the survey locations as roost sites prior to commuting to alternate daytime foraging areas.

During each survey visit the perimeter of the quarry was walked and its surface was scanned with binoculars and telescope for waterfowl, following the standard Wildfowl and Wetland Trust (WWT) WeBS methodology (WWT website). In the case of the bog habitat at site 5 a transect was walked across the bog surface, located to maximise the recording of any wintering wildfowl/waders present. The species of any waterfowl present were identified and their numbers/distribution recorded on field maps. When large flocks of species, such as gulls, were present an estimate of flock size was made. The time and duration of each survey was recorded along with weather conditions and disturbance levels from both humans and mammalian or avian predators.

© Mouchel 2016

Incidental recording

All occurrences of sightings and evidence of the presence of protected or notable wintering bird species were recorded during the habitats and species surveys carried out for the Proposed Scheme.

Habitat assessment

Information obtained from aerial photography and from the Phase 1 Habitat Survey was used to inform the selection of survey sites. Following surveys, a habitat value (expressed as high, medium or low) was assigned to each survey site based on the criteria shown in Table 11Q.1.

Table 11Q.1 Habitat assessment criteria

Habitat value	Criteria
High	Habitats considered to offer abundant good quality foraging opportunities for wintering birds.
Medium	Habitats considered to offer scattered and/or localised foraging for wintering birds.
Low	Habitats considered to offer occasional or limited foraging opportunities for wintering birds.

Data analysis

The number of different species for each site was determined, as was the total number of birds recorded. This last is given as cumulative abundance in the results below.

Limitations

The diurnal survey methodology applied across the majority of the survey area was unsuitable for recording the presence of species that have nocturnal or cryptic behaviour, e.g. woodcock *Scolopax rusticola* and long-eared owl *Asio otus*.

The size differences in the area of each survey site mean that direct comparison of wintering bird numbers does not necessarily reflect the relative importance of different sites. As the wintering bird habitats present in Sites 2 – 7 are considered to encompass habitats representative of the Proposed Scheme (Site 1 is unique as being the only quarry surveyed and in that it was surveyed for wetland birds only), it is reasonable to infer that bird assemblages recorded are typical of the study area.

Results

Existing species records

No historic wintering bird data was obtained from the consultation process.

© Mouchel 2016

Field survey

Site 1

Site 1 is located east of Carricklee Hill and is crossed by the Proposed Scheme at ~ Ch 20500. It comprises a flooded quarry, which is circular in nature. The pit in the centre is filled with stagnant water, which is largely encompassed by steep cliffs. However, there is a small area of gravel shore located adjacent to the south of the pit. The site is assessed as of low value to winter birds. This site was subject to WeBS survey.

The results of the survey reported in the A5WTC ES 2010 were:

> Four species were recorded during the survey at the flooded quarry. Of these, two are Amber listed Birds of Conservation Concern. The cumulative abundance recorded at the site over the six survey visits was 20 wetland birds. It should be noted that this is not comparable to the other sites as in this case only wetland birds were recorded.

The 2013/2014 survey recorded 2 species of waterfowl using the flooded quarry (little grebe *Tachybaptus ruficollis* and mallard *Anas platyrhynchos*), with a cumulative abundance of 7 wetland birds (6 sightings of little grebe and one of mallard). Both these species are amber listed Birds of Conservation Concern.

Site 2

Site 2 is located at Ballyfatten Bridge and is crossed by the Proposed Scheme at ~ Ch 22000. It comprises three winter stubble fields, bound by hedgerows. In addition, there is a small area of improved grassland located in the northern corner of the site. The site is assessed as of high value to winter birds. This site was subject to a winter farmland bird survey.

The results of the survey reported in the A5WTC ES 2010 were:

> 31 species were recorded during the survey. Of these, two were Schedule 1 species, 12 were NI priority species, two were BoCC red list species, three were BoCC amber list species and one was an NIBAP species. The cumulative abundance recorded at the site over the six survey visits was 390 birds.

The 2013/2014 survey recorded 28 species. This number included 8 BoCC Red list species (skylark *Alauda arvensis*, fieldfare *Turdus pilaris*, redwing *Turdus iliacus*, starling *Sturnus vulgaris,* house sparrow *Passer domesticus*, tree sparrow *Passer montanus*,, linnet *Carduelis cannabina,* yellowhammer *Emberiza citrinella*), 5 BoCC Amber list (kestrel *Falco tinnunculus*, snipe *Gallinago gallinago*, meadow pipit *Anthus pratensis*, dunnock *Prunella modularis*, mistle thrush *Turdus viscivorus*). Ten of these species are NI Priority Species (skylark, dunnock, fieldfare, redwing, starling, house sparrow, tree sparrow, linnet, yellowhammer, reed bunting) and 2 are Schedule 1 species (fieldfare and redwing). In addition, 12 of these species are listed under the Derry~Londonderry & Strabane Local Biodiversity Action Plan (kestrel, snipe, skylark, meadow pipit, dunnock, mistle thrush, starling, house sparrow, tree sparrow, linnet, yellowhammer and reed bunting). The cumulative abundance at the site was 618 birds.

© Mouchel 2016

Site 3
Site 3 is located south of Sion Mills and is crossed by the Proposed Scheme at ~ Ch 228200. It comprises six winter stubble fields bound by mature hedgerows, which contain occasional mature standard broadleaved trees. This site was assessed as of high value to winter birds. This site was subject to a winter farmland bird survey.

The results of the survey reported for the A5WTC ES 2010 were:

> 28 species were recorded during the survey. Of these, two were Schedule 1 species, ten were NI priority species, two were BoCCI red list species, four were BoCCI amber list species and one was an NIBAP species. The cumulative abundance recorded at the site over the six survey visits was 802 birds.

The 2013/2014 survey recorded 27 species. This number included 8 BoCC Red list species (skylark, song thrush, redwing, starling, house sparrow, tree sparrow, linnet, and yellowhammer), 5 BoCC Amber list (snipe, black-headed gull, meadow pipit, dunnock, mistle thrush). Ten of these species are NI Priority Species (black-headed gull, skylark, dunnock, song thrush, redwing, starling, house sparrow, tree sparrow, linnet, yellowhammer) and 2 are Schedule 1 species (brambling and redwing). In addition, 11 of these species are listed under the Derry~Londonderry & Strabane Local Biodiversity Action Plan (snipe, black-headed gull, skylark, meadow pipit, dunnock, mistle thrush, starling, house sparrow, tree sparrow, linnet, and yellowhammer). The cumulative abundance at the site was 574 birds.

Site 4
Site 4 is located east of Upper Beltany and is crossed by the Proposed Scheme at ~ Ch 43200. It comprises winter stubble fields, bound by hedgerows. This site was assessed as of high value to winter birds. This site was subject to a winter farmland bird survey.

The results of the survey reported the A5WTC ES 2010 were:

> 29 species were recorded during the survey. Of these, two were Schedule 1 species, 11 were NI priority species, two were BoCCI red list species, three were BoCCI amber list species and one was an NIBAP species. The cumulative abundance recorded at the site over the six survey visits was 688 birds.

The 2013/2014 survey recorded 25 species. This number included 5 BoCC Red list species (skylark, fieldfare, redwing, starling, house sparrow), 4 BoCC Amber list (meadow pipit, dunnock, mistle thrush, bullfinch). Seven of these species are NI Priority Species (skylark, dunnock, fieldfare, redwing, starling, house sparrow, bullfinch) and 2 are Schedule 1 species (fieldfare and redwing). In addition, 11 of these species are listed under the Derry~Londonderry & Strabane Local Biodiversity Action Plan (skylark, meadow pipit, dunnock, mistle thrush, goldcrest, starling, house sparrow, and bullfinch). The cumulative abundance at the site was 389 birds.

Site 5
Site 5 is located at Mountjoy and is crossed by the Proposed Scheme at ~ Ch 47000. It comprises a mosaic of habitats namely winter stubble and improved grassland (both bound by hedgerows, and a bog, surrounded by wet broadleaved). This site was assessed as of high value

© Mouchel 2016

to winter birds. This site was surveyed using a combination of Winter Farmland Bird and WeBS surveys.

The results of the survey reported for the A5WTC ES 2010 were:

> 31 species were recorded during the survey. Of these, one was a Schedule 1 species, nine were NI priority species and five were BoCCI amber list species. The cumulative abundance recorded at the site over the six survey visits was 861 birds.

The 2013/2014 survey recorded 29 species. This number included 7 BoCC Red list species (skylark, fieldfare, song thrush, redwing, starling, house sparrow, lesser redpoll), 3 BoCC Amber list (meadow pipit, dunnock, mistle thrush). Eight of these species are NI Priority Species (skylark, dunnock, fieldfare, song thrush, redwing, starling, house sparrow, lesser redpoll) and 2 are Schedule 1 species (fieldfare and redwing). In addition, 7 of these species are listed under the Derry~Londonderry & Strabane Local Biodiversity Action Plan (skylark, meadow pipit, dunnock, mistle thrush, starling, house sparrow, and lesser redpoll). The cumulative abundance at the site was 392 birds.

Site 6

Site 6 is located south of Drumragh Bridge and is crossed by the Proposed Scheme at ~ Ch 57000. It comprises winter stubble fields, bound by hedgerows. This site was assessed as of high value to winter birds. This site was subject to a winter farmland bird survey.

The results of the survey reported for the A5WTC ES 2010 were:

> 27 species were recorded during the survey. Of these, two were Schedule 1 species, 12 were NI priority species, one was a BoCCI red list species, four were BoCCI amber list species and one was an NIBAP species. The cumulative abundance recorded at the site over the six survey visits was 367 birds.

The 2013/2014 survey recorded 30 species. This number included 10 BoCC Red list species (skylark, fieldfare, song thrush, redwing, starling, house sparrow, tree sparrow, linnet, lesser redpoll, yellowhammer), five BoCC Amber list (mallard, meadow pipit, dunnock, mistle thrush, reed bunting). Twelve of these species are NI Priority Species (skylark, dunnock, fieldfare, song thrush, redwing, starling, house sparrow, tree sparrow, linnet, lesser redpoll, yellowhammer, reed bunting) and 2 are Schedule 1 species (fieldfare and redwing). In addition, 12 of these species are listed under the Derry~Londonderry & Strabane Local Biodiversity Action Plan (skylark, meadow pipit, dunnock, mistle thrush, goldcrest, starling, house sparrow, tree sparrow, linnet, lesser redpoll, yellowhammer, reed bunting). The cumulative abundance at the site was 648 birds.

Site 7

Site 7 is located south of Pinegrove and is crossed by the Proposed Scheme at ~ Ch 64400. It comprises winter stubble fields, bound by hedgerows. This site was assessed as of high value to winter birds. This site was subject to a winter farmland bird survey.

The results of the survey reported in the A5WTC ES 2010 were:

© Mouchel 2016

28 species were recorded during the survey. Of these, one was an Annex I species, three were Schedule 1 species, 14 were NI priority species, three were BoCCI red list species, seven were BoCCI amber list species, one was an NIBAP species and one was a LBAP species. The cumulative abundance recorded at the site over the six survey visits was 550 birds.

The 2013/2014 survey recorded 24 species. This number included 7 BoCC Red list species (skylark, fieldfare, song thrush, house sparrow, tree sparrow, linnet, and yellowhammer), 4 BoCC Amber list (mallard, meadow pipit, dunnock, reed bunting). Nine of these species are NI Priority Species (skylark, dunnock, fieldfare, song thrush, house sparrow, tree sparrow, linnet, yellowhammer, reed bunting) and 1 is a Schedule 1 species (fieldfare). In addition, 8 are species listed under the Derry~Londonderry & Strabane Local Biodiversity Action Plan (skylark, meadow pipit, dunnock, house sparrow, tree sparrow, linnet, yellowhammer, reed bunting). The cumulative abundance at the site was 437 birds.

Overall

In summary, a total of 42 wintering bird species were recorded throughout the seven sites during the survey visits. Of those three are listed on Schedule 1 to the Wildlife (Northern Ireland) Order 1985 (as amended), 10 are BoCCI Red List species, 10 are BoCCI Amber List species, 14 are listed as NI Priority Species and 17 are listed under the Derry~ Londonderry & Strabane Local Biodiversity Action Plan. No Bird Directive Annexe 1 species were observed.

Conclusion

Other than site 1, which was only surveyed for wetland birds, the sites have a similar level of diversity ranging from between 24 – 30 species. More variety was shown in abundance with Site 2 and Site 6 supporting a cumulative total of more than 600 birds each. It is not possible to directly compare abundance due to the size differences in sites.

Forty-two species were recorded throughout the 7 sites during the wintering bird surveys. Of those none were listed on Annex I to The Birds Directive. The species recorded are typical of those expected to be present in each habitat type, and, as such, it is assessed that similar habitat types located throughout the study area will support similar wintering bird assemblages. The exception to this is the standing water, located in the disused quarry (Site 1). The low assemblage and abundance of wetland birds recorded here is indicative of its poor quality, hence its low value.

APPENDIX 11R – SMOOTH NEWT *LISSOTRITON VULGARIS*

Legislation

The smooth newt is protected under Article 10 of the Wildlife (Northern Ireland) Order 1985 (as amended). They are listed within Schedule 5 of this act, and therefore receive full protection in NI from the following offences: (i) intentional killing, injuring, taking or possession; (ii) intentional damage, destruction or obstruction of access to any structure or place used for shelter or protection; and, (iii) intentional disturbance while occupying structures or places used for shelter or protection. This legislation applies to all life-stages, including eggs. The smooth newt is also listed on Appendix III of the Bern Convention on the Conservation of Wildlife and Natural Habitats.

Conservation status

The EC Habitats Directive (Article 1, sections (e) and (i)) offers a definition of conservation status for species:

'*the sum of influences acting on the species concerned that may affect the long-term distribution and abundance of its populations within a given geographical area'*.

The definition implies that two factors are paramount when assessing the conservation status of a species: (1) threat (a decline in abundance and/or distribution/range) and (2) rarity (limited abundance and/or distribution/range).

The smooth newt is widespread throughout NI (O'Neill *et al*., 2004) and is not currently threatened or rare enough to warrant listing as a UK or Northern Irish Species of Conservation Concern (SoCC), Northern Ireland Priority Species or currently requiring a Species Action Plan (SAP). It is also not listed within the Derry or Omagh local BAPs. Therefore, the conservation status of the smooth newt in NI is currently considered favourable, although, due to anthropogenic encroachment, habitats used for the purpose of breeding and shelter by the species have undergone a significant decline and the species is likely to become threatened in the near future (O'Neill *et al*., 2004).

Policies and guidance notes

The following policies and guidance documents aim to help conserve and protect the smooth newt within NI and the study area:

- National Planning Policy Framework (NPPF);
- Policy ENV1.1 in Section 12 of the Regional Development Strategy 2025 "Caring for the Environment";
- Northern Ireland Biodiversity Strategy;
- Road Service Northern Ireland Biodiversity Plan.

© Mouchel 2016

Baseline data collection

The following tasks have been undertaken to inform the identification and description of the baseline environment relating to smooth newt:

- Consultation with NIEA and CEDaR to identify any statutory or non-statutory designated sites within the study area that have been notified for their value to smooth newts and any records or smooth newts over the past 10 years;
- A review of digital mapping and aerial photography within the vicinity of the Proposed Scheme to identify potential ponds which may support smooth newts;
- A review of data collected during the studies undertaken in 2009 during the assessment of the scheme proposed in the A5WTC ES 2010;
- Completion of site visits to each potential pond location identified by the review of mapping and aerial photography; and
- Completion of detailed field surveys to determine the presence/likely absence of smooth newts in ponds, and where smooth newt were recorded to determine the population size class of those newts

Study area

The study area (Volume 2 - Chapter 11 – Figure 11.69) included the route corridor in addition to lands surrounding the corridor up to 250 m from the vesting line. All ponds visible from aerial photography and Ordnance Survey Northern Ireland maps within this area subject to initial field survey to determine whether they were still present and contained water.

Methods

The methods used to collect information regarding smooth newt were informed by guidance provided within Volume 11, Part 4 of the Design Manual for Roads and Bridges (HA, 2008) and Volume 10, Section 4, Part 6 (HA, 2001). This included:

- Obtaining up-to-date details of the location and nature of all statutory and non-statutory designated sites, notified for their value to smooth newt, within the study area from NIEA;
- Collation of information from desk-based sources relating to the presence of smooth newt in NI and potential distribution and habitat preference;
- Completion of detailed field surveys to identify the presence / absence of smooth newt within the vicinity of the Proposed Scheme; and,

© Mouchel 2016

- Completion of detailed field surveys to inform the population class size of smooth newts when found to be present.

Desk study assessment

A request for smooth newt records from the study area was sought from the following organisations:

- NIEA;
- Ulster Wildlife Trust;
- Centre for Environmental Data and Recording (CeDAR); and
- Local planning authority biodiversity officers.

A search of published literature relating to smooth newts within NI was also undertaken, from the literature search records that related to the study area were noted e.g. O'Neill *et al*., (2004) and Meehan (2013).

Field survey

Waterbodies within the study area were identified from Ordnance Survey mapping and from information gathered for the A5WTC ES 2010. A total of 52 ponds were identified within the study area. Thirty-four of these waterbodies were visited in December 2013 to investigate their suitability for supporting newts, 18 ponds were either too dangerous for further survey or had access for survey denied. Thirteen pond locations were found to have dried out, or to be filled in quarry sites, or no pond or evidence of a pond could be located in the area of the map coordinates.

Where possible, ponds were surveyed to confirm the presence / absence of smooth newt, and where appropriate, relative population sizes were estimated. The surveys were undertaken by Mouchel Ecologists Aidan Ryan, Jonathan Williames, Sarah Ive, Lisa Webb and David Lovett. The surveyors are all experienced ecologists and members of CIEEM. The surveyors worked in pairs with at least one member of each pair an experienced newt surveyor and holder of an NIEA smooth newt survey licence.

All surveys were undertaken in suitable climatic conditions (air temperature >5°C) between mid-March and mid-June 2014 in accordance with requirements outlined by the NIEA (2014). Waterbodies that had an overlapping 200 m buffer were considered as one area, and as a result, if newts were found during any of the search methods below then it was assumed that newts were present within all ponds in the group. Each survey site was visited on at least four separate occasions, and if smooth newts were recorded during any of these visits then a further two survey visits were completed.

Egg Searches
This method was used to determine presence or absence, only. Once smooth newt eggs were identified, egg searching was not repeated again in the water body concerned.

© Mouchel 2016

This method involved searching both live and dead submerged pond vegetation for newt embryos during daylight hours. The search was conducted with care not to damage the eggs or the marginal vegetation. Surveyors searched folded leaved by unwrapping them in order to determine the presence of smooth newt eggs. Once a single egg was found no further egg searches were made at that pond as such data cannot be used for population size estimation. In larger ponds egg searching was conducted in different sections of the pond margins. When eggs were found the development stage of newt eggs was noted.

Net searches
This method was used to determine presence or absence only, and once this method, or any previous presence or absence method has determined the presence in a pond it was not repeated again in that specific water body.

A standard dip net was used to sample the areas around the pond edges, with a perimeter walk around the pond with a survey effort of 15 minutes of netting for 50m of shoreline. The surveys were completed during daylight hours before any torching was employed and immediately after egg searches. While netting the surveyors took note of the numbers of smooth newts, and their gender.

Terrestrial Searches
This method was used to determine presence or absence only, and once this method, or any previous presence or absence method has determined the presence in a pond it was not repeated again in that specific water body.

This method involved searching any suitable and accessible refuge (e.g. logs, rocks, boards and debris) within a 200 m radius of the water body as per NIEA (2014) survey guidelines.

The survey method was undertaken with care as to not injure newts or damage refuge.

Torch Surveys
This method was used to determine presence or absence and population estimates of smooth newt. Once positive records of newts were recorded in a pond or the surrounding area then this was the only method that was continued until all six visits were concluded.

This method involved searching for newts at night by shining a torch (1,000,000 candle power) in the pond. To standardise the newt surveys the margins of each pond were walked around once and the number of male and female newts recorded. The start time and end time of the survey was recorded, and if areas of the pond were not accessible then surveyors identified sections which could be surveyed readily on the first visit and included these marginal pond sections on all repeat visits. Torch surveys were not completed if the night time air temperature was <5°C.

Limitations

Some of the survey sites were located within areas of land ownership that were not granted access and therefore were unable to be surveyed. Additionally, some areas of land located within 200m of water bodies were not accessible due to restricted land access and/ or dangerous terrain (for example, steep edges around water bodies) for terrestrial and torch surveying (see Table 11R.1).

© Mouchel 2016

Whilst this reduced the number of ponds available for the survey, the scope of the surveys across the study area was otherwise comprehensive and sound conclusions can be drawn from the data gathered.

During the field survey season the landowner of ponds 46 and 47 advised that there were aggressive cattle in the field containing the ponds and only four survey visits were completed. The landowner of ponds 52 and 53 insisted on being present during the surveys, however the landowner was not available for some of the survey period and as a consequence the ponds were visited four times.

Results

Designated sites

There were no sites within the study area that are designated specifically for smooth newt.

Existing species records

Data collected for the A5WTC ES 2010 indicate that while some records of smooth newt exist for County Derry and County Tyrone, none of these records fall within the study area, no additional

© Mouchel 2016

data was received from the consultees during the update desk study. A smooth newt survey conducted by Meehan (2013) suggests that smooth newts appear to be widespread across Ireland as a whole, although data is lacking which has resulted in records of patchy distribution, particularly in Northern Ireland. Data obtained through smooth newt surveys for the A5WTC ES 2010 provide specific records of smooth newts at 9 of the ponds (17, 25, 31, 34, 37, 52, 53, 72 and 77).

Field survey

Table 11R.2 presents the findings of the presence / absence survey, and population size class estimates. The population size class estimates have been calculated in accordance with Guidelines for the Selection of Biological SSSIs JNCC (2013). As shown in Table 11R.2, smooth newts were found to be present within 18 of the 21 ponds. Where found to be present, peak counts obtained through torch surveys recorded 16 population class size estimates. In addition, ponds 52 and 101 were within 200m of a pond containing smooth newt, and as such have been given the same population size class as their adjacent pond.

Table 11R.2: Summary of the presence/absence survey results and subsequent population class size estimate, calculated using JNCC (2013).

Pond Reference	Present[1] / absent	Peak counts during torching	Population class size estimate classification
17	Present	86	Good
21	Absent	0	-
23	Absent	0	-
24	Present	3	Low
25	Present	25	Good
31	Present	9	Low
34	Present	2	Low
37	Present	14	Good
38	Present	2	Low
42	Present	7	Low
46	Present	1	Low[2]
47	Present	14	Good[2]
48	Present	1	Low
52	Present	0	Low[1,2]
53	Present	3	Low[2]

[1] Smooth newts were assumed to be present within a pond if recorded during presence / absence surveys within 200m of the pond in question.

[2] Only four visits undertaken due to restricted access.

APPENDIX 12B SOLID STRATA AROUND THE OMAGH THRUST FAULT

Table 12B.1 Strata to the North of the Omagh Thrust Fault (OTF)

Age			NW Limb of Sperrin Mountains	SE Limb of Sperrins Mountain	Spatial Context
Palaeozoic	Carboniferous	Visean	-	Ballyshannon Limestone Formation (BAL) - Limestone, dark bluish grey, some silty mudstone, fossiliferous; rare chert	Present as a small wedge southwest of Omagh
			-	Claragh Sandstone Formation (CLSG) Sandstone, very coarse grained, fine conglomerate, fawn and grey, arkosic; thin limestone; grey mudstone with micropores	North of the OTF. In the area to the north and west of Mountjoy down to Gillygooly
		Tournaisian	-	Owenkillew Sandstone Group (OWSA) - Greenish grey and purplish red sandstone and siltstone with thin beds of algal laminated limestone. Dark grey mudstones contain microspores	North of the OTF Around the Victoria Bridge area
			-	Omagh Sandstone Group (OMSG) - Red sandstone with calcrete nodules and pebbles of white quartz.	North of the OTF, around Gortnagarn, Knockmoyle and west of Gilygooly
Precambrian	Dalradian	Southern Highland Group	-	Mullaghcarn Formation (MCA) – Schistose semipelite, psammite and pelite	Located immediately to the north of the OTF, with the exception of the area around Omagh
			Claudy Formation (DCCF) Psammite, quartz and feldspar rich, coarse detritial grains of blue quartz and pink and white feldspar; minor semipelite, limestone and green beds	Dart Formation (DART) Volcaniclastic semipelite and schistose amphibolite	DCCF – Located in the north west of the engineering study area, underlying Sion Mills and Glebe DART – Located in the north east of the engineering study area on the east of the Mourne River, down to Gortinagin, with the exception of the Newtownstewart area
		Argyll Group	Dungiven Formation (DUNN) Pelite, semipelite, psammite, quartzite, basaltic lava flows and volcaniclastic sediments		Located to the north west and south east of the Newtownstewart Formation and underlying the settlement of Ardstraw
			Newtownstewart Formation (DBNF) Thickly bedded quartzose psammite with thin pelite interbeds		Located in the centre of the nappe, to the north west of Newtownstewart

© Mouchel 2016

Table 12B.2 Strata to the South of the Omagh Thrust Fault

Age			South of the Omagh Thrust Fault	Description	Spatial Context
Palaeogene			Dolerite and Basalt (D)	Olivine Basalt and Dolerite, intermediate grain size intrusive and lava flow igneous strata, associated with the Antrim Basalts.	South west of Seskinore. Only present as a thin wedge.
Palaeozoic	Carboniferous	Westphalian	Slievebane Group (SLI)	Undivided – Volcaniclastic conglomerate and sandstone, thin mudstone	South of the OTF. Only present as a small wedge
		Namurian	Ballinamallard Mudstone Formation (BLM)	Mudstone and siltstone, greyish red, rarely greyish green	In the area of Seskinore and to the west.
			Greenan Sandstone Formation (GNNS)	Medium to coarse grained sandstone with thin laminations of mudstone	North of Edenderry Only present as a thin wedge
		Visean	Carrickaness Sandstone Formation (CRSF)	Coarse-grained, pebbly lithic sandstone.	Present as two wedges to the South East, the larger spreading west to Aughnacloy.
			Meenymore Formation (MEF)	Sandstone, brown; micritic limestone; mudstone, grey with sparse marine fauna of corals, brachiopods and nautiloids.	Present as two small wedges to the South of Augher.
			Dartry Limestone Formation (DARL)	Limestone, dark grey, bluish black chert, fine-grained, fine-grained, fossiliferous; thin mudstone.	Occurs as several small wedges to the South of Augher.
			Maydown Limestone Formation (MYLF)	Is a Limestone formation with abundant Asbian corals and branchiopods.	Present to the North of Aughnacloy and to the west of Ballygawley covering a large area.
			Bundoran Shale Formation (BUNS)	Mudstone, dark grey, yellow staining; with siltstone, calcareous fossiliferous limestone. Thin basal multicoloured clay.	Present as a wedge to the South East of Aughnacloy.
			Clogher Valley Formation (CVG)	Fossiliferous mudstone, siltstone, sandstone and thin crinoidal limestone.	Occurs in the Clogher Valley Present as many wedges to the south along two fault lines.
			Ballyness Formation (BYC)	Red and purplish red sandstone and conglomerate.	Occurs to the south of Ballygawley Present as many wedges to the south along two fault lines.
	Devonian	Upper	Raveagh Sandstone Formation (RSF)	Sandstone, very coarse grained, fine conglomerate, fawn and grey, arkosic.	South east of Seskinore. Only present as a thin wedge.

© Mouchel 2016

Age			South of the Omagh Thrust Fault	Description	Spatial Context
		Middle	Gortfinbar Conglomerate Formation (GOCF)	Conglomerate, purplish brown, clasts boulder and pebble sized, volcaniclastic, rare vein quartz, quartzite and greywacke; sandstone, coarse-grained. (subsidiary vesicular, flow banded lava)	Limited presence to the south of the Shanmullagh Formation, along the Killadeas-Seskinore Fault.
			Shanmaghery Sandstone Formation (SMSF)	Sandstone, purplish brown, red and green stained, coarse-grained, calcareous, micaeous, fining upwards, with thin siltstone and mudstone intercalations; parallel, cross and ripple laminations and desiccation cracks. Basal conglomerate with pebbles of vein quartz, quartzite, biotite granite, tuff, jasper and mica schist.	North East of Section, South of Six Mile Cross. Only present as a thin wedge.
		Lower	Shanmullagh Formation (SHAN)	Brown coarse grained pebbly sandstone, thin purplish grey fine-grained sandstone and mudstone. Also consists of purplish grey sandstone and mudstone laminae with ripples. Sandstone also in channels (up to 2 m deep) & consists of sand siltstone, reddish brown mudstone.	Covers a wide area to the north of the Tempo-Sixmilecross Fault.
	Ordovician		Tyrone Volcanic Group (TVG)	Intermediate Lavas and volcanistic tuffs, rhyolites, banded chert, jasper and argillaceous sediment	A small wedge south of the OTF to the south east of Omagh

© Mouchel 2016

APPENDIX 12C SUMMARY OF STRATIGRAPHY ENCOUNTERED IN MAIN GROUND INVESTIGATION

New Buildings to South of Strabane

The ground investigation in this area generally confirmed the distribution of geological units as described in the Preliminary Sources Study although there is little differentiation between the more granular glacial till deposits and the river terrace gravels.

Between New Buildings and Bready, rockhead varied between just over 3m below ground level (m bGL) and just less than 10m bGL. Rock was at shallow depth in the area of Bready Cut, increasing to a maximum of around 3.5m bGL between Bready and north of Burn Dennet, though generally at just less than 2m bGL.

Between Burn Dennet and west of Strabane rockhead was not proved. Up to 15m of alluvial material and/or peat was proved between Burn Dennet and just south of Ballymagorry. Between this point and west of Strabane the alluvial material was generally between 3 and 7m thick.

Between west of Strabane and north of Sion Mills, rock head was generally between 1.5m bGL (west of the flooded quarry) and 8.5m bGL although rock was not proved immediately to the south of the flooded quarry.

© Mouchel 2016

South of Strabane to South of Omagh

The ground investigation in this area generally confirmed the findings of the desk study, although it was assumed that what had been described on the OS and GSNI mapping as “Hummocky Glacial and Moraine Deposits” were in fact Glacial Tills, with the map description describing their geomorphological form.

Detailed differences are described below however a particular feature worth noting is that north of the Ulster American Folk Park the glacial till is distinctly granular in composition whilst south of the park the tills are more cohesive.

At the River Derg crossing the geological mapping showed alluvium, however, the ground investigation only encountered glacial till in this area. Additionally, about 3km to the south, east of Wood Hills, localised alluvium was encountered instead of the till shown on the mapping.

South of Newtownstewart and west of the Ulster American Folk Park thin peat deposits were occasionally encountered in the glacial tills and sands and gravels.

Localised moderately thick peat deposits were also observed to the west of Mountjoy.

West of Mountjoy Bridge the mapping shows rock outcropping at surface, however, the ground investigation encountered at least 3m of glacial till overlying the rock in this area. Similarly, just east of Tully, at least 3m of glaciofluvial sands and gravels were encountered rather than the outcropping rock shown on the mapping.

Glaciofluvial sands and gravels were encountered instead of the mapped raised peat bogs just to the south of the area described in the paragraph above and north of Woodvale House.

The mapping shows rock outcropping to the north west of Omagh. In the main the rock in this area was overlain by glacial till with an area of raised peat bog east of Deerpark House.

A linear area of raised peat bogs has been mapped north and south of Tamlaght Road. The investigation proved that, with the exception of a 200m length south of the road, glacial till was in fact present.

As with the rock outcrops to the north west of Omagh those shown to the west and south west were actually overlain by glacial tills and thin peat deposits.

Where encountered, rock head was variable along the route. Between Sion Mills and Victoria Bridge it varied from around 3m bGL (~78 m OD0 to 11m bGL (~44 m OD) with a proved depth of 10.30m bGL (25.46 m OD) at the Liscreevaghan Burn crossing.

Between Victoria Bridge and the River Derg rock was generally at 6m BGL, with the level varying with topography. At the River Derg crossing the depth to rock was 9m bGL (~18.8m OD). The depth increased to the south of the Derg to 13.5m bGL, however between the Derg and Newtownstewart it was generally at around 6 to 10 m bGL.

On the side long ground to the south of Newtownstewart rock head was shallower (~2 – 5m bGL).

© Mouchel 2016

West of the Ulster American Folk Park the depth increased to a maximum proved of 13.5m bGL (~80.5m OD), decreasing to between 5 and 10m bGL between Mountjoy and the Fairy Water.

Rockhead at the Fairy Water crossing and under the glacial sands and gravels to the south is 15m bGL (~45m OD) and this decreases to between 6 and 10m bGL to the west and south of Omagh (generally 70-80m OD), increasing to 13.2m bGL (83m OD), approximately 0.75km north of the Drumragh River crossing.

© Mouchel 2016

South of Omagh to Aughnacloy

Information obtained from the ground investigation has confirmed the solid and drift geology determined during the desk study. Further detail on the ground strata as a result of the ground investigation is provided below.

South of Omagh to Seskinore the superficial deposits are predominantly glacial till comprising firm to stiff sandy gravelly clay extending from ground surface to 5m bGL with the exception of drumlins where glacial till deposits extend up to 18m bGL. Local deposits of alluvium associated with the Ranelly Drain were found to extend to 3m bGL. Extensive deposits of peat were encountered within lowland raised peat bogs south of the Seskinore Road and Doogary with peat extending up to 7.5m bGL and 10.5m bGL respectively. Bedrock comprises sandstone of the Shanmullagh Formation and was found typically 4m bGL in the interdrumlin areas, becoming shallower with progression towards Seskinore where rock is close to the surface at less than 1m bGL.

Between Seskinore and Moylagh, glacial till predominantly described firm to very stiff slightly silty, gravely sandy clay is present to depths of up to 7m bGL overlying red sandstone bedrock of the Raveagh Formation. Further south, between Moylagh and Ballygawley, the ground comprises thin deposits of glacial till overlying bedrock which comprises purple conglomerate of the Gortfinbar Conglomerate Formation with rockhead typically between 0.5m and 4m bGL. A lowland raised peat bog is present at Newtownsaville with peat extending 7 m bGL.

South of Ballygawley to Aughnacloy, the ground investigation confirmed the presence of glacial till within the drumlins to depths of up to 37.5m bGL. The glacial till is described as very stiff sandy gravelly clay. Alluvial deposits associated with the Ballygawley Water extend to 7m bGL and comprise firm silt overlying medium dense to dense sands and gravels. Local bands of alluvium were also found to depths of 4m bGL associated with tributaries of the Aughnacloy and Lisadavil Rivers. Bedrock comprises black mudstone of the Clogher Valley Formation or grey argillaceous limestone of the Maydown Limestone Formation. Bedrock is typically found at between 4 m and 6 m bGL in interdrumlin areas.

Due to both land access issues and variations in alignment since completion of the ground investigation there is limited GI for the V2 alignment at the Peat bogs in Doogary and Newtownsaville, the Ballygawley Junction and south of Ballygawley in the vicinity of Tullywinney Road.

© Mouchel 2016

APPENDIX 12D DISCUSSION OF CONTAMINATED LAND RESULTS

New Buildings to Cloghcor

This area is predominantly greenfield land with a mixture of arable and pastoral farming. The main settlements which the existing A5 passes through within this area include New Buildings, Magheramason and Cloghcor respectively, moving towards the south. Various localised areas of fly tipping, in addition to a disused quarry are present, particularly in the vicinity of Magheramason and Sollus. One filling station is situated adjacent to the existing A5. Several disused corn and flax mills and kilns are located within the corridor. The latter is believed to present a low risk of impact; as a result of possible accidental spillage of chemicals which may have occurred in storage areas or during processing.

With respect to both short and long term human health risk, chemical concentrations in all of the samples tested did not exceed the relevant screening values with the exception of three samples within the greenfield areas. One additional sample exceeded the screening value for pH alkalinity at pH 9.3 located approximately 150m to the north east of Meenagh Road.

A poly chlorinated biphenyl (PCB) concentration of 0.00036mg/kg was detected near to Magheramason within the Glacial Till, however this did not exceed any human health screening values.

With regard to phytotoxicity, only one sample exceeded the screening values. This was for an alkaline pH of 9.3 in the same sample north east of Meenagh Rd.

In terms of risk to aquatic environments, 60% of the samples did not exceed the relevant screening levels. Ammonia concentrations exceeded in 24% of samples in the greenfield areas ranging from 0.05µg/l to 0.21µg/l, though locations were sporadic and not related to any particular feature. 40% of the samples tested exceeded the screening value in the brownfield areas ranging from 0.08 µg/l to 0.15µg/l, these were all located in the area 250m to the west of Grange Road. Acidic pH values exceeded in 8% of samples in the greenfield areas ranging from 5.2 to 5.7 adjacent to the south of Ballybeeny Road and west of Meenagh Road. 40% of samples within the brownfield areas exceeded screening values ranged from 5.7 to 5.8 located 250m to the west of Grange Road.

© Mouchel 2016

Cloghcor to North of Strabane

The Proposed Scheme passes through Cloghcor and west of Ballymagorry within this section, which is largely greenfield. There are also petrol stations that may be local point sources of contamination.

With regard to short term human health risk, 75% of the samples did not exceed the screening values. An acidic pH of 3.6 was encountered within a greenfield area to the north of Leckpatrick, and south of Cloghcor, along an unnamed road 350m to the south west of Lowry's Lane, This sample, however, was taken from strata underlying a peat soil which would account for the acidic pH.

In relation to long term human health exposure, all of the samples within the greenfield areas did not exceed the screening values.

With regard to phytotoxicity, an acidic pH of 3.6 was recorded in a sample to the south west of Lowry's Lane, south of Cloghcor, as described above.

In terms of risk to aquatic environments, 25% of the samples tested did not exceed the screening values. However, 75% of the results exceeded the screening values for ammonium and/or ammonia. It should be noted that this is only a small section of the Proposed Scheme and only 8 samples in total were tested. One location along the unnamed road 350m to the south west of Lowry's Lane, south of Cloghcor, exceeded the screening values for nickel (100 µg/kg), zinc (450 µg/kg) and acidic pH (3.3) within a brownfield area, all other exceedances were within greenfield land.

In the infilled brickfield along the unnamed road 180m to the north west of Ballyheather Road, sulphate (5.9%) exceeded the short term human health screen and this is also an issue for buried concrete.

With regard to phytotoxicity, all of the samples within the brownfield areas did not exceed the screening values.

© Mouchel 2016

North of Strabane to South of Strabane

The Proposed Scheme passes through Strabane and ends just to the north of Sion Mills within this section. This area is dominated by Strabane town and the area surrounding the old Strabane Canal. As such, there is a relatively higher proportion of sites of potential contamination present within this section. There are areas of greenfield land but these are mainly to the south west of Strabane.

Within the greenfield areas, in relation to short term and long term human health, all but one of the samples did not exceed the screening values. Benzo(a)pyrene exceeded screening values at one location, however the material comprised made ground and was situated directly adjacent to the former refuse tip at Park Road.

One sample in the greenfield area, located adjacent to Glenfinn Park Road, recorded a PCB concentration of 0.00038µg/kg in natural material. This level, however, did not exceed any human health screening values.

With regard to phytotoxicity, all of the samples taken from the greenfield areas did not exceed the screening values.

In terms of risk to aquatic environments, 44% of the samples in the greenfield areas did not exceed the screening values. Ammonia exceeded the screening values for 28% of the results ranging from 0.05µg/l to 0.68µg/l located at Park Road, 180m to the south west of the Bradley Way and Carrick Strand roundabout, 270m to the east of Carricklee Road and 100m to the west of Town Parks Road. Acidic pH values exceeded in 22% of samples in the greenfield areas ranging from 5.4 to 5.8 located 270m to the east of Carricklee Road, 230m to the north west of Peacock Road and 50m to the south of Peacock Road. One exceedance of alkaline pH (10.3) was located 100m to the west of Town Parks Road.

The areas of potential contamination are largely a function of the built environment. The area adjacent to the Proposed Scheme includes historical canal yards, an abattoir, tannery, ironworks, garage, a gasworks site and several infilled features including refuse tips, brickfields, quarries, millponds and a canal. The Proposed Scheme crosses the site of the former railway station and sidings.

One of the main areas that could potentially have a high risk of contamination is the former refuse tip adjacent to the current A5 and Park Road. The material from the former refuse tip comprised waste materials such as glass bottles, fabric, metal, wood, rubber, burnt waste and had a hydrocarbon odour.

The majority of samples contained exceedances in relation to long term human health PAHs (benzo(b)fluoranthene 7.0µg/kg; benzo(a)pyrene 2.8 - 5.8µg/kg), arsenic (41 – 42µg/kg), lead (470 – 990µg/kg), Total Petroleum Hydrocarbons (C16 – C21 aliphatic 20 – 29µg/kg; C21 – C35 aliphatic 62 – 150µg/kg) acidic pH 4.6 and carbazole 0.2µg/kg.

Short term human health exceedances were also in all samples for zinc (1600 – 1800 µg/kg), sulphate (2.3 – 4%) and acidic pH (3.6).

© Mouchel 2016

With regard to phytotoxicity, all samples exceeded the screening values for contaminants comprising cadmium (4 - 5µg/kg) copper (390µg/kg), lead (320 – 990µg/kg) molybdenum (12 – 14µg/kg), zinc (1600 – 1800µg/kg) and acidic pH (4.6).

With respect to risk to aquatic environments, exceedances were found in all samples including PAHs (fluoranthene 0.05 – 0.15 µg/l; pyrene 0.04 – 0.15 µg/l; benzo(a)anthracene 0.03 µg/l; benzo(a)pyrene 0.05 µg/l; phenanthrene 0.03 – 0.04 µg/l; anthracene 0.02 µg/l), acidic pH (5.1 – 5.9) ammonium (1.2 µg/l) and ammonia (0.05 – 0.09 µg/l).

Made ground was present on the opposite side of the road to the former refuse tip by Park Road, where exceedances of TPH (C21 – C35 aliphatic 17 µg/kg) with respect to long term human health risk were identified. With regard to phytotoxicity, one sample identified exceedances of molybdenum (4 µg/kg), nickel (60 µg/kg) and acidic pH (4.4). In respect of risk to aquatic environments, leachability exceedances of ammonia (1.9 µg/l) and ammonium (2.5 µg/l) were noted.

In addition, areas of fly tipping have been identified across this section, in particular the area adjacent to Urney Road located next to the Carricklee Hill former landfill. This was confirmed as an area where waste materials had been deposited. TPH (C16 – C21 aliphatic 18 µg/kg; C21 – C35 aliphatic 110 µg/kg) exceedances were found in relation to long term human health, however no short term human health risks were found. With regard to phytotoxicity, none of the samples exceeded the screen. In terms of risk to aquatic environments, exceedances of ammonia (1.1 – 2.2 µg/l) and ammonium (1.5 – 2.9 µg/l) were identified.

Made ground was encountered within the land adjacent to the garage on Lifford Road. With regard to long term human health risk, exceedances of PAHs (benzo(a)pyrene 2.1 µg/kg), lead (500 µg/kg), TPH (C16 – C21 aliphatic 30 µg/kg; C21 – C35 aliphatic 100 µg/kg), and the combustion product, carbazole (0.1 - 0.6 µg/kg) were noted. With regard to phytotoxicity, none of the samples exceeded the screening values. In terms of risk to aquatic environments, exceedances of PAHs (pyrene 0.03 - 0.04 µg/l) and ammonia (0.05 – 0.19 µg/l) were noted in leachability analysis of this material.

A railway station, railway line and sidings were formerly present along this section of the Proposed Scheme. With regard to human health, only one minor exceedance for acidic pH (5.9) was located at the former station area. In relation to phytotoxicity, none of the samples exceeded the screening values. In terms of risk to aquatic environments, ammonia (0.16 – 3.0 µg/l), ammonium (3.8 µg/l) and alkaline pH (10.6) exceedances were noted within the leachate analysis.

Several areas of made ground were encountered relating to infilled areas such as infilled brickfields, an infilled canal, backfilled quarries and a backfilled millpond.

With regard to long term human health risk, one exceedance relating to arsenic (83 µg/kg) was found within the infilled quarry/concrete works, located 560m to the west of Orchard Industrial Estate, and two acidic pH (4.2 – 4.9) values were found within the infilled canal, which runs parallel to Park Road. The infilled canal also found high concentrations of sulphate ranging from 1.5% to 5.8% with regard to short term human health risk.

© Mouchel 2016

In relation to phytotoxicity, one location within the infilled canal exceeded for acidic pH (4.2) and one location within the backfilled quarry / concrete works exceeded the screening value for arsenic (83 µg/kg).

In terms of risk to aquatic environments, the majority of samples from these infilled areas exceeded the screening values for ammonia (0.06 – 2.0 µg/l), with additional exceedances of PAHs (anthracene 0.14 µg/l) in the backfilled quarry (located 145m to the east of Knockroe Road, south of the current concrete works) and ammonium (1.3 - 8.9 µg/l) within the infilled canal.

© Mouchel 2016

South of Strabane to South of Omagh

The majority of this section of the scheme would be constructed on greenfield land. However, along the Proposed Scheme there are areas identified as having possible contaminative uses and thus may be potential sources of contamination. These are detailed below:

The alignment follows the former route of the Great Northern Railway line from 200m south of Rash Road, for approximately 1.5km, to Todds Road.

Several backfilled quarries and gravel pits with unknown backfill material are located within 250m of the alignment.

There are no registered landfill sites within 250m of the alignment. Located approximately 200m to the east of the alignment, just south of the Fairy Water, is the former Nestle factory, which has been used as a dumping ground since the factory closed in 1999.

Areas of flytipping and made ground were encountered along the Proposed Scheme of the alignment during the ground investigation. Imported fill and construction and demolition waste has been used to build up low lying ground in marshy areas, particularly in the area south of Omagh at Tamlaght Road and Blackfort Road, in order to reclaim usable farmland. The ground in these areas has often been built up 1.5 – 2.5m above the surrounding land.

Fuel storage sites, sewage works, timber treatment and textiles processing as well as farms are located within the area of the alignment. However, these were largely not on or immediately adjacent to the Proposed Scheme, which was designed to avoid the need for acquiring buildings where possible. The alignment does cross over several former lime kilns and mills, however, these sites date back to the early 20th Century and it is unlikely that contaminants would be present in the soils at concentrations which would pose a risk to human health and / or controlled waters.

None of the soil samples analysed from greenfield areas along the Proposed Scheme and the areas of potential contamination described above recorded concentrations greater than the relevant screening values for long term human health risk.

In terms of short term human health risk, one sample out of 72 soil samples tested exceeded the short term human health exposure value. The exceedance was for arsenic (482 µg/kg) and the sample was obtained from natural stratum in a field approximately 170m south of Milltown Road.

In terms of phytotoxicity, 94% of samples did not exceed the applicable screening values. Elevated concentrations of arsenic (50.3 µg/kg and 482 µg/kg) were identified in two greenfield locations; one in the same field 170m to the south of Milltown Road and one approximately 150m south of the A23 Clanabogan Road. An elevated boron concentration (7.1 µg/kg) was noted within natural stratum at a location approximately 500m south of the junction of Stone Road and Urbalreagh Road. Alkaline and acid soil conditions were also identified in two isolated greenfield areas (<5.5 or >9 pH units).

Regarding the risk to aquatic environments, 67% of the soil samples tested did not exceed the screening values. Twenty five soil samples had a soil leachate concentration greater than the

© Mouchel 2016

screening values for determinands including benzo(a)anthracene, fluoranthene and pyrene, cyanide, zinc and ammoniacal nitrogen and are described below. If this material is to be reused on site it should not be used for earthworks within 100m of any watercourse.

In the greenfield areas along the Proposed Scheme, 20% of samples tested (15 samples) across the whole of this section exceeded the screening for ammoniacal nitrogen with concentrations ranging from 0.03 µg/l to 4 µg/l. Zinc exceeded the screening values in two samples taken from greenfield areas. The concentrations of the zinc exceedances were 0.381 µg/l and 0.341 µg/l located 350m south of Mellon Country Inn and 280m northwest of the proposed Baronscourt Road junction to the southwest of Newtownstewart.

In the areas identified as potential sources of contamination, leachable concentrations of PAHs (benzo(a)anthracene, fluoranthene and pyrene) were identified in samples obtained from the railway embankment area. The PAH exceedance concentrations ranged from 0.023 µg/l to 0.058 µg/l for benzo(a)anthracene, 0.039 µg/l to 0.091 µg/l for fluoranthene and a single exceedance concentration of 0.104 µg/l for pyrene. A single total cyanide leachate exceedance of 0.34 µg/l was identified adjacent to an infilled quarry to the west of Sion Mills. Also, an ammoniacal nitrogen concentration of 0.05 µg/l was recorded from a sample obtained from natural ground adjacent to the infilled quarry.

© Mouchel 2016

South of Omagh – Gortaclare/Seskinore

The area is largely greenfield and the predominant land use in the area is pastoral farming. Drumlins in the area provide well drained farmland with less productive agricultural land in the interdrumlin areas which are generally wetter and marshier.

The main settlements within this section are Seskinore and Moylagh / Gortaclare in the south. These are small settlements which are primarily agriculture based. Individual farmsteads and houses are located along local roads and spread throughout the sparsely populated rural landscape.

The most significant potential contamination risk is associated with backfilled quarries in the area, particularly at the Moylagh Road Junction. Several small disused corn and flax mills and kilns are also located throughout the area.

With respect to both short and long term human health risk and phytotoxicity, chemical concentrations in all of the samples tested did not exceed the relevant screening values.

Regarding the risk to aquatic environments, chemical concentrations in 13% of the samples tested did not exceed the screening values. Local exceedances were found in greenfield locations for copper, zinc and lead.

Chemical concentrations exceeded zinc screening values for 87% of the samples tested, ranging between 32 µg/l and 323 µg/l, at A5 Doogary Road, Camowen Road, Tullyrush Road, Rarone Road and Augher Point Road.

Chemical concentrations exceeded copper screening values for 67% of the samples tested, ranging between 5 µg/l and 34 µg/l, at the same locations A5 Doogary Road, Camowen Road, Tullyrush Road, Rarone Road and Augher Point Road.

Chemical concentrations exceeded lead screening values for 13% of the samples tested, with values of 37 µg/l and 54 µg/l at Rarone Road and Tullyrush Road respectively.

© Mouchel 2016

Seskinore/Gortaclare – Ballygawley

This upland section comprises a diverse mosaic of pastures, woodland with marsh hollows and abandoned quarries. The area is generally used for rough pasture, with few well drained fields.

Settlements in this section include Eskra and Newtownsaville. These communities are primarily agriculturally supported with the exception of the sand and gravel pits situated at Eskragh however this does not impact on the Proposed Scheme. Outside of the settlement areas, isolated single rural dwellings are common.

Fly tipping is common in the section particularly next to Newtownsaville peat bog northeast of Tullycorker.

With respect to both short and long term human health risk, chemical concentrations in all of the samples tested did not exceed the relevant screening values.

In terms of phytotoxicity, chemical concentrations in 71% of the samples tested did not exceed the relevant values. Local exceedances were found in greenfield locations for boron and alkaline pH.

Chemical concentrations slightly exceeded boron screening values for 26% of the samples tested, ranging between 3.4 µg/kg and 5.8 µg/kg, at Legacurry Road, Tullanafoile Road, Tycanny Road, Newtownsaville/Glenhoy Road Junction, Crew Road and Feddan Road.

Chemical concentrations exceeded alkaline pH screening values for 6% of the samples tested with values of 9 and 9.1 at Newtownsaville/Glenhoy Road Junction and Rarogan Road respectively.

Regarding the risk to aquatic environments, chemical concentrations in 26% of the samples tested did not exceed the screening values. Local exceedances were found in greenfield locations for copper, zinc and lead.

Chemical concentrations exceeded copper screening values for 60% of the samples tested, ranging between 5 µg/l and 73 µg/l, at Springhill Road, Rockmore Road, Cormore Road, Newtownsaville Road, Tullycorker Road, Tullanafoile Road, Tycanny Road, Rarogan Road, Glenhoy Road, Feddan Road and Annaghilla Road.

Chemical concentrations exceeded zinc screening values for 68% of the samples tested, ranging between 31 µg/l and 299 µg/l, at Legacurry Road, Springhill Road, Rockmore Road, Cormore Road, Glenalt Road, Newtownsaville Road, Tullycorker Road, Tullanafoile Road, Tycanny Road, Rarogan Road, Glenhoy Road, Crew Road, Feddan Road and Annaghilla Road.

Chemical concentrations exceeded lead screening values for 6% of the samples tested, 35 µg/l and 84 µg/l at Tullanafoile Road and Cormore Road respectively.

Samples taken from Newtownsaville Bog reclaimed land which was one of the identified brownfield locations had chemical concentrations exceeding the screening values for aquatic environments for copper, zinc and sulphate.

© Mouchel 2016

Clogher Valley & Aughnacloy

Residential development is focussed around the town of Aughnacloy in the south of the section and the smaller settlements of Ballygawley in the east and Augher and Clogher in the west. Elsewhere in the section, isolated single dwellings are located sporadically and agriculture is the main industry. A large active landfill is situated at Tullyvar with a smaller reclaimed landfill to the east of the Aughnacloy town. Two areas of made ground have been identified at Old Chapel Road and south of Aughnacloy.

The Proposed Scheme avoids these, but there are also a large number of disused quarries throughout the area particularly a disused limestone quarry south of Tullywinny Road, a backfilled quarry adjacent to Old Chapel Road and backfilled quarry and gravel pit adjacent to Tullyvar Road.

The disused Clogher Valley railway roughly extends from Clogher to Ballygawley and then south to Aughnacloy and crossed the Proposed Scheme at Ballygawley.

With respect to both short and long term human health risk, chemical concentrations in all of the samples tested did not exceed the relevant screening values.

In terms of phytotoxicity, chemical concentrations in 60% of the samples tested did not exceed the relevant screening values. Local exceedances were found in both greenfield and brownfield locations for boron. This ranged between 4.1 µg/kg and 10.7 µg/kg at Tullywinny Road, Old Chapel Road, Tullyvar Road, Carnteel Road and Rehaghy Road in the greenfield areas.

In addition localised exceedances (5.9 µg/kg and 10.6 µg/kg) were found in the made ground at Old Chapel Road.

Regarding the risk to aquatic environments, chemical concentrations in 45% of the samples tested did not exceed the screening values. Local exceedances were found in greenfield locations for copper, zinc and sulphate.

Chemical concentrations exceeded copper screening values for 25% of the samples tested, ranging between 5 µg/l and 20 µg/l, at South of Annaghilla Road, Tullywinney Road, Old Chapel Road, Carnteel Road and Rehaghy Road.

Chemical concentrations exceeded zinc screening values for 45% of the samples tested, ranging between 48 µg/l and 180 µg/l, at South of Annaghilla Road, Tullywinney Road, Lisginny Road, Old Chapel Road, Carnteel Road, Rehaghy Road and Caledon Road.

Chemical concentrations exceeded sulphate screening values for one sample (396 µg/l) at north of Caledon Road.

With regard to the brownfield locations, local exceedances for copper and zinc were found at the disused limestone quarry south of Tullywinny Road.

© Mouchel 2016

APPENDIX 13A GUIDANCE, LEGISLATION AND POLICY CONTEXT

The Design Manual for Roads and Bridges

The Design Manual for Roads and Bridges (DMRB) Volume11, Section 3, Part 7, HD211/08 Noise and Vibration provides advice on the assessment of noise and vibration impacts due to road traffic.

It does not provide procedures for calculating noise from road traffic; instead it provides guidance on assessing the potential impact of changes in noise levels on sensitive receptors. The various levels of the DMRB methodology are as detailed below. These are intended to apply to various phases of the planning, design and execution of a scheme proposal:

- **Screening Assessment** – to determine whether the project has the potential to cause a change to the receiving environment which could result in noise and vibration impacts.
- **Scoping Assessment** – to determine the likely extent of any assessment and to identify sensitive receptors.
- **Simple Assessment** – assessment of noise and vibration impacts at dwellings and other sensitive receptors; and
- **Detailed Assessment** – assessment of noise and vibration impacts at dwellings and other sensitive receptors.

These stages are generally followed in a sequential manner although the progression of the scheme, through the order and extent of the assessment may depend upon the scale of the project, and specific site and local circumstances.

The difference between stages 3 (Simple Assessment) and 4 (Detailed Assessment) relates to the depth into which the assessment is undertaken.

© Mouchel 2016

Calculation of Road Traffic Noise Memorandum

The Technical Memorandum, Calculation of Road Traffic Noise (CRTN) (Department of Transport and Welsh Office, 1988) document details an empirical prediction methodology for the calculation of road traffic noise. The procedures described within the document set out the calculation methodology as well as the information requirements which includes traffic flow components, the type of ground cover, relevant heights and distances, and the presence of any barriers/obstructions.

These are used in order to calculate the source noise level of the given road link and the reduction in noise at a given receiver location due to propagation and screening effects.

The document further outlines where and how the monitoring of existing traffic noise conditions should be undertaken.

© Mouchel 2016

The Noise Insulation Regulations (Northern Ireland) 1995

Under the Noise Insulation Regulations (Northern Ireland) 1995 dwellings and other places used for residential properties may qualify for an offer of noise insulation the following well defined conditions are satisfied at 1m in front of the most exposed door or window of an eligible room in the façade of a property:

In respect of road traffic noise, properties may qualify if all four of the following conditions are satisfied:

- the property must be within 300m of the nearest point of the new or altered carriageway;
- the Facade Noise Level due to road traffic on any highway (the "Relevant" noise level) for the design year, or for any intervening year if the noise level is higher, must equal or exceed 68 dB $L_{A10,18h}$, (the "specified" level), with levels of 67.5 dB $L_{A10,18h}$ being rounded upwards;
- the "Relevant" noise level for the design year, or for any intervening year if noisier, must be at least 1 dB $L_{A10,18h}$ higher than the pre-construction year road traffic noise level (the Prevailing Noise Level); and
- noise from the new or altered road must contribute at least 1 dB $L_{A10,18h}$ to the "Relevant" noise level.

Roads Service has a duty under these Regulations to offer Sound Insulation for residential properties with respect to a new road, and discretionary powers in relation to altered roads. Various discretionary powers are also available in relation to façades or parts of façades contiguous (definition: touching or in contact) with a qualifying façade. The Regulations apply to habitable rooms only and so exclude bathrooms, toilets, halls and kitchens that do not include dining areas.

Some residential buildings are not eligible under the Regulations; these include houses first occupied after the opening date of the road. The "opening date" is defined for the purposes of the Regulations as the date a new road was first opened to public traffic or an altered road was opened following completion of the alteration.

© Mouchel 2016

The Land Acquisition and Compensation (Northern Ireland) Order 1973

The Land Acquisition and Compensation (Northern Ireland) Order 1973 (LACO) defines the right of a person/persons to claim compensation for the depreciation of the value of property caused by the usage of Highways, aerodromes and other public works.

The Order includes provision for compensation for loss in property value resulting from physical agents including noise and Vibration.

The relevant parts of the LACO relating to noise is split into 2 parts as defined below:

Part II Compensation for Depreciation caused by use of Public Works

Part III Mitigation of Injurious Effect of Public Works

© Mouchel 2016

BS 5228-2:2009 – 'Code of practice for noise and vibration control on construction and open sites'

This standard contains guidance on the prediction of noise levels at sensitive receptors from the operation of fixed and mobile noise sources found on construction and open (quarry and OCCS) sites.

It provides source sound level data for various machinery and tasks associated with the construction phase of a site. It also contains information pertaining to mitigation of noise from construction operations.

The standard, however, does not go as far as specifying acceptable working criteria in the form of noise limits, but Part 1 of the document does provide details of an example methodology that could be implemented for the determination of the significance of construction noise impacts; the "ABC Method".

The specifics of the assessment method that could be used to derive appropriate construction noise limits for the works are detailed below.

BS5228 The ABC Method

The ABC method is based upon threshold noise levels defined by both time and existing ambient noise levels. The method requires the ambient pre construction noise level to be determined and rounded to the nearest 5dB. This ambient noise level is then compared to the total noise level which would contain noise associated with the construction operations. If the total noise level exceeds the appropriate category value then a significant effect is deemed to occur. The threshold/category values and definitions are presented within Table 13A.1 below:

© Mouchel 2016

Table 13A.1 BS5228 Example Method 1 – ABC Method

Assessment category and threshold value period (L_{Aeq})	Threshold value, in decibels (dB)		
	Category A [A)]	Category B [B)]	Category C [C)]
Night-time (23:00 – 07:00)	45	50	55
Evening and Weekends [D)]	55	60	65
Daytime (07:00 -19:00) and Saturdays (07:00 – 13:00)	65	70	75

NOTE 1 A significant effect has been deemed to occur if the total L_{Aeq} noise level, including construction, exceeds the threshold level for the Category appropriate to the ambient noise level.

NOTE 2 If the ambient noise level exceeds the threshold values given in the table (i.e. the ambient noise level is higher than the above values), then a significant effect is deemed to occur if the total LAeq noise level for the period increases by more than 3 dB due to construction activity.

NOTE 3 Applied to residential receptors only.

[A)] Category A: threshold values to use when ambient noise levels (when rounded to the nearest 5 dB) are less than these values

[B)] Category B: threshold values to use when ambient noise levels (when rounded to the nearest 5 dB) are the same as category A values

[C)] Category C: threshold values to use when ambient noise levels (when rounded to the nearest 5 dB) are higher than category A values

[D)] 19:00 – 23:00 weekdays, 13:00 – 23:00 Saturdays and 07:00 – 23:00 Sundays.

The criteria further requires that for a significant effect to occur the total noise level must exceed the pre construction ambient noise for a duration of one month or more, unless works of a shorter duration are likely to result in significant impacts.

© Mouchel 2016

BS5228 'Code of practice for noise and vibration control on construction and open sites' Part 2: Vibration

Part 2 of BS5228 gives recommendations for basic methods of vibration control relating to construction and open sites. The standard also describes the legislative background to vibration control and offers advice regarding the establishment of effective liaison between developers, site operators and local authorities.

The standard also contains guidance on measuring and assessing the effects of vibration.

With regard to the assessment of significance of vibration relating to human response BS5228 presents the following guidance on vibration levels and effects referenced to PPV criteria as reproduced within Table13A.2 below.

Table13A.2 BS5228 Guidance on Effects of Vibration Levels

Vibration Level	Effect
0.14 mm/s	Vibration might be just perceptible in the most sensitive situations for most vibration frequencies associated with construction. At lower frequencies, people are less sensitive to vibration
0.3mm/s	Vibration might be just perceptible in residential environments
1.0 mm/s	It is likely that vibration of this level in residential environments will cause complaint, but can be tolerated if prior warning and explanation has been given to residents
10 mm/s	Vibration is likely to be intolerable for any more than a very brief exposure to this level

With regard to structural response to vibration BS5228 refers to the damage threshold criteria presented in BS7385.

© Mouchel 2016

APPENDIX 13B CONSTRUCTION NOISE

13B.1 Methods of Assessment

Evaluation of the Magnitude of Construction Noise

13B.1.1 Noise emission levels from operational plant are heavily dependent on the detailed design and component selection. Although an indicative list of plant and equipment used on the project has been provided, these do not allow for the precise quantification of noise emission levels at this stage. Realistic, but indicative equipment noise levels have been used to make a high level assessment of the likely impact from operational noise.

13B.1.2 The four main construction activities have been identified as follows;

- Site Preparation and Earthworks;
- Construction of Road Pavement;
- Temporary Building Construction; and
- Bridge Construction.

13B.1.3 Tables 13G.1 to 13G.4 in Appendix 13G detail the assumed plant type, quantity, L_{Aeq} at 10 m and the total calculated sound power level for each construction activity. Table 13B.1 below provides a summary of the calculated sound power level for each construction activity.

Table 13B.1 Construction Activity Sound Power Level

Construction Activity	Overall Sound Power Level, (dB)
Site Preparation and Earthworks	121
Construction of Road Pavement	115
Temporary Building Construction	116
Bridge Construction	125

© Mouchel 2016

13B.2 Predicted Impacts – Construction Related Noise

13B.2.1 Due to the size of the development, assessment of each potential noise source at all receptors along the length of the development in not practicable. As such, the assessment focusses on areas where the nature of construction activities would likely involve higher orders of noise. Table 13B.2 details the four identified areas likely to be subject to higher levels of noise, and the number of each area in each phase.

13B.2.2 The location of these potential construction “hot spots” and the principal compounds is detailed in Table 13B.4.

© Mouchel 2016

Table 13B.2 Construction Hot Spots and Number within each Phase

Hot Spot Name	Number of Hot Spots			
	Phase 1a	Phase 2	Phase 1b	Phase 3
Major Road Construction (Junctions)	3	9	2	3
Compounds	2	7	1	2
Large Earthworks	1	4	4	0
Bridges/Flyovers	3	3	1	1

13B.2.3 Table 13B.3 specifies the distances from each construction activity where noise levels will exceed 65 dB(A). In performing the construction noise calculations of these significant noise impact distances, the following assumptions have been made;

- Propagation is assumed to occur over mixed ground conditions;
- All construction equipment included in the calculation will operate concurrently; and
- There will be no intervening barriers or terrain.

13B.2.4 In addition to the distances from each construction activity above which noise levels will exceed 65 dB(A), Table 13B.3 below identifies distances at which 65 dB(A) would be exceeded by 5 dB (i.e. a level of 70 dB(A)) and 10 dB (i.e. a level of 75 dB(A)).

© Mouchel 2016

Table 13B.3 Distance to 65, 70 and 75 dB(A)for each Construction Activity

Construction Activity	Distance to 65 dB(A)	Distance to 70 dB(A)	Distance to 75 dB(A)
Site Preparation and Earthworks	180 m	110 m	65 m
Construction of Road Pavement	110 m	65 m	40 m
Temporary Building Construction	120 m	75 m	45 m
Bridge Construction	280 m	170 m	105 m

13B.2.5 Table 13B.4 quantifies the number of receptors likely to experience predicted noise levels above 65 dB(A) for each noise hot spot, based on the distances in Table 13B.3. It also provides the number of receptors where predicted noise levels will exceed the limit by 0 - 5dB and 5 - 10 dB for each hot spot. In some instances, certain receptors will experience significant effects from more than one hot spot.

13B.3 Predicted Impacts – Construction Traffic Noise

13B.3.1 Tables 13B.9 to 13B.12 detail the assessment of construction traffic related noise for each phase of the Development. The magnitudes of impact are summarised as below:

- 11 access routes would result in an impact above 65dB; and
- 58 access routes would result in an impact less than 65dB;

13B.4 Predicted Impacts – Vibration Due to Construction

13B.4.1 Construction activities which generate the highest orders of vibration are blasting, pile driving, ground stabilisation and significant demolition. These activities tend to occur around areas of major earthworks and during the construction of bridges. These construction activities tend to occur in more rural areas, where soft ground requires piling or major earthworks are present.

13B.4.2 Table 13B.13 details the locations where piling, ground stabilisation, significant demolition or rock-blasting are likely to be required, in addition to the approximate distance to the nearest receptor. In general the receptors are individual properties, located up to approximately 200 m from working areas.

Table 13B.13 Sites which have the potential to cause significant construction vibration impacts

Approximate Chainage	Anticipated Activity	Approx. Distance to nearest receptor
7700	Earthworks cut and embankment construction works	>180 m
10500	Construction of Flyover	>180 m
12700	Construction of Flyover	>180 m
13500	Construction of Flyover	>180 m
20400	Earthworks cut and embankment construction works	>180 m
34374	Construction of bridge over River Derg	>180 m
39500	Aggregate Processing	>120 m
43900	Earthworks cut and embankment construction works	>65 m
55200	Earthworks cut and embankment construction works	>180 m
56693	Construction of ridge over River Drumragh	>170 m

APPENDIX 13C MEASUREMENT OF NOISE

Description of Noise

Noise is defined as unwanted sound and is measured in units referred to as decibels (dB). The decibel is a logarithmic measure of sound pressure i.e. the magnitude of the pressure vibrations in the air. The audible range of sound pressure levels is between 0 dB (the threshold of hearing) to 120 dB (the threshold of pain).

For variable noise sources within an area an increase of 3 dB(A) would be considered to be the minimum perceptible to the human ear under normal conditions and it is generally accepted that an increase/decrease of 10 dB(A) corresponds to a doubling or halving in perceived loudness. The perceived 'loudness' of a noise is a purely subjective parameter, dependant not only upon the sound pressure of the event but also on the dynamics of the listener's ear, the time of the day and general mood of the listener. Table 13C.1 below gives an indication of Sound Pressure Levels (SPLs) for typical activities which people can associate with.

Table 13C.1 The Level of Typical Common Sounds on the dB(A) Scale

Typical Activities	dB(A)
Threshold of hearing	0
Quiet bedroom	35
Communication starts becoming difficult	55
Busy general office	60
Passenger car at 60 km/h at 7 m	71
Twin engine jet during take off at 152 m	82
Heavy diesel lorry at 40 km/h at 7 m	85
Pneumatic drill	95
Threshold of pain	120

The frequency response of the human ear to noise is usually taken to be about 18Hz (number of oscillations per second) to 18,000Hz. However, the human ear does not respond equally to different frequencies at the same level, it is more sensitive in the mid-frequency range than the lower and higher frequencies and, because of this, when undertaking the measurement of noise the low and high frequency components of any given sound are reduced in importance by applying a filtering (weighting) circuit to the noise measuring instrument. The weighting which is most widely used and which correlates best with the subjective nature of human response to noise is the A-weighted filter set. This is an internationally accepted standard for noise measurements.

© Mouchel 2016

With regard to environmental noise levels (in the open air), these are rarely steady, but rise and fall according to the activities being undertaken within the surrounding area at any given time. In an attempt to produce a figure that relates this variable nature of noise to human subjective response, a number of statistical noise metrics have been developed. These include:

L_{Aeq} Noise Level

This is the 'equivalent continuous A-weighted sound pressure level, in decibels', and is defined in British Standard BS7445 as the '*value of the A-weighted sound pressure level of a continuous, steady sound that, within a specified time interval, T, has the same mean square sound pressure as a sound under consideration whose level varies with time*'.
It is the unit most suitable for the description of environmental noise.

L_{A10} Noise Level

The L_{A10} is the noise level that is exceeded for 10% of the measurement period, and gives an indication of the noisier portion of the climate.
It is a unit that has been used over many years for the measurement and assessment of road traffic noise.

L_{A90} Noise Level

The L_{A90} is the noise level that is exceeded for 90% of the measurement period and gives an indication of the noise level during the quieter periods.
It is often referred to as the 'background' noise level.

L_{Amax} Noise Level

The L_{Amax} is the maximum value that the A-weighted sound pressure level reaches during the measurement period.

Road Traffic Noise

The actual sources of noise associated with road vehicles can be separated into two main components:-

- Mechanical noise generated from the engine, exhaust and transmission systems of the vehicle. This is the dominant noise source when traffic is not freely flowing; and
- Noise generated from the interaction of the tyres with the road surface. This is the dominant noise source under freely flowing traffic conditions at moderate to high road speeds.

The main factors that influence the noise generated by road traffic movements at a given receptor are broadly as detailed below:-

- traffic flow;
- speed and composition;
- road gradient; and
- road surface characteristics.

The noise level at a particular reception point removed from the road source would also be affected further by other factors including the distance from the road source, the nature of the intervening ground surface/cover and the presence of any screens or obstructions.

Equipment Setup Parameters

Measurement parameters

The class 1 sound level meters used in the monitoring survey give the option of defining the setup parameters logged during the monitoring period.

Time Weighting

Time weighting is a measure of the response time of the sound level meter to impulsive sound. The more rapid the response, the more accurately the meter will represent the source sound. There are two standard time weightings:

- Fast – Has a response time of 125 milliseconds
- Slow – Has a response time of 1 second.

The time weighting, in this instance, was set to a fast response in order to more accurately map the changes in noise level.

Frequency Weighting

As mentioned above, the human response to sound is not linear across the audible frequency spectrum, favouring instead, the mid range above the low and high end frequencies. To reflect this bias, the class 1 sound level meter introduces a weighting network to more accurately resemble the human response to sound.

The A weighting network is the internationally accepted standard for noise measurements (Table 13C.2).

Table 13C.2 A Weighting Frequency Network

Centre Frequency (Hz)	16	31.5	63	125	250	500	1000	2000	4000	8000
A Weighting factor (dB)	-56.7	-39.4	-26.2	-16.1	-8.6	-3.2	0	1.2	1	-1.1

Interval measurement

A 15 minute measurement period was used on all surveys to ensure an adequate sample of noise data was averaged.

This certificate provides traceability of measurement to recognised national standards, and to the units of measurement realised at the National Physical Laboratory or other recognised national standards laboratories. This certificate may not be reproduced other than in full except with the prior written approval of the issuing laboratory.

Certificate of Calibration

Issued by University of Salford (Acoustics Calibration Laboratory)

Certificate Number: 01098/3 Date of Issue: 6 November 2012

SET-UP INFORMATION

The instrument version was Master 01 V1.401. The reference range, reference SPL, primary indicator range, pulse range and linearity range as specified by the manufacturer have been used. The instrument was adjusted to read 113.7 dB (A) in response to the associated calibrator. This reading was obtained from the calibration certificate of the calibrator, 01098/2 and information in the manufacturer's instruction manual, when the instrument is fitted with the supplied windshield.

MEASUREMENTS

The levels of self-generated noise were:

A:	**9.5 dB***
B:	**8.2 dB***
C:	**9.8 dB***
Z:	**14.0 dB***

*Under-range indicated on instrument.

At the end of the tests the indication of the sound level meter in response to the associated sound calibrator was 113.6 dB (A) which corresponds to the following level at 101.325 kPa:

Sound Pressure Level 113.6 **dB (A)**
This reading should be used henceforth to set up the sound level meter for field use.

THE SOUND LEVEL METER WAS VERIFIED ACCORDING TO THE PROCEDURE GIVEN IN BS7580: Part 1 1997 WITH THE FOLLOWING EXCEPTIONS:

A stricter test than that specified in 5.5.10 and 5.5.11 of BS 7580 has been used by not applying the low level signal.

STATEMENT OF RESULT:

THE SOUND LEVEL METER CONFORMS TO BS7580: PART1 1997

Instruments used in the verification procedure were traceable to National Standards. The method of acoustic calibration employed a standard sound pressure calibrator for the 1 kHz test whilst the tests at 125 Hz and 8 kHz were performed by the electrostatic actuator method. The uncertainty of the Laboratory's 1 kHz calibrator was ±0.10 dB. The uncertainty of the standard calibrator is not included in the applied tolerances. It is assumed that the sound level meter was manufactured in accordance with BSEN60651: 1994 Type 1, and BSEN60804: 1994 Type 1.

The reported expanded uncertainty is based on a standard uncertainty multiplied by a coverage factor k=2, providing a level of confidence of approximately 95%. The uncertainty evaluation has been carried out in accordance with UKAS requirements. All measurement results are retained at the acoustic calibration laboratory for at least four years.

This certificate provides traceability of measurement to recognised national standards, and to the units of measurement realised at the National Physical Laboratory or other recognised national standards laboratories. This certificate may not be reproduced other than in full except with the prior written approval of the issuing laboratory.

Certificate of Calibration

Issued by University of Salford (Acoustics Calibration Laboratory)

Page 2 of 2

Certificate Number: 01175/1 Date of Issue: 30 January 2013

SET-UP INFORMATION

The instrument version was Master 01 V1.400. The reference range, reference SPL, primary indicator range, pulse range and linearity range as specified by the manufacturer have been used. The instrument was adjusted to read 114.1 dB (A) in response to the associated calibrator. This reading was obtained from the calibration certificate of the calibrator, 01175/1 and information in the manufacturer's instruction manual. The instrument was calibrated without a windshield. Consult manufacturer's instructions if using a windshield.

MEASUREMENTS

The levels of self-generated noise were:

A:	**11.2 dB***
B:	**9.5 dB***
C:	**11.0 dB***
Z:	**16.0 dB***

***Under-range indicated**

At the end of the tests the indication of the sound level meter in response to the associated sound calibrator was 114.1 dB (A) which corresponds to the following level at 101.325 kPa:

Sound Pressure Level 114.1 **dB (A)**
This reading should be used henceforth to set up the sound level meter for field use.

THE SOUND LEVEL METER WAS VERIFIED ACCORDING TO THE PROCEDURE GIVEN IN BS7580: Part 1 1997 WITH THE FOLLOWING EXCEPTIONS:

Cirrus Research plc
dedicated to noise measurement

Equipment Details

Instrument Manufacturer	Cirrus Research plc
Instrument Type	CR:811C
Description	Sound Level Meter
Serial Number	D22149FD

Calibration Procedure

The instrument detailed above has been calibrated to the publish test and calibration data as detailed in the instrument hand book, using the techniques recommended in the latest revisions of the International Standards IEC 61672-1:2002, IEC 60651:1979, IEC 60804:2001,IEC 61260:1995, IEC 60942:1997, IEC 61252:1993, ANSI S1.4-1983, ANSI S1.11-1986 and ANSI S1.43-1997 where applicable.
Sound Level Meters: All Calibration procedures were carried out by subsitituting the microphone capsule with a suitable electrical signal, apart from the final acoustic calibration.

Calibration Traceability

The equipment detailed above was calibrated against the calibration laboratory standards held by Cirrus Research plc. These are traceable to International Standards {A.0.6}. The standards are:

Microphone Type	B&K4180	Serial Number	1893453	Calibration Ref.	S 6009
Pistonphone Type	B&K4220	Serial Number	613843	Calibration Ref.	S 5964

Calibrated by T. A. Goodhill

Calibration Date	28 February 2014
Calibration Certificate Number	215577

This Calibration Certificate is valid for 12 months from the date above.

Certificate of Calibration

Issued by University of Salford (Acoustics Calibration Laboratory)

Certificate Number: 01563/1 Date of Issue: 8 November 2013

MEASUREMENTS

The sound pressure level generated by the calibrator was measured using a calibrated, WS2P condenser microphone as specified in the certificate. The calibration was carried out with the calibrator in the half-inch configuration.

Five determinations of the sound pressure level, frequency and total distortion were made.

The results have been corrected to the reference pressure of 101.325 kPa using manufacturer's data.

RESULTS

Coupler configuration:	Half-inch
Microphone type:	GRAS 40AG
Output level (dB re 20μPa):	114.19 dB ± 0.08 dB
Frequency (Hz):	1000.62 Hz ± 0.12 Hz
Total Harmonic Distortion (%):	0.02 % ± 0.16 %

Average environmental conditions at the time of measurement and maximum deviation from the stated average:

Pressure:	98.484 kPa ± 0.016 kPa
Temperature:	23.4 °C ± 0.1 °C
Relative humidity:	43.1 % ± 0.2 %

The reported expanded uncertainty is based on a standard uncertainty multiplied by a coverage factor k=2, providing a level of confidence of approximately 95%. The uncertainty evaluation has been carried out in accordance with UKAS requirements.

All measurement results are retained at the acoustic calibration laboratory for at least four years.

This certificate provides traceability of measurement to recognised national standards, and to the units of measurement realised at the National Physical Laboratory or other recognised national standards laboratories. APPENDIX 13I SCHEDULE OF NOISE CHANGES

All values in the tables below are in dB. Predicted noise levels are LA10, 18hr.

The assessment has looked at the following scenario years;

2019 – Opening year Phase 1

2023 – Opening year Phase 2

2028 – Opening Phase 3

2041 – Future year (13 years after start of Phase 3)

Glossary

DM – Do-minimum

DS – Do-something

ST – Short term

LT – Long term

CH – Change
